Description of STM32H7 HAL and low-layer drivers

Introduction

STM32Cube is an STMicroelectronics original initiative to significantly improve developer productivity by reducing development effort, time and cost. STM32Cube covers the STM32 portfolio.

STM32Cube includes:

- STM32CubeMX, a graphical software configuration tool that allows the generation of C initialization code using graphical wizards.
- A comprehensive embedded software platform, delivered per Series (such as STM32CubeH7 for STM32H7 Series)
  - The STM32Cube HAL, STM32 abstraction layer embedded software ensuring maximized portability across the STM32 portfolio. HAL APIs are available for all peripherals.
  - Low-layer APIs (LL) offering a fast light-weight expert-oriented layer which is closer to the hardware than the HAL. LL APIs are available only for a set of peripherals.
  - A consistent set of middleware components such as RTOS, USB, TCP/IP and Graphics.
  - All embedded software utilities, delivered with a full set of examples.

The HAL driver layer provides a simple, generic multi-instance set of APIs (application programming interfaces) to interact with the upper layer (application, libraries and stacks). The HAL driver APIs are split into two categories: generic APIs, which provide common and generic functions for all the STM32 series and extension APIs, which include specific and customized functions for a given line or part number. The HAL drivers include a complete set of ready-to-use APIs that simplify the user application implementation. For example, the communication peripherals contain APIs to initialize and configure the peripheral, manage data transfers in polling mode, handle interrupts or DMA, and manage communication errors. The HAL drivers are feature-oriented instead of IP-oriented. For example, the timer APIs are split into several categories following the IP functions, such as basic timer, capture and pulse width modulation (PWM). The HAL driver layer implements run-time failure detection by checking the input values of all functions. Such dynamic checking enhances the firmware robustness. Run-time detection is also suitable for user application development and debugging.

The LL drivers offer hardware services based on the available features of the STM32 peripherals. These services reflect exactly the hardware capabilities, and provide atomic operations that must be called by following the programming model described in the product line reference manual. As a result, the LL services are not based on standalone processes and do not require any additional memory resources to save their states, counter or data pointers. All operations are performed by changing the content of the associated peripheral registers. Unlike the HAL, LL APIs are not provided for peripherals for which optimized access is not a key feature, or for those requiring heavy software configuration and/or a complex upper-level stack (such as USB).

The HAL and LL are complementary and cover a wide range of application requirements:

- The HAL offers high-level and feature-oriented APIs with a high-portability level. These hide the MCU and peripheral complexity from the end-user.
- The LL offers low-level APIs at register level, with better optimization but less portability. These require deep knowledge of the MCU and peripheral specifications.
- All STM32H7 single- and dual-core lines are supported by the same STM32CubeH7 HAL and LL drivers.

The HAL- and LL-driver source code is developed in Strict ANSI-C, which makes it independent of the development tools. It is checked with the CodeSonar® static analysis tool. It is fully documented.

It is compliant with MISRA C®:2012 standard.

This user manual is structured as follows:

- Supporting dual-core architectures
- Overview of HAL drivers
- Overview of low-layer drivers
- Cohabiting of HAL and LL drivers
- Detailed description of each peripheral driver: configuration structures, functions, and how to use the given API to build your application

1 General information

The STM32CubeH7 MCU Package runs on STM32H7 32-bit microcontrollers based on the Arm® Cortex®-M processor.

Note: Arm is a registered trademark of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

2 Acronyms and definitions

Table 1. **Acronyms and definitions**

Acronym	Definition
ADC	Analog-to-digital converter
AES	Advanced encryption standard
ANSI	American national standards institute
API	Application programming interface
BSP	Board support package
CAN	Controller area network
CEC	Consumer electronic controller
CMSIS	Cortex microcontroller software interface standard
COMP	Comparator
CORDIC	Trigonometric calculation unit
CPU	Central processing unit
CRC	CRC calculation unit
CRYP	Cryptographic processor
CSS	Clock security system
DAC	Digital to analog converter
DLYB	Delay block
DCMI	Digital camera interface
DFSDM	Digital filter sigma delta modulator
DMA	Direct memory access
DMAMUX	Direct memory access request multiplexer
DSI	Display serial interface
DTS	Digital temperature sensor
ESE	Security enable Flash user option bit
ETH	Ethernet controller
EXTI	External interrupt/event controller
FDCAN	Flexible data-rate controller area network unit
FLASH	Flash memory
FMAC	Filtering mathematical calculation unit
FMC	Flexible memory controller
FW	Firewall
GFXMMU	Chrom-GRC
GPIO	General purpose I/Os
HAL	Hardware abstraction layer
HASH	Hash processor
HCD	USB host controller driver
HRTIM	High-resolution timer
I2C	Inter-integrated circuit

Acronym	Definition
I2S	Inter-integrated sound
ICACHE	Instruction cache
IRDA	Infrared data association
IWDG	Independent watchdog
JPEG	Joint photographic experts group
LCD	Liquid crystal display controller
LTDC	LCD TFT display controller
LPTIM	Low-power timer
LPUART	Low-power universal asynchronous receiver/transmitter
MCO	Microcontroller clock output
MDIOS	Management data input/output (MDIO) slave
MDMA	Master direct memory access
MMC	MultiMediaCard
MPU	Memory protection unit
MSP	MCU specific package
NAND	NAND Flash memory
NOR	NOR Flash memory
NVIC	Nested vectored interrupt controller
OCTOSPI	Octo-SPI interface
OPAMP	Operational amplifier
OTFDEC	On-the-fly decryption engine
OTG-FS	USB on-the-go full-speed
PKA	Public key accelerator
PCD	USB peripheral controller driver
PPP	STM32 peripheral or block
PSSI	Parallel synchronous slave interface
PWR	Power controller
QSPI (QUADSPI)	Quad-SPI Flash memory
RAMECC	RAM ECC monitoring
RCC	Reset and clock controller
RNG	Random number generator
RTC	Real-time clock
SAI	Serial audio interface
SD	Secure digital
SDMMC	SD/SDIO/MultiMediaCard card host interface
SMARTCARD	Smartcard IC
SMBUS	System management bus
SPI	Serial peripheral interface
SPDIFRX	SPDIF-RX Receiver interface
SRAM	SRAM external memory
SWPMI	Serial wire protocol master interface

Acronym	Definition
SysTick	System tick timer
TIM	Advanced-control, general-purpose or basic timer
TSC	Touch sensing controller
UART	Universal asynchronous receiver/transmitter
UCPD	USB Type-C® and Power Delivery interface
USART	Universal synchronous receiver/transmitter
VREFBUF	Voltage reference buffer
WWDG	Window watchdog
USB	Universal serial bus

3 Support of dual-core architectures

The STM32H7 microcontrollers come in two product lines:

- Single-core lines, based on an Arm® Cortex®-M7 architecture.
- Dual-core lines based on an Arm® Cortex®-M7 and Arm® Cortex®-M4 architecture.

Supporting dual-core architectures with STM32H7 HAL and LL drivers

In STM32H7 dual-core lines, all peripherals are available for both Arm® Cortex®-M7 (CM7) and Arm® Cortex®-M4 (CM4) cores. There is no default peripheral allocation to a given core. There is consequently a great advantage to share the same peripheral drivers between the cores. This mainly targets standard peripherals which features must be available for both cores.

However for most system peripheral HAL drivers (such as RCC, GPIO, FLASH, PWR and HSEM), some features can be present in dual-core lines but not in the single-core lines.

Other features (such as boot sequence, extended interrupt and event handling and power management) may be configured differently in the two lines.

STM32H7 HAL and LL drivers have consequently been built to support both single- and dual-core architectures, with the following considerations:

- *DUAL_CORE*: this define statement is used to delimit the code (such as defines, functions and macros) that is available only in dual-core architectures. This define statement is automatically available through the STM32 CMSIS dual-core device files stm32h7XYxx.h.

Figure 1. Example of code portion used for dual-core architectures

```
void HAL_PWR_EnterSTOPMode(uint32_t Regulator, uint8_t STOPEntry)
{
  (...)
#if defined(DUAL_CORE)
  /* Keep DSTOP mode when D1 domain enters Deep sleep */
  CLEAR_BIT(PWR->CPUCR, PWR_CPUCR_PDDS_D1);
  CLEAR_BIT(PWR->CPU2CR, PWR_CPU2CR_PDDS_D1);
#else
  /* Keep DSTOP mode when D1 domain enters Deep sleep */
  CLEAR_BIT(PWR->CPUCR, PWR_CPUCR_PDDS_D1);

  /* Keep DSTOP mode when D2 domain enters Deep sleep */
  CLEAR_BIT(PWR->CPUCR, PWR_CPUCR_PDDS_D2);

  /* Keep DSTOP mode when D3 domain enters Deep sleep */
  CLEAR_BIT(PWR->CPUCR, PWR_CPUCR_PDDS_D3);
#endif /*DUAL_CORE*/
 (...)
}
```

- *CORE_CM4*: this define statement is used to delimit the code that contains a specific configuration/code portion applying to the Arm® Cortex®-M4 core. This define statement must be available in the compiler preprocessor define list at application level for the Arm® Cortex®-M4 target configuration.
- *CORE_CM7*: this define statement is used to delimit the code containing a specific configuration/code portion applying to the Arm® Cortex®-M7 core. This define statement must be available in the compiler preprocessor defines list at application level for the Arm® Cortex®-M7 target configuration.

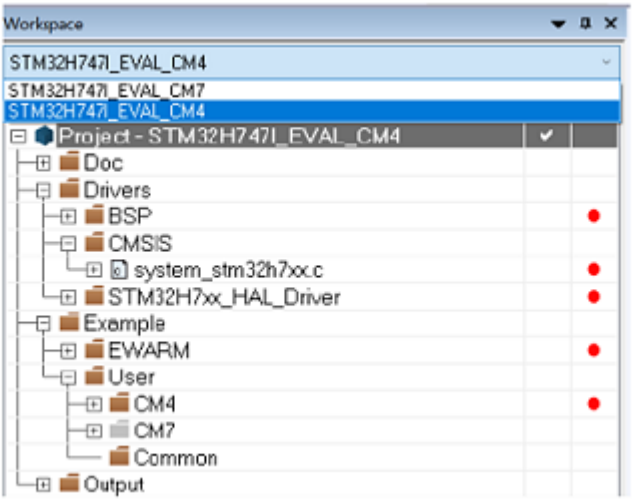
Dual-core architecture applications

The dual-core examples and applications available within the STM32CubeH7 MCU Package are structured as follows:

- One project (one workspace) per example/application, in order to be compatible with the single-core architecture.
- Two target project configurations per workspace (one per core), named STM32YYxx_CM7 and STM32YYxx_CM4.

The target configurations can be configured individually by setting the following options: target device, linker options, read-only (RO) and read/write (RW) zones, preprocessor symbols and defines (CORE_CM7 , CORE_CM4). This allows compiling user code linked and programmed separately for each core, and generating two binaries, CM7 and CM4.

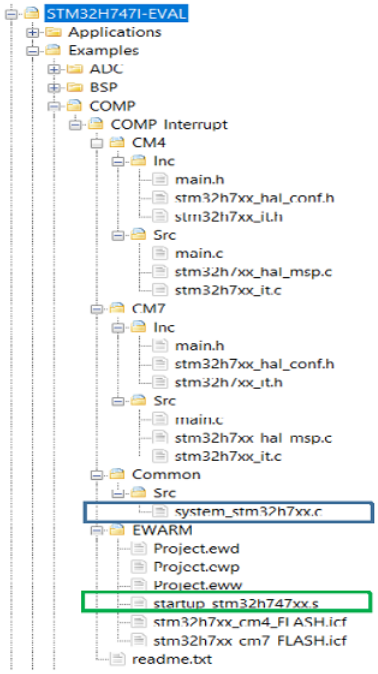
Figure 2. Dual-core project structure



The applicative layer source files of dual-core examples and applications is organized as follows:

- Two separate folders, *CM7* and *CM4* for Arm® Cortex®-M7 and Arm® Cortex®-M4, respectively.
- Each *CM7* and *CM4* folder includes in turns the following subfolders:
  - *Inc* that hosts all the header files for Arm® Cortex®-M7 and -M4.
  - *Src* that hosts the source code files for Arm® Cortex®-M7 and -M4.
- A *common* folder, with *Inc* and *Src* subfolders, that hosts the common header and source files for both cores.

Figure 3. Dual-core example structure



4 Overview of HAL drivers

The HAL drivers are designed to offer a rich set of APIs and to interact easily with the application upper layers.

Each driver consists of a set of functions covering the most common peripheral features. The development of each driver is driven by a common API which standardizes the driver structure, the functions and the parameter names.

The HAL drivers include a set of driver modules, each module being linked to a standalone peripheral. However, in some cases, the module is linked to a peripheral functional mode. As an example, several modules exist for the USART peripheral: UART driver module, USART driver module, SMARTCARD driver module and IRDA driver module.

The HAL main features are the following:

- Cross-family portable set of APIs covering the common peripheral features as well as extension APIs in case of specific peripheral features.
- Three API programming models: polling, interrupt and DMA.
- APIs are RTOS compliant:
  - Fully reentrant APIs
  - Systematic usage of timeouts in polling mode
- Support of peripheral multi-instance allowing concurrent API calls for multiple instances of a given peripheral (such as USART1 or USART2)
- All HAL APIs implement user-callback functions mechanism:
  - Peripheral Init/DeInit HAL APIs can call user-callback functions to perform peripheral system level Initialization/De-Initialization (clock, GPIOs, interrupt, DMA)
  - Peripherals interrupt events
  - Error events
- Object locking mechanism: safe hardware access to prevent multiple spurious accesses to shared resources.
- Timeout used for all blocking processes: the timeout can be a simple counter or a timebase.

4.1 HAL and user-application files

4.1.1 HAL driver files

HAL drivers are composed of the following set of files:

Table 2. HAL driver files

File	Description
stm32h7xx_hal_ppp.c	Main peripheral/module driver file It includes the APIs that are common to all STM32 devices. *Example: stm32h7xx_hal_adc.c, stm32h7xx_hal_irda.c.*
stm32h7xx_hal_ppp.h	Header file of the main driver C file It includes common data, handle and enumeration structures, define statements and macros, as well as the exported generic APIs. *Example:stm32h7xx_hal_adc.h,stm32h7xx_hal_irda.h.*
stm32h7xx_hal_ppp_ex.c	Extension file of a peripheral/module driver. It includes the specific APIs for a given part number or family, as well as the newly defined APIs that overwrite the default generic APIs if the internal process is implemented in different way. *Example:stm32h7xx_hal_adc_ex.c,stm32h7xx_hal_flash_ex.c.*
stm32h7xx_hal_ppp_ex.h	Header file of the extension C file It includes the specific data and enumeration structures, define statements and macros, as well as the exported device part number specific APIs *Example: stm32h7xx_hal_adc_ex.h,stm32h7xx_hal_flash_ex.h.*
stm32h7xx_hal.c	This file is used for HAL initialization and contains DBGMCU, Remap and Time Delay based on SysTick APIs.
stm32h7xx_hal.h	stm32h7xx_hal.c header file
stm32h7xx_hal_msp_template.c	Template file to be copied to the user application folder It contains the MSP initialization and de-initialization (main routine and callbacks) of the peripheral used in the user application.
stm32h7xx_hal_conf_template.h	Template file allowing to customize the drivers for a given application
stm32h7xx_hal_def.h	Common HAL resources such as common define statements, enumerations, structures and macros

4.1.2 User-application files

The minimum files required to build an application using the HAL are listed in the table below:

Table 3. User-application files

File	Description
system_stm32h7xx.c	This file contains SystemInit() that is called at startup just after reset and before branching to the main program. It does not configure the system clock at startup (contrary to the standard library). This is to be done using the HAL APIs in the user files. It allows relocating the vector table in internal SRAM.
startup_stm32h7xx.s	Toolchain specific file that contains reset handler and exception vectors. For some toolchains, it allows adapting the stack/heap size to fit the application requirements.
stm32h7xx_flash.icf (optional)	Linker file for EWARM toolchain allowing mainly adapting the stack/heap size to fit the application requirements.
stm32h7xx_hal_msp.c	This file contains the MSP initialization and de-initialization (main routine and callbacks) of the peripheral used in the user application.

File	Description
stm32h7xx_hal_conf.h	This file allows the user to customize the HAL drivers for a specific application. It is not mandatory to modify this configuration. The application can use the default configuration without any modification.
stm32h7xx_it.c/.h	This file contains the exceptions handler and peripherals interrupt service routine, and calls HAL_IncTick() at regular time intervals to increment a local variable (declared in *stm32h7xx*_hal.c) used as HAL timebase. By default, this function is called each 1ms in Systick ISR. . The PPP_IRQHandler() routine must call HAL_PPP_IRQHandler() if an interrupt based process is used within the application.
main.c/.h	This file contains the main program routine, mainly: • Arm® Cortex®-M7 instruction and data cache enabling • Call to HAL_Init() • assert_failed() implementation • system clock configuration • peripheral HAL initialization and user application code.

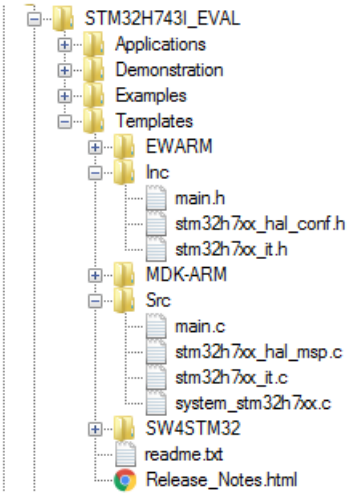
The STM32Cube package comes with ready-to-use project templates, one for each supported board. Each project contains the files listed above and a preconfigured project for the supported toolchains.

Each project template provides empty main loop function and can be used as a starting point to get familiar with project settings for STM32Cube. Its features are the following:

- It contains the sources of HAL, CMSIS and BSP drivers which are the minimal components to develop a code on a given board.
- It contains the include paths for all the firmware components.
- It defines the STM32 device supported, and allows configuring the CMSIS and HAL drivers accordingly.
- It provides ready to use user files preconfigured as defined below:
  - HAL is initialized
  - SysTick ISR implemented for HAL_Delay()
  - System clock configured with the maximum device frequency.

Note: If an existing project is copied to another location, then include paths must be updated.

Figure 4. Example of project template



4.2 HAL data structures

Each HAL driver can contain the following data structures:

- Peripheral handle structures
- Initialization and configuration structures
- Specific process structures.

4.2.1 Peripheral handle structures

The APIs have a modular generic multi-instance architecture that enables working with several IP instances simultaneously.

PPP_HandleTypeDef *handle is the main structure that is implemented in the HAL drivers. It handles the peripheral/module configuration and registers and embeds all the structures and variables needed to follow the peripheral device flow.

The peripheral handle is used for the following purposes:

- Multi-instance support: each peripheral/module instance has its own handle. As a result instance resources are independent.
- Peripheral process intercommunication: the handle is used to manage shared data resources between the process routines.

  Example: global pointers, DMA handles, state machine.
- Storage : this handle is used also to manage global variables within a given HAL driver.

An example of peripheral structure is shown below:

```
typedef struct
{
USART_TypeDef *Instance; /* USART registers base address */
USART_InitTypeDef Init; /* Usart communication parameters */
uint8_t *pTxBuffPtr;/* Pointer to Usart Tx transfer Buffer */
uint16_t TxXferSize; /* Usart Tx Transfer size */
__IO uint16_t TxXferCount;/* Usart Tx Transfer Counter */
uint8_t *pRxBuffPtr;/* Pointer to Usart Rx transfer Buffer */
uint16_t RxXferSize; /* Usart Rx Transfer size */
__IO uint16_t RxXferCount; /* Usart Rx Transfer Counter */
DMA_HandleTypeDef *hdmatx; /* Usart Tx DMA Handle parameters */
DMA_HandleTypeDef *hdmarx; /* Usart Rx DMA Handle parameters */
HAL_LockTypeDef Lock; /* Locking object */
__IO HAL_USART_StateTypeDef State; /* Usart communication state */
__IO HAL_USART_ErrorTypeDef ErrorCode;/* USART Error code */
}USART_HandleTypeDef;
```

Note:

1. *The multi-instance feature implies that all the APIs used in the application are reentrant and avoid using global variables because subroutines can fail to be reentrant if they rely on a global variable to remain unchanged but that variable is modified when the subroutine is recursively invoked. For this reason, the following rules are respected:*
   - *Reentrant code does not hold any static (or global) non-constant data: reentrant functions can work with global data. For example, a reentrant interrupt service routine can grab a piece of hardware status to work with (for example serial port read buffer) which is not only global, but volatile. Still, typical use of static variables and global data is not advised, in the sense that only atomic read-modify-write instructions should be used in these variables. It should not be possible for an interrupt or signal to occur during the execution of such an instruction.*
   - *Reentrant code does not modify its own code.*
2. *When a peripheral can manage several processes simultaneously using the DMA (full duplex case), the DMA interface handle for each process is added in the PPP_HandleTypeDef.*
3. *For the shared and system peripherals, no handle or instance object is used. The peripherals concerned by this exception are the following:*
   - *GPIO*
   - *SYSTICK*
   - *NVIC*
   - *PWR*
   - *RCC*
   - *FLASH*

4.2.2 Initialization and configuration structure

These structures are defined in the generic driver header file when it is common to all part numbers. When they can change from one part number to another, the structures are defined in the extension header file for each part number.

```
typedef struct
        {
        uint32_t BaudRate;  /*!< This member configures the UART communication baud rate
*/
        uint32_t WordLength;/*!< Specifies the number of data bits transmitted or received
in a frame */
        uint32_t StopBits;  /*!< Specifies the number of stop bits transmitted */
        uint32_t Parity;    /*!< Specifies the parity mode */
        uint32_t Mode;      /*!< Specifies whether the Receive or Transmit mode is enabled
or disabled */
        uint32_t HwFlowCtl; /*!< Specifies whether the hardware flow control mode is enabled
or disabled.*/
        uint32_t OverSampling;    /*!< Specifies whether the Over sampling 8 is enabled or
disabled, to achieve higher speed (up to f_PCLK/8) */
        uint32_t OneBitSampling;  /*!< Specifies whether a single sample or three samples'
majority vote is selected  */
        uint32_t Prescaler;       /*!< Specifies the prescaler value used to divide the UART
clock source */
        uint32_t FIFOMode;        /*!< Specifies if the FIFO mode will be used. This
parameter can be a value */
        uint32_t TXFIFOThreshold; /*!< Specifies the TXFIFO threshold level */
        uint32_t RXFIFOThreshold; /*!< Specifies the RXFIFO threshold level */
    }UART_InitTypeDef;
```

Note: The config structure is used to initialize the sub-modules or sub-instances. See below example:

```
HAL_ADC_ConfigChannel (ADC_HandleTypeDef* hadc, ADC_ChannelConfTypeDef* sConfig)
```

4.2.3 Specific process structures

The specific process structures are used for specific process (common APIs). They are defined in the generic driver header file.

Example:

```
HAL_PPP_Process (PPP_HandleTypeDef* hadc,PPP_ProcessConfig* sConfig)
```

4.3 API classification

The HAL APIs are classified into the following categories:

- **Generic APIs:** common generic APIs applying to all STM32 devices. These APIs are consequently present in the generic HAL driver files of all STM32 microcontrollers.

```
HAL_StatusTypeDef HAL_ADC_Init(ADC_HandleTypeDef* hadc);
HAL_StatusTypeDef HAL_ADC_DeInit(ADC_HandleTypeDef *hadc);
HAL_StatusTypeDef HAL_ADC_Start(ADC_HandleTypeDef* hadc);
HAL_StatusTypeDef HAL_ADC_Stop(ADC_HandleTypeDef* hadc);
HAL_StatusTypeDef HAL_ADC_Start_IT(ADC_HandleTypeDef* hadc);
HAL_StatusTypeDef HAL_ADC_Stop_IT(ADC_HandleTypeDef* hadc);
void HAL_ADC_IRQHandler(ADC_HandleTypeDef* hadc);
```

- **Extension APIs:**

  This set of APIs are **family specific APIs** that apply to a given family. They are located in the extension HAL driver file (see example below related to the ADC).

```
HAL_StatusTypeDef HAL_ADCEx_Calibration_Start(ADC_HandleTypeDef* hadc, uint32_t
SingleDiff); uint32_t HAL_ADCEx_Calibration_GetValue(ADC_HandleTypeDef* hadc, uint32_t
SingleDiff);
```

The following table summarizes the location of the different categories of HAL APIs in the driver files.

Table 4. API classification

	Generic file	Extension file
Common APIs	X	X
Family specific APIs	-	X

Note: Family specific APIs are only related to a given family. This means that if a specific API is implemented in another family, and the arguments of this latter family are different, additional structures and arguments might need to be added.

The IRQ handlers are used for common and family specific processes.

4.4 Devices supported by HAL drivers

Table 5. List of devices supported by HAL drivers

IP/module	STM32H742xx	STM32H743xx	STM32H753xx	STM32H750xx	STM32H753xx	STM32H745xx	STM32H755xx	STM32H747xx	STM32H757xx	STM32H7A3xx	STM32H7A3xxQ	STM32H7B0xx	STM32H7B0xxQ	STM32H7B3xx	STM32H7B3xxQ	STM32H723xx	STM32H733xx	STM32H725xx	STM32H735xx	STM32H730xx	STM32H730xxQ

4.5 HAL driver rules

4.5.1 HAL API naming rules

The following naming rules are used in HAL drivers:

Table 6. HAL API naming rules

	Generic	Family specific APIs	Device specific APIs
File names	*stm32h7xx_hal_ppp (c/h)*	*stm32h7xx_hal_ppp_ex (c/h)*	*stm32h7xx_ hal_ppp_ex (c/h)*
Module name	*HAL_PPP_ MODULE*		
Function name	*HAL_PPP_Function HAL_PPP_FeatureFunction_MODE*	*HAL_PPPEx_Function HAL_PPPEx_FeatureFunction_MODE*	*HAL_PPPEx_Function HAL_PPPEx_FeatureFunction_MODE*
Handle name	*PPP_HandleTypedef*	*NA*	*NA*
Init structure name	*PPP_InitTypeDef*	*NA*	*PPP_InitTypeDef*
Enum name	*HAL_PPP_StructnameTypeDef*	*NA*	*NA*

- The **PPP** prefix refers to the peripheral functional mode and not to the peripheral itself. For example, if the USART, PPP can be USART, IRDA, UART or SMARTCARD depending on the peripheral mode.
- The constants used in one file are defined within this file. A constant used in several files is defined in a header file. All constants are written in uppercase, except for peripheral driver function parameters.
- typedef variable names should be suffixed with _TypeDef.
- Registers are considered as constants. In most cases, their name is in uppercase and uses the same acronyms as in the STM32H7 reference manuals.
- Peripheral registers are declared in the PPP_TypeDef structure (for example ADC_TypeDef) in stm32h7xxx.h header file:

  stm32h7xxx.h corresponds to stm32h742xx.h, stm32h743xx.h, stm32h745xx.h, stm32h747xx.h, stm32h750xx.h, stm32h753xx.h, stm32h755xx.h, stm32h757xx.h, stm32h7a3xx.h, stm32h7a3xxq.h, stm32h7b3xx.h, stm32h7b3xxq.h stm32h7b0xx.h, stm32h7B0xxq.h, stm32h725xx.h, stm32h723xx.h, stm32h730xx.h, stm32h730xxq.h, stm32h733xx.h and stm32h735xx.h.
- Peripheral function names are prefixed by HAL_, then the corresponding peripheral acronym in uppercase followed by an underscore. The first letter of each word is in uppercase (for example HAL_UART_Transmit()). Only one underscore is allowed in a function name to separate the peripheral acronym from the rest of the function name.
- The structure containing the PPP peripheral initialization parameters are named PPP_InitTypeDef (for example ADC_InitTypeDef).
- The structure containing the Specific configuration parameters for the PPP peripheral are named PPP_xxxxConfTypeDef (for example ADC_ChannelConfTypeDef).
- Peripheral handle structures are named PPP_HandleTypedef (e.g DMA_HandleTypeDef)
- The functions used to initialize the PPP peripheral according to parameters specified in PPP_InitTypeDef are named HAL_PPP_Init (for example HAL_TIM_Init()).
- The functions used to reset the PPP peripheral registers to their default values are named HAL_PPP_DeInit (for example HAL_TIM_DeInit()).
- The **MODE** suffix refers to the process mode, which can be polling, interrupt or DMA. As an example, when the DMA is used in addition to the native resources, the function should be called: *HAL_PPP_Function_DMA()*.

- The **Feature** prefix should refer to the new feature.
  Example: *HAL_ADC_Start*() refers to the injection mode.

4.5.2 HAL general naming rules

- For the shared and system peripherals, no handle or instance object is used. This rule applies to the following peripherals:
  - GPIO
  - SYSTICK
  - NVIC
  - RCC
  - FLASH

Example: The *HAL_GPIO_Init()* requires only the GPIO address and its configuration parameters.

```
HAL_StatusTypeDef HAL_GPIO_Init (GPIO_TypeDef* GPIOx, GPIO_InitTypeDef *Init)
{
/*GPIO Initialization body */
}
```

- The macros that handle interrupts and specific clock configurations are defined in each peripheral/module driver. These macros are exported in the peripheral driver header files so that they can be used by the extension file. The list of these macros is defined below:

Note: This list is not exhaustive and other macros related to peripheral features can be added, so that they can be used in the user application.

Table 7. Macros handling interrupts and specific clock configurations

Macros	Description
__HAL_PPP_ENABLE_IT(__HANDLE__, __INTERRUPT__)	Enables a specific peripheral interrupt
__HAL_PPP_DISABLE_IT(__HANDLE__, __INTERRUPT__)	Disables a specific peripheral interrupt
__HAL_PPP_GET_IT (__HANDLE__, __ INTERRUPT __)	Gets a specific peripheral interrupt status
__HAL_PPP_CLEAR_IT (__HANDLE__, __ INTERRUPT __)	Clears a specific peripheral interrupt status
__HAL_PPP_GET_FLAG (__HANDLE__, __FLAG__)	Gets a specific peripheral flag status
__HAL_PPP_CLEAR_FLAG (__HANDLE__, __FLAG__)	Clears a specific peripheral flag status
__HAL_PPP_ENABLE(__HANDLE__)	Enables a peripheral
__HAL_PPP_DISABLE(__HANDLE__)	Disables a peripheral
__HAL_PPP_XXXX (__HANDLE__, __PARAM__)	Specific PPP HAL driver macro
__HAL_PPP_GET_ IT_SOURCE (__HANDLE__, __ INTERRUPT __)	Checks the source of specified interrupt

- NVIC and SYSTICK are two Arm® Cortex® core features. The APIs related to these features are located in the stm32h7xx_hal_cortex.c file.
- When a status bit or a flag is read from registers, it is composed of shifted values depending on the number of read values and of their size. In this case, the returned status width is 32 bits. Example:
  STATUS = XX | (YY << 16) or STATUS = XX | (YY << 8) | (YY << 16) | (YY << 24).

- The PPP handles are valid before using the HAL_PPP_Init() API. The init function performs a check before modifying the handle fields.

```
 HAL_PPP_Init(PPP_HandleTypeDef)
if(hppp == NULL)
 {
 return HAL_ERROR;
 }
```

- The macros defined below are used:
  - Conditional macro:

```
#define ABS(x) (((x) > 0) ? (x) : -(x))
```

  - Pseudo-code macro (multiple instructions macro):

```
#define __HAL_LINKDMA(__HANDLE__, __PPP_DMA_FIELD_, __DMA_HANDLE_) \
do{ \
(__HANDLE__)->__PPP_DMA_FIELD_ = &(__DMA_HANDLE_); \
(__DMA_HANDLE_).Parent = (__HANDLE__); \
} while(0)
```

4.5.3 HAL interrupt handler and callback functions

Besides the APIs, HAL peripheral drivers include:

- HAL_PPP_IRQHandler() peripheral interrupt handler that should be called from stm32h7xx_it.c
- User callback functions.

The user callback functions are defined as empty functions with “weak” attribute. They have to be defined in the user code.

There are three types of user callbacks functions:

- Peripheral system level initialization/ de-Initialization callbacks: HAL_PPP_MspInit() and HAL_PPP_MspDeInit
- Process complete callbacks : HAL_PPP_ProcessCpltCallback
- Error callback: HAL_PPP_ErrorCallback.

Table 8. Callback functions

Callback functions	Example
HAL_PPP_MspInit() / _DeInit()	Example: HAL_USART_MspInit() Called from HAL_PPP_Init() API function to perform peripheral system level initialization (GPIOs, clock, DMA, interrupt)
HAL_PPP_ProcessCpltCallback	Example: HAL_USART_TxCpltCallback Called by peripheral or DMA interrupt handler when the process completes
HAL_PPP_ErrorCallback	Example: HAL_USART_ErrorCallback Called by peripheral or DMA interrupt handler when an error occurs

4.6 HAL generic APIs

The generic APIs provide common generic functions applying to all STM32 devices. They are composed of four APIs groups:

- **Initialization and de-initialization functions:**HAL_PPP_Init(), HAL_PPP_DeInit()
- **IO operation functions**: HAL_PPP_Read(), HAL_PPP_Write(),HAL_PPP_Transmit(), HAL_PPP_Receive()
- **Control functions**: HAL_PPP_Set (), HAL_PPP_Get ().
- **State and Errors functions**: HAL_PPP_GetState (), HAL_PPP_GetError ().

For some peripheral/module drivers, these groups are modified depending on the peripheral/module implementation.

Example: in the timer driver, the API grouping is based on timer features (such as PWM, OC and IC).

The initialization and de-initialization functions allow initializing a peripheral and configuring the low-level resources, mainly clocks, GPIO, alternate functions (AF) and possibly DMA and interrupts. The *HAL_DeInit()* function restores the peripheral default state, frees the low-level resources and removes any direct dependency with the hardware.

The IO operation functions perform a row access to the peripheral payload data in write and read modes.

The control functions are used to change dynamically the peripheral configuration and set another operating mode.

The peripheral state and errors functions allow retrieving in run time the peripheral and data flow states, and identifying the type of errors that occurred. The example below is based on the ADC peripheral. The list of generic APIs is not exhaustive. It is only given as an example.

Table 9. HAL generic APIs

Function group	Common API name	Description
Initialization group	*HAL_ADC_Init()*	This function initializes the peripheral and configures the low -level resources (clocks, GPIO, AF..)
	HAL_ADC_DeInit()	This function restores the peripheral default state, frees the low-level resources and removes any direct dependency with the hardware.
IO operation group	*HAL_ADC_Start ()*	This function starts ADC conversions when the polling method is used
	HAL_ADC_Stop ()	This function stops ADC conversions when the polling method is used
	HAL_ADC_PollForConversion()	This function allows waiting for the end of conversions when the polling method is used. In this case, a timout value is specified by the user according to the application.
	HAL_ADC_Start_IT()	This function starts ADC conversions when the interrupt method is used
	HAL_ADC_Stop_IT()	This function stops ADC conversions when the interrupt method is used
	HAL_ADC_IRQHandler()	This function handles ADC interrupt requests
	HAL_ADC_ConvCpltCallback()	Callback function called in the IT subroutine to indicate the end of the current process or when a DMA transfer has completed
	HAL_ADC_ErrorCallback()	Callback function called in the IT subroutine if a peripheral error or a DMA transfer error occurred
Control group	*HAL_ADC_ConfigChannel()*	This function configures the selected ADC regular channel, the corresponding rank in the sequencer and the sample time
	HAL_ADC_AnalogWDGConfig	This function configures the analog watchdog for the selected ADC
State and Errors group	*HAL_ADC_GetState()*	This function allows getting in run time the peripheral and the data flow states.
	HAL_ADC_GetError()	This fuction allows getting in run time the error that occurred during IT routine

4.7 HAL extension APIs

4.7.1 HAL extension model overview

The extension APIs provide specific functions or overwrite modified APIs for a specific family (series) or specific part number within the same family.

The extension model consists of an additional file, stm32h7xx_hal_ppp_ex.c, that includes all the specific functions and define statements (stm32h7xx_hal_ppp_ex.h) for a given part number.

Below an example based on the ADC peripheral:

Table 10. HAL extension APIs

Function group	Common API name
HAL_ADCEx_CalibrationStart()	This function is used to start the automatic ADC calibration

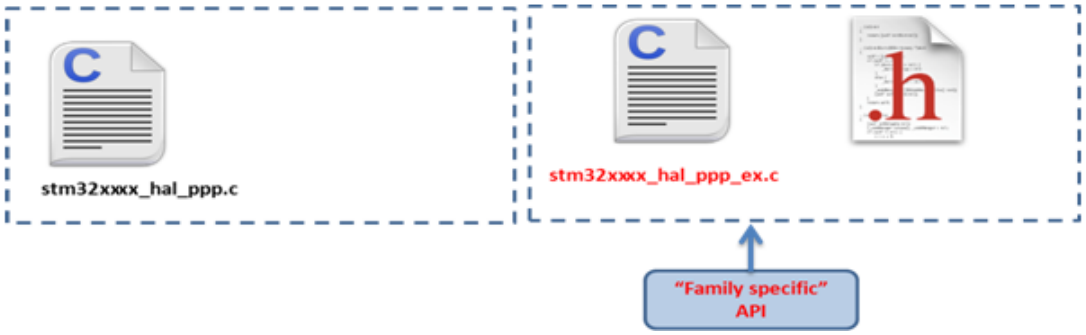
4.7.2 HAL extension model cases

The specific peripheral features can be handled by the HAL drivers in five different ways. They are described below.

Adding a family-specific function

In this case, the API is added in the extension driver C file and named HAL_PPPEx_Function ().

Figure 5. Adding family-specific functions

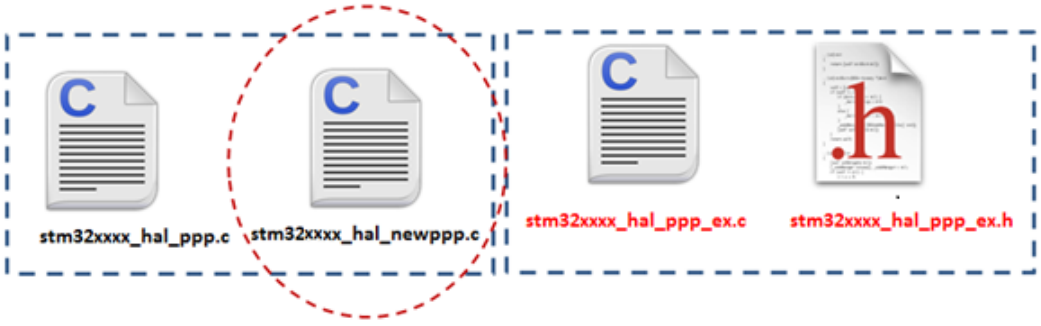


Adding a new peripheral (specific to a device belonging to a given family)

When a peripheral which is available only in a specific device is required, the APIs corresponding to this new peripheral/module (newPPP) are added in a new stm32h7xx_hal_newppp.c. However the inclusion of this file is selected in the stm32h7xx_hal_conf.h using the macro:

```
#define HAL_NEWPPP_MODULE_ENABLED
```

Figure 6. Adding new peripherals

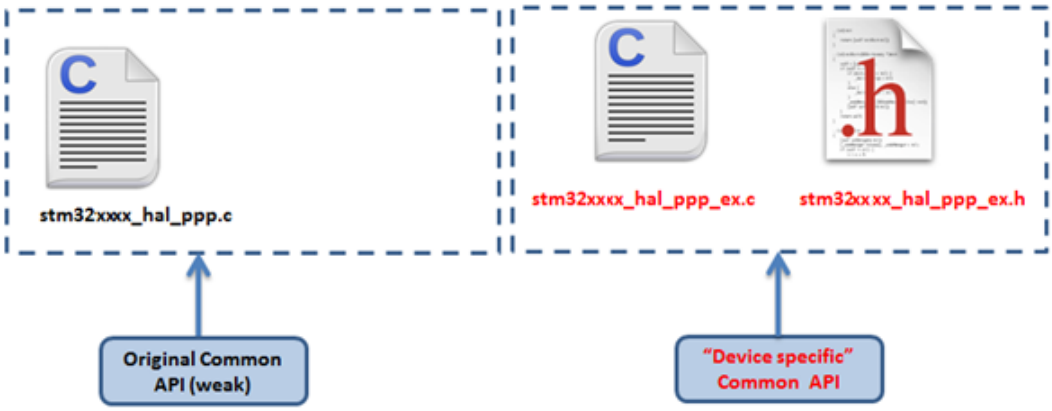


Example: stm32h7xx_hal_adc.c/h

Updating existing common APIs

In this case, the routines are defined with the same names in the stm32h7xx_hal_ppp_ex.c extension file, while the generic API is defined as *weak*, so that the compiler overwrites the original routine by the new defined function.

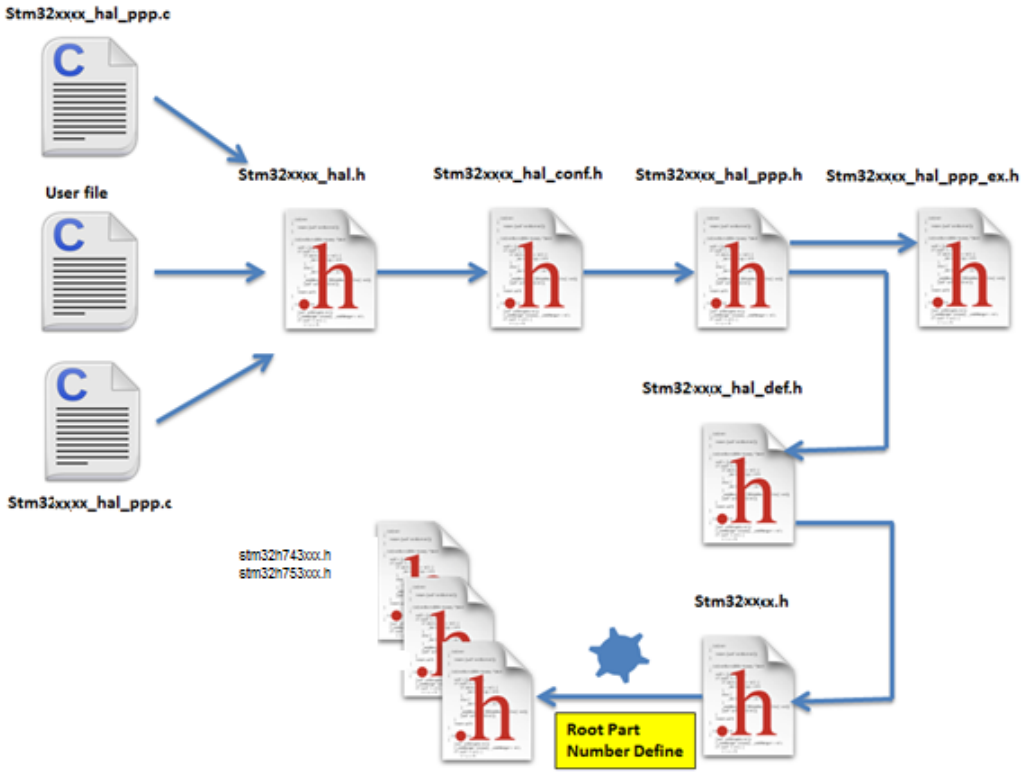
Figure 7. Updating existing APIs



4.8 File inclusion model

The header of the common HAL driver file (stm32h7xx_hal.h) includes the common configurations for the whole HAL library. It is the only header file that is included in the user sources and the HAL C sources files to be able to use the HAL resources.

Figure 8. File inclusion model



A PPP driver is a standalone module which is used in a project. The user must enable the corresponding USE_HAL_PPP_MODULE define statement in the configuration file.

```
/**********************************************************************
* @file stm32h7xx_hal_conf.h
* @author MCD Application Team
* @version VX.Y.Z * @date dd-mm-yyyy
* @brief This file contains the modules to be used
**********************************************************************
(…)
#define USE_HAL_USART_MODULE
#define USE_HAL_IRDA_MODULE
#define USE_HAL_DMA_MODULE
#define USE_HAL_RCC_MODULE
(…)
```

4.9 HAL common resources

The common HAL resources, such as common define enumerations, structures and macros, are defined in *stm32h7xx_hal_def.h.*The main common define enumeration is *HAL_StatusTypeDef*.

- **HAL Status**

  The HAL status is used by almost all HAL APIs, except for boolean functions and IRQ handler. It returns the status of the current API operations. It has four possible values as described below:

```
Typedef enum
{
HAL_OK = 0x00,
HAL_ERROR = 0x01,
HAL_BUSY = 0x02,
HAL_TIMEOUT = 0x03
} HAL_StatusTypeDef;
```

- **HAL Locked**

  The HAL lock is used by all HAL APIs to prevent accessing by accident shared resources.

```
typedef enum
{
HAL_UNLOCKED = 0x00, /*!<Resources unlocked */
HAL_LOCKED = 0x01 /*!< Resources locked */
} HAL_LockTypeDef;
```

  In addition to common resources, the stm32h7xx_hal_def.h file calls the stm32h7xx.h file in CMSIS library to get the data structures and the address mapping for all peripherals:

  – Declarations of peripheral registers and bits definition.

  – Macros to access peripheral registers hardware (such as Write register or Read register).

- **Common macros**

  – Macro defining HAL_MAX_DELAY

```
#define HAL_MAX_DELAY 0xFFFFFFFF
```

  – Macro linking a PPP peripheral to a DMA structure pointer:

```
#define __HAL_LINKDMA(__HANDLE__, __PPP_DMA_FIELD_, __DMA_HANDLE_) \
do{ \
  (__HANDLE__)->__PPP_DMA_FIELD_ = &(__DMA_HANDLE_); \
  (__DMA_HANDLE_).Parent = (__HANDLE__); \
} while(0)
```

4.10 HAL configuration

The configuration file, stm32h7xx_hal_conf.h, allows customizing the drivers for the user application. Modifying this configuration is not mandatory: the application can use the default configuration without any modification.

To configure these parameters, the user should enable, disable or modify some options by uncommenting, commenting or modifying the values of the related define statements as described in the table below:

Table 11. Define statements used for HAL configuration

Configuration item	Description	Default Value
HSE_VALUE	Defines the value of the external oscillator (HSE) expressed in Hz. The user must adjust this define statement when using a different crystal value.	25 000 000 Hz
HSE_STARTUP_TIMEOUT	Timeout for HSE start-up, expressed in ms	5000
HSI_VALUE	Defines the value of the internal oscillator (HSI) expressed in Hz.	64 000 000 Hz

Configuration item	Description	Default Value
LSE_VALUE	Defines the value of the external oscillator (HSE) expressed in Hz. The user must adjust this define statement when using a different crystal value.	32768 Hz
LSE_STARTUP_TIMEOUT	Timeout for LSE start-up, expressed in ms	5000
CSI_VALUE	Defines the value of the internal oscillator (CSI) expressed in Hz	4 000 000 Hz
LSI_VALUE	Defines the value of the internal oscillator (LSI) expressed in Hz	32 000 Hz
VDD_VALUE	VDD value	3300 (mV)
USE_RTOS	Enables the use of RTOS	FALSE (reserved for future use)

Note: The stm32h7xx_hal_conf_template.h file is located in the HAL drivers Inc folder. It should be copied to the user folder, renamed and modified as described above.

By default, the values defined in the stm32h7xx_hal_conf_template.h file are the same as the ones used for the examples and demonstrations. All HAL include files are enabled so that they can be used in the user code without modifications.

4.11 HAL system peripheral handling

This section gives an overview of how the system peripherals are handled by the HAL drivers. The full API list is provided within each peripheral driver description section.

4.11.1 Clocks

Two main functions can be used to configure the system clock:

- HAL_RCC_OscConfig (RCC_OscInitTypeDef *RCC_OscInitStruct). This function configures/enables multiple clock sources (HSE, HSI, LSE, LSI, PLL).
- HAL_RCC_ClockConfig (RCC_ClkInitTypeDef *RCC_ClkInitStruct, uint32_t FLatency). This function
  - selects the system clock source
  - configures AHB, APB1, APB2, APB3 and APB4 clock dividers
  - configures the number of Flash memory wait states
  - updates the SysTick configuration when HCLK clock changes.

Some peripheral clocks are not derived from the system clock (such as RTC, USB). In this case, the clock configuration is performed by an extended API defined in stm32h7xx_hal_rcc_ex.c: *HAL_RCCEx_PeriphCLKConfig(RCC_PeriphCLKInitTypeDef *PeriphClkInit)*.

Additional RCC HAL driver functions are available:

- HAL_RCC_DeInit() Clock de-initialization function that returns clock configuration to reset state
- Get clock functions that allow retreiving various clock configurations (such as system clock, HCLK, PCLK1 or PCLK2)
- MCO and CSS configuration functions

A set of macros are defined in stm32h7xx_hal_rcc.h and stm32h7xx_hal_rcc_ex.h. They allow executing elementary operations on RCC block registers, such as peripherals clock gating/reset control:

- __HAL_RCC_PPP_CLK_ENABLE/__HAL_RCC_PPP_CLK_DISABLE to enable/disable the peripheral clock
- __HAL_RCC_PPP_FORCE_RESET/__HAL_RCC_PPP_RELEASE_RESET to force/release peripheral reset
- __HAL_RCC_PPP_CLK_SLEEP_ENABLE/__HAL_RCC_PPP_CLK_SLEEP_DISABLE to enable/disable the peripheral clock during Sleep mode

4.11.2 GPIOs

GPIO HAL APIs are the following:

- HAL_GPIO_Init() / HAL_GPIO_DeInit()
- HAL_GPIO_ReadPin() / HAL_GPIO_WritePin()

- HAL_GPIO_TogglePin ().

In addition to standard GPIO modes (input, output, analog), the pin mode can be configured as EXTI with interrupt or event generation.

When selecting EXTI mode with interrupt generation, the user must call HAL_GPIO_EXTI_IRQHandler() from stm32h7xx_it.c and implement HAL_GPIO_EXTI_Callback()

The table below describes the GPIO_InitTypeDef structure field.

Table 12. Description of GPIO_InitTypeDef structure

Structure field	Description
Pin	Specifies the GPIO pins to be configured. Possible values: GPIO_PIN_x or GPIO_PIN_All, where x[0..15]
Mode	Specifies the operating mode for the selected pins: GPIO mode or EXTI mode. Possible values are: • GPIO mode – GPIO_MODE_INPUT : Input floating – GPIO_MODE_OUTPUT_PP : Output push-pull – GPIO_MODE_OUTPUT_OD : Output open drain – GPIO_MODE_AF_PP : Alternate function push-pull – GPIO_MODE_AF_OD : Alternate function open drain – GPIO_MODE_ANALOG : Analog mode • External Interrupt mode – GPIO_MODE_IT_RISING : Rising edge trigger detection – GPIO_MODE_IT_FALLING : Falling edge trigger detection – GPIO_MODE_IT_RISING_FALLING : Rising/Falling edge trigger detection • External Event mode – GPIO_MODE_EVT_RISING : Rising edge trigger detection – GPIO_MODE_EVT_FALLING : Falling edge trigger detection – GPIO_MODE_EVT_RISING_FALLING: Rising/Falling edge trigger detection
Pull	Specifies the Pull-up or Pull-down activation for the selected pins. Possible values are: GPIO_NOPULL GPIO_PULLUP GPIO_PULLDOWN
Speed	Specifies the speed for the selected pins Possible values are: GPIO_SPEED_FREQ_LOW GPIO_SPEED_FREQ_MEDIUM GPIO_SPEED_FREQ_HIGH GPIO_SPEED_FREQ_VERY_HIGH

Please find below typical GPIO configuration examples:

- Configuring GPIOs as output push-pull to drive external LEDs:

```
GPIO_InitStruct.Pin = GPIO_PIN_12 | GPIO_PIN_13 | GPIO_PIN_14 | GPIO_PIN_15;
GPIO_InitStruct.Mode = GPIO_MODE_OUTPUT_PP;
GPIO_InitStruct.Pull = GPIO_PULLUP;
GPIO_InitStruct.Speed = GPIO_SPEED_FREQ_MEDIUM;
HAL_GPIO_Init(GPIOD, &GPIO_InitStruct);
```

- Configuring PA0 as external interrupt with falling edge sensitivity:

```
GPIO_InitStructure.Mode = GPIO_MODE_IT_FALLING;
GPIO_InitStructure.Pull = GPIO_NOPULL;
GPIO_InitStructure.Pin = GPIO_PIN_0;
HAL_GPIO_Init(GPIOA, &GPIO_InitStructure);
```

4.11.3 Cortex® NVIC and SysTick timer

The Cortex® HAL driver, stm32h7xx_hal_cortex.c, provides APIs to handle NVIC and SysTick. The supported APIs include:

- HAL_NVIC_SetPriority()/ HAL_NVIC_SetPriorityGrouping()
- HAL_NVIC_GetPriority() / HAL_NVIC_GetPriorityGrouping()
- HAL_NVIC_EnableIRQ()/HAL_NVIC_DisableIRQ()
- HAL_NVIC_SystemReset()
- HAL_SYSTICK_IRQHandler()
- HAL_NVIC_GetPendingIRQ() / HAL_NVIC_SetPendingIRQ () / HAL_NVIC_ClearPendingIRQ()
- HAL_NVIC_GetActive(IRQn)
- HAL_SYSTICK_Config()
- HAL_SYSTICK_CLKSourceConfig()
- HAL_SYSTICK_Callback()

4.11.4 PWR

The PWR HAL driver handles power management. The features shared between all STM32 Series are listed below:

- PVD configuration, enabling/disabling and interrupt handling
  - HAL_PWR_ConfigPVD()
  - HAL_PWR_EnablePVD() / HAL_PWR_DisablePVD()
  - HAL_PWR_PVD_IRQHandler()
  - HAL_PWR_PVDCallback()
- Wakeup pin configuration
  - HAL_PWR_EnableWakeUpPin() / HAL_PWR_DisableWakeUpPin()
- Low-power mode entry
  - HAL_PWR_EnterSLEEPMode()
  - HAL_PWR_EnterSTOPMode()
  - HAL_PWR_EnterSTANDBYMode()

4.11.5 EXTI

The EXTI is not considered as a standalone peripheral but rather as a service used by other peripheral, that are handled through EXTI HAL APIs. In addition, each peripheral HAL driver implements the associated EXTI configuration and function as macros in its header file.

The first 16 EXTI lines connected to the GPIOs, are managed within the GPIO driver. The GPIO_InitTypeDef structure allows configuring an I/O as external interrupt or external event.

The EXTI lines connected internally to the PVD, RTC, USB, and Ethernet, are configured within the HAL drivers of these peripheral through the macros given in the table below.

The EXTI internal connections depend on the targeted STM32 microcontroller (refer to the product datasheet for more details):

Table 13. Description of EXTI configuration macros

Macros	Description
__HAL_PPP_{SUBLOCK}__EXTI_ENABLE_IT()	Enables a given EXTI line interrupt Example:

Macros	Description
	__HAL_PWR_PVD_EXTI_ENABLE_IT()
__HAL_PPP_{SUBLOCK}__EXTI_DISABLE_IT()	Disables a given EXTI line. Example: __HAL_PWR_PVD_EXTI_DISABLE_IT()
__HAL_ PPP_{SUBLOCK}__EXTI_GET_FLAG()	Gets a given EXTI line interrupt flag pending bit status. Example: __HAL_PWR_PVD_EXTI_GET_FLAG()
__HAL_ PPP_{SUBLOCK}_EXTI_CLEAR_FLAG()	Clears a given EXTI line interrupt flag pending bit. Example; __HAL_PWR_PVD_EXTI_CLEAR_FLAG()
__HAL_ PPP_{SUBLOCK}_EXTI_GENERATE_SWIT()	Generates a software interrupt for a given EXTI line. Example: __HAL_PWR_PVD_EXTI_ GENERATE_SWIT ()
__HAL_PPP_SUBBLOCK_EXTI_ENABLE_EVENT()	Enable a given EXTI line event Example: __HAL_RTC_WAKEUP_EXTI_ENABLE_EVENT()
__HAL_PPP_SUBBLOCK_EXTI_DISABLE_EVENT()	Disable a given EXTI line event Example: __HAL_RTC_WAKEUP_EXTI_DISABLE_EVENT()
__HAL_ PPP_SUBBLOCK_EXTI_ENABLE_RISING_EDGE()	Configure an EXTI Interrupt or Event on rising edge
__HAL_ PPP_SUBBLOCK_EXTI_ENABLE_FALLING_EDGE()	Enable an EXTI Interrupt or Event on Falling edge
__HAL_ PPP_SUBBLOCK_EXTI_DISABLE_RISING_EDGE()	Disable an EXTI Interrupt or Event on rising edge
__HAL_ PPP_SUBBLOCK_EXTI_DISABLE_FALLING_EDGE()	Disable an EXTI Interrupt or Event on Falling edge
__HAL_ PPP_SUBBLOCK_EXTI_ENABLE_RISING_FALLING_EDGE()	Enable an EXTI Interrupt or Event on Rising/Falling edge
__HAL_ PPP_SUBBLOCK_EXTI_DISABLE_RISING_FALLING_EDGE()	Disable an EXTI Interrupt or Event on Rising/Falling edge

If the EXTI interrupt mode is selected, the user application must call HAL_PPP_FUNCTION_IRQHandler() (for example HAL_PWR_PVD_IRQHandler()), from stm32h7xx_it.c file, and implement HAL_PPP_FUNCTIONCallback() callback function (for example HAL_PWR_PVDCallback().

4.11.6 DMA

The DMA HAL driver allows enabling and configuring the peripheral to be connected to the DMA Channels (except for internal SRAM/FLASH memory which do not require any initialization). Refer to the product reference manual for details on the DMA request corresponding to each peripheral.

For a given channel, HAL_DMA_Init() API allows programming the required configuration through the following parameters:

- Transfer direction
- Source and destination data formats
- Circular, Normal control mode
- Channel priority level
- Source and destination Increment mode

Two operating modes are available:

- Polling mode I/O operation
  1. Use HAL_DMA_Start() to start DMA transfer when the source and destination addresses and the Length of data to be transferred have been configured.
  2. Use HAL_DMA_PollForTransfer() to poll for the end of current transfer. In this case a fixed timeout can be configured depending on the user application.

- Interrupt mode I/O operation
  1. Configure the DMA interrupt priority using HAL_NVIC_SetPriority().
  2. Enable the DMA IRQ handler using HAL_NVIC_EnableIRQ().
  3. Use HAL_DMA_Start_IT() to start DMA transfer when the source and destination addresses and the length of data to be transferred have been configured. In this case the DMA interrupt is configured.
  4. Use HAL_DMA_IRQHandler() called under DMA_IRQHandler() Interrupt subroutine.
  5. When data transfer is complete, HAL_DMA_IRQHandler() function is executed and a user function can be called by customizing XferCpltCallback and XferErrorCallback function pointer (that is a member of DMA handle structure).

Additional functions and macros are available to ensure efficient DMA management:

- Use HAL_DMA_GetState() function to return the DMA state and HAL_DMA_GetError() in case of error detection.
- Use HAL_DMA_Abort() function to abort the current transfer.

The most used DMA HAL driver macros are the following:

- __HAL_DMA_ENABLE: enables the specified DMA channel
- __HAL_DMA_DISABLE: disables the specified DMA channel
- __HAL_DMA_GET_FLAG: gets the DMA channel pending flags
- __HAL_DMA_CLEAR_FLAG: clears the DMA channel pending flags
- __HAL_DMA_ENABLE_IT: enables the specified DMA channel interrupts
- __HAL_DMA_DISABLE_IT: disables the specified DMA channel interrupts
- __HAL_DMA_GET_IT_SOURCE: checks whether the specified DMA channel interrupt has been enabled or not

Note: When a peripheral is used in DMA mode, the DMA initialization must be done in the HAL_PPP_MspInit() callback. In addition, the user application must associate the DMA handle to the PPP handle (refer to section "HAL IO operation functions").

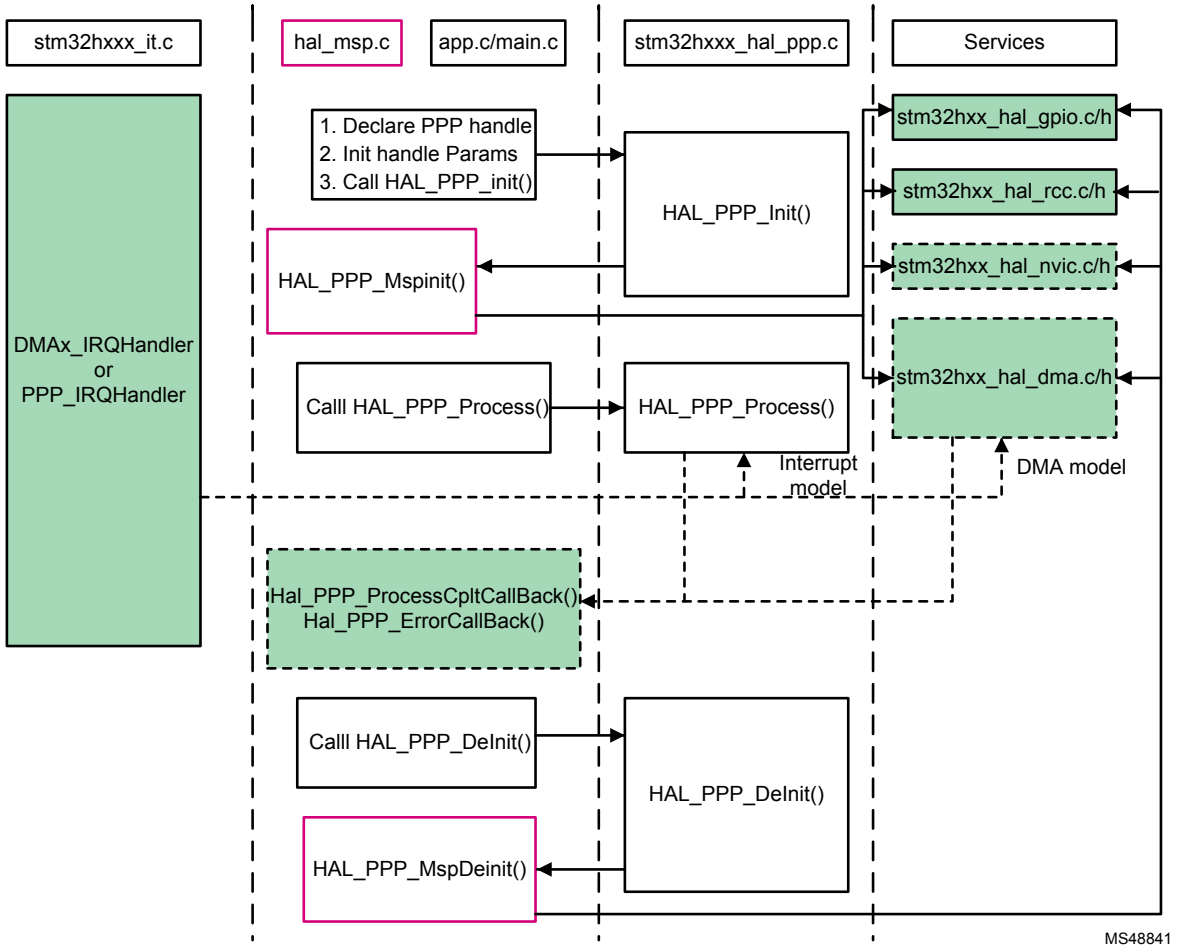
Note: DMA channel callbacks need to be initialized by the user application only in case of memory-to-memory transfer. However when peripheral-to-memory transfers are used, these callbacks are automatically initialized by calling a process API function that uses the DMA.

4.12 How to use HAL drivers

4.12.1 HAL usage models

The following figure shows the typical use of the HAL driver and the interaction between the application user, the HAL driver and the interrupts.

Figure 9. **HAL driver model**



Note: The functions implemented in the HAL driver are shown in green, the functions called from interrupt handlers in dotted lines, and the msp functions implemented in the user application in red. Non-dotted lines represent the interactions between the user application functions.

Basically, the HAL driver APIs are called from user files and optionally from interrupt handlers file when the APIs based on the DMA or the PPP peripheral dedicated interrupts are used.

When DMA or PPP peripheral interrupts are used, the PPP process complete callbacks are called to inform the user about the process completion in real-time event mode (interrupts). Note that the same process completion callbacks are used for DMA in interrupt mode.

4.12.2 HAL initialization

4.12.2.1 HAL global initialization

In addition to the peripheral initialization and de-initialization functions, a set of APIs are provided to initialize the HAL core implemented in file stm32h7xx_hal.c.

- HAL_Init(): this function must be called at application startup to
  - initialize data/instruction cache and pre-fetch queue
  - set SysTick timer to generate an interrupt each 1ms (based on HSI clock) with the lowest priority
  - call HAL_MspInit() user callback function to perform system level initializations (Clock, GPIOs, DMA, interrupts). HAL_MspInit() is defined as “weak” empty function in the HAL drivers.
- HAL_DeInit()
  - resets all peripherals
  - calls function HAL_MspDeInit() which is a user callback function to do system level De-Initalizations.

- HAL_GetTick(): this function gets current SysTick counter value (incremented in SysTick interrupt) used by peripherals drivers to handle timeouts.
- HAL_Delay(). this function implements a delay (expressed in milliseconds) using the SysTick timer.

  Care must be taken when using HAL_Delay() since this function provides an accurate delay (expressed in milliseconds) based on a variable incremented in SysTick ISR. This means that if HAL_Delay() is called from a peripheral ISR, then the SysTick interrupt must have highest priority (numerically lower) than the peripheral interrupt, otherwise the caller ISR is blocked.

4.12.2.2 *System clock initialization*

The clock configuration is done at the beginning of the user code. However the user can change the configuration of the clock in his own code.

Below the typical clock configuration sequence.

```
static void SystemClock_Config(void)
{
  RCC_ClkInitTypeDef RCC_ClkInitStruct;
  RCC_OscInitTypeDef RCC_OscInitStruct;
  HAL_StatusTypeDef ret = HAL_OK;

  /*!< Supply configuration update enable */
  HAL_PWREx_ConfigSupply(PWR_LDO_SUPPLY);

  /* The voltage scaling allows optimizing the power consumption when the device is
     clocked below the maximum system frequency, to update the voltage scaling value
     regarding system frequency refer to product datasheet.  */
  __HAL_PWR_VOLTAGESCALING_CONFIG(PWR_REGULATOR_VOLTAGE_SCALE1);

  while(!__HAL_PWR_GET_FLAG(PWR_FLAG_VOSRDY)) {}

  /* Enable HSE Oscillator and activate PLL with HSE as source */
  RCC_OscInitStruct.OscillatorType = RCC_OSCILLATORTYPE_HSE;
  RCC_OscInitStruct.HSEState = RCC_HSE_ON;
  RCC_OscInitStruct.HSIState = RCC_HSI_OFF;
  RCC_OscInitStruct.CSIState = RCC_CSI_OFF;
  RCC_OscInitStruct.PLL.PLLState = RCC_PLL_ON;
  RCC_OscInitStruct.PLL.PLLSource = RCC_PLLSOURCE_HSE;

  RCC_OscInitStruct.PLL.PLLM = 5;
  RCC_OscInitStruct.PLL.PLLN = 160;
  RCC_OscInitStruct.PLL.PLLFRACN = 0;
  RCC_OscInitStruct.PLL.PLLP = 2;
  RCC_OscInitStruct.PLL.PLLR = 2;
  RCC_OscInitStruct.PLL.PLLQ = 4;

  RCC_OscInitStruct.PLL.PLLVCOSEL = RCC_PLL1VCOWIDE;
  RCC_OscInitStruct.PLL.PLLRGE = RCC_PLL1VCIRANGE_2;
  ret = HAL_RCC_OscConfig(&RCC_OscInitStruct);
  if(ret != HAL_OK)
  {
    Error_Handler();
  }

/* Select PLL as system clock source and configure  bus clock dividers */
  RCC_ClkInitStruct.ClockType = (RCC_CLOCKTYPE_SYSCLK | RCC_CLOCKTYPE_HCLK |
RCC_CLOCKTYPE_D1PCLK1 | RCC_CLOCKTYPE_PCLK1 | \
                                 RCC_CLOCKTYPE_PCLK2  | RCC_CLOCKTYPE_D3PCLK1);

  RCC_ClkInitStruct.SYSCLKSource = RCC_SYSCLKSOURCE_PLLCLK;
  RCC_ClkInitStruct.SYSCLKDivider = RCC_SYSCLK_DIV1;
  RCC_ClkInitStruct.AHBCLKDivider = RCC_HCLK_DIV2;
  RCC_ClkInitStruct.APB3CLKDivider = RCC_APB3_DIV2;
  RCC_ClkInitStruct.APB1CLKDivider = RCC_APB1_DIV2;
  RCC_ClkInitStruct.APB2CLKDivider = RCC_APB2_DIV2;
  RCC_ClkInitStruct.APB4CLKDivider = RCC_APB4_DIV2;
  ret = HAL_RCC_ClockConfig(&RCC_ClkInitStruct, FLASH_LATENCY_4);
  if(ret != HAL_OK)
  {
    Error_Handler();
  }

  /*
  Note : The activation of the I/O Compensation Cell is recommended with communication
interfaces
          (GPIO, SPI, FMC, QSPI ...)  when  operating at  high frequencies(please refer to
product datasheet)
          The I/O Compensation Cell activation  procedure requires :
        - The activation of the CSI clock
        - The activation of the SYSCFG clock
        - Enabling the I/O Compensation Cell : setting bit[0] of register SYSCFG_CCCSR

          To do this please uncomment the following code
*/
```

```
  /*
  __HAL_RCC_CSI_ENABLE() ;

  __HAL_RCC_SYSCFG_CLK_ENABLE() ;

  HAL_EnableCompensationCell();
  */
}
```

Caution: **Consideration for firmware power configuration versus hardware board configuration**

STM32H7 boards are configured either in direct SMPS or in LDO power regulator mode.

Therefore the firmware running on a given board must match its hardware configuration, otherwise a deadlock might occur since ST-LINK will not be able to connect the target after reset. Refer to the corresponding board user manual to check which power configuration is implemented.

The firmware power configuration is performed in SystemClock_Config through the following lines:

- In case of “Direct SMPS” hardware configuration:
  HAL_PWREx_ConfigSupply(PWR_DIRECT_SMPS_SUPPLY);
- In case of “LDO” hardware configuration:
  HAL_PWREx_ConfigSupply(PWR_LDO_SUPPLY);

4.12.2.3 *HAL MSP initialization process*

The peripheral initialization is done through *HAL_PPP_Init()* while the hardware resources initialization used by a peripheral (PPP) is performed during this initialization by calling MSP callback function *HAL_PPP_MspInit().*

The MspInit callback performs the low level initialization related to the different additional hardware resources: RCC, GPIO, NVIC and DMA.

All the HAL drivers with handles include two MSP callbacks for initialization and de-initialization:

```
/**
* @brief Initializes the PPP MSP.
* @param hppp: PPP handle
* @retval None */
void __weak HAL_PPP_MspInit(PPP_HandleTypeDef *hppp) {
/* NOTE : This function Should not be modified, when the callback is needed,
the HAL_PPP_MspInit could be implemented in the user file */
}
/**
* @brief DeInitializes PPP MSP.
* @param hppp: PPP handle
* @retval None */
void __weak HAL_PPP_MspDeInit(PPP_HandleTypeDef *hppp) {
/* NOTE : This function Should not be modified, when the callback is needed,
the HAL_PPP_MspDeInit could be implemented in the user file */
}
```

The MSP callbacks are declared empty as weak functions in each peripheral driver. The user can use them to set the low level initialization code or omit them and use his own initialization routine.

The HAL MSP callback is implemented inside the *stm32h7xx_hal_msp.c* file in the user folders. An *stm32h7xx_hal_msp.c* file template is located in the HAL folder and should be copied to the user folder. It can be generated automatically by STM32CubeMX tool and further modified. Note that all the routines are declared as weak functions and could be overwritten or removed to use user low level initialization code.

stm32h7xx_hal_msp.c file contains the following functions:

Table 14. MSP functions

Routine	Description
void HAL_MspInit()	Global MSP initialization routine
void HAL_MspDeInit()	Global MSP de-initialization routine
void HAL_PPP_MspInit()	PPP MSP initialization routine

Routine	Description
void HAL_PPP_MspDeInit()	PPP MSP de-initialization routine

By default, if no peripheral needs to be de-initialized during the program execution, the whole MSP initialization is done in *Hal_MspInit()* and MSP De-Initialization in the *Hal_MspDeInit()*. In this case the *HAL_PPP_MspInit()* and *HAL_PPP_MspDeInit()* are not implemented.

When one or more peripherals needs to be de-initialized in run time and the low level resources of a given peripheral need to be released and used by another peripheral, HAL_PPP_MspDeInit() and *HAL_PPP_MspInit()* are implemented for the concerned peripheral and other peripherals initialization and de-Initialization are kept in the global *HAL_MspInit()* and the *HAL_MspDeInit()*.

If there is nothing to be initialized by the global *HAL_MspInit()* and *HAL_MspDeInit()*, the two routines can simply be omitted.

4.12.3 HAL I/O operation process

The HAL functions with internal data processing like transmit, receive, write and read are generally provided with three data processing modes as follows:

- Polling mode
- Interrupt mode
- DMA mode

4.12.3.1 Polling mode

In Polling mode, the HAL functions return the process status when the data processing in blocking mode is complete. The operation is considered complete when the function returns the HAL_OK status, otherwise an error status is returned. The user can get more information through the *HAL_PPP_GetState()* function. The data processing is handled internally in a loop. A timeout (expressed in ms) is used to prevent process hanging.

The example below shows the typical Polling mode processing sequence :

```
HAL_StatusTypeDef HAL_PPP_Transmit ( PPP_HandleTypeDef * phandle, uint8_t pData,
int16_tSize,uint32_tTimeout)
{
if((pData == NULL ) || (Size == 0))
{
return HAL_ERROR;
}
(…) while (data processing is running)
{
if( timeout reached )
{
return HAL_TIMEOUT;
}
}
(…)
return HAL_OK; }
```

4.12.3.2 Interrupt mode

In Interrupt mode, the HAL function returns the process status after starting the data processing and enabling the appropriate interruption. The end of the operation is indicated by a callback declared as a weak function. It can be customized by the user to be informed in real-time about the process completion. The user can also get the process status through the *HAL_PPP_GetState()* function.

In Interrupt mode, four functions are declared in the driver:

- *HAL_PPP_Process_IT()*: launches the process
- *HAL_PPP_IRQHandler()*: global PPP peripheral interruption
- *__weak HAL_PPP_ProcessCpltCallback ()*: callback relative to the process completion.
- *__weak HAL_PPP_ProcessErrorCallback()*: callback relative to the process Error.

To use a process in Interrupt mode, *HAL_PPP_Process_IT()* is called in the user file and HAL_PPP_IRQHandler in *stm32h7xx_it.c.*

The *HAL_PPP_ProcessCpltCallback()* function is declared as weak function in the driver. This means that the user can declare it again in the application. The function in the driver is not modified.

An example of use is illustrated below:

main.c file:

```
UART_HandleTypeDef UartHandle;
int main(void)
{
/* Set User Parameters */
UartHandle.Init.BaudRate = 9600;
UartHandle.Init.WordLength = UART_DATABITS_8;
UartHandle.Init.StopBits = UART_STOPBITS_1;
UartHandle.Init.Parity = UART_PARITY_NONE;
UartHandle.Init.HwFlowCtl = UART_HWCONTROL_NONE;
UartHandle.Init.Mode = UART_MODE_TX_RX;
UartHandle.Init.Instance = USART1;
HAL_UART_Init(&UartHandle);
HAL_UART_SendIT(&UartHandle, TxBuffer, sizeof(TxBuffer));
while (1);
}
void HAL_UART_TxCpltCallback(UART_HandleTypeDef *huart)
{
}
void HAL_UART_ErrorCallback(UART_HandleTypeDef *huart)
{
}
```

*stm32h7xx_it.c*file:

```
extern UART_HandleTypeDef UartHandle;
void USART1_IRQHandler(void)
{
HAL_UART_IRQHandler(&UartHandle);
}
```

4.12.3.3 DMA mode

In DMA mode, the HAL function returns the process status after starting the data processing through the DMA and after enabling the appropriate DMA interruption. The end of the operation is indicated by a callback declared as a weak function and can be customized by the user to be informed in real-time about the process completion. The user can also get the process status through the *HAL_PPP_GetState()* function. For the DMA mode, three functions are declared in the driver:

- *HAL_PPP_Process_DMA()*: launch the process
- *HAL_PPP_DMA_IRQHandler()*: the DMA interruption used by the PPP peripheral
- *__weak HAL_PPP_ProcessCpltCallback()*: the callback relative to the process completion.
- *__weak HAL_PPP_ErrorCpltCallback()*: the callback relative to the process Error.

To use a process in DMA mode, *HAL_PPP_Process_DMA()* is called in the user file and the *HAL_PPP_DMA_IRQHandler()* is placed in the *stm32h7xx_it.c*. When DMA mode is used, the DMA initialization is done in the *HAL_PPP_MspInit()* callback. The user should also associate the DMA handle to the PPP handle. For this purpose, the handles of all the peripheral drivers that use the DMA must be declared as follows:

```
typedef struct
{
PPP_TypeDef *Instance; /* Register base address */
PPP_InitTypeDef Init; /* PPP communication parameters */
HAL_StateTypeDef State; /* PPP communication state */
(…)
DMA_HandleTypeDef *hdma; /* associated DMA handle */
} PPP_HandleTypeDef;
```

The initialization is done as follows (UART example):

```
int main(void)
{
/* Set User Parameters */
UartHandle.Init.BaudRate = 9600;
UartHandle.Init.WordLength = UART_DATABITS_8;
UartHandle.Init.StopBits = UART_STOPBITS_1;
UartHandle.Init.Parity = UART_PARITY_NONE;
UartHandle.Init.HwFlowCtl = UART_HWCONTROL_NONE;
UartHandle.Init.Mode = UART_MODE_TX_RX;
UartHandle.Init.Instance = UART1;
HAL_UART_Init(&UartHandle);
(..)
}
void HAL_USART_MspInit (UART_HandleTypeDef * huart)
{
static DMA_HandleTypeDef hdma_tx;
static DMA_HandleTypeDef hdma_rx;
(…)
__HAL_LINKDMA(UartHandle, DMA_Handle_tx, hdma_tx);
__HAL_LINKDMA(UartHandle, DMA_Handle_rx, hdma_rx);
(…)
}
```

The *HAL_PPP_ProcessCpltCallback()* function is declared as weak function in the driver that means, the user can declare it again in the application code. The function in the driver should not be modified.

An example of use is illustrated below:

main.c file:

```
UART_HandleTypeDef UartHandle;
int main(void)
{
/* Set User Paramaters */
UartHandle.Init.BaudRate = 9600;
UartHandle.Init.WordLength = UART_DATABITS_8;
UartHandle.Init.StopBits = UART_STOPBITS_1;
UartHandle.Init.Parity = UART_PARITY_NONE;
UartHandle.Init.HwFlowCtl = UART_HWCONTROL_NONE;
UartHandle.Init.Mode = UART_MODE_TX_RX; UartHandle.Init.Instance = USART1;
HAL_UART_Init(&UartHandle);
HAL_UART_Send_DMA(&UartHandle, TxBuffer, sizeof(TxBuffer));
while (1);
}
void HAL_UART_TxCpltCallback(UART_HandleTypeDef *phuart)
{
}
void HAL_UART_TxErrorCallback(UART_HandleTypeDef *phuart)
{
}
```

stm32h7xx_it.c file:

```
extern UART_HandleTypeDef UartHandle;
void DMAx_IRQHandler(void)
{
HAL_DMA_IRQHandler(&UartHandle.DMA_Handle_tx);
}
```

HAL_USART_TxCpltCallback() and *HAL_USART_ErrorCallback()* should be linked in the *HAL_PPP_Process_DMA()* function to the DMA transfer complete callback and the DMA transfer Error callback by using the following statement:

```
HAL_PPP_Process_DMA (PPP_HandleTypeDef *hppp, Params….)
{
(…)
hppp->DMA_Handle->XferCpltCallback = HAL_UART_TxCpltCallback ;
hppp->DMA_Handle->XferErrorCallback = HAL_UART_ErrorCallback ;
(…)
}
```

4.12.4 Timeout and error management

4.12.4.1 *Timeout management*

The timeout is often used for the APIs that operate in Polling mode. It defines the delay during which a blocking process should wait till an error is returned. An example is provided below:

```
HAL_StatusTypeDef HAL_DMA_PollForTransfer(DMA_HandleTypeDef *hdma, uint32_t CompleteLevel,
uint32_t Timeout)
```

The timeout possible values are the following:

Table 15. Timeout values

Timeout value	Description
0	No poll : Immediate process check and exit
1 ... (HAL_MAX_DELAY -1) (1)	Timeout in ms
HAL_MAX_DELAY	Infinite poll till process is successful

1. *HAL_MAX_DELAY is defined in the stm32h7xx_hal_def.h as 0xFFFFFFFF*

However, in some cases, a fixed timeout is used for system peripherals or internal HAL driver processes. In these cases, the timeout has the same meaning and is used in the same way, except when it is defined locally in the drivers and cannot be modified or introduced as an argument in the user application.

Example of fixed timeout:

```
#define LOCAL_PROCESS_TIMEOUT 100
HAL_StatusTypeDef HAL_PPP_Process(PPP_HandleTypeDef)
{
(…)
timeout = HAL_GetTick() + LOCAL_PROCESS_TIMEOUT;
(…)
while(ProcessOngoing)
{
(…)
if(HAL_GetTick() ≥ timeout)
{
/* Process unlocked */
__HAL_UNLOCK(hppp);
hppp->State= HAL_PPP_STATE_TIMEOUT;
return HAL_PPP_STATE_TIMEOUT;
}
}
(…)
}
```

The following example shows how to use the timeout inside the polling functions:

```
HAL_PPP_StateTypeDef HAL_PPP_Poll (PPP_HandleTypeDef *hppp, uint32_t Timeout)
{
(…)
timeout = HAL_GetTick() + Timeout;
(…)
while(ProcessOngoing)
{
(…)
if(Timeout != HAL_MAX_DELAY)
{
if(HAL_GetTick() ≥ timeout)
{
/* Process unlocked */
__HAL_UNLOCK(hppp);
hppp->State= HAL_PPP_STATE_TIMEOUT;
return hppp->State;
}
}
(…)
}
```

4.12.4.2 *Error management*

The HAL drivers implement a check on the following items:

- Valid parameters: for some process the used parameters should be valid and already defined, otherwise the system may crash or go into an undefined state. These critical parameters are checked before being used (see example below).

```
HAL_StatusTypeDef HAL_PPP_Process(PPP_HandleTypeDef* hppp, uint32_t *pdata, uint32
Size)
{
if ((pData == NULL ) || (Size == 0))
{
return HAL_ERROR;
}
}
```

- Valid handle: the PPP peripheral handle is the most important argument since it keeps the PPP driver vital parameters. It is always checked in the beginning of the *HAL_PPP_Init()* function.

```
HAL_StatusTypeDef HAL_PPP_Init(PPP_HandleTypeDef* hppp)
{
if (hppp == NULL) //the handle should be already allocated
{
return HAL_ERROR;
}
}
```

- Timeout error: the following statement is used when a timeout error occurs:

```
while (Process ongoing)
{
timeout = HAL_GetTick() + Timeout; while (data processing is running)
{
if(timeout) { return HAL_TIMEOUT;
}
}
```

When an error occurs during a peripheral process, *HAL_PPP_Process ()* returns with a *HAL_ERROR* status. The HAL PPP driver implements the *HAL_PPP_GetError ()* to allow retrieving the origin of the error.

```
HAL_PPP_ErrorTypeDef HAL_PPP_GetError (PPP_HandleTypeDef *hppp);
```

In all peripheral handles, a *HAL_PPP_ErrorTypeDef* is defined and used to store the last error code.

```
typedef struct
{
PPP_TypeDef * Instance; /* PPP registers base address */
PPP_InitTypeDef Init; /* PPP initialization parameters */
HAL_LockTypeDef Lock; /* PPP locking object */
__IO HAL_PPP_StateTypeDef State; /* PPP state */
__IO HAL_PPP_ErrorTypeDef ErrorCode; /* PPP Error code */
(…)
/* PPP specific parameters */
}
PPP_HandleTypeDef;
```

The error state and the peripheral global state are always updated before returning an error:

```
PPP->State = HAL_PPP_READY;  /* Set the peripheral ready */
PP->ErrorCode = HAL_ERRORCODE ; /* Set the error code */
_HAL_UNLOCK(PPP) ; /* Unlock the PPP resources */
return HAL_ERROR;  /*return with HAL error */
```

HAL_PPP_GetError () must be used in interrupt mode in the error callback:

```
void HAL_PPP_ProcessCpltCallback(PPP_HandleTypeDef *hspi)
{
ErrorCode = HAL_PPP_GetError (hppp); /* retreive error code */
}
```

4.12.4.3 *Run-time checking*

The HAL implements run-time failure detection by checking the input values of all HAL driver functions. The run-time checking is achieved by using an *assert_param* macro. This macro is used in all the HAL driver functions which have an input parameter. It allows verifying that the input value lies within the parameter allowed values.

To enable the run-time checking, use the *assert_param* macro, and leave the define ***USE_FULL_ASSERT*** uncommented in *stm32h7xx_hal_conf.h* file.

```
void HAL_UART_Init(UART_HandleTypeDef *huart)
{
(..) /* Check the parameters */
assert_param(IS_UART_INSTANCE(huart->Instance));
assert_param(IS_UART_BAUDRATE(huart->Init.BaudRate));
assert_param(IS_UART_WORD_LENGTH(huart->Init.WordLength));
assert_param(IS_UART_STOPBITS(huart->Init.StopBits));
assert_param(IS_UART_PARITY(huart->Init.Parity));
assert_param(IS_UART_MODE(huart->Init.Mode));
assert_param(IS_UART_HARDWARE_FLOW_CONTROL(huart->Init.HwFlowCtl));
(..)
```

```
/** @defgroup UART_Word_Length *
@{
*/
#define UART_WORDLENGTH_8B ((uint32_t)0x00000000)
#define UART_WORDLENGTH_9B ((uint32_t)USART_CR1_M)
#define IS_UART_WORD_LENGTH(LENGTH) (((LENGTH) == UART_WORDLENGTH_8B) ||
\ ((LENGTH) == UART_WORDLENGTH_9B))
```

If the expression passed to the assert_param macro is false, the*assert_failed* function is called and returns the name of the source file and the source line number of the call that failed. If the expression is true, no value is returned.

The *assert_param* macro is implemented in stm32h7xx_hal_conf.h:

```
/* Exported macro ------------------------------------------------------------*/
#ifdef USE_FULL_ASSERT
/**
* @brief The assert_param macro is used for function's parameters check.
* @param expr: If expr is false, it calls assert_failed function
* which reports the name of the source file and the source
* line number of the call that failed.
* If expr is true, it returns no value.
* @retval None */
#define assert_param(expr) ((expr)?(void)0:assert_failed((uint8_t *)__FILE__, __LINE__))
/* Exported functions --------------------------------------*/
void assert_failed(uint8_t* file, uint32_t line);
#else
#define assert_param(expr)((void)0)
#endif /* USE_FULL_ASSERT */
```

The *assert_failed* function is implemented in the main.c file or in any other user C file:

```
#ifdef USE_FULL_ASSERT /**
* @brief Reports the name of the source file and the source line number
* where the assert_param error has occurred.
* @param file: pointer to the source file name
* @param line: assert_param error line source number
* @retval None */
void assert_failed(uint8_t* file, uint32_t line)
{
/* User can add his own implementation to report the file name and line number,
ex: printf("Wrong parameters value: file %s on line %d\r\n", file, line) */
/* Infinite loop */
while (1)
{
}
}
```

Attention: ***Because of the overhead run-time checking introduces, it is recommended to use it during application code development and debugging, and to remove it from the final application to improve code size and speed.***

5 Overview of low-layer drivers

The low-layer (LL) drivers are designed to offer a fast light-weight expert-oriented layer which is closer to the hardware than the HAL. Contrary to the HAL, LL APIs are not provided for peripherals where optimized access is not a key feature, or those requiring heavy software configuration and/or complex upper-level stack (such as USB).

The LL drivers feature:

- A set of functions to initialize peripheral main features according to the parameters specified in data structures
- A set of functions used to fill initialization data structures with the reset values of each field
- Functions to perform peripheral de-initialization (peripheral registers restored to their default values)
- A set of inline functions for direct and atomic register access
- Full independence from HAL since LL drivers can be used either in standalone mode (without HAL drivers) or in mixed mode (with HAL drivers)
- Full coverage of the supported peripheral features

The low-layer drivers provide hardware services based on the available features of the STM32 peripherals. These services reflect exactly the hardware capabilities and provide one-shot operations that must be called following the programming model described in the microcontroller line reference manual. As a result, the LL services do not implement any processing and do not require any additional memory resources to save their states, counter or data pointers: all the operations are performed by changing the associated peripheral registers content.

5.1 Low-layer files

The low-layer drivers are built around header/C files (one per each supported peripheral) plus five header files for some System and Cortex related features.

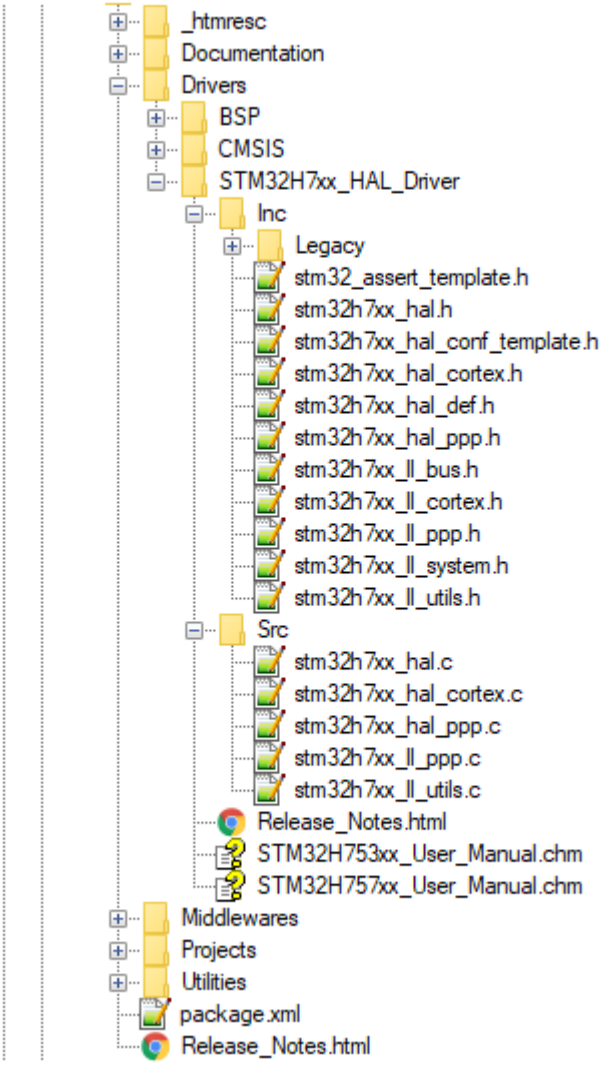
Table 16. LL driver files

File	Description
stm32h7xx_ll_bus.h	This is the h-source file for core bus control and peripheral clock activation and deactivation *Example: LL_AHB2_GRP1_EnableClock*
stm32h7xx_ll_ppp.h/.c	stm32h7xx_ll_ppp.c provides peripheral initialization functions such as LL_PPP_Init(), LL_PPP_StructInit(), LL_PPP_DeInit(). All the other APIs are definined within stm32h7xx_ll_ppp.h file. The low-layer PPP driver is a standalone module. To use it, the application must include it in the stm32h7xx_ll_ppp.h file.
stm32h7xx_ll_cortex.h	Cortex-M related register operation APIs including the Systick, Low power (such as LL_SYSTICK_xxxxx and LL_LPM_xxxxx "Low Power Mode")
stm32h7xx_ll_utils.h/.c	This file covers the generic APIs: • Read of device unique ID and electronic signature • Timebase and delay management • System clock configuration.
stm32h7xx_ll_system.h	System related operations. Example: LL_SYSCFG_xxx, LL_DBGMCU_xxx and LL_FLASH_xxx and LL_VREFBUF_xxx
stm32_assert_template.h	Template file allowing to define the assert_param macro, that is used when run-time checking is enabled. This file is required only when the LL drivers are used in standalone mode (without calling the HAL APIs). It should be copied to the application folder and renamed to stm32_assert.h.

Note: There is no configuration file for the LL drivers.

The low-layer files are located in the same HAL driver folder.

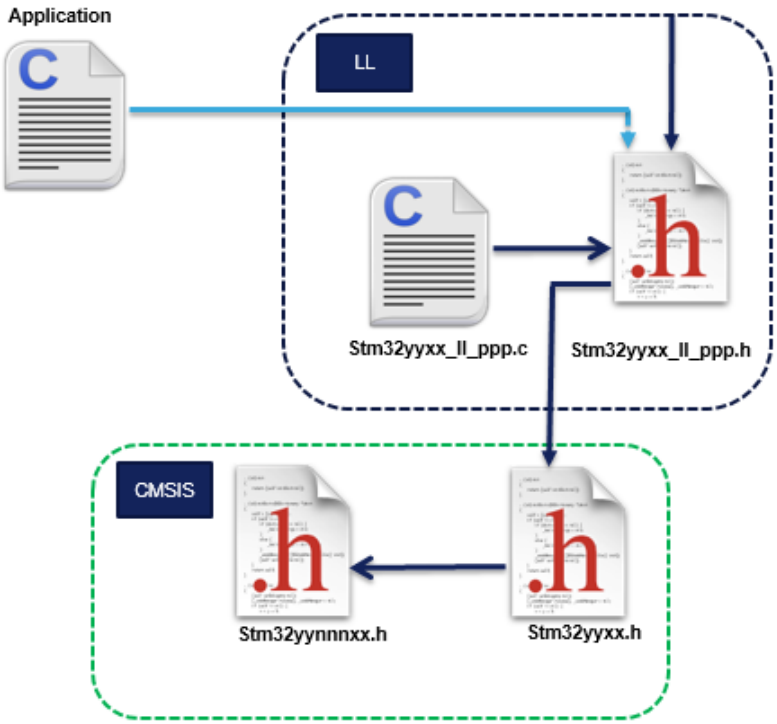
Figure 10. **Low-layer driver folders**



In general, low-layer drivers include only the STM32 CMSIS device file.

```
#include "stm32yyxx.h"
```

Figure 11. **Low-layer driver CMSIS files**



Application files have to include only the used low-layer driver header files.

5.2 Overview of low-layer APIs and naming rules

5.2.1 Peripheral initialization functions

The LL drivers offer three sets of initialization functions. They are defined in stm32h7xx_ll_ppp.c file:

- Functions to initialize peripheral main features according to the parameters specified in data structures
- A set of functions used to fill initialization data structures with the reset values of each field
- Function for peripheral de-initialization (peripheral registers restored to their default values)

The definition of these LL initialization functions and associated resources (structure, literals and prototypes) is conditioned by a compilation switch: *USE_FULL_LL_DRIVER*. To use these functions, this switch must be added in the toolchain compiler preprocessor or to any generic header file which is processed before the LL drivers.

The below table shows the list of the common functions provided for all the supported peripherals:

Table 17. Common peripheral initialization functions

Functions	Return Type	Parameters	Description
LL_PPP_Init	*ErrorStatus*	• *PPP_TypeDef* PPPx* • *LL_PPP_InitTypeDef* PPP_InitStruct*	Initializes the peripheral main features according to the parameters specified in PPP_InitStruct. Example: LL_USART_Init(USART_TypeDef *USARTx, LL_USART_InitTypeDef *USART_InitStruct)
LL_PPP_StructInit	*void*	• *LL_PPP_InitTypeDef* PPP_InitStruct*	Fills each PPP_InitStruct member with its default value. Example. LL_USART_StructInit(LL_USART_InitTypeDef *USART_InitStruct)
LL_PPP_DeInit	*ErrorStatus*	• *PPP_TypeDef* PPPx*	De-initializes the peripheral registers, that is restore them to their default reset values. Example. LL_USART_DeInit(USART_TypeDef *USARTx)

Additional functions are available for some peripherals (refer to Table 18. Optional peripheral initialization functions).

Table 18. Optional peripheral initialization functions

Functions	Return Type	Parameters	Examples
LL_PPP{_CATEGORY}_Init	*ErrorStatus*	• *PPP_TypeDef* PPPx* • *LL_PPP{_CATEGORY}_InitTypeDef* PPP{_CATEGORY}_InitStruct*	Initializes peripheral features according to the parameters specified in PPP_InitStruct. Example: LL_ADC_INJ_Init(ADC_TypeDef *ADCx, LL_ADC_INJ_InitTypeDef *ADC_INJ_InitStruct) LL_RTC_TIME_Init(RTC_TypeDef *RTCx, uint32_t RTC_Format, LL_RTC_TimeTypeDef *RTC_TimeStruct) LL_RTC_DATE_Init(RTC_TypeDef *RTCx, uint32_t RTC_Format, LL_RTC_DateTypeDef *RTC_DateStruct) LL_TIM_IC_Init(TIM_TypeDef* TIMx, uint32_t Channel, LL_TIM_IC_InitTypeDef* TIM_IC_InitStruct) LL_TIM_ENCODER_Init(TIM_TypeDef* TIMx, LL_TIM_ENCODER_InitTypeDef* TIM_EncoderInitStruct)
LL_PPP{_CATEGORY}_StructInit	*void*	*LL_PPP{_CATEGORY}_InitTypeDef* PPP{_CATEGORY}_InitStruct*	Fills each *PPP{_CATEGORY}_InitStruct* member with its default value. Example: LL_ADC_INJ_StructInit(LL_ADC_INJ_InitTypeDef *ADC_INJ_InitStruct)
LL_PPP_CommonInit	*ErrorStatus*	• *PPP_TypeDef* PPPx* • *LL_PPP_CommonInitTypeDef* PPP_CommonInitStruct*	Initializes the common features shared between different instances of the same peripheral. Example: LL_ADC_CommonInit(ADC_Common_TypeDef *ADCxy_COMMON, LL_ADC_CommonInitTypeDef *ADC_CommonInitStruct)
LL_PPP_CommonStructInit	*void*	*LL_PPP_CommonInitTypeDef* PPP_CommonInitStruct*	Fills each *PPP_CommonInitStruct* member with its default value Example: LL_ADC_CommonStructInit(LL_ADC_CommonInitTypeDef *ADC_CommonInitStruct)
LL_PPP_ClockInit	*ErrorStatus*	• *PPP_TypeDef* PPPx* • *LL_PPP_ClockInitTypeDef* PPP_ClockInitStruct*	Initializes the peripheral clock configuration in synchronous mode.

Functions	Return Type	Parameters	Examples
			Example: LL_USART_ClockInit(USART_TypeDef *USARTx, LL_USART_ClockInitTypeDef *USART_ClockInitStruct)
LL_PPP_ClockStructInit	*void*	*LL_PPP_ClockInitTypeDef* PPP_ClockInitStruct*	Fills each *PPP_ClockInitStruct* member with its default value Example: LL_USART_ClockStructInit(LL_USART_ClockInitTypeDef *USART_ClockInitStruct)

5.2.1.1 *Run-time checking*

Like HAL drivers, LL initialization functions implement run-time failure detection by checking the input values of all LL driver functions. For more details, refer to Section 4.12.4.3 Run-time checking.

When using the LL drivers in standalone mode (without calling HAL functions), the following actions are required to use run-time checking:

1. Copy stm32_assert_template.h to the application folder and rename it to stm32_assert.h. This file defines the assert_param macro which is used when run-time checking is enabled.
2. Include stm32_assert.h file within the application main header file.
3. Add the USE_FULL_ASSERT compilation switch in the toolchain compiler preprocessor or in any generic header file which is processed before the stm32_assert.h driver.

Note: Run-time checking is not available for LL inline functions.

5.2.2 Peripheral register-level configuration functions

On top of the peripheral initialization functions, the LL drivers offer a set of inline functions for direct atomic register access. Their format is as follows:

```
__STATIC_INLINE return_type LL_PPP_Function (PPPx_TypeDef *PPPx, args)
```

The “Function” naming is defined depending to the action category:

- **Specific Interrupt, DMA request and status flags management**: Set/Get/Clear/Enable/Disable flags on interrupt and status registers

Table 19. Specific Interrupt, DMA request and status flags management

Name	Examples
LL_PPP_{_CATEGORY}_ActionItem_BITNAME *LL_PPP{_CATEGORY}_IsItem_BITNAME_Action*	• LL_RCC_IsActiveFlag_LSIRDY • LL_RCC_IsActiveFlag_FWRST() • LL_ADC_ClearFlag_EOC(ADC1) • LL_DMA_ClearFlag_TCx(DMA_TypeDef* DMAx)

Table 20. Available function formats

Item	Action	Format
Flag	Get	*LL_PPP_IsActiveFlag_BITNAME*
	Clear	*LL_PPP_ClearFlag_BITNAME*
Interrupts	Enable	*LL_PPP_EnableIT_BITNAME*
	Disable	*LL_PPP_DisableIT_BITNAME*
	Get	*LL_PPP_IsEnabledIT_BITNAME*
DMA	Enable	*LL_PPP_EnableDMAReq_BITNAME*
	Disable	*LL_PPP_DisableDMAReq_BITNAME*
	Get	*LL_PPP_IsEnabledDMAReq_BITNAME*

Note: BITNAME refers to the peripheral register bit name as described in the product line reference manual.

- **Peripheral clock activation/deactivation management**: Enable/Disable/Reset a peripheral clock

Table 21. Peripheral clock activation/deactivation management

Name	Examples
LL_BUS_GRPx_ActionClock{Mode}	• *LL_AHB2_GRP1_EnableClock (LL_AHB2_GRP1_PERIPH_GPIOA| LL_AHB2_GRP1_PERIPH_GPIOB)* • *LL_APB1_GRP1_EnableClockSleep (LL_APB1_GRP1_PERIPH_DAC1)*

Note: 'x' corresponds to the group index and refers to the index of the modified register on a given bus. 'bus' corresponds to the bus name.

- ***Peripheral activation/deactivation management*** : Enable/disable a peripheral or activate/deactivate specific peripheral features

Table 22. Peripheral activation/deactivation management

Name	Examples
LL_PPP{_CATEGORY}_Action{Item} *LL_PPP{_CATEGORY}_IsItemAction*	• *LL_ADC_Enable ()* • *LL_ADC_StartCalibration();* • *LL_ADC_IsCalibrationOnGoing;* • *LL_RCC_HSI_Enable ()* • *LL_RCC_HSI_IsReady()*

- ***Peripheral configuration management*** : Set/get a peripheral configuration settings

Table 23. Peripheral configuration management

Name	Examples
LL_PPP{_CATEGORY}_Set{ or Get}ConfigItem	*LL_USART_SetBaudRate (USART2, Clock, LL_USART_BAUDRATE_9600)*

- ***Peripheral register management*** : Write/read the content of a register/retrun DMA relative register address

Table 24. Peripheral register management

Name
LL_PPP_WriteReg(__INSTANCE__, __REG__, __VALUE__)
LL_PPP_ReadReg(__INSTANCE__, __REG__)
*LL_PPP_DMA_GetRegAddr (PPP_TypeDef *PPPx,{Sub Instance if any ex: Channel} , {uint32_t Propriety})*

Note: The Propriety is a variable used to identify the DMA transfer direction or the data register type.

6 Cohabiting of HAL and LL

The low-ayer APIs are designed to be used in standalone mode or combined with the HAL. They cannot be automatically used with the HAL for the same peripheral instance. If you use the LL APIs for a specific instance, you can still use the HAL APIs for other instances. Be careful that the low-layer APIs might overwrite some registers which content is mirrored in the HAL handles.

6.1 Low-layer driver used in Standalone mode

The low-layer APIs can be used without calling the HAL driver services. This is done by simply including stm32h7xx_ll_ppp.h in the application files. The LL APIs for a given peripheral are called by executing the same sequence as the one recommended by the programming model in the corresponding product line reference manual. In this case the HAL drivers associated to the used peripheral can be removed from the workspace. However the STM32CubeH7 framework should be used in the same way as in the HAL drivers case which means that System file, startup file and CMSIS should always be used.

Note: When the BSP drivers are included, the used HAL drivers associated with the BSP functions drivers should be included in the workspace, even if they are not used by the application layer.

6.2 Mixed use of low-layer APIs and HAL drivers

In this case the low-layer APIs are used in conjunction with the HAL drivers to achieve direct and register level based operations.

Mixed use is allowed, however some consideration should be taken into account:

- It is recommended to avoid using simultaneously the HAL APIs and the combination of low-layer APIs for a given peripheral instance. If this is the case, one or more private fields in the HAL PPP handle structure should be updated accordingly.
- For operations and processes that do not alter the handle fields including the initialization structure, the HAL driver APIs and the low-layer services can be used together for the same peripheral instance.
- The low-layer drivers can be used without any restriction with all the HAL drivers that are not based on handle objects (RCC, common HAL, Flash and GPIO).

Several examples showing how to use HAL and LL in the same application are provided within stm32h7 firmware package (refer to Examples_MIX projects).

Note:

1. *When the HAL Init/DeInit APIs are not used and are replaced by the low-layer macros, the InitMsp() functions are not called and the MSP initialization should be done in the user application.*
2. *When process APIs are not used and the corresponding function is performed through the low-layer APIs, the callbacks are not called and post processing or error management should be done by the user application.*
3. *When the LL APIs is used for process operations, the IRQ handler HAL APIs cannot be called and the IRQ should be implemented by the user application. Each LL driver implements the macros needed to read and clear the associated interrupt flags.*

7 HAL System Driver

7.1 HAL Firmware driver API description

The following section lists the various functions of the HAL library.

7.1.1 How to use this driver

The common HAL driver contains a set of generic and common APIs that can be used by the PPP peripheral drivers and the user to start using the HAL.

The HAL contains two APIs' categories:

- Common HAL APIs
- Services HAL APIs

7.1.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initializes the Flash interface the NVIC allocation and initial clock configuration. It initializes the systick also when timeout is needed and the backup domain when enabled.
- De-Initializes common part of the HAL.
- Configure The time base source to have 1ms time base with a dedicated Tick interrupt priority.
  - SysTick timer is used by default as source of time base, but user can eventually implement his proper time base source (a general purpose timer for example or other time source), keeping in mind that Time base duration should be kept 1ms since PPP_TIMEOUT_VALUEs are defined and handled in milliseconds basis.
  - Time base configuration function (HAL_InitTick ()) is called automatically at the beginning of the program after reset by HAL_Init() or at any time when clock is configured, by HAL_RCC_ClockConfig().
  - Source of time base is configured to generate interrupts at regular time intervals. Care must be taken if HAL_Delay() is called from a peripheral ISR process, the Tick interrupt line must have higher priority (numerically lower) than the peripheral interrupt. Otherwise the caller ISR process will be blocked.
  - functions affecting time base configurations are declared as __weak to make override possible in case of other implementations in user file.

This section contains the following APIs:

- ***HAL_Init()***
- ***HAL_DeInit()***
- ***HAL_MspInit()***
- ***HAL_MspDeInit()***
- ***HAL_InitTick()***

7.1.3 HAL Control functions

This section provides functions allowing to:

- Provide a tick value in millisecond
- Provide a blocking delay in millisecond
- Suspend the time base source interrupt
- Resume the time base source interrupt
- Get the HAL API driver version
- Get the device identifier
- Get the device revision identifier
- Enable/Disable Debug module during SLEEP mode
- Enable/Disable Debug module during STOP mode

- Enable/Disable Debug module during STANDBY mode

This section contains the following APIs:

- *HAL_IncTick()*
- *HAL_GetTick()*
- *HAL_GetTickPrio()*
- *HAL_SetTickFreq()*
- *HAL_GetTickFreq()*
- *HAL_Delay()*
- *HAL_SuspendTick()*
- *HAL_ResumeTick()*
- *HAL_GetHalVersion()*
- *HAL_GetREVID()*
- *HAL_GetDEVID()*
- *HAL_GetUIDw0()*
- *HAL_GetUIDw1()*
- *HAL_GetUIDw2()*
- *HAL_SYSCFG_VREFBUF_VoltageScalingConfig()*
- *HAL_SYSCFG_VREFBUF_HighImpedanceConfig()*
- *HAL_SYSCFG_VREFBUF_TrimmingConfig()*
- *HAL_SYSCFG_EnableVREFBUF()*
- *HAL_SYSCFG_DisableVREFBUF()*
- *HAL_SYSCFG_ETHInterfaceSelect()*
- *HAL_SYSCFG_AnalogSwitchConfig()*
- *HAL_SYSCFG_EnableBOOST()*
- *HAL_SYSCFG_DisableBOOST()*
- *HAL_SYSCFG_CM7BootAddConfig()*
- *HAL_SYSCFG_CM4BootAddConfig()*
- *HAL_SYSCFG_EnableCM7BOOT()*
- *HAL_SYSCFG_DisableCM7BOOT()*
- *HAL_SYSCFG_EnableCM4BOOT()*
- *HAL_SYSCFG_DisableCM4BOOT()*
- *HAL_EnableCompensationCell()*
- *HAL_DisableCompensationCell()*
- *HAL_SYSCFG_EnableIOSpeedOptimize()*
- *HAL_SYSCFG_DisableIOSpeedOptimize()*
- *HAL_SYSCFG_CompensationCodeSelect()*
- *HAL_SYSCFG_CompensationCodeConfig()*
- *HAL_DBGMCU_EnableDBGSleepMode()*
- *HAL_DBGMCU_DisableDBGSleepMode()*
- *HAL_DBGMCU_EnableDBGStopMode()*
- *HAL_DBGMCU_DisableDBGStopMode()*
- *HAL_DBGMCU_EnableDBGStandbyMode()*
- *HAL_DBGMCU_DisableDBGStandbyMode()*
- *HAL_EnableDomain2DBGSleepMode()*
- *HAL_DisableDomain2DBGSleepMode()*
- *HAL_EnableDomain2DBGStopMode()*
- *HAL_DisableDomain2DBGStopMode()*
- *HAL_EnableDomain2DBGStandbyMode()*
- *HAL_DisableDomain2DBGStandbyMode()*

- *HAL_SetFMCMemorySwappingConfig()*
- *HAL_GetFMCMemorySwappingConfig()*
- *HAL_EXTI_EdgeConfig()*
- *HAL_EXTI_GenerateSWInterrupt()*
- *HAL_EXTI_D1_ClearFlag()*
- *HAL_EXTI_D2_ClearFlag()*
- *HAL_EXTI_D1_EventInputConfig()*
- *HAL_EXTI_D2_EventInputConfig()*
- *HAL_EXTI_D3_EventInputConfig()*

7.1.4 Detailed description of functions

HAL_Init

Function name

HAL_StatusTypeDef HAL_Init (void)

Function description

This function is used to initialize the HAL Library; it must be the first instruction to be executed in the main program (before to call any other HAL function), it performs the following: Configures the SysTick to generate an interrupt each 1 millisecond, which is clocked by the HSI (at this stage, the clock is not yet configured and thus the system is running from the internal HSI at 16 MHz).

Return values

- **HAL:** status

Notes

- SysTick is used as time base for the HAL_Delay() function, the application need to ensure that the SysTick time base is always set to 1 millisecond to have correct HAL operation.

HAL_DeInit

Function name

HAL_StatusTypeDef HAL_DeInit (void)

Function description

This function de-Initializes common part of the HAL and stops the systick.

Return values

- **HAL:** status

HAL_MspInit

Function name

void HAL_MspInit (void)

Function description

Initializes the MSP.

Return values

- **None:**

HAL_MspDeInit

Function name

void HAL_MspDeInit (void)

Function description

DeInitializes the MSP.

Return values

- **None:**

HAL_InitTick

Function name

HAL_StatusTypeDef HAL_InitTick (uint32_t TickPriority)

Function description

This function configures the source of the time base.

Parameters

- **TickPriority:** Tick interrupt priority.

Return values

- **HAL:** status

Notes

- This function is called automatically at the beginning of program after reset by HAL_Init() or at any time when clock is reconfigured by HAL_RCC_ClockConfig().
- In the default implementation, SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals. Care must be taken if HAL_Delay() is called from a peripheral ISR process, the SysTick interrupt must have higher priority (numerically lower) than the peripheral interrupt. Otherwise the caller ISR process will be blocked. The function is declared as __weak to be overwritten in case of other implementation in user file.

HAL_IncTick

Function name

void HAL_IncTick (void)

Function description

This function is called to increment a global variable "uwTick" used as application time base.

Return values

- **None:**

Notes

- In the default implementation, this variable is incremented each 1ms in Systick ISR.
- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_Delay

Function name

void HAL_Delay (uint32_t Delay)

Function description

This function provides minimum delay (in milliseconds) based on variable incremented.

Parameters

- **Delay:** specifies the delay time length, in milliseconds.

Return values

- **None:**

Notes

- In the default implementation , SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals where uwTick is incremented.
- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_GetTick

Function name

uint32_t HAL_GetTick (void)

Function description

Provides a tick value in millisecond.

Return values

- **tick:** value

Notes

- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_GetTickPrio

Function name

uint32_t HAL_GetTickPrio (void)

Function description

This function returns a tick priority.

Return values

- **tick:** priority

HAL_SetTickFreq

Function name

HAL_StatusTypeDef HAL_SetTickFreq (HAL_TickFreqTypeDef Freq)

Function description

Set new tick Freq.

Return values

- **Status:**

HAL_GetTickFreq

Function name

HAL_TickFreqTypeDef HAL_GetTickFreq (void)

Function description

Return tick frequency.

Return values

- **tick:** period in Hz

HAL_SuspendTick

Function name

void HAL_SuspendTick (void)

Function description

Suspend Tick increment.

Return values

- **None:**

Notes

- In the default implementation , SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals. Once HAL_SuspendTick() is called, the SysTick interrupt will be disabled and so Tick increment is suspended.
- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_ResumeTick

Function name

void HAL_ResumeTick (void)

Function description

Resume Tick increment.

Return values

- **None:**

Notes

- In the default implementation , SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals. Once HAL_ResumeTick() is called, the SysTick interrupt will be enabled and so Tick increment is resumed.
- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_GetHalVersion

Function name

uint32_t HAL_GetHalVersion (void)

Function description

Returns the HAL revision.

Return values

- **version:** : 0xXYZR (8bits for each decimal, R for RC)

HAL_GetREVID

Function name

uint32_t HAL_GetREVID (void)

Function description

Returns the device revision identifier.

Return values

- **Device:** revision identifier

HAL_GetDEVID

Function name

uint32_t HAL_GetDEVID (void)

Function description

Returns the device identifier.

Return values

- **Device:** identifier

HAL_GetUIDw0

Function name

uint32_t HAL_GetUIDw0 (void)

Function description

Return the first word of the unique device identifier (UID based on 96 bits)

Return values

- **Device:** identifier

HAL_GetUIDw1

Function name

uint32_t HAL_GetUIDw1 (void)

Function description

Return the second word of the unique device identifier (UID based on 96 bits)

Return values

- **Device:** identifier

HAL_GetUIDw2

Function name

uint32_t HAL_GetUIDw2 (void)

Function description

Return the third word of the unique device identifier (UID based on 96 bits)

Return values

- **Device:** identifier

HAL_SYSCFG_ETHInterfaceSelect

Function name

void HAL_SYSCFG_ETHInterfaceSelect (uint32_t SYSCFG_ETHInterface)

Function description

Ethernet PHY Interface Selection either MII or RMII.

Parameters

- **SYSCFG_ETHInterface:** Selects the Ethernet PHY interface This parameter can be one of the following values:
  - SYSCFG_ETH_MII : Select the Media Independent Interface
  - SYSCFG_ETH_RMII: Select the Reduced Media Independent Interface

Return values

- **None:**

HAL_SYSCFG_AnalogSwitchConfig

Function name

void HAL_SYSCFG_AnalogSwitchConfig (uint32_t SYSCFG_AnalogSwitch, uint32_t SYSCFG_SwitchState)

Function description

Analog Switch control for dual analog pads.

Parameters

- **SYSCFG_AnalogSwitch:** Selects the analog pad This parameter can be one or a combination of the following values:
  - SYSCFG_SWITCH_PA0 : Select PA0 analog switch
  - SYSCFG_SWITCH_PA1: Select PA1 analog switch
  - SYSCFG_SWITCH_PC2 : Select PC2 analog switch
  - SYSCFG_SWITCH_PC3: Select PC3 analog switch
- **SYSCFG_SwitchState:** Open or Close the analog switch between dual pads (PXn and PXn_C) This parameter can be one or a combination of the following values:
  - SYSCFG_SWITCH_PA0_OPEN
  - SYSCFG_SWITCH_PA0_CLOSE
  - SYSCFG_SWITCH_PA1_OPEN
  - SYSCFG_SWITCH_PA1_CLOSE
  - SYSCFG_SWITCH_PC2_OPEN
  - SYSCFG_SWITCH_PC2_CLOSE
  - SYSCFG_SWITCH_PC3_OPEN
  - SYSCFG_SWITCH_PC3_CLOSE

Return values

- **None:**

HAL_SYSCFG_EnableBOOST

Function name

void HAL_SYSCFG_EnableBOOST (void)

Function description

Enables the booster to reduce the total harmonic distortion of the analog switch when the supply voltage is lower than 2.7 V.

Return values

- **None:**

Notes

- Activating the booster allows to guaranty the analog switch AC performance when the supply voltage is below 2.7 V: in this case, the analog switch performance is the same on the full voltage range

HAL_SYSCFG_DisableBOOST

Function name

void HAL_SYSCFG_DisableBOOST (void)

Function description

Disables the booster.

Return values

- **None:**

Notes

- Activating the booster allows to guaranty the analog switch AC performance when the supply voltage is below 2.7 V: in this case, the analog switch performance is the same on the full voltage range

HAL_SYSCFG_CM7BootAddConfig

Function name

void HAL_SYSCFG_CM7BootAddConfig (uint32_t BootRegister, uint32_t BootAddress)

Function description

BootCM7 address 0 configuration.

Parameters

- **BootRegister:** :Specifies the Boot Address register (Address0 or Address1) This parameter can be one of the following values:
  - SYSCFG_BOOT_ADDR0 : Select the boot address0
  - SYSCFG_BOOT_ADDR1: Select the boot address1
- **BootAddress:** :Specifies the CM7 Boot Address to be loaded in Address0 or Address1

Return values

- **None:**

HAL_SYSCFG_CM4BootAddConfig

Function name

void HAL_SYSCFG_CM4BootAddConfig (uint32_t BootRegister, uint32_t BootAddress)

Function description

BootCM4 address 0 configuration.

Parameters

- **BootRegister:** :Specifies the Boot Address register (Address0 or Address1) This parameter can be one of the following values:
  - SYSCFG_BOOT_ADDR0 : Select the boot address0
  - SYSCFG_BOOT_ADDR1: Select the boot address1
- **BootAddress:** :Specifies the CM4 Boot Address to be loaded in Address0 or Address1

Return values

- **None:**

HAL_SYSCFG_EnableCM7BOOT

Function name

void HAL_SYSCFG_EnableCM7BOOT (void)

Function description

Enables the Cortex-M7 boot.

Return values

- **None:**

HAL_SYSCFG_DisableCM7BOOT

Function name

void HAL_SYSCFG_DisableCM7BOOT (void)

Function description

Disables the Cortex-M7 boot.

Return values

- **None:**

Notes

- Disabling the boot will gate the CPU clock

HAL_SYSCFG_EnableCM4BOOT

Function name

void HAL_SYSCFG_EnableCM4BOOT (void)

Function description

Enables the Cortex-M4 boot.

Return values

- **None:**

HAL_SYSCFG_DisableCM4BOOT

Function name

void HAL_SYSCFG_DisableCM4BOOT (void)

Function description

Disables the Cortex-M4 boot.

Return values

- **None:**

Notes

- Disabling the boot will gate the CPU clock

HAL_EnableCompensationCell

Function name

void HAL_EnableCompensationCell (void)

Function description

Enables the I/O Compensation Cell.

Return values

- **None:**

Notes

- The I/O compensation cell can be used only when the device supply voltage ranges from 1.62 to 2.0 V and from 2.7 to 3.6 V.

HAL_DisableCompensationCell

Function name

void HAL_DisableCompensationCell (void)

Function description

Power-down the I/O Compensation Cell.

Return values

- **None:**

Notes

- The I/O compensation cell can be used only when the device supply voltage ranges from 1.62 to 2.0 V and from 2.7 to 3.6 V.

HAL_SYSCFG_EnableIOSpeedOptimize

Function name

void HAL_SYSCFG_EnableIOSpeedOptimize (void)

Function description

To Enable optimize the I/O speed when the product voltage is low.

Return values

- **None:**

Notes

- This bit is active only if PRODUCT_BELOW_25V user option bit is set. It must be used only if the product supply voltage is below 2.5 V. Setting this bit when VDD is higher than 2.5 V might be destructive.

HAL_SYSCFG_DisableIOSpeedOptimize

Function name

void HAL_SYSCFG_DisableIOSpeedOptimize (void)

Function description

To Disable optimize the I/O speed when the product voltage is low.

Return values

- **None:**

Notes

- This bit is active only if PRODUCT_BELOW_25V user option bit is set. It must be used only if the product supply voltage is below 2.5 V. Setting this bit when VDD is higher than 2.5 V might be destructive.

HAL_SYSCFG_CompensationCodeSelect

Function name

void HAL_SYSCFG_CompensationCodeSelect (uint32_t SYSCFG_CompCode)

Function description

Code selection for the I/O Compensation cell.

Parameters

- **SYSCFG_CompCode:** Selects the code to be applied for the I/O compensation cell This parameter can be one of the following values:
  - SYSCFG_CELL_CODE : Select Code from the cell (available in the SYSCFG_CCVR)
  - SYSCFG_REGISTER_CODE: Select Code from the SYSCFG compensation cell code register (SYSCFG_CCCR)

Return values

- **None:**

HAL_SYSCFG_CompensationCodeConfig

Function name

void HAL_SYSCFG_CompensationCodeConfig (uint32_t SYSCFG_PMOSCode, uint32_t SYSCFG_NMOSCode)

Function description

Code selection for the I/O Compensation cell.

Parameters

- **SYSCFG_PMOSCode:** PMOS compensation code This code is applied to the I/O compensation cell when the CS bit of the SYSCFG_CMPCR is set
- **SYSCFG_NMOSCode:** NMOS compensation code This code is applied to the I/O compensation cell when the CS bit of the SYSCFG_CMPCR is set

Return values

- **None:**

HAL_DBGMCU_EnableDBGSleepMode

Function name

void HAL_DBGMCU_EnableDBGSleepMode (void)

Function description

Enable the Debug Module during Domain1/CDomain SLEEP mode.

Return values

- **None:**

HAL_DBGMCU_DisableDBGSleepMode

Function name

void HAL_DBGMCU_DisableDBGSleepMode (void)

Function description

Disable the Debug Module during Domain1/CDomain SLEEP mode.

Return values

- **None:**

HAL_DBGMCU_EnableDBGStopMode

Function name

void HAL_DBGMCU_EnableDBGStopMode (void)

Function description

Enable the Debug Module during Domain1/CDomain STOP mode.

Return values

- **None:**

HAL_DBGMCU_DisableDBGStopMode

Function name

void HAL_DBGMCU_DisableDBGStopMode (void)

Function description

Disable the Debug Module during Domain1/CDomain STOP mode.

Return values

- **None:**

HAL_DBGMCU_EnableDBGStandbyMode

Function name

void HAL_DBGMCU_EnableDBGStandbyMode (void)

Function description

Enable the Debug Module during Domain1/CDomain STANDBY mode.

Return values

- **None:**

HAL_DBGMCU_DisableDBGStandbyMode

Function name

void HAL_DBGMCU_DisableDBGStandbyMode (void)

Function description

Disable the Debug Module during Domain1/CDomain STANDBY mode.

Return values

- **None:**

HAL_EnableDomain2DBGSleepMode

Function name

void HAL_EnableDomain2DBGSleepMode (void)

Function description

Enable the Debug Module during Domain1 SLEEP mode.

Return values

- **None:**

HAL_DisableDomain2DBGSleepMode

Function name

void HAL_DisableDomain2DBGSleepMode (void)

Function description

Disable the Debug Module during Domain2 SLEEP mode.

Return values

- **None:**

HAL_EnableDomain2DBGStopMode

Function name

void HAL_EnableDomain2DBGStopMode (void)

Function description

Enable the Debug Module during Domain2 STOP mode.

Return values

- **None:**

HAL_DisableDomain2DBGStopMode

Function name

void HAL_DisableDomain2DBGStopMode (void)

Function description

Disable the Debug Module during Domain2 STOP mode.

Return values

- **None:**

HAL_EnableDomain2DBGStandbyMode

Function name

void HAL_EnableDomain2DBGStandbyMode (void)

Function description

Enable the Debug Module during Domain2 STANDBY mode.

Return values

- **None:**

HAL_DisableDomain2DBGStandbyMode

Function name

void HAL_DisableDomain2DBGStandbyMode (void)

Function description

Disable the Debug Module during Domain2 STANDBY mode.

Return values

- **None:**

HAL_EXTI_EdgeConfig

Function name

void HAL_EXTI_EdgeConfig (uint32_t EXTI_Line, uint32_t EXTI_Edge)

Function description

Configure the EXTI input event line edge.

Parameters

- **EXTI_Line:** Specifies the EXTI LINE, it can be one of the following values, (EXTI_LINE0....EXTI_LINE87)excluding :line45, line81,line83 which are reserved
- **EXTI_Edge:** Specifies EXTI line Edge used. This parameter can be one of the following values :
  - EXTI_RISING_EDGE : Configurable line, with Rising edge trigger detection
  - EXTI_FALLING_EDGE: Configurable line, with Falling edge trigger detection

Return values

- **None:**

Notes

- No edge configuration for direct lines but for configurable lines:(EXTI_LINE0..EXTI_LINE21), EXTI_LINE49,EXTI_LINE51,EXTI_LINE82,EXTI_LINE84,EXTI_LINE85 and EXTI_LINE86.

HAL_EXTI_GenerateSWInterrupt

Function name

void HAL_EXTI_GenerateSWInterrupt (uint32_t EXTI_Line)

Function description

Generates a Software interrupt on selected EXTI line.

Parameters

- **EXTI_Line:** Specifies the EXTI LINE, it can be one of the following values, (EXTI_LINE0..EXTI_LINE21),EXTI_LINE49,EXTI_LINE51,EXTI_LINE82,EXTI_LINE84,EXTI_LINE85 and EXTI_LINE86.

Return values

- **None:**

HAL_EXTI_D2_ClearFlag

Function name

void HAL_EXTI_D2_ClearFlag (uint32_t EXTI_Line)

Function description

Clears the EXTI's line pending flags for Domain D2.

Parameters

- **EXTI_Line:** Specifies the EXTI LINE, it can be one of the following values, (EXTI_LINE0....EXTI_LINE87)excluding :line45, line81,line83 which are reserved

Return values

- **None:**

HAL_EXTI_D1_ClearFlag

Function name

void HAL_EXTI_D1_ClearFlag (uint32_t EXTI_Line)

Function description

Clears the EXTI's line pending flags for Domain D1.

Parameters

- **EXTI_Line:** Specifies the EXTI LINE, it can be one of the following values, (EXTI_LINE0....EXTI_LINE87)excluding :line45, line81,line83 which are reserved

Return values

- **None:**

HAL_EXTI_D1_EventInputConfig

Function name

void HAL_EXTI_D1_EventInputConfig (uint32_t EXTI_Line, uint32_t EXTI_Mode, uint32_t EXTI_LineCmd)

Function description

Configure the EXTI input event line for Domain D1.

Parameters

- **EXTI_Line:** Specifies the EXTI LINE, it can be one of the following values, (EXTI_LINE0....EXTI_LINE87)excluding :line45, line81,line83 which are reserved
- **EXTI_Mode:** Specifies which EXTI line is used as interrupt or an event. This parameter can be one or a combination of the following values :
  - EXTI_MODE_IT : Interrupt Mode selected
  - EXTI_MODE_EVT : Event Mode selected
- **EXTI_LineCmd:** controls (Enable/Disable) the EXTI line.

Return values

- **None:**

HAL_EXTI_D2_EventInputConfig

Function name

void HAL_EXTI_D2_EventInputConfig (uint32_t EXTI_Line, uint32_t EXTI_Mode, uint32_t EXTI_LineCmd)

Function description

Configure the EXTI input event line for Domain D2.

Parameters

- **EXTI_Line:** Specifies the EXTI LINE, it can be one of the following values, (EXTI_LINE0....EXTI_LINE87)excluding :line45, line81,line83 which are reserved
- **EXTI_Mode:** Specifies which EXTI line is used as interrupt or an event. This parameter can be one or a combination of the following values :
  - EXTI_MODE_IT : Interrupt Mode selected
  - EXTI_MODE_EVT : Event Mode selected
- **EXTI_LineCmd:** controls (Enable/Disable) the EXTI line.

Return values

- **None:**

HAL_EXTI_D3_EventInputConfig

Function name

void HAL_EXTI_D3_EventInputConfig (uint32_t EXTI_Line, uint32_t EXTI_LineCmd, uint32_t EXTI_ClearSrc)

Function description

Configure the EXTI input event line for Domain D3.

Parameters

- **EXTI_Line:** Specifies the EXTI LINE, it can be one of the following values, (EXTI_LINE0...EXTI_LINE15),(EXTI_LINE19...EXTI_LINE21),EXTI_LINE25, EXTI_LINE34, EXTI_LINE35,EXTI_LINE41,(EXTI_LINE48...EXTI_LINE53)
- **EXTI_LineCmd:** controls (Enable/Disable) the EXTI line.
- **EXTI_ClearSrc:** Specifies the clear source of D3 pending event. This parameter can be one of the following values :
  - BDMA_CH6_CLEAR : BDMA ch6 event selected as D3 domain pendclear source
  - BDMA_CH7_CLEAR : BDMA ch7 event selected as D3 domain pendclear source
  - LPTIM4_OUT_CLEAR : LPTIM4 out selected as D3 domain pendclear source
  - LPTIM5_OUT_CLEAR : LPTIM5 out selected as D3 domain pendclear source

Return values

- **None:**

HAL_SetFMCMemorySwappingConfig

Function name

void HAL_SetFMCMemorySwappingConfig (uint32_t BankMapConfig)

Function description

Set the FMC Memory Mapping Swapping config.

Parameters

- **BankMapConfig:** Defines the FMC Bank mapping configuration. This parameter can be FMC_SWAPBMAP_DISABLE, FMC_SWAPBMAP_SDRAM_SRAM, FMC_SWAPBMAP_SDRAMB2

Return values

- **HAL:** state

HAL_GetFMCMemorySwappingConfig

Function name

uint32_t HAL_GetFMCMemorySwappingConfig (void)

Function description

Get FMC Bank mapping mode.

Return values

- **The:** FMC Bank mapping mode. This parameter can be FMC_SWAPBMAP_DISABLE, FMC_SWAPBMAP_SDRAM_SRAM, FMC_SWAPBMAP_SDRAMB2

HAL_SYSCFG_VREFBUF_VoltageScalingConfig

Function name

void HAL_SYSCFG_VREFBUF_VoltageScalingConfig (uint32_t VoltageScaling)

Function description

Configure the internal voltage reference buffer voltage scale.

Parameters

- **VoltageScaling:** specifies the output voltage to achieve This parameter can be one of the following values:
  - SYSCFG_VREFBUF_VOLTAGE_SCALE0: VREF_OUT1 around 2.5 V. This requires VDDA equal to or higher than 2.8 V.
  - SYSCFG_VREFBUF_VOLTAGE_SCALE1: VREF_OUT2 around 2.048 V. This requires VDDA equal to or higher than 2.4 V.
  - SYSCFG_VREFBUF_VOLTAGE_SCALE2: VREF_OUT3 around 1.8 V. This requires VDDA equal to or higher than 2.1 V.
  - SYSCFG_VREFBUF_VOLTAGE_SCALE3: VREF_OUT4 around 1.5 V. This requires VDDA equal to or higher than 1.8 V.

Return values

- **None:**

HAL_SYSCFG_VREFBUF_HighImpedanceConfig

Function name

void HAL_SYSCFG_VREFBUF_HighImpedanceConfig (uint32_t Mode)

Function description

Configure the internal voltage reference buffer high impedance mode.

Parameters

- **Mode:** specifies the high impedance mode This parameter can be one of the following values:
  - SYSCFG_VREFBUF_HIGH_IMPEDANCE_DISABLE: VREF+ pin is internally connect to VREFINT output.
  - SYSCFG_VREFBUF_HIGH_IMPEDANCE_ENABLE: VREF+ pin is high impedance.

Return values

- **None:**

HAL_SYSCFG_VREFBUF_TrimmingConfig

Function name

void HAL_SYSCFG_VREFBUF_TrimmingConfig (uint32_t TrimmingValue)

Function description

Tune the Internal Voltage Reference buffer (VREFBUF).

Return values

- **None:**

HAL_SYSCFG_EnableVREFBUF

Function name

HAL_StatusTypeDef HAL_SYSCFG_EnableVREFBUF (void)

Function description

Enable the Internal Voltage Reference buffer (VREFBUF).

Return values

- **HAL_OK/HAL_TIMEOUT:**

HAL_SYSCFG_DisableVREFBUF

Function name

void HAL_SYSCFG_DisableVREFBUF (void)

Function description

Disable the Internal Voltage Reference buffer (VREFBUF).

Return values

- **None:**

7.2 HAL Firmware driver defines

The following section lists the various define and macros of the module.

7.2.1 HAL

HAL

ETH States

HAL_ETH_STATE_RESET

Peripheral not yet Initialized or disabled

HAL_ETH_STATE_READY

Peripheral Communication started

HAL_ETH_STATE_BUSY

an internal process is ongoing

HAL_ETH_STATE_STARTED

an internal process is started

HAL_ETH_STATE_ERROR

Error State

HAL FDCAN Error Code

HAL_FDCAN_ERROR_NONE

No error

HAL_FDCAN_ERROR_TIMEOUT

Timeout error

HAL_FDCAN_ERROR_NOT_INITIALIZED

Peripheral not initialized

HAL_FDCAN_ERROR_NOT_READY

Peripheral not ready

HAL_FDCAN_ERROR_NOT_STARTED

Peripheral not started

HAL_FDCAN_ERROR_NOT_SUPPORTED

Mode not supported

HAL_FDCAN_ERROR_PARAM

Parameter error

HAL_FDCAN_ERROR_PENDING

Pending operation

HAL_FDCAN_ERROR_RAM_ACCESS

Message RAM Access Failure

HAL_FDCAN_ERROR_FIFO_EMPTY

Put element in full FIFO

HAL_FDCAN_ERROR_FIFO_FULL

Get element from empty FIFO

HAL_FDCAN_ERROR_LOG_OVERFLOW

Overflow of CAN Error Logging Counter

HAL_FDCAN_ERROR_RAM_WDG

Message RAM Watchdog event occurred

HAL_FDCAN_ERROR_PROTOCOL_ARBT

Protocol Error in Arbitration Phase (Nominal Bit Time is used)

HAL_FDCAN_ERROR_PROTOCOL_DATA

Protocol Error in Data Phase (Data Bit Time is used)

HAL_FDCAN_ERROR_RESERVED_AREA

Access to Reserved Address

HAL_FDCAN_ERROR_TT_GLOBAL_TIME

Global Time Error : Synchronization deviation exceeded limit

HAL_FDCAN_ERROR_TT_TX_UNDERFLOW

Tx Count Underflow : Less Tx trigger than expected in one matrix cycle

HAL_FDCAN_ERROR_TT_TX_OVERFLOW

Tx Count Overflow : More Tx trigger than expected in one matrix cycle

HAL_FDCAN_ERROR_TT_SCHEDULE1

Scheduling error 1

HAL_FDCAN_ERROR_TT_SCHEDULE2

Scheduling error 2

HAL_FDCAN_ERROR_TT_NO_INIT_REF

No system startup due to missing reference message

HAL_FDCAN_ERROR_TT_NO_REF

Missing reference message

HAL_FDCAN_ERROR_TT_APPL_WDG

Application watchdog not served in time

HAL_FDCAN_ERROR_TT_CONFIG

Error found in trigger list

HAL_FDCAN_ERROR_INVALID_CALLBACK

Invalid Callback error

HAL state definition

HAL_SMBUS_STATE_RESET

SMBUS not yet initialized or disabled

HAL_SMBUS_STATE_READY

SMBUS initialized and ready for use

HAL_SMBUS_STATE_BUSY

SMBUS internal process is ongoing

HAL_SMBUS_STATE_MASTER_BUSY_TX

Master Data Transmission process is ongoing

HAL_SMBUS_STATE_MASTER_BUSY_RX

Master Data Reception process is ongoing

HAL_SMBUS_STATE_SLAVE_BUSY_TX

Slave Data Transmission process is ongoing

HAL_SMBUS_STATE_SLAVE_BUSY_RX

Slave Data Reception process is ongoing

HAL_SMBUS_STATE_TIMEOUT

Timeout state

HAL_SMBUS_STATE_ERROR

Reception process is ongoing

HAL_SMBUS_STATE_LISTEN

Address Listen Mode is ongoing

Analog Switch Config

SYSCFG_SWITCH_PA0

Select PA0 analog switch

SYSCFG_SWITCH_PA1

Select PA1 analog switch

SYSCFG_SWITCH_PC2

Select PC2 analog switch

SYSCFG_SWITCH_PC3

Select PC3 analog switch

SYSCFG_SWITCH_PA0_OPEN

PA0 analog switch opened

SYSCFG_SWITCH_PA0_CLOSE

PA0 analog switch closed

SYSCFG_SWITCH_PA1_OPEN

PA1 analog switch opened

SYSCFG_SWITCH_PA1_CLOSE

PA1 analog switch closed

SYSCFG_SWITCH_PC2_OPEN

PC2 analog switch opened

SYSCFG_SWITCH_PC2_CLOSE

PC2 analog switch closed

SYSCFG_SWITCH_PC3_OPEN

PC3 analog switch opened

SYSCFG_SWITCH_PC3_CLOSE

PC3 analog switch closed

Boot Config

SYSCFG_BOOT_ADDR0

Select Boot address0

SYSCFG_BOOT_ADDR1

Select Boot address1

IS_SYSCFG_BOOT_REGISTER

IS_SYSCFG_BOOT_ADDRESS

__HAL_SYSCFG_BREAK_AXISRAM_DBL_ECC_LOCK

Notes:

- The selected configuration is locked and can be unlocked only by system reset. This feature is available on STM32H7 rev.B and above.

Enable and lock the connection of AXIRAM double ECC error to TIM1/8/15/16/17 and HRTIMER Break input.

__HAL_SYSCFG_BREAK_ITCM_DBL_ECC_LOCK

Notes:

- The selected configuration is locked and can be unlocked only by system reset. This feature is available on STM32H7 rev.B and above.

Enable and lock the connection of ITCM double ECC error to TIM1/8/15/16/17 and HRTIMER Break input.

__HAL_SYSCFG_BREAK_DTCM_DBL_ECC_LOCK

Notes:

- The selected configuration is locked and can be unlocked only by system reset. This feature is available on STM32H7 rev.B and above.

Enable and lock the connection of DTCM double ECC error to TIM1/8/15/16/17 and HRTIMER Break input.

__HAL_SYSCFG_BREAK_SRAM1_DBL_ECC_LOCK

Notes:

- The selected configuration is locked and can be unlocked only by system reset. This feature is available on STM32H7 rev.B and above.

Enable and lock the connection of SRAM1 double ECC error to TIM1/8/15/16/17 and HRTIMER Break input.

__HAL_SYSCFG_BREAK_SRAM2_DBL_ECC_LOCK

Notes:

- The selected configuration is locked and can be unlocked only by system reset. This feature is available on STM32H7 rev.B and above.

Enable and lock the connection of SRAM2 double ECC error to TIM1/8/15/16/17 and HRTIMER Break input.

__HAL_SYSCFG_BREAK_SRAM3_DBL_ECC_LOCK

Notes:

- The selected configuration is locked and can be unlocked only by system reset. This feature is available on STM32H7 rev.B and above.

Enable and lock the connection of SRAM3 double ECC error to TIM1/8/15/16/17 and HRTIMER Break input.

__HAL_SYSCFG_BREAK_SRAM4_DBL_ECC_LOCK

Notes:

- The selected configuration is locked and can be unlocked only by system reset. This feature is available on STM32H7 rev.B and above.

Enable and lock the connection of SRAM4 double ECC error to TIM1/8/15/16/17 and HRTIMER Break input.

__HAL_SYSCFG_BREAK_BKRAM_DBL_ECC_LOCK

Notes:

- The selected configuration is locked and can be unlocked only by system reset. This feature is available on STM32H7 rev.B and above.

Enable and lock the connection of Backup SRAM double ECC error to TIM1/8/15/16/17 and HRTIMER Break input.

__HAL_SYSCFG_BREAK_CM7_LOCKUP_LOCK

Notes:

- The selected configuration is locked and can be unlocked only by system reset. This feature is available on STM32H7 rev.B and above.

Enable and lock the connection of Cortex-M7 LOCKUP output to TIM1/8/15/16/17 and HRTIMER Break input.

__HAL_SYSCFG_BREAK_FLASH_DBL_ECC_LOCK

Notes:

- The selected configuration is locked and can be unlocked only by system reset. This feature is available on STM32H7 rev.B and above.

Enable and lock the connection of Flash double ECC error connection to TIM1/8/15/16/17 and HRTIMER Break input.

__HAL_SYSCFG_BREAK_PVD_LOCK

Notes:

- The selected configuration is locked and can be unlocked only by system reset. This feature is available on STM32H7 rev.B and above.

Enable and lock the PVD connection to Timer1/8/15/16/17 and HRTIMER Break input, as well as the PVDE and PLS[2:0] in the PWR_CR1 register.

__HAL_SYSCFG_BREAK_CM4_LOCKUP_LOCK

Notes:

- The selected configuration is locked and can be unlocked only by system reset. This feature is available on STM32H7 rev.B and above.

Enable and lock the connection of Cortex-M4 LOCKUP output to TIM1/8/15/16/17 and HRTIMER Break input.

IOCompenstionCell Config

SYSCFG_CELL_CODE

Select Code from the cell

SYSCFG_REGISTER_CODE

Code from the SYSCFG compensation cell code register

IS_SYSCFG_CODE_SELECT

IS_SYSCFG_CODE_CONFIG

VREFBUF High Impedance

SYSCFG_VREFBUF_HIGH_IMPEDANCE_DISABLE

VREF_plus pin is internally connected to Voltage reference buffer output

SYSCFG_VREFBUF_HIGH_IMPEDANCE_ENABLE

VREF_plus pin is high impedance

8 HAL ADC Generic Driver

8.1 ADC Firmware driver registers structures

8.1.1 ADC_OversamplingTypeDef

ADC_OversamplingTypeDef is defined in the stm32h7xx_hal_adc.h

Data Fields

- ***uint32_t Ratio***
- ***uint32_t RightBitShift***
- ***uint32_t TriggeredMode***
- ***uint32_t OversamplingStopReset***

Field Documentation

- ***uint32_t ADC_OversamplingTypeDef::Ratio***
  Configures the oversampling ratio.
- ***uint32_t ADC_OversamplingTypeDef::RightBitShift***
  Configures the division coefficient for the Oversampler. This parameter can be a value of ***ADC_HAL_EC_OVS_SHIFT***
- ***uint32_t ADC_OversamplingTypeDef::TriggeredMode***
  Selects the regular triggered oversampling mode. This parameter can be a value of ***ADC_HAL_EC_OVS_DISCONT_MODE***
- ***uint32_t ADC_OversamplingTypeDef::OversamplingStopReset***
  Selects the regular oversampling mode. The oversampling is either temporary stopped or reset upon an injected sequence interruption. If oversampling is enabled on both regular and injected groups, this parameter is discarded and forced to setting "ADC_REGOVERSAMPLING_RESUMED_MODE" (the oversampling buffer is zeroed during injection sequence). This parameter can be a value of ***ADC_HAL_EC_OVS_SCOPE_REG***

8.1.2 ADC_InitTypeDef

ADC_InitTypeDef is defined in the stm32h7xx_hal_adc.h

Data Fields

- ***uint32_t ClockPrescaler***
- ***uint32_t Resolution***
- ***uint32_t ScanConvMode***

- ***FunctionalState OversamplingMode***
- ***ADC_OversamplingTypeDef Oversampling***

Field Documentation

- ***uint32_t ADC_InitTypeDef::ClockPrescaler***

  Select ADC clock source (synchronous clock derived from APB clock or asynchronous clock derived from system clock or PLL (Refer to reference manual for list of clocks available)) and clock prescaler. This parameter can be a value of ***ADC_HAL_EC_COMMON_CLOCK_SOURCE***. Note: The ADC clock configuration is common to all ADC instances. Note: In case of usage of channels on injected group, ADC frequency should be lower than AHB clock frequency /4 for resolution 12 or 10 bits, AHB clock frequency /3 for resolution 8 bits, AHB clock frequency /2 for resolution 6 bits. Note: In case of synchronous clock mode based on HCLK/1, the configuration must be enabled only if the system clock has a 50% duty clock cycle (APB prescaler configured inside RCC must be bypassed and PCLK clock must have 50% duty cycle). Refer to reference manual for details. Note: In case of usage of asynchronous clock, the selected clock must be preliminarily enabled at RCC top level. Note: This parameter can be modified only if all ADC instances are disabled.

- ***uint32_t ADC_InitTypeDef::Resolution***

  Configure the ADC resolution. This parameter can be a value of ***ADC_HAL_EC_RESOLUTION***

- ***uint32_t ADC_InitTypeDef::ScanConvMode***

  Configure the sequencer of ADC groups regular and injected. This parameter can be associated to parameter 'DiscontinuousConvMode' to have main sequence subdivided in successive parts. If disabled: Conversion is performed in single mode (one channel converted, the one defined in rank 1). Parameters 'NbrOfConversion' and 'InjectedNbrOfConversion' are discarded (equivalent to set to 1). If enabled: Conversions are performed in sequence mode (multiple ranks defined by 'NbrOfConversion' or 'InjectedNbrOfConversion' and rank of each channel in sequencer). Scan direction is upward: from rank 1 to rank 'n'. This parameter can be a value of ***ADC_Scan_mode***

- ***uint32_t ADC_InitTypeDef::EOCSelection***

  Specify which EOC (End Of Conversion) flag is used for conversion by polling and interruption: end of unitary conversion or end of sequence conversions. This parameter can be a value of ***ADC_EOCSelection***.

- ***FunctionalState ADC_InitTypeDef::LowPowerAutoWait***

  Select the dynamic low power Auto Delay: new conversion start only when the previous conversion (for ADC group regular) or previous sequence (for ADC group injected) has been retrieved by user software, using function **HAL_ADC_GetValue()** or **HAL_ADCEx_InjectedGetValue()**. This feature automatically adapts the frequency of ADC conversions triggers to the speed of the system that reads the data. Moreover, this avoids risk of overrun for low frequency applications. This parameter can be set to ENABLE or DISABLE. Note: It is not recommended to use with interruption or DMA (**HAL_ADC_Start_IT()**, **HAL_ADC_Start_DMA()**) since these modes have to clear immediately the EOC flag (by CPU to free the IRQ pending event or by DMA). Auto wait will work but fort a very short time, discarding its intended benefit (except specific case of high load of CPU or DMA transfers which can justify usage of auto wait). Do use with polling: 1. Start conversion with **HAL_ADC_Start()**, 2. Later on, when ADC conversion data is needed: and use **HAL_ADC_GetValue()** to retrieve conversion result and trig another conversion (in case of usage of injected group, use the equivalent functions HAL_ADCExInjected_Start(), **HAL_ADCEx_InjectedGetValue()**, ...).

- ***FunctionalState ADC_InitTypeDef::ContinuousConvMode***

  Specify whether the conversion is performed in single mode (one conversion) or continuous mode for ADC group regular, after the first ADC conversion start trigger occurred (software start or external trigger). This parameter can be set to ENABLE or DISABLE.

- ***uint32_t ADC_InitTypeDef::NbrOfConversion***

  Specify the number of ranks that will be converted within the regular group sequencer. To use the regular group sequencer and convert several ranks, parameter 'ScanConvMode' must be enabled. This parameter must be a number between Min_Data = 1 and Max_Data = 16. Note: This parameter must be modified when no conversion is on going on regular group (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).

- ***FunctionalState ADC_InitTypeDef::DiscontinuousConvMode***

  Specify whether the conversions sequence of ADC group regular is performed in Complete-sequence/ Discontinuous-sequence (main sequence subdivided in successive parts). Discontinuous mode is used only if sequencer is enabled (parameter 'ScanConvMode'). If sequencer is disabled, this parameter is discarded. Discontinuous mode can be enabled only if continuous mode is disabled. If continuous mode is enabled, this parameter setting is discarded. This parameter can be set to ENABLE or DISABLE.

- ***uint32_t ADC_InitTypeDef::NbrOfDiscConversion***

  Specifies the number of discontinuous conversions in which the main sequence of ADC group regular (parameter NbrOfConversion) will be subdivided. If parameter 'DiscontinuousConvMode' is disabled, this parameter is discarded. This parameter must be a number between Min_Data = 1 and Max_Data = 8.
- ***uint32_t ADC_InitTypeDef::ExternalTrigConv***

  Select the external event source used to trigger ADC group regular conversion start. If set to ADC_SOFTWARE_START, external triggers are disabled and software trigger is used instead. This parameter can be a value of ***ADC_regular_external_trigger_source***. Caution: external trigger source is common to all ADC instances.
- ***uint32_t ADC_InitTypeDef::ExternalTrigConvEdge***

  Select the external event edge used to trigger ADC group regular conversion start. If trigger source is set to ADC_SOFTWARE_START, this parameter is discarded. This parameter can be a value of ***ADC_regular_external_trigger_edge***
- ***uint32_t ADC_InitTypeDef::ConversionDataManagement***

  Specifies whether the Data conversion data is managed: using the DMA (oneshot or circular), or stored in the DR register or transferred to DFSDM register. Note: In continuous mode, DMA must be configured in circular mode. Otherwise an overrun will be triggered when DMA buffer maximum pointer is reached. This parameter can be a value of ***ADC_ConversionDataManagement***. Note: This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
- ***uint32_t ADC_InitTypeDef::Overrun***

  Select the behavior in case of overrun: data overwritten or preserved (default). This parameter applies to ADC group regular only. This parameter can be a value of ***ADC_HAL_EC_REG_OVR_DATA_BEHAVIOR***. Note: In case of overrun set to data preserved and usage with programming model with interruption (HAL_Start_IT()): ADC IRQ handler has to clear end of conversion flags, this induces the release of the preserved data. If needed, this data can be saved in function **HAL_ADC_ConvCpltCallback()**, placed in user program code (called before end of conversion flags clear). Note: Error reporting with respect to the conversion mode:
  - Usage with ADC conversion by polling for event or interruption: Error is reported only if overrun is set to data preserved. If overrun is set to data overwritten, user can willingly not read all the converted data, this is not considered as an erroneous case.
  - Usage with ADC conversion by DMA: Error is reported whatever overrun setting (DMA is expected to process all data from data register).
- ***uint32_t ADC_InitTypeDef::LeftBitShift***

  Configures the left shifting applied to the final result with or without oversampling. This parameter can be a value of ***ADCEx_Left_Bit_Shift***
- ***FunctionalState ADC_InitTypeDef::OversamplingMode***

  Specify whether the oversampling feature is enabled or disabled. This parameter can be set to ENABLE or DISABLE. Note: This parameter can be modified only if there is no conversion is ongoing on ADC groups regular and injected
- ***ADC_OversamplingTypeDef ADC_InitTypeDef::Oversampling***

  Specify the Oversampling parameters. Caution: this setting overwrites the previous oversampling configuration if oversampling is already enabled.

8.1.3 ADC_ChannelConfTypeDef

ADC_ChannelConfTypeDef is defined in the stm32h7xx_hal_adc.h

Data Fields

- ***uint32_t Channel***
- ***uint32_t Rank***
- ***uint32_t SamplingTime***
- ***uint32_t SingleDiff***
- ***uint32_t OffsetNumber***
- ***uint32_t Offset***
- ***FunctionalState OffsetRightShift***

- ***FunctionalState OffsetSignedSaturation***

Field Documentation

- ***uint32_t ADC_ChannelConfTypeDef::Channel***

  Specify the channel to configure into ADC regular group. This parameter can be a value of ***ADC_HAL_EC_CHANNEL*** Note: Depending on devices and ADC instances, some channels may not be available on device package pins. Refer to device datasheet for channels availability.

- ***uint32_t ADC_ChannelConfTypeDef::Rank***

  Specify the rank in the regular group sequencer. This parameter can be a value of ***ADC_HAL_EC_REG_SEQ_RANKS*** Note: to disable a channel or change order of conversion sequencer, rank containing a previous channel setting can be overwritten by the new channel setting (or parameter number of conversions adjusted)

- ***uint32_t ADC_ChannelConfTypeDef::SamplingTime***

  Sampling time value to be set for the selected channel. Unit: ADC clock cycles Conversion time is the addition of sampling time and processing time (12.5 ADC clock cycles at ADC resolution 12 bits, 10.5 cycles at 10 bits, 8.5 cycles at 8 bits, 6.5 cycles at 6 bits). This parameter can be a value of ***ADC_HAL_EC_CHANNEL_SAMPLINGTIME*** Caution: This parameter applies to a channel that can be used into regular and/or injected group. It overwrites the last setting. Note: In case of usage of internal measurement channels (VrefInt/Vbat/TempSensor), sampling time constraints must be respected (sampling time can be adjusted in function of ADC clock frequency and sampling time setting) Refer to device datasheet for timings values.

- ***uint32_t ADC_ChannelConfTypeDef::SingleDiff***

  Select single-ended or differential input. In differential mode: Differential measurement is carried out between the selected channel 'i' (positive input) and channel 'i+1' (negative input). Only channel 'i' has to be configured, channel 'i+1' is configured automatically. This parameter must be a value of ***ADC_HAL_EC_CHANNEL_SINGLE_DIFF_ENDING*** Caution: This parameter applies to a channel that can be used in a regular and/or injected group. It overwrites the last setting. Note: Refer to Reference Manual to ensure the selected channel is available in differential mode. Note: When configuring a channel 'i' in differential mode, the channel 'i+1' is not usable separately. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion). If ADC is enabled, this parameter setting is bypassed without error reporting (as it can be the expected behavior in case of another parameter update on the fly)

- ***uint32_t ADC_ChannelConfTypeDef::OffsetNumber***

  Select the offset number This parameter can be a value of ***ADC_HAL_EC_OFFSET_NB*** Caution: Only one offset is allowed per channel. This parameter overwrites the last setting.

- ***uint32_t ADC_ChannelConfTypeDef::Offset***

  Define the offset to be subtracted from the raw converted data. Offset value must be a positive number. Maximum value depends on ADC resolution and oversampling ratio (in case of oversampling used). This parameter must be a number between Min_Data = 0x0000 and Max_Data = 0x3FFFC00 (corresponding to resolution 16 bit and oversampling ratio 1024). Note: This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).

- ***FunctionalState ADC_ChannelConfTypeDef::OffsetRightShift***

  Define the Right-shift data after Offset correction. This parameter is applied only for 16-bit or 8-bit resolution. This parameter can be set to ENABLE or DISABLE.

- ***FunctionalState ADC_ChannelConfTypeDef::OffsetSignedSaturation***

  Specify whether the Signed saturation feature is used or not. This parameter is applied only for 16-bit or 8-bit resolution. This parameter can be set to ENABLE or DISABLE.

8.1.4 ADC_AnalogWDGConfTypeDef

ADC_AnalogWDGConfTypeDef is defined in the stm32h7xx_hal_adc.h

Data Fields

- ***uint32_t WatchdogNumber***
- ***uint32_t WatchdogMode***
- ***uint32_t Channel***
- ***FunctionalState ITMode***

- ***uint32_t HighThreshold***
- ***uint32_t LowThreshold***

Field Documentation

- ***uint32_t ADC_AnalogWDGConfTypeDef::WatchdogNumber***

  Select which ADC analog watchdog is monitoring the selected channel. For Analog Watchdog 1: Only 1 channel can be monitored (or overall group of channels by setting parameter 'WatchdogMode') For Analog Watchdog 2 and 3: Several channels can be monitored (by successive calls of '**HAL_ADC_AnalogWDGConfig()**' for each channel) This parameter can be a value of ***ADC_HAL_EC_AWD_NUMBER***.
- ***uint32_t ADC_AnalogWDGConfTypeDef::WatchdogMode***

  Configure the ADC analog watchdog mode: single/all/none channels. For Analog Watchdog 1: Configure the ADC analog watchdog mode: single channel or all channels, ADC groups regular and-or injected. For Analog Watchdog 2 and 3: Several channels can be monitored by applying successively the AWD init structure. Channels on ADC group regular and injected are not differentiated: Set value 'ADC_ANALOGWATCHDOG_SINGLE_xxx' to monitor 1 channel, value 'ADC_ANALOGWATCHDOG_ALL_xxx' to monitor all channels, 'ADC_ANALOGWATCHDOG_NONE' to monitor no channel. This parameter can be a value of ***ADC_analog_watchdog_mode***.
- ***uint32_t ADC_AnalogWDGConfTypeDef::Channel***

  Select which ADC channel to monitor by analog watchdog. For Analog Watchdog 1: this parameter has an effect only if parameter 'WatchdogMode' is configured on single channel (only 1 channel can be monitored). For Analog Watchdog 2 and 3: Several channels can be monitored. To use this feature, call successively the function **HAL_ADC_AnalogWDGConfig()** for each channel to be added (or removed with value 'ADC_ANALOGWATCHDOG_NONE'). This parameter can be a value of ***ADC_HAL_EC_CHANNEL***.
- ***FunctionalState ADC_AnalogWDGConfTypeDef::ITMode***

  Specify whether the analog watchdog is configured in interrupt or polling mode. This parameter can be set to ENABLE or DISABLE
- ***uint32_t ADC_AnalogWDGConfTypeDef::HighThreshold***

  Configure the ADC analog watchdog High threshold value. Depending of ADC resolution selected (16, 14, 12, 10, 8 bits), this parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFFF, 0x3FFF, 0xFFF, 0x3FF or 0xFF respectively. Note: Analog watchdog 2 and 3 are limited to a resolution of 8 bits: if ADC resolution is 12 bits the 4 LSB are ignored, if ADC resolution is 10 bits the 2 LSB are ignored. Note: If ADC oversampling is enabled, ADC analog watchdog thresholds are impacted: the comparison of analog watchdog thresholds is done on oversampling intermediate computation (after ratio, before shift application): intermediate register bitfield [32:7] (26 most significant bits).
- ***uint32_t ADC_AnalogWDGConfTypeDef::LowThreshold***

  Configures the ADC analog watchdog Low threshold value. Depending of ADC resolution selected (16, 14, 12, 10, 8 bits), this parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFFF, 0x3FFF, 0xFFF, 0x3FF or 0xFF respectively. Note: Analog watchdog 2 and 3 are limited to a resolution of 8 bits: if ADC resolution is 12 bits the 4 LSB are ignored, if ADC resolution is 10 bits the 2 LSB are ignored. Note: If ADC oversampling is enabled, ADC analog watchdog thresholds are impacted: the comparison of analog watchdog thresholds is done on oversampling intermediate computation (after ratio, before shift application): intermediate register bitfield [32:7] (26 most significant bits).

8.1.5 ADC_InjectionConfigTypeDef

ADC_InjectionConfigTypeDef is defined in the stm32h7xx_hal_adc.h

Data Fields

- ***uint32_t ContextQueue***
- ***uint32_t ChannelCount***

Field Documentation

- ***uint32_t ADC_InjectionConfigTypeDef::ContextQueue***

  Injected channel configuration context: build-up over each **HAL_ADCEx_InjectedConfigChannel()** call to finally initialize JSQR register at **HAL_ADCEx_InjectedConfigChannel()** last call
- ***uint32_t ADC_InjectionConfigTypeDef::ChannelCount***

  Number of channels in the injected sequence

8.1.6 __ADC_HandleTypeDef

__ADC_HandleTypeDef is defined in the stm32h7xx_hal_adc.h

Data Fields

- ***ADC_TypeDef * Instance***
- ***ADC_InitTypeDef Init***
- ***DMA_HandleTypeDef * DMA_Handle***
- ***HAL_LockTypeDef Lock***
- ***__IO uint32_t State***
- ***__IO uint32_t ErrorCode***
- ***ADC_InjectionConfigTypeDef InjectionConfig***
- ***void(* ConvCpltCallback***
- ***void(* ConvHalfCpltCallback***
- ***void(* LevelOutOfWindowCallback***
- ***void(* ErrorCallback***
- ***void(* InjectedConvCpltCallback***
- ***void(* InjectedQueueOverflowCallback***
- ***void(* LevelOutOfWindow2Callback***
- ***void(* LevelOutOfWindow3Callback***
- ***void(* EndOfSamplingCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***ADC_TypeDef* __ADC_HandleTypeDef::Instance***
  Register base address
- ***ADC_InitTypeDef __ADC_HandleTypeDef::Init***
  ADC initialization parameters and regular conversions setting
- ***DMA_HandleTypeDef* __ADC_HandleTypeDef::DMA_Handle***
  Pointer DMA Handler
- ***HAL_LockTypeDef __ADC_HandleTypeDef::Lock***
  ADC locking object
- ***__IO uint32_t __ADC_HandleTypeDef::State***
  ADC communication state (bitmap of ADC states)
- ***__IO uint32_t __ADC_HandleTypeDef::ErrorCode***

- ***void(* __ADC_HandleTypeDef::MspInitCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC Msp Init callback
- ***void(* __ADC_HandleTypeDef::MspDeInitCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC Msp DeInit callback

8.2 ADC Firmware driver API description

The following section lists the various functions of the ADC library.

8.2.1 ADC peripheral features

- 16-bit, 14-bit, 12-bit, 10-bit or 8-bit configurable resolution. Note: On devices STM32H72xx and STM32H73xx, these resolution are applicable to instances ADC1 and ADC2. ADC3 is featuring resolutions 12-bit, 10-bit, 8-bit, 6-bit.
- Interrupt generation at the end of regular conversion and in case of analog watchdog or overrun events.
- Single and continuous conversion modes.
- Scan mode for conversion of several channels sequentially.
- Data alignment with in-built data coherency.
- Programmable sampling time (channel wise)
- External trigger (timer or EXTI) with configurable polarity
- DMA request generation for transfer of conversions data of regular group.
- Configurable delay between conversions in Dual interleaved mode.
- ADC channels selectable single/differential input.
- ADC offset shared on 4 offset instances.
- ADC calibration
- ADC conversion of regular group.
- ADC supply requirements: 1.62 V to 3.6 V.
- ADC input range: from Vref- (connected to Vssa) to Vref+ (connected to Vdda or to an external voltage reference).

8.2.2 How to use this driver

Configuration of top level parameters related to ADC

1. Enable the ADC interface
   - As prerequisite, ADC clock must be configured at RCC top level.
   - Two clock settings are mandatory:
     - ADC clock (core clock, also possibly conversion clock).
     - ADC clock (conversions clock). Two possible clock sources: synchronous clock derived from AHB clock or asynchronous clock derived from system clock, the PLL2 or the PLL3 running up to 400MHz.
     - Example: Into HAL_ADC_MspInit() (recommended code location) or with other device clock parameters configuration:
     - __HAL_RCC_ADC_CLK_ENABLE(); (mandatory) RCC_ADCCLKSOURCE_PLL2 enable: (optional: if asynchronous clock selected)
     - RCC_PeriphClkInitTypeDef RCC_PeriphClkInit;
     - PeriphClkInit.PeriphClockSelection = RCC_PERIPHCLK_ADC;
     - PeriphClkInit.AdcClockSelection = RCC_ADCCLKSOURCE_PLL2;
     - HAL_RCCEx_PeriphCLKConfig(&PeriphClkInit);
   - ADC clock source and clock prescaler are configured at ADC level with parameter "ClockPrescaler" using function HAL_ADC_Init().
2. ADC pins configuration
   - Enable the clock for the ADC GPIOs using macro __HAL_RCC_GPIOx_CLK_ENABLE()
   - Configure these ADC pins in analog mode using function HAL_GPIO_Init()
3. Optionally, in case of usage of ADC with interruptions:
   - Configure the NVIC for ADC using function HAL_NVIC_EnableIRQ(ADCx_IRQn)
   - Insert the ADC interruption handler function HAL_ADC_IRQHandler() into the function of corresponding ADC interruption vector ADCx_IRQHandler().
4. Optionally, in case of usage of DMA:
   - Configure the DMA (DMA channel, mode normal or circular, ...) using function HAL_DMA_Init().
   - Configure the NVIC for DMA using function HAL_NVIC_EnableIRQ(DMAx_Channelx_IRQn)
   - Insert the ADC interruption handler function HAL_ADC_IRQHandler() into the function of corresponding DMA interruption vector DMAx_Channelx_IRQHandler().

Configuration of ADC, group regular, channels parameters

1. Configure the ADC parameters (resolution, data alignment, ...) and regular group parameters (conversion trigger, sequencer, ...) using function HAL_ADC_Init().
2. Configure the channels for regular group parameters (channel number, channel rank into sequencer, ..., into regular group) using function HAL_ADC_ConfigChannel().
3. Optionally, configure the analog watchdog parameters (channels monitored, thresholds, ...) using function HAL_ADC_AnalogWDGConfig().

Execution of ADC conversions

1. Optionally, perform an automatic ADC calibration to improve the conversion accuracy using function HAL_ADCEx_Calibration_Start().

2. ADC driver can be used among three modes: polling, interruption, transfer by DMA.
   - ADC conversion by polling:
     - Activate the ADC peripheral and start conversions using function HAL_ADC_Start()
     - Wait for ADC conversion completion using function HAL_ADC_PollForConversion()
     - Retrieve conversion results using function HAL_ADC_GetValue()
     - Stop conversion and disable the ADC peripheral using function HAL_ADC_Stop()
   - ADC conversion by interruption:
     - Activate the ADC peripheral and start conversions using function HAL_ADC_Start_IT()
     - Wait for ADC conversion completion by call of function HAL_ADC_ConvCpltCallback() (this function must be implemented in user program)
     - Retrieve conversion results using function HAL_ADC_GetValue()
     - Stop conversion and disable the ADC peripheral using function HAL_ADC_Stop_IT()
   - ADC conversion with transfer by DMA:
     - Activate the ADC peripheral and start conversions using function HAL_ADC_Start_DMA()
     - Wait for ADC conversion completion by call of function HAL_ADC_ConvCpltCallback() or HAL_ADC_ConvHalfCpltCallback() (these functions must be implemented in user program)
     - Conversion results are automatically transferred by DMA into destination variable address.
     - Stop conversion and disable the ADC peripheral using function HAL_ADC_Stop_DMA()

Note: Callback functions must be implemented in user program:

- *HAL_ADC_ErrorCallback()*
- *HAL_ADC_LevelOutOfWindowCallback() (callback of analog watchdog)*
- *HAL_ADC_ConvCpltCallback()*
- *HAL_ADC_ConvHalfCpltCallback*

Deinitialization of ADC

1. Disable the ADC interface
   - ADC clock can be hard reset and disabled at RCC top level.
   - Hard reset of ADC peripherals using macro __HAL_RCC_ADCx_FORCE_RESET(), __HAL_RCC_ADCx_RELEASE_RESET().
   - ADC clock disable using the equivalent macro/functions as configuration step.
     - Example: Into HAL_ADC_MspDeInit() (recommended code location) or with other device clock parameters configuration:
     - __HAL_RCC_ADC_CLK_DISABLE(); (if not used anymore) RCC_ADCCLKSOURCE_CLKP restore: (optional)
     - RCC_PeriphClkInitTypeDef RCC_PeriphClkInit;
     - PeriphClkInit.PeriphClockSelection = RCC_PERIPHCLK_ADC;
     - PeriphClkInit.AdcClockSelection = RCC_ADCCLKSOURCE_CLKP;
     - HAL_RCCEx_PeriphCLKConfig(&PeriphClkInit);
2. ADC pins configuration
   - Disable the clock for the ADC GPIOs using macro __HAL_RCC_GPIOx_CLK_DISABLE()
3. Optionally, in case of usage of ADC with interruptions:
   - Disable the NVIC for ADC using function HAL_NVIC_EnableIRQ(ADCx_IRQn)
4. Optionally, in case of usage of DMA:
   - Deinitialize the DMA using function HAL_DMA_Init().
   - Disable the NVIC for DMA using function HAL_NVIC_EnableIRQ(DMAx_Channelx_IRQn)

Callback registration

The compilation flag USE_HAL_ADC_REGISTER_CALLBACKS, when set to 1, allows the user to configure dynamically the driver callbacks. Use Functions HAL_ADC_RegisterCallback() to register an interrupt callback.

Function HAL_ADC_RegisterCallback() allows to register following callbacks:

- ConvCpltCallback : ADC conversion complete callback
- ConvHalfCpltCallback : ADC conversion DMA half-transfer callback
- LevelOutOfWindowCallback : ADC analog watchdog 1 callback
- ErrorCallback : ADC error callback
- InjectedConvCpltCallback : ADC group injected conversion complete callback
- InjectedQueueOverflowCallback : ADC group injected context queue overflow callback
- LevelOutOfWindow2Callback : ADC analog watchdog 2 callback
- LevelOutOfWindow3Callback : ADC analog watchdog 3 callback
- EndOfSamplingCallback : ADC end of sampling callback
- MspInitCallback : ADC Msp Init callback
- MspDeInitCallback : ADC Msp DeInit callback This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_ADC_UnRegisterCallback to reset a callback to the default weak function.

HAL_ADC_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- ConvCpltCallback : ADC conversion complete callback
- ConvHalfCpltCallback : ADC conversion DMA half-transfer callback
- LevelOutOfWindowCallback : ADC analog watchdog 1 callback
- ErrorCallback : ADC error callback
- InjectedConvCpltCallback : ADC group injected conversion complete callback
- InjectedQueueOverflowCallback : ADC group injected context queue overflow callback
- LevelOutOfWindow2Callback : ADC analog watchdog 2 callback
- LevelOutOfWindow3Callback : ADC analog watchdog 3 callback
- EndOfSamplingCallback : ADC end of sampling callback
- MspInitCallback : ADC Msp Init callback
- MspDeInitCallback : ADC Msp DeInit callback

By default, after the HAL_ADC_Init() and when the state is HAL_ADC_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_ADC_ConvCpltCallback(), HAL_ADC_ErrorCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_ADC_Init()/ HAL_ADC_DeInit() only when these callbacks are null (not registered beforehand).

If MspInit or MspDeInit are not null, the HAL_ADC_Init()/ HAL_ADC_DeInit() keep and use the user MspInit/ MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in HAL_ADC_STATE_READY state only. Exception done MspInit/MspDeInit functions that can be registered/unregistered in HAL_ADC_STATE_READY or HAL_ADC_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/ DeInit.

Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_ADC_RegisterCallback() before calling HAL_ADC_DeInit() or HAL_ADC_Init() function.

When the compilation flag USE_HAL_ADC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

8.2.3 Peripheral Control functions

This section provides functions allowing to:

- Configure channels on regular group
- Configure the analog watchdog

This section contains the following APIs:

- ***HAL_ADC_ConfigChannel()***
- ***HAL_ADC_AnalogWDGConfig()***

8.2.4 Peripheral state and errors functions

This subsection provides functions to get in run-time the status of the peripheral.

- Check the ADC state
- Check the ADC error code

This section contains the following APIs:

- *HAL_ADC_GetState()*
- *HAL_ADC_GetError()*

8.2.5 Detailed description of functions

HAL_ADC_Init

Function name

HAL_StatusTypeDef HAL_ADC_Init (ADC_HandleTypeDef * hadc)

Function description

Initialize the ADC peripheral and regular group according to parameters specified in structure "ADC_InitTypeDef".

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- As prerequisite, ADC clock must be configured at RCC top level (refer to description of RCC configuration for ADC in header of this file).
- Possibility to update parameters on the fly: This function initializes the ADC MSP (HAL_ADC_MspInit()) only when coming from ADC state reset. Following calls to this function can be used to reconfigure some parameters of ADC_InitTypeDef structure on the fly, without modifying MSP configuration. If ADC MSP has to be modified again, HAL_ADC_DeInit() must be called before HAL_ADC_Init(). The setting of these parameters is conditioned to ADC state. For parameters constraints, see comments of structure "ADC_InitTypeDef".
- This function configures the ADC within 2 scopes: scope of entire ADC and scope of regular group. For parameters details, see comments of structure "ADC_InitTypeDef".
- Parameters related to common ADC registers (ADC clock mode) are set only if all ADCs are disabled. If this is not the case, these common parameters setting are bypassed without error reporting: it can be the intended behaviour in case of update of a parameter of ADC_InitTypeDef on the fly, without disabling the other ADCs.

HAL_ADC_DeInit

Function name

HAL_StatusTypeDef HAL_ADC_DeInit (ADC_HandleTypeDef * hadc)

Function description

Deinitialize the ADC peripheral registers to their default reset values, with deinitialization of the ADC MSP.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- For devices with several ADCs: reset of ADC common registers is done only if all ADCs sharing the same common group are disabled. (function "HAL_ADC_MspDeInit()" is also called under the same conditions: all ADC instances use the same core clock at RCC level, disabling the core clock reset all ADC instances). If this is not the case, reset of these common parameters reset is bypassed without error reporting: it can be the intended behavior in case of reset of a single ADC while the other ADCs sharing the same common group is still running.
- By default, HAL_ADC_DeInit() set ADC in mode deep power-down: this saves more power by reducing leakage currents and is particularly interesting before entering MCU low-power modes.

HAL_ADC_MspInit

Function name

void HAL_ADC_MspInit (ADC_HandleTypeDef * hadc)

Function description

Initialize the ADC MSP.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_MspDeInit

Function name

void HAL_ADC_MspDeInit (ADC_HandleTypeDef * hadc)

Function description

DeInitialize the ADC MSP.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

Notes

- All ADC instances use the same core clock at RCC level, disabling the core clock reset all ADC instances).

HAL_ADC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_ADC_RegisterCallback (ADC_HandleTypeDef * hadc, HAL_ADC_CallbackIDTypeDef CallbackID, pADC_CallbackTypeDef pCallback)

Function description

Register a User ADC Callback To be used instead of the weak predefined callback.

Parameters

- **hadc:** Pointer to a ADC_HandleTypeDef structure that contains the configuration information for the specified ADC.
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_ADC_CONVERSION_COMPLETE_CB_ID ADC conversion complete callback ID
  - HAL_ADC_CONVERSION_HALF_CB_ID ADC conversion DMA half-transfer callback ID
  - HAL_ADC_LEVEL_OUT_OF_WINDOW_1_CB_ID ADC analog watchdog 1 callback ID
  - HAL_ADC_ERROR_CB_ID ADC error callback ID
  - HAL_ADC_INJ_CONVERSION_COMPLETE_CB_ID ADC group injected conversion complete callback ID
  - HAL_ADC_INJ_QUEUE_OVEFLOW_CB_ID ADC group injected context queue overflow callback ID
  - HAL_ADC_LEVEL_OUT_OF_WINDOW_2_CB_ID ADC analog watchdog 2 callback ID
  - HAL_ADC_LEVEL_OUT_OF_WINDOW_3_CB_ID ADC analog watchdog 3 callback ID
  - HAL_ADC_END_OF_SAMPLING_CB_ID ADC end of sampling callback ID
  - HAL_ADC_MSPINIT_CB_ID ADC Msp Init callback ID
  - HAL_ADC_MSPDEINIT_CB_ID ADC Msp DeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_ADC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_ADC_UnRegisterCallback (ADC_HandleTypeDef * hadc, HAL_ADC_CallbackIDTypeDef CallbackID)

Function description

Unregister a ADC Callback ADC callback is redirected to the weak predefined callback.

Parameters

- **hadc:** Pointer to a ADC_HandleTypeDef structure that contains the configuration information for the specified ADC.
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_ADC_CONVERSION_COMPLETE_CB_ID ADC conversion complete callback ID
  - HAL_ADC_CONVERSION_HALF_CB_ID ADC conversion DMA half-transfer callback ID
  - HAL_ADC_LEVEL_OUT_OF_WINDOW_1_CB_ID ADC analog watchdog 1 callback ID
  - HAL_ADC_ERROR_CB_ID ADC error callback ID
  - HAL_ADC_INJ_CONVERSION_COMPLETE_CB_ID ADC group injected conversion complete callback ID
  - HAL_ADC_INJ_QUEUE_OVEFLOW_CB_ID ADC group injected context queue overflow callback ID
  - HAL_ADC_LEVEL_OUT_OF_WINDOW_2_CB_ID ADC analog watchdog 2 callback ID
  - HAL_ADC_LEVEL_OUT_OF_WINDOW_3_CB_ID ADC analog watchdog 3 callback ID
  - HAL_ADC_END_OF_SAMPLING_CB_ID ADC end of sampling callback ID
  - HAL_ADC_MSPINIT_CB_ID ADC Msp Init callback ID
  - HAL_ADC_MSPDEINIT_CB_ID ADC Msp DeInit callback ID

Return values

- **HAL:** status

HAL_ADC_Start

Function name

HAL_StatusTypeDef HAL_ADC_Start (ADC_HandleTypeDef * hadc)

Function description

Enable ADC, start conversion of regular group.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- Interruptions enabled in this function: None.
- Case of multimode enabled (when multimode feature is available): if ADC is Slave, ADC is enabled but conversion is not started, if ADC is master, ADC is enabled and multimode conversion is started.

HAL_ADC_Stop

Function name

HAL_StatusTypeDef HAL_ADC_Stop (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of regular group (and injected channels in case of auto_injection mode), disable ADC peripheral.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

Notes

- : ADC peripheral disable is forcing stop of potential conversion on injected group. If injected group is under use, it should be preliminarily stopped using HAL_ADCEx_InjectedStop function.

HAL_ADC_PollForConversion

Function name

HAL_StatusTypeDef HAL_ADC_PollForConversion (ADC_HandleTypeDef * hadc, uint32_t Timeout)

Function description

Wait for regular group conversion to be completed.

Parameters

- **hadc:** ADC handle
- **Timeout:** Timeout value in millisecond.

Return values

- **HAL:** status

Notes

- ADC conversion flags EOS (end of sequence) and EOC (end of conversion) are cleared by this function, with an exception: if low power feature "LowPowerAutoWait" is enabled, flags are not cleared to not interfere with this feature until data register is read using function HAL_ADC_GetValue().
- This function cannot be used in a particular setup: ADC configured in DMA mode and polling for end of each conversion (ADC init parameter "EOCSelection" set to ADC_EOC_SINGLE_CONV). In this case, DMA resets the flag EOC and polling cannot be performed on each conversion. Nevertheless, polling can still be performed on the complete sequence (ADC init parameter "EOCSelection" set to ADC_EOC_SEQ_CONV).

HAL_ADC_PollForEvent

Function name

HAL_StatusTypeDef HAL_ADC_PollForEvent (ADC_HandleTypeDef * hadc, uint32_t EventType, uint32_t Timeout)

Function description

Poll for ADC event.

Parameters

- **hadc:** ADC handle
- **EventType:** the ADC event type. This parameter can be one of the following values:
  - ADC_EOSMP_EVENT ADC End of Sampling event
  - ADC_AWD1_EVENT ADC Analog watchdog 1 event (main analog watchdog, present on all STM32 devices)
  - ADC_AWD2_EVENT ADC Analog watchdog 2 event (additional analog watchdog, not present on all STM32 families)
  - ADC_AWD3_EVENT ADC Analog watchdog 3 event (additional analog watchdog, not present on all STM32 families)
  - ADC_OVR_EVENT ADC Overrun event
  - ADC_JQOVF_EVENT ADC Injected context queue overflow event
- **Timeout:** Timeout value in millisecond.

Return values

- **HAL:** status

Notes

- The relevant flag is cleared if found to be set, except for ADC_FLAG_OVR. Indeed, the latter is reset only if hadc->Init.Overrun field is set to ADC_OVR_DATA_OVERWRITTEN. Otherwise, data register may be potentially overwritten by a new converted data as soon as OVR is cleared. To reset OVR flag once the preserved data is retrieved, the user can resort to macro __HAL_ADC_CLEAR_FLAG(hadc, ADC_FLAG_OVR);

HAL_ADC_Start_IT

Function name

HAL_StatusTypeDef HAL_ADC_Start_IT (ADC_HandleTypeDef * hadc)

Function description

Enable ADC, start conversion of regular group with interruption.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- Interruptions enabled in this function according to initialization setting : EOC (end of conversion), EOS (end of sequence), OVR overrun. Each of these interruptions has its dedicated callback function.
- Case of multimode enabled (when multimode feature is available): HAL_ADC_Start_IT() must be called for ADC Slave first, then for ADC Master. For ADC Slave, ADC is enabled only (conversion is not started). For ADC Master, ADC is enabled and multimode conversion is started.
- To guarantee a proper reset of all interruptions once all the needed conversions are obtained, HAL_ADC_Stop_IT() must be called to ensure a correct stop of the IT-based conversions.
- By default, HAL_ADC_Start_IT() does not enable the End Of Sampling interruption. If required (e.g. in case of oversampling with trigger mode), the user must: 1. first clear the EOSMP flag if set with macro __HAL_ADC_CLEAR_FLAG(hadc, ADC_FLAG_EOSMP) 2. then enable the EOSMP interrupt with macro __HAL_ADC_ENABLE_IT(hadc, ADC_IT_EOSMP) before calling HAL_ADC_Start_IT().

HAL_ADC_Stop_IT

Function name

HAL_StatusTypeDef HAL_ADC_Stop_IT (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of regular group (and injected group in case of auto_injection mode), disable interrution of end-of-conversion, disable ADC peripheral.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

HAL_ADC_Start_DMA

Function name

HAL_StatusTypeDef HAL_ADC_Start_DMA (ADC_HandleTypeDef * hadc, uint32_t * pData, uint32_t Length)

Function description

Enable ADC, start conversion of regular group and transfer result through DMA.

Parameters

- **hadc:** ADC handle
- **pData:** Destination Buffer address.
- **Length:** Number of data to be transferred from ADC peripheral to memory

Return values

- **HAL:** status.

Notes

- Interruptions enabled in this function: overrun (if applicable), DMA half transfer, DMA transfer complete. Each of these interruptions has its dedicated callback function.
- Case of multimode enabled (when multimode feature is available): HAL_ADC_Start_DMA() is designed for single-ADC mode only. For multimode, the dedicated HAL_ADCEx_MultiModeStart_DMA() function must be used.

HAL_ADC_Stop_DMA

Function name

HAL_StatusTypeDef HAL_ADC_Stop_DMA (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of regular group (and injected group in case of auto_injection mode), disable ADC DMA transfer, disable ADC peripheral.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

Notes

- : ADC peripheral disable is forcing stop of potential conversion on ADC group injected. If ADC group injected is under use, it should be preliminarily stopped using HAL_ADCEx_InjectedStop function.
- Case of multimode enabled (when multimode feature is available): HAL_ADC_Stop_DMA() function is dedicated to single-ADC mode only. For multimode, the dedicated HAL_ADCEx_MultiModeStop_DMA() API must be used.

HAL_ADC_GetValue

Function name

uint32_t HAL_ADC_GetValue (ADC_HandleTypeDef * hadc)

Function description

Get ADC regular group conversion result.

Parameters

- **hadc:** ADC handle

Return values

- **ADC:** group regular conversion data

Notes

- Reading register DR automatically clears ADC flag EOC (ADC group regular end of unitary conversion).
- This function does not clear ADC flag EOS (ADC group regular end of sequence conversion). Occurrence of flag EOS rising: If sequencer is composed of 1 rank, flag EOS is equivalent to flag EOC.If sequencer is composed of several ranks, during the scan sequence flag EOC only is raised, at the end of the scan sequence both flags EOC and EOS are raised. To clear this flag, either use function: in programming model IT: HAL_ADC_IRQHandler(), in programming model polling: HAL_ADC_PollForConversion() or __HAL_ADC_CLEAR_FLAG(&hadc, ADC_FLAG_EOS).

HAL_ADC_IRQHandler

Function name

void HAL_ADC_IRQHandler (ADC_HandleTypeDef * hadc)

Function description

Handle ADC interrupt request.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_ConvCpltCallback

Function name

void HAL_ADC_ConvCpltCallback (ADC_HandleTypeDef * hadc)

Function description

Conversion complete callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_ConvHalfCpltCallback

Function name

void HAL_ADC_ConvHalfCpltCallback (ADC_HandleTypeDef * hadc)

Function description

Conversion DMA half-transfer callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_LevelOutOfWindowCallback

Function name

void HAL_ADC_LevelOutOfWindowCallback (ADC_HandleTypeDef * hadc)

Function description

Analog watchdog 1 callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_ErrorCallback

Function name

void HAL_ADC_ErrorCallback (ADC_HandleTypeDef * hadc)

Function description

ADC error callback in non-blocking mode (ADC conversion with interruption or transfer by DMA).

Parameters

- **hadc:** ADC handle

Return values

- **None:**

Notes

- In case of error due to overrun when using ADC with DMA transfer (HAL ADC handle parameter "ErrorCode" to state "HAL_ADC_ERROR_OVR"): Reinitialize the DMA using function "HAL_ADC_Stop_DMA()".If needed, restart a new ADC conversion using function "HAL_ADC_Start_DMA()" (this function is also clearing overrun flag)

HAL_ADC_ConfigChannel

Function name

HAL_StatusTypeDef HAL_ADC_ConfigChannel (ADC_HandleTypeDef * hadc, ADC_ChannelConfTypeDef * sConfig)

Function description

Configure a channel to be assigned to ADC group regular.

Parameters

- **hadc:** ADC handle
- **sConfig:** Structure of ADC channel assigned to ADC group regular.

Return values

- **HAL:** status

Notes

- In case of usage of internal measurement channels: Vbat/VrefInt/TempSensor. These internal paths can be disabled using function HAL_ADC_DeInit().
- Possibility to update parameters on the fly: This function initializes channel into ADC group regular, following calls to this function can be used to reconfigure some parameters of structure "ADC_ChannelConfTypeDef" on the fly, without resetting the ADC. The setting of these parameters is conditioned to ADC state: Refer to comments of structure "ADC_ChannelConfTypeDef".

HAL_ADC_AnalogWDGConfig

Function name

HAL_StatusTypeDef HAL_ADC_AnalogWDGConfig (ADC_HandleTypeDef * hadc, ADC_AnalogWDGConfTypeDef * AnalogWDGConfig)

Function description

Configure the analog watchdog.

Parameters

- **hadc:** ADC handle
- **AnalogWDGConfig:** Structure of ADC analog watchdog configuration

Return values

- **HAL:** status

Notes

- Possibility to update parameters on the fly: This function initializes the selected analog watchdog, successive calls to this function can be used to reconfigure some parameters of structure "ADC_AnalogWDGConfTypeDef" on the fly, without resetting the ADC. The setting of these parameters is conditioned to ADC state. For parameters constraints, see comments of structure "ADC_AnalogWDGConfTypeDef".
- On this STM32 series, analog watchdog thresholds cannot be modified while ADC conversion is on going.

HAL_ADC_GetState

Function name

uint32_t HAL_ADC_GetState (ADC_HandleTypeDef * hadc)

Function description

Return the ADC handle state.

Parameters

- **hadc:** ADC handle

Return values

- **ADC:** handle state (bitfield on 32 bits)

Notes

- ADC state machine is managed by bitfields, ADC status must be compared with states bits.
  For example: " if ((HAL_ADC_GetState(hadc1) & HAL_ADC_STATE_REG_BUSY) != 0UL) " " if ((HAL_ADC_GetState(hadc1) & HAL_ADC_STATE_AWD1) != 0UL) "

HAL_ADC_GetError

Function name

uint32_t HAL_ADC_GetError (ADC_HandleTypeDef * hadc)

Function description

Return the ADC error code.

Parameters

- **hadc:** ADC handle

Return values

- **ADC:** error code (bitfield on 32 bits)

ADC_ConversionStop

Function name

HAL_StatusTypeDef ADC_ConversionStop (ADC_HandleTypeDef * hadc, uint32_t ConversionGroup)

Function description

Stop ADC conversion.

Parameters

- **hadc:** ADC handle
- **ConversionGroup:** ADC group regular and/or injected. This parameter can be one of the following values:
  - ADC_REGULAR_GROUP ADC regular conversion type.
  - ADC_INJECTED_GROUP ADC injected conversion type.
  - ADC_REGULAR_INJECTED_GROUP ADC regular and injected conversion type.

Return values

- **HAL:** status.

ADC_Enable

Function name

HAL_StatusTypeDef ADC_Enable (ADC_HandleTypeDef * hadc)

Function description

Enable the selected ADC.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

Notes

- Prerequisite condition to use this function: ADC must be disabled and voltage regulator must be enabled (done into HAL_ADC_Init()).

ADC_Disable

Function name

HAL_StatusTypeDef ADC_Disable (ADC_HandleTypeDef * hadc)

Function description

Disable the selected ADC.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

Notes

- Prerequisite condition to use this function: ADC conversions must be stopped.

ADC_DMAConvCplt

Function name

void ADC_DMAConvCplt (DMA_HandleTypeDef * hdma)

Function description

DMA transfer complete callback.

Parameters

- **hdma:** pointer to DMA handle.

Return values

- **None:**

ADC_DMAHalfConvCplt

Function name

void ADC_DMAHalfConvCplt (DMA_HandleTypeDef * hdma)

Function description

DMA half transfer complete callback.

Parameters

- **hdma:** pointer to DMA handle.

Return values

- **None:**

ADC_DMAError

Function name

void ADC_DMAError (DMA_HandleTypeDef * hdma)

Function description

DMA error callback.

Parameters

- **hdma:** pointer to DMA handle.

Return values

- **None:**

ADC_ConfigureBoostMode

Function name

void ADC_ConfigureBoostMode (ADC_HandleTypeDef * hadc)

Function description

Configure boost mode of selected ADC.

Parameters

- **hadc:** ADC handle

Return values

- **None.:**

Notes

- Prerequisite condition to use this function: ADC conversions must be stopped.

8.3 ADC Firmware driver defines

The following section lists the various define and macros of the module.

8.3.1 ADC

ADC

ADC Analog Watchdog Mode

ADC_ANALOGWATCHDOG_NONE

No analog watchdog selected

ADC_ANALOGWATCHDOG_SINGLE_REG

Analog watchdog applied to a regular group single channel

ADC_ANALOGWATCHDOG_SINGLE_INJEC

Analog watchdog applied to an injected group single channel

ADC_ANALOGWATCHDOG_SINGLE_REGINJEC

Analog watchdog applied to a regular and injected groups single channel

ADC_ANALOGWATCHDOG_ALL_REG

Analog watchdog applied to regular group all channels

ADC_ANALOGWATCHDOG_ALL_INJEC

Analog watchdog applied to injected group all channels

ADC_ANALOGWATCHDOG_ALL_REGINJEC

Analog watchdog applied to regular and injected groups all channels

ADCx CFGR fields

ADC_CFGR_FIELDS

ADCx CFGR sub fields

ADC_CFGR_FIELDS_2

ADC Conversion Data Management

ADC_CONVERSIONDATA_DR

Regular Conversion data stored in DR register only

ADC_CONVERSIONDATA_DFSDM

DFSDM mode selected

ADC_CONVERSIONDATA_DMA_ONESHOT

DMA one shot mode selected

ADC_CONVERSIONDATA_DMA_CIRCULAR

DMA circular mode selected

ADC sequencer end of unitary conversion or sequence conversions

ADC_EOC_SINGLE_CONV

End of unitary conversion flag

ADC_EOC_SEQ_CONV

End of sequence conversions flag

ADC Error Code

HAL_ADC_ERROR_NONE

No error

HAL_ADC_ERROR_INTERNAL

ADC peripheral internal error (problem of clocking, enable/disable, erroneous state, ...)

HAL_ADC_ERROR_OVR

Overrun error

HAL_ADC_ERROR_DMA

DMA transfer error

HAL_ADC_ERROR_JQOVF

Injected context queue overflow error

HAL_ADC_ERROR_INVALID_CALLBACK

Invalid Callback error

ADC Event type

ADC_EOSMP_EVENT

ADC End of Sampling event

ADC_AWD1_EVENT

ADC Analog watchdog 1 event (main analog watchdog, present on all STM32 series)

ADC_AWD2_EVENT

ADC Analog watchdog 2 event (additional analog watchdog, not present on all STM32 series)

ADC_AWD3_EVENT

ADC Analog watchdog 3 event (additional analog watchdog, not present on all STM32 series)

ADC_OVR_EVENT

ADC overrun event

ADC_JQOVF_EVENT

ADC Injected Context Queue Overflow event

ADC Exported Constants

ADC_AWD_EVENT

ADC Analog watchdog 1 event: Naming for compatibility with other STM32 devices having only one analog watchdog

ADC flags definition

ADC_FLAG_RDY

ADC Ready flag

ADC_FLAG_EOSMP

ADC End of Sampling flag

ADC_FLAG_EOC

ADC End of Regular Conversion flag

ADC_FLAG_EOS

ADC End of Regular sequence of Conversions flag

ADC_FLAG_OVR

ADC overrun flag

ADC_FLAG_JEOC

ADC End of Injected Conversion flag

ADC_FLAG_JEOS

ADC End of Injected sequence of Conversions flag

ADC_FLAG_AWD1

ADC Analog watchdog 1 flag (main analog watchdog)

ADC_FLAG_AWD2

ADC Analog watchdog 2 flag (additional analog watchdog)

ADC_FLAG_AWD3

ADC Analog watchdog 3 flag (additional analog watchdog)

ADC_FLAG_JQOVF

ADC Injected Context Queue Overflow flag

ADC_FLAG_LDORDY

ADC LDO output voltage ready bit

Analog watchdog - Analog watchdog number

ADC_ANALOGWATCHDOG_1

ADC analog watchdog number 1

ADC_ANALOGWATCHDOG_2

ADC analog watchdog number 2

ADC_ANALOGWATCHDOG_3

ADC analog watchdog number 3

ADC instance - Channel number

ADC_CHANNEL_0

ADC external channel (channel connected to GPIO pin) ADCx_IN0

ADC_CHANNEL_1

ADC external channel (channel connected to GPIO pin) ADCx_IN1

ADC_CHANNEL_2

ADC external channel (channel connected to GPIO pin) ADCx_IN2

ADC_CHANNEL_3

ADC external channel (channel connected to GPIO pin) ADCx_IN3

ADC_CHANNEL_4

ADC external channel (channel connected to GPIO pin) ADCx_IN4

ADC_CHANNEL_5

ADC external channel (channel connected to GPIO pin) ADCx_IN5

ADC_CHANNEL_6

ADC external channel (channel connected to GPIO pin) ADCx_IN6

ADC_CHANNEL_7

ADC external channel (channel connected to GPIO pin) ADCx_IN7

ADC_CHANNEL_8

ADC external channel (channel connected to GPIO pin) ADCx_IN8

ADC_CHANNEL_9

ADC external channel (channel connected to GPIO pin) ADCx_IN9

ADC_CHANNEL_10

ADC external channel (channel connected to GPIO pin) ADCx_IN10

ADC_CHANNEL_11

ADC external channel (channel connected to GPIO pin) ADCx_IN11

ADC_CHANNEL_12

ADC external channel (channel connected to GPIO pin) ADCx_IN12

ADC_CHANNEL_13

ADC external channel (channel connected to GPIO pin) ADCx_IN13

ADC_CHANNEL_14

ADC external channel (channel connected to GPIO pin) ADCx_IN14

ADC_CHANNEL_15

ADC external channel (channel connected to GPIO pin) ADCx_IN15

ADC_CHANNEL_16

ADC external channel (channel connected to GPIO pin) ADCx_IN16

ADC_CHANNEL_17

ADC external channel (channel connected to GPIO pin) ADCx_IN17

ADC_CHANNEL_18

ADC external channel (channel connected to GPIO pin) ADCx_IN18

ADC_CHANNEL_19

ADC external channel (channel connected to GPIO pin) ADCx_IN19

ADC_CHANNEL_VREFINT

ADC internal channel connected to VrefInt: Internal voltage reference, channel specific to ADC3.

ADC_CHANNEL_TEMPSENSOR

ADC internal channel connected to Temperature sensor, channel specific to ADC3.

ADC_CHANNEL_VBAT

ADC internal channel connected to Vbat/4: Vbat voltage through a divider ladder of factor 1/4 to have Vbat always below Vdda, channel specific to ADC3.

ADC_CHANNEL_DAC1CH1_ADC2

ADC internal channel connected to DAC1 channel 1, channel specific to ADC2

ADC_CHANNEL_DAC1CH2_ADC2

ADC internal channel connected to DAC1 channel 2, channel specific to ADC2

Channel - Sampling time

ADC_SAMPLETIME_1CYCLE_5

Sampling time 1.5 ADC clock cycles, On devices STM32H72xx and STM32H73xx, parameter available only on ADC instance: ADC1, ADC2

ADC_SAMPLETIME_2CYCLES_5

Sampling time 2.5 ADC clock cycles, On devices STM32H72xx and STM32H73xx, parameter available only on ADC instance: ADC1, ADC2

ADC_SAMPLETIME_8CYCLES_5

Sampling time 8.5 ADC clock cycles, On devices STM32H72xx and STM32H73xx, parameter available only on ADC instance: ADC1, ADC2

ADC_SAMPLETIME_16CYCLES_5

Sampling time 16.5 ADC clock cycles, On devices STM32H72xx and STM32H73xx, parameter available only on ADC instance: ADC1, ADC2

ADC_SAMPLETIME_32CYCLES_5

Sampling time 32.5 ADC clock cycles, On devices STM32H72xx and STM32H73xx, parameter available only on ADC instance: ADC1, ADC2

ADC_SAMPLETIME_64CYCLES_5

Sampling time 64.5 ADC clock cycles, On devices STM32H72xx and STM32H73xx, parameter available only on ADC instance: ADC1, ADC2

ADC_SAMPLETIME_387CYCLES_5

Sampling time 387.5 ADC clock cycles, On devices STM32H72xx and STM32H73xx, parameter available only on ADC instance: ADC1, ADC2

ADC_SAMPLETIME_810CYCLES_5

Sampling time 810.5 ADC clock cycles, On devices STM32H72xx and STM32H73xx, parameter available only on ADC instance: ADC1, ADC2

Channel - Single or differential ending

ADC_SINGLE_ENDED

ADC channel ending set to single ended (literal also used to set calibration mode)

ADC_DIFFERENTIAL_ENDED

ADC channel ending set to differential (literal also used to set calibration mode)

ADC common - Clock source

ADC_CLOCK_SYNC_PCLK_DIV1

ADC synchronous clock derived from AHB clock without prescaler

ADC_CLOCK_SYNC_PCLK_DIV2

ADC synchronous clock derived from AHB clock with prescaler division by 2

ADC_CLOCK_SYNC_PCLK_DIV4

ADC synchronous clock derived from AHB clock with prescaler division by 4

ADC_CLOCK_ASYNC_DIV1

ADC asynchronous clock without prescaler

ADC_CLOCK_ASYNC_DIV2

ADC asynchronous clock with prescaler division by 2

ADC_CLOCK_ASYNC_DIV4

ADC asynchronous clock with prescaler division by 4

ADC_CLOCK_ASYNC_DIV6

ADC asynchronous clock with prescaler division by 6

ADC_CLOCK_ASYNC_DIV8

ADC asynchronous clock with prescaler division by 8

ADC_CLOCK_ASYNC_DIV10

ADC asynchronous clock with prescaler division by 10

ADC_CLOCK_ASYNC_DIV12

ADC asynchronous clock with prescaler division by 12

ADC_CLOCK_ASYNC_DIV16

ADC asynchronous clock with prescaler division by 16

ADC_CLOCK_ASYNC_DIV32

ADC asynchronous clock with prescaler division by 32

ADC_CLOCK_ASYNC_DIV64

ADC asynchronous clock with prescaler division by 64

ADC_CLOCK_ASYNC_DIV128

ADC asynchronous clock with prescaler division by 128

ADC_CLOCK_ASYNC_DIV256

ADC asynchronous clock with prescaler division by 256

ADC instance - Groups

ADC_REGULAR_GROUP

ADC group regular (available on all STM32 devices)

ADC_INJECTED_GROUP

ADC group injected (not available on all STM32 devices)

ADC_REGULAR_INJECTED_GROUP

ADC both groups regular and injected

Multimode - Mode

ADC_MODE_INDEPENDENT

ADC dual mode disabled (ADC independent mode)

ADC_DUALMODE_REGSIMULT

ADC dual mode enabled: group regular simultaneous

ADC_DUALMODE_INTERL

ADC dual mode enabled: Combined group regular interleaved

ADC_DUALMODE_INJECSIMULT

ADC dual mode enabled: group injected simultaneous

ADC_DUALMODE_ALTERTRIG

ADC dual mode enabled: group injected alternate trigger. Works only with external triggers (not internal SW start)

ADC_DUALMODE_REGSIMULT_INJECSIMULT

ADC dual mode enabled: Combined group regular simultaneous + group injected simultaneous

ADC_DUALMODE_REGSIMULT_ALTERTRIG

ADC dual mode enabled: Combined group regular simultaneous + group injected alternate trigger

ADC_DUALMODE_REGINTERL_INJECSIMULT

ADC dual mode enabled: Combined group regular interleaved + group injected simultaneous

Multimode - Delay between two sampling phases

ADC_TWOSAMPLINGDELAY_1CYCLE

ADC multimode delay between two sampling phases: 1 ADC clock cycle

ADC_TWOSAMPLINGDELAY_2CYCLES

ADC multimode delay between two sampling phases: 2 ADC clock cycles

ADC_TWOSAMPLINGDELAY_3CYCLES

ADC multimode delay between two sampling phases: 3 ADC clock cycles

ADC_TWOSAMPLINGDELAY_4CYCLES

ADC multimode delay between two sampling phases: 4 ADC clock cycles

ADC_TWOSAMPLINGDELAY_5CYCLES

ADC multimode delay between two sampling phases: 5 ADC clock cycles

ADC_TWOSAMPLINGDELAY_6CYCLES

ADC multimode delay between two sampling phases: 6 ADC clock cycles

ADC_TWOSAMPLINGDELAY_7CYCLES

ADC multimode delay between two sampling phases: 7 ADC clock cycles

ADC_TWOSAMPLINGDELAY_8CYCLES

ADC multimode delay between two sampling phases: 8 ADC clock cycles

ADC_TWOSAMPLINGDELAY_9CYCLES

ADC multimode delay between two sampling phases: 9 ADC clock cycles

ADC instance - Offset number

ADC_OFFSET_NONE

ADC offset disabled: no offset correction for the selected ADC channel

ADC_OFFSET_1

ADC offset number 1: ADC channel and offset level to which the offset programmed will be applied (independently of channel mapped on ADC group regular or group injected)

ADC_OFFSET_2

ADC offset number 2: ADC channel and offset level to which the offset programmed will be applied (independently of channel mapped on ADC group regular or group injected)

ADC_OFFSET_3

ADC offset number 3: ADC channel and offset level to which the offset programmed will be applied (independently of channel mapped on ADC group regular or group injected)

ADC_OFFSET_4

ADC offset number 4: ADC channel and offset level to which the offset programmed will be applied (independently of channel mapped on ADC group regular or group injected)

Oversampling - Discontinuous mode

ADC_TRIGGEREDMODE_SINGLE_TRIGGER

ADC oversampling discontinuous mode: continuous mode (all conversions of oversampling ratio are done from 1 trigger)

ADC_TRIGGEREDMODE_MULTI_TRIGGER

ADC oversampling discontinuous mode: discontinuous mode (each conversion of oversampling ratio needs a trigger)

Oversampling - Oversampling scope for ADC group regular

ADC_REGOVERSAMPLING_CONTINUED_MODE

Oversampling buffer maintained during injection sequence

ADC_REGOVERSAMPLING_RESUMED_MODE

Oversampling buffer zeroed during injection sequence

Oversampling - Data shift

ADC_RIGHTBITSHIFT_NONE

ADC oversampling no shift (sum of the ADC conversions data is not divided to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_1

ADC oversampling shift of 1 (sum of the ADC conversions data is divided by 2 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_2

ADC oversampling shift of 2 (sum of the ADC conversions data is divided by 4 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_3

ADC oversampling shift of 3 (sum of the ADC conversions data is divided by 8 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_4

ADC oversampling shift of 4 (sum of the ADC conversions data is divided by 16 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_5

ADC oversampling shift of 5 (sum of the ADC conversions data is divided by 32 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_6

ADC oversampling shift of 6 (sum of the ADC conversions data is divided by 64 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_7

ADC oversampling shift of 7 (sum of the ADC conversions data is divided by 128 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_8

ADC oversampling shift of 8 (sum of the ADC conversions data is divided by 256 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_9

ADC oversampling shift of 9 (sum of the ADC conversions data is divided by 512 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_10

ADC oversampling shift of 10 (sum of the ADC conversions data is divided by 1024 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_11

ADC oversampling shift of 11 (sum of the ADC conversions data is divided by 2048 to result as the ADC oversampling conversion data)

ADC group regular - DFSDM transfer of ADC conversion data

ADC_DFSDM_MODE_DISABLE

ADC conversions are not transferred by DFSDM.

ADC_DFSDM_MODE_ENABLE

ADC conversion data are transferred to DFSDM for post processing. The ADC conversion data format must be 16-bit signed and right aligned, refer to reference manual. DFSDM transfer cannot be used if DMA transfer is enabled.

ADC group regular - Overrun behavior on conversion data

ADC_OVR_DATA_PRESERVED

ADC group regular behavior in case of overrun: data preserved

ADC_OVR_DATA_OVERWRITTEN

ADC group regular behavior in case of overrun: data overwritten

ADC group regular - Sequencer ranks

ADC_REGULAR_RANK_1

ADC group regular sequencer rank 1

ADC_REGULAR_RANK_2

ADC group regular sequencer rank 2

ADC_REGULAR_RANK_3

ADC group regular sequencer rank 3

ADC_REGULAR_RANK_4

ADC group regular sequencer rank 4

ADC_REGULAR_RANK_5

ADC group regular sequencer rank 5

ADC_REGULAR_RANK_6

ADC group regular sequencer rank 6

ADC_REGULAR_RANK_7

ADC group regular sequencer rank 7

ADC_REGULAR_RANK_8

ADC group regular sequencer rank 8

ADC_REGULAR_RANK_9

ADC group regular sequencer rank 9

ADC_REGULAR_RANK_10

ADC group regular sequencer rank 10

ADC_REGULAR_RANK_11

ADC group regular sequencer rank 11

ADC_REGULAR_RANK_12

ADC group regular sequencer rank 12

ADC_REGULAR_RANK_13

ADC group regular sequencer rank 13

ADC_REGULAR_RANK_14

ADC group regular sequencer rank 14

ADC_REGULAR_RANK_15

ADC group regular sequencer rank 15

ADC_REGULAR_RANK_16

ADC group regular sequencer rank 16

ADC instance - Resolution

ADC_RESOLUTION_16B

ADC resolution 16 bits, On devices STM32H72xx and STM32H73xx, parameter available only on ADC instance: ADC1, ADC2

ADC_RESOLUTION_14B

ADC resolution 14 bits, On devices STM32H72xx and STM32H73xx, parameter available only on ADC instance: ADC1, ADC2

ADC_RESOLUTION_12B

ADC resolution 12 bits

ADC_RESOLUTION_10B

ADC resolution 10 bits

ADC_RESOLUTION_8B

ADC resolution 8 bits

ADC_RESOLUTION_14B_OPT

ADC resolution 14 bits optimized for power consumption, available on for devices revision V only

ADC_RESOLUTION_12B_OPT

ADC resolution 12 bits optimized for power consumption, available on for devices revision V only

HAL ADC macro to manage HAL ADC handle, IT and flags.

__HAL_ADC_RESET_HANDLE_STATE

Description:

- Reset ADC handle state.

Parameters:

- __HANDLE__: ADC handle

Return value:

- None

__HAL_ADC_ENABLE_IT

Description:

- Enable ADC interrupt.

Parameters:

- __HANDLE__: ADC handle
- __INTERRUPT__: ADC Interrupt This parameter can be one of the following values:
  - ADC_IT_RDY ADC Ready interrupt source
  - ADC_IT_EOSMP ADC End of Sampling interrupt source
  - ADC_IT_EOC ADC End of Regular Conversion interrupt source
  - ADC_IT_EOS ADC End of Regular sequence of Conversions interrupt source
  - ADC_IT_OVR ADC overrun interrupt source
  - ADC_IT_JEOC ADC End of Injected Conversion interrupt source
  - ADC_IT_JEOS ADC End of Injected sequence of Conversions interrupt source
  - ADC_IT_AWD1 ADC Analog watchdog 1 interrupt source (main analog watchdog)
  - ADC_IT_AWD2 ADC Analog watchdog 2 interrupt source (additional analog watchdog)
  - ADC_IT_AWD3 ADC Analog watchdog 3 interrupt source (additional analog watchdog)
  - ADC_IT_JQOVF ADC Injected Context Queue Overflow interrupt source.

Return value:

- None

__HAL_ADC_DISABLE_IT

Description:

- Disable ADC interrupt.

Parameters:

- __HANDLE__: ADC handle
- __INTERRUPT__: ADC Interrupt This parameter can be one of the following values:
  - ADC_IT_RDY ADC Ready interrupt source
  - ADC_IT_EOSMP ADC End of Sampling interrupt source
  - ADC_IT_EOC ADC End of Regular Conversion interrupt source
  - ADC_IT_EOS ADC End of Regular sequence of Conversions interrupt source
  - ADC_IT_OVR ADC overrun interrupt source
  - ADC_IT_JEOC ADC End of Injected Conversion interrupt source
  - ADC_IT_JEOS ADC End of Injected sequence of Conversions interrupt source
  - ADC_IT_AWD1 ADC Analog watchdog 1 interrupt source (main analog watchdog)
  - ADC_IT_AWD2 ADC Analog watchdog 2 interrupt source (additional analog watchdog)
  - ADC_IT_AWD3 ADC Analog watchdog 3 interrupt source (additional analog watchdog)
  - ADC_IT_JQOVF ADC Injected Context Queue Overflow interrupt source.

Return value:

- None

__HAL_ADC_GET_IT_SOURCE

Description:

- Checks if the specified ADC interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: ADC handle
- __INTERRUPT__: ADC interrupt source to check This parameter can be one of the following values:
  - ADC_IT_RDY ADC Ready interrupt source
  - ADC_IT_EOSMP ADC End of Sampling interrupt source
  - ADC_IT_EOC ADC End of Regular Conversion interrupt source
  - ADC_IT_EOS ADC End of Regular sequence of Conversions interrupt source
  - ADC_IT_OVR ADC overrun interrupt source
  - ADC_IT_JEOC ADC End of Injected Conversion interrupt source
  - ADC_IT_JEOS ADC End of Injected sequence of Conversions interrupt source
  - ADC_IT_AWD1 ADC Analog watchdog 1 interrupt source (main analog watchdog)
  - ADC_IT_AWD2 ADC Analog watchdog 2 interrupt source (additional analog watchdog)
  - ADC_IT_AWD3 ADC Analog watchdog 3 interrupt source (additional analog watchdog)
  - ADC_IT_JQOVF ADC Injected Context Queue Overflow interrupt source.

Return value:

- State: of interruption (SET or RESET)

__HAL_ADC_GET_FLAG

Description:

- Check whether the specified ADC flag is set or not.

Parameters:

- __HANDLE__: ADC handle
- __FLAG__: ADC flag This parameter can be one of the following values:
  - ADC_FLAG_RDY ADC Ready flag
  - ADC_FLAG_EOSMP ADC End of Sampling flag
  - ADC_FLAG_EOC ADC End of Regular Conversion flag
  - ADC_FLAG_EOS ADC End of Regular sequence of Conversions flag
  - ADC_FLAG_OVR ADC overrun flag
  - ADC_FLAG_JEOC ADC End of Injected Conversion flag
  - ADC_FLAG_JEOS ADC End of Injected sequence of Conversions flag
  - ADC_FLAG_AWD1 ADC Analog watchdog 1 flag (main analog watchdog)
  - ADC_FLAG_AWD2 ADC Analog watchdog 2 flag (additional analog watchdog)
  - ADC_FLAG_AWD3 ADC Analog watchdog 3 flag (additional analog watchdog)
  - ADC_FLAG_JQOVF ADC Injected Context Queue Overflow flag
  - ADC_FLAG_LDORDY ADC LDO output voltage ready bit.

Return value:

- State: of flag (TRUE or FALSE).

__HAL_ADC_CLEAR_FLAG

Description:

- Clear the specified ADC flag.

Parameters:

- __HANDLE__: ADC handle
- __FLAG__: ADC flag This parameter can be one of the following values:
  - ADC_FLAG_RDY ADC Ready flag
  - ADC_FLAG_EOSMP ADC End of Sampling flag
  - ADC_FLAG_EOC ADC End of Regular Conversion flag
  - ADC_FLAG_EOS ADC End of Regular sequence of Conversions flag
  - ADC_FLAG_OVR ADC overrun flag
  - ADC_FLAG_JEOC ADC End of Injected Conversion flag
  - ADC_FLAG_JEOS ADC End of Injected sequence of Conversions flag
  - ADC_FLAG_AWD1 ADC Analog watchdog 1 flag (main analog watchdog)
  - ADC_FLAG_AWD2 ADC Analog watchdog 2 flag (additional analog watchdog)
  - ADC_FLAG_AWD3 ADC Analog watchdog 3 flag (additional analog watchdog)
  - ADC_FLAG_JQOVF ADC Injected Context Queue Overflow flag.

Return value:

- None

HAL ADC helper macro

__HAL_ADC_CHANNEL_TO_DECIMAL_NB

Description:

- Helper macro to get ADC channel number in decimal format from literals ADC_CHANNEL_x.

Parameters:

- __CHANNEL__: This parameter can be one of the following values:
  - ADC_CHANNEL_0 (3)
  - ADC_CHANNEL_1 (3)
  - ADC_CHANNEL_2 (3)
  - ADC_CHANNEL_3 (3)
  - ADC_CHANNEL_4 (3)
  - ADC_CHANNEL_5 (3)
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18
  - ADC_CHANNEL_VREFINT (1)
  - ADC_CHANNEL_TEMPSENSOR (1)
  - ADC_CHANNEL_VBAT (1)
  - ADC_CHANNEL_DAC1CH1_ADC2 (2)
  - ADC_CHANNEL_DAC1CH2_ADC2 (2)

Return value:

- Value: between Min_Data=0 and Max_Data=18

Notes:

- Example: __HAL_ADC_CHANNEL_TO_DECIMAL_NB(ADC_CHANNEL_4) will return decimal number "4". The input can be a value from functions where a channel number is returned, either defined with number or with bitfield (only one bit must be set).

__HAL_ADC_DECIMAL_NB_TO_CHANNEL

Description:

- Helper macro to get ADC channel in literal format ADC_CHANNEL_x from number in decimal format.

Parameters:

- __DECIMAL_NB__: Value between Min_Data=0 and Max_Data=18

Return value:

- Returned: value can be one of the following values:
  - ADC_CHANNEL_0 (3)
  - ADC_CHANNEL_1 (3)
  - ADC_CHANNEL_2 (3)
  - ADC_CHANNEL_3 (3)
  - ADC_CHANNEL_4 (3)
  - ADC_CHANNEL_5 (3)
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18
  - ADC_CHANNEL_VREFINT (1)
  - ADC_CHANNEL_TEMPSENSOR (1)
  - ADC_CHANNEL_VBAT (1)
  - ADC_CHANNEL_DAC1CH1_ADC2 (2)
  - ADC_CHANNEL_DAC1CH2_ADC2 (2)

Notes:

- Example: __HAL_ADC_DECIMAL_NB_TO_CHANNEL(4) will return a data equivalent to "ADC_CHANNEL_4".

__HAL_ADC_IS_CHANNEL_INTERNAL

Description:

- Helper macro to determine whether the selected channel corresponds to literal definitions of driver.

Parameters:

- __CHANNEL__: This parameter can be one of the following values:
  - ADC_CHANNEL_0 (3)
  - ADC_CHANNEL_1 (3)
  - ADC_CHANNEL_2 (3)
  - ADC_CHANNEL_3 (3)
  - ADC_CHANNEL_4 (3)
  - ADC_CHANNEL_5 (3)
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18
  - ADC_CHANNEL_VREFINT (1)
  - ADC_CHANNEL_TEMPSENSOR (1)
  - ADC_CHANNEL_VBAT (1)
  - ADC_CHANNEL_DAC1CH1_ADC2 (2)
  - ADC_CHANNEL_DAC1CH2_ADC2 (2)

Return value:

- Value: "0" if the channel corresponds to a parameter definition of a ADC external channel (channel connected to a GPIO pin). Value "1" if the channel corresponds to a parameter definition of a ADC internal channel.

Notes:

- The different literal definitions of ADC channels are: ADC internal channel: ADC_CHANNEL_VREFINT, ADC_CHANNEL_TEMPSENSOR, ...ADC external channel (channel connected to a GPIO pin): ADC_CHANNEL_1, ADC_CHANNEL_2, ... The channel parameter must be a value defined from literal definition of a ADC internal channel (ADC_CHANNEL_VREFINT, ADC_CHANNEL_TEMPSENSOR, ...), ADC external channel (ADC_CHANNEL_1, ADC_CHANNEL_2, ...), must not be a value from functions where a channel number is returned from ADC registers, because internal and external channels share the same channel number in ADC registers. The differentiation is made only with parameters definitions of driver.

__HAL_ADC_CHANNEL_INTERNAL_TO_EXTERNAL

Description:

- Helper macro to convert a channel defined from parameter definition of a ADC internal channel (ADC_CHANNEL_VREFINT, ADC_CHANNEL_TEMPSENSOR, ...), to its equivalent parameter definition of a ADC external channel (ADC_CHANNEL_1, ADC_CHANNEL_2, ...).

Parameters:

- __CHANNEL__: This parameter can be one of the following values:
  - ADC_CHANNEL_0 (3)
  - ADC_CHANNEL_1 (3)
  - ADC_CHANNEL_2 (3)
  - ADC_CHANNEL_3 (3)
  - ADC_CHANNEL_4 (3)
  - ADC_CHANNEL_5 (3)
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18
  - ADC_CHANNEL_VREFINT (1)
  - ADC_CHANNEL_TEMPSENSOR (1)
  - ADC_CHANNEL_VBAT (1)
  - ADC_CHANNEL_DAC1CH1_ADC2 (2)
  - ADC_CHANNEL_DAC1CH2_ADC2 (2)

Return value:

- Returned: value can be one of the following values:
  - ADC_CHANNEL_0
  - ADC_CHANNEL_1
  - ADC_CHANNEL_2
  - ADC_CHANNEL_3
  - ADC_CHANNEL_4
  - ADC_CHANNEL_5
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18

Notes:

- The channel parameter can be, additionally to a value defined from parameter definition of a ADC internal channel (ADC_CHANNEL_VREFINT, ADC_CHANNEL_TEMPSENSOR, ...), a value defined from parameter definition of ADC external channel (ADC_CHANNEL_1, ADC_CHANNEL_2, ...) or a value from functions where a channel number is returned from ADC registers.

__HAL_ADC_IS_CHANNEL_INTERNAL_AVAILABLE

Description:

- Helper macro to determine whether the internal channel selected is available on the ADC instance selected.

Parameters:

- __ADC_INSTANCE__: ADC instance
- __CHANNEL__: This parameter can be one of the following values:
  - ADC_CHANNEL_VREFINT (1)
  - ADC_CHANNEL_TEMPSENSOR (1)
  - ADC_CHANNEL_VBAT (1)
  - ADC_CHANNEL_DAC1CH1_ADC2 (2)
  - ADC_CHANNEL_DAC1CH2_ADC2 (2)

Return value:

- Value: "0" if the internal channel selected is not available on the ADC instance selected. Value "1" if the internal channel selected is available on the ADC instance selected.

Notes:

- The channel parameter must be a value defined from parameter definition of a ADC internal channel (ADC_CHANNEL_VREFINT, ADC_CHANNEL_TEMPSENSOR, ...), must not be a value defined from parameter definition of ADC external channel (ADC_CHANNEL_1, ADC_CHANNEL_2, ...) or a value from functions where a channel number is returned from ADC registers, because internal and external channels share the same channel number in ADC registers. The differentiation is made only with parameters definitions of driver.

__HAL_ADC_MULTI_CONV_DATA_MASTER_SLAVE

Description:

- Helper macro to get the ADC multimode conversion data of ADC master or ADC slave from raw value with both ADC conversion data concatenated.

Parameters:

- __ADC_MULTI_MASTER_SLAVE__: This parameter can be one of the following values:
  - LL_ADC_MULTI_MASTER
  - LL_ADC_MULTI_SLAVE
- __ADC_MULTI_CONV_DATA__: Value between Min_Data=0x000 and Max_Data=0xFFF

Return value:

- Value: between Min_Data=0x000 and Max_Data=0xFFF

Notes:

- This macro is intended to be used when multimode transfer by DMA is enabled: refer to function LL_ADC_SetMultiDMATransfer(). In this case the transferred data need to processed with this macro to separate the conversion data of ADC master and ADC slave.

__HAL_ADC_COMMON_INSTANCE

Description:

- Helper macro to select the ADC common instance to which is belonging the selected ADC instance.

Parameters:

- __ADCx__: ADC instance

Return value:

- ADC: common register instance

Notes:

- ADC common register instance can be used for: Set parameters common to several ADC instancesMultimode (for devices with several ADC instances) Refer to functions having argument "ADCxy_COMMON" as parameter.

__HAL_ADC_IS_ENABLED_ALL_COMMON_INSTANCE

Description:

- Helper macro to check if all ADC instances sharing the same ADC common instance are disabled.

Parameters:

- __ADCXY_COMMON__: ADC common instance (can be set directly from CMSIS definition or by using helper macro

Return value:

- Value: "0" if all ADC instances sharing the same ADC common instance are disabled. Value "1" if at least one ADC instance sharing the same ADC common instance is enabled.

Notes:

- This check is required by functions with setting conditioned to ADC state: All ADC instances of the ADC common group must be disabled. Refer to functions having argument "ADCxy_COMMON" as parameter. On devices with only 1 ADC common instance, parameter of this macro is useless and can be ignored (parameter kept for compatibility with devices featuring several ADC common instances).

__HAL_ADC_DIGITAL_SCALE

Description:

- Helper macro to define the ADC conversion data full-scale digital value corresponding to the selected ADC resolution.

Parameters:

- __ADC_RESOLUTION__: This parameter can be one of the following values:
  - ADC_RESOLUTION_16B
  - ADC_RESOLUTION_14B
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B

Return value:

- ADC: conversion data full-scale digital value

Notes:

- ADC conversion data full-scale corresponds to voltage range determined by analog voltage references Vref+ and Vref- (refer to reference manual).

__HAL_ADC_CONVERT_DATA_RESOLUTION

Description:

- Helper macro to convert the ADC conversion data from a resolution to another resolution.

Parameters:

- __DATA__: ADC conversion data to be converted
- __ADC_RESOLUTION_CURRENT__: Resolution of to the data to be converted This parameter can be one of the following values:
  - ADC_RESOLUTION_16B
  - ADC_RESOLUTION_14B
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B
- __ADC_RESOLUTION_TARGET__: Resolution of the data after conversion This parameter can be one of the following values:
  - ADC_RESOLUTION_16B
  - ADC_RESOLUTION_14B
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B

Return value:

- ADC: conversion data to the requested resolution

__HAL_ADC_CALC_DATA_TO_VOLTAGE

Description:

- Helper macro to calculate the voltage (unit: mVolt) corresponding to a ADC conversion data (unit: digital value).

Parameters:

- __VREFANALOG_VOLTAGE__: Analog reference voltage (unit: mV)
- __ADC_DATA__: ADC conversion data (resolution 12 bits) (unit: digital value).
- __ADC_RESOLUTION__: This parameter can be one of the following values:
  - ADC_RESOLUTION_16B
  - ADC_RESOLUTION_14B
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B

Return value:

- ADC: conversion data equivalent voltage value (unit: mVolt)

Notes:

- Analog reference voltage (Vref+) must be either known from user board environment or can be calculated using ADC measurement and ADC helper macro __LL_ADC_CALC_VREFANALOG_VOLTAGE().

__HAL_ADC_CALC_VREFANALOG_VOLTAGE

Description:

- Helper macro to calculate analog reference voltage (Vref+) (unit: mVolt) from ADC conversion data of internal voltage reference VrefInt.

Parameters:

- __VREFINT_ADC_DATA__: ADC conversion data (resolution 12 bits) of internal voltage reference VrefInt (unit: digital value).
- __ADC_RESOLUTION__: This parameter can be one of the following values:
  - ADC_RESOLUTION_16B
  - ADC_RESOLUTION_14B
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B

Return value:

- Analog: reference voltage (unit: mV)

Notes:

- Computation is using VrefInt calibration value stored in system memory for each device during production. This voltage depends on user board environment: voltage level connected to pin Vref+. On devices with small package, the pin Vref+ is not present and internally bonded to pin Vdda. On this STM32 series, calibration data of internal voltage reference VrefInt corresponds to a resolution of 12 bits, this is the recommended ADC resolution to convert voltage of internal voltage reference VrefInt. Otherwise, this macro performs the processing to scale ADC conversion data to 12 bits.

__HAL_ADC_CALC_TEMPERATURE

Description:

- Helper macro to calculate the temperature (unit: degree Celsius) from ADC conversion data of internal temperature sensor.

Parameters:

- __VREFANALOG_VOLTAGE__: Analog reference voltage (unit: mV)
- __TEMPSENSOR_ADC_DATA__: ADC conversion data of internal temperature sensor (unit: digital value).
- __ADC_RESOLUTION__: ADC resolution at which internal temperature sensor voltage has been measured. This parameter can be one of the following values:
  - ADC_RESOLUTION_16B
  - ADC_RESOLUTION_14B
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B

Return value:

- Temperature: (unit: degree Celsius)

Notes:

- Computation is using temperature sensor calibration values stored in system memory for each device during production. Calculation formula: Temperature = ((TS_ADC_DATA - TS_CAL1) * (TS_CAL2_TEMP - TS_CAL1_TEMP)) / (TS_CAL2 - TS_CAL1) + TS_CAL1_TEMP with TS_ADC_DATA = temperature sensor raw data measured by ADC Avg_Slope = (TS_CAL2 - TS_CAL1) / (TS_CAL2_TEMP - TS_CAL1_TEMP) TS_CAL1 = equivalent TS_ADC_DATA at temperature TEMP_DEGC_CAL1 (calibrated in factory) TS_CAL2 = equivalent TS_ADC_DATA at temperature TEMP_DEGC_CAL2 (calibrated in factory) Caution: Calculation relevancy under reserve that calibration parameters are correct (address and data). To calculate temperature using temperature sensor datasheet typical values (generic values less, therefore less accurate than calibrated values), use helper macro __LL_ADC_CALC_TEMPERATURE_TYP_PARAMS(). As calculation input, the analog reference voltage (Vref+) must be defined as it impacts the ADC LSB equivalent voltage. Analog reference voltage (Vref+) must be either known from user board environment or can be calculated using ADC measurement and ADC helper macro __LL_ADC_CALC_VREFANALOG_VOLTAGE(). On this STM32 series, calibration data of temperature sensor corresponds to a resolution of 12 bits, this is the recommended ADC resolution to convert voltage of temperature sensor. Otherwise, this macro performs the processing to scale ADC conversion data to 12 bits.

__HAL_ADC_CALC_TEMPERATURE_TYP_PARAMS

Description:

- Helper macro to calculate the temperature (unit: degree Celsius) from ADC conversion data of internal temperature sensor.

Parameters:

- __TEMPSENSOR_TYP_AVGSLOPE__: Device datasheet data: Temperature sensor slope typical value (unit: uV/DegCelsius). On STM32H7, refer to device datasheet parameter "Avg_Slope".
- __TEMPSENSOR_TYP_CALX_V__: Device datasheet data: Temperature sensor voltage typical value (at temperature and Vref+ defined in parameters below) (unit: mV). On STM32H7, refer to device datasheet parameter "V30" (corresponding to TS_CAL1).
- __TEMPSENSOR_CALX_TEMP__: Device datasheet data: Temperature at which temperature sensor voltage (see parameter above) is corresponding (unit: mV)
- __VREFANALOG_VOLTAGE__: Analog voltage reference (Vref+) voltage (unit: mV)
- __TEMPSENSOR_ADC_DATA__: ADC conversion data of internal temperature sensor (unit: digital value).
- __ADC_RESOLUTION__: ADC resolution at which internal temperature sensor voltage has been measured. This parameter can be one of the following values:
  - ADC_RESOLUTION_16B
  - ADC_RESOLUTION_14B
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B

Return value:

- Temperature: (unit: degree Celsius)

Notes:

- Computation is using temperature sensor typical values (refer to device datasheet). Calculation formula: Temperature = (TS_TYP_CALx_VOLT(uV) - TS_ADC_DATA * Conversion_uV) / Avg_Slope + CALx_TEMP with TS_ADC_DATA = temperature sensor raw data measured by ADC (unit: digital value) Avg_Slope = temperature sensor slope (unit: uV/Degree Celsius) TS_TYP_CALx_VOLT = temperature sensor digital value at temperature CALx_TEMP (unit: mV) Caution: Calculation relevancy under reserve the temperature sensor of the current device has characteristics in line with datasheet typical values. If temperature sensor calibration values are available on on this device (presence of macro __LL_ADC_CALC_TEMPERATURE()), temperature calculation will be more accurate using helper macro __LL_ADC_CALC_TEMPERATURE(). As calculation input, the analog reference voltage (Vref+) must be defined as it impacts the ADC LSB equivalent voltage. Analog reference voltage (Vref+) must be either known from user board environment or can be calculated using ADC measurement and ADC helper macro __LL_ADC_CALC_VREFANALOG_VOLTAGE(). ADC measurement data must correspond to a resolution of 12bits (full scale digital value 4095). If not the case, the data must be preliminarily rescaled to an equivalent resolution of 12 bits.

ADC group injected trigger edge (when external trigger is selected)

ADC_EXTERNALTRIGINJECCONV_EDGE_NONE

Injected conversions hardware trigger detection disabled

ADC_EXTERNALTRIGINJECCONV_EDGE_RISING

Injected conversions hardware trigger detection on the rising edge

ADC_EXTERNALTRIGINJECCONV_EDGE_FALLING

Injected conversions hardware trigger detection on the falling edge

ADC_EXTERNALTRIGINJECCONV_EDGE_RISINGFALLING

Injected conversions hardware trigger detection on both the rising and falling edges

ADC group injected trigger source

ADC_INJECTED_SOFTWARE_START

Software triggers injected group conversion start

ADC_EXTERNALTRIGINJEC_T1_TRGO

ADC group injected conversion trigger from external peripheral: TIM1 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T1_CC4

ADC group injected conversion trigger from external peripheral: TIM1 channel 4 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T2_TRGO

ADC group injected conversion trigger from external peripheral: TIM2 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T2_CC1

ADC group injected conversion trigger from external peripheral: TIM2 channel 1 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T3_CC4

ADC group injected conversion trigger from external peripheral: TIM3 channel 4 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T4_TRGO

ADC group injected conversion trigger from external peripheral: TIM4 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_EXT_IT15

ADC group injected conversion trigger from external peripheral: external interrupt line 15. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T8_CC4

ADC group injected conversion trigger from external peripheral: TIM8 channel 4 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T1_TRGO2

ADC group injected conversion trigger from external peripheral: TIM1 TRGO2 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T8_TRGO

ADC group injected conversion trigger from external peripheral: TIM8 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T8_TRGO2

ADC group injected conversion trigger from external peripheral: TIM8 TRGO2 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T3_CC3

ADC group injected conversion trigger from external peripheral: TIM3 channel 3 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T3_TRGO

ADC group injected conversion trigger from external peripheral: TIM3 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T3_CC1

ADC group injected conversion trigger from external peripheral: TIM3 channel 1 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T6_TRGO

ADC group injected conversion trigger from external peripheral: TIM6 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T15_TRGO

ADC group injected conversion trigger from external peripheral: TIM15 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_HR1_ADCTRG2

ADC group injected conversion trigger from external peripheral: HRTIM1 TRG2 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_HR1_ADCTRG4

ADC group injected conversion trigger from external peripheral: HRTIM1 TRG4 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_LPTIM1_OUT

ADC group injected conversion trigger from external peripheral: LPTIM1 OUT event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_LPTIM2_OUT

ADC group injected conversion trigger from external peripheral: LPTIM2 OUT event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_LPTIM3_OUT

ADC group injected conversion trigger from external peripheral: LPTIM3 OUT event. Trigger edge set to rising edge (default setting).

ADC group injected - Sequencer ranks

ADC_INJECTED_RANK_1

ADC group injected sequencer rank 1

ADC_INJECTED_RANK_2

ADC group injected sequencer rank 2

ADC_INJECTED_RANK_3

ADC group injected sequencer rank 3

ADC_INJECTED_RANK_4

ADC group injected sequencer rank 4

ADC interrupts definition

ADC_IT_RDY

ADC Ready interrupt source

ADC_IT_EOSMP

ADC End of sampling interrupt source

ADC_IT_EOC

ADC End of regular conversion interrupt source

ADC_IT_EOS

ADC End of regular sequence of conversions interrupt source

ADC_IT_OVR

ADC overrun interrupt source

ADC_IT_JEOC

ADC End of injected conversion interrupt source

ADC_IT_JEOS

ADC End of injected sequence of conversions interrupt source

ADC_IT_AWD1

ADC Analog watchdog 1 interrupt source (main analog watchdog)

ADC_IT_AWD2

ADC Analog watchdog 2 interrupt source (additional analog watchdog)

ADC_IT_AWD3

ADC Analog watchdog 3 interrupt source (additional analog watchdog)

ADC_IT_JQOVF

ADC Injected Context Queue Overflow interrupt source

ADC_IT_AWD

ADC Analog watchdog 1 interrupt source: naming for compatibility with other STM32 devices having only one analog watchdog

ADC group regular trigger edge (when external trigger is selected)

ADC_EXTERNALTRIGCONVEDGE_NONE

Regular conversions hardware trigger detection disabled

ADC_EXTERNALTRIGCONVEDGE_RISING

ADC group regular conversion trigger polarity set to rising edge

ADC_EXTERNALTRIGCONVEDGE_FALLING

ADC group regular conversion trigger polarity set to falling edge

ADC_EXTERNALTRIGCONVEDGE_RISINGFALLING

ADC group regular conversion trigger polarity set to both rising and falling edges

ADC group regular trigger source

ADC_SOFTWARE_START

ADC group regular conversion trigger internal: SW start.

ADC_EXTERNALTRIG_T1_CC1

ADC group regular conversion trigger from external peripheral: TIM1 channel 1 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T1_CC2

ADC group regular conversion trigger from external peripheral: TIM1 channel 2 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T1_CC3

ADC group regular conversion trigger from external peripheral: TIM1 channel 3 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T2_CC2

ADC group regular conversion trigger from external peripheral: TIM2 channel 2 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T3_TRGO

ADC group regular conversion trigger from external peripheral: TIM3 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T4_CC4

ADC group regular conversion trigger from external peripheral: TIM4 channel 4 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_EXT_IT11

ADC group regular conversion trigger from external peripheral: external interrupt line 11 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T8_TRGO

ADC group regular conversion trigger from external peripheral: TIM8 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T8_TRGO2

ADC group regular conversion trigger from external peripheral: TIM8 TRGO2 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T1_TRGO

ADC group regular conversion trigger from external peripheral: TIM1 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T1_TRGO2

ADC group regular conversion trigger from external peripheral: TIM1 TRGO2 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T2_TRGO

ADC group regular conversion trigger from external peripheral: TIM2 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T4_TRGO

ADC group regular conversion trigger from external peripheral: TIM4 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T6_TRGO

ADC group regular conversion trigger from external peripheral: TIM6 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T15_TRGO

ADC group regular conversion trigger from external peripheral: TIM15 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T3_CC4

ADC group regular conversion trigger from external peripheral: TIM3 channel 4 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_HR1_ADCTRG1

ADC group regular conversion trigger from external peripheral: HRTIM TRG1 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_HR1_ADCTRG3

ADC group regular conversion trigger from external peripheral: HRTIM TRG3 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_LPTIM1_OUT

ADC group regular conversion trigger from external peripheral: LPTIM1 OUT event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_LPTIM2_OUT

ADC group regular conversion trigger from external peripheral: LPTIM2 OUT event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_LPTIM3_OUT

ADC group regular conversion trigger from external peripheral: LPTIM3 event OUT. Trigger edge set to rising edge (default setting).

ADC sequencer scan mode

ADC_SCAN_DISABLE

Scan mode disabled

ADC_SCAN_ENABLE

Scan mode enabled

ADCx SMPR1 fields

ADC_SMPR1_FIELDS

ADC States

HAL_ADC_STATE_RESET

Notes:

- ADC state machine is managed by bitfields, state must be compared with bit by bit.
  For example: " if ((HAL_ADC_GetState(hadc1) & HAL_ADC_STATE_REG_BUSY) != 0UL) " " if ((HAL_ADC_GetState(hadc1) & HAL_ADC_STATE_AWD1) != 0UL) " ADC not yet initialized or disabled

HAL_ADC_STATE_READY

ADC peripheral ready for use

HAL_ADC_STATE_BUSY_INTERNAL

ADC is busy due to an internal process (initialization, calibration)

HAL_ADC_STATE_TIMEOUT

TimeOut occurrence

HAL_ADC_STATE_ERROR_INTERNAL

Internal error occurrence

HAL_ADC_STATE_ERROR_CONFIG

Configuration error occurrence

HAL_ADC_STATE_ERROR_DMA

DMA error occurrence

HAL_ADC_STATE_REG_BUSY

A conversion on ADC group regular is ongoing or can occur (either by continuous mode, external trigger, low power auto power-on (if feature available), multimode ADC master control (if feature available))

HAL_ADC_STATE_REG_EOC

Conversion data available on group regular

HAL_ADC_STATE_REG_OVR

Overrun occurrence

HAL_ADC_STATE_REG_EOSMP

Not available on this STM32 series: End Of Sampling flag raised

HAL_ADC_STATE_INJ_BUSY

A conversion on ADC group injected is ongoing or can occur (either by auto-injection mode, external trigger, low power auto power-on (if feature available), multimode ADC master control (if feature available))

HAL_ADC_STATE_INJ_EOC

Conversion data available on group injected

HAL_ADC_STATE_INJ_JQOVF

Injected queue overflow occurrence

HAL_ADC_STATE_AWD1

Out-of-window occurrence of ADC analog watchdog 1

HAL_ADC_STATE_AWD2

Out-of-window occurrence of ADC analog watchdog 2

HAL_ADC_STATE_AWD3

Out-of-window occurrence of ADC analog watchdog 3

HAL_ADC_STATE_MULTIMODE_SLAVE

ADC in multimode slave state, controlled by another ADC master (when feature available)

9 HAL ADC Extension Driver

9.1 ADCEx Firmware driver registers structures

9.1.1 ADC_InjOversamplingTypeDef

ADC_InjOversamplingTypeDef is defined in the stm32h7xx_hal_adc_ex.h

Data Fields

- ***uint32_t Ratio***
- ***uint32_t RightBitShift***

Field Documentation

- ***uint32_t ADC_InjOversamplingTypeDef::Ratio***
  Configures the oversampling ratio.
- ***uint32_t ADC_InjOversamplingTypeDef::RightBitShift***
  Configures the division coefficient for the Oversampler. This parameter can be a value of ***ADC_HAL_EC_OVS_SHIFT***

9.1.2 ADC_InjectionConfTypeDef

ADC_InjectionConfTypeDef is defined in the stm32h7xx_hal_adc_ex.h

Data Fields

- ***uint32_t InjectedChannel***
- ***uint32_t InjectedRank***
- ***uint32_t InjectedSamplingTime***
- ***uint32_t InjectedSingleDiff***
- ***uint32_t InjectedOffsetNumber***
- ***uint32_t InjectedOffset***
- ***uint32_t InjectedOffsetRightShift***
- ***FunctionalState InjectedOffsetSignedSaturation***
- ***uint32_t InjectedNbrOfConversion***
- ***FunctionalState InjectedDiscontinuousConvMode***
- ***FunctionalState AutoInjectedConv***
- ***FunctionalState QueueInjectedContext***
- ***uint32_t ExternalTrigInjecConv***
- ***uint32_t ExternalTrigInjecConvEdge***
- ***FunctionalState InjecOversamplingMode***
- ***ADC_InjOversamplingTypeDef InjecOversampling***

Field Documentation

- ***uint32_t ADC_InjectionConfTypeDef::InjectedChannel***
  Specifies the channel to configure into ADC group injected. This parameter can be a value of ***ADC_HAL_EC_CHANNEL*** Note: Depending on devices and ADC instances, some channels may not be available on device package pins. Refer to device datasheet for channels availability.
- ***uint32_t ADC_InjectionConfTypeDef::InjectedRank***
  Specifies the rank in the ADC group injected sequencer. This parameter must be a value of ***ADC_INJ_SEQ_RANKS***. Note: to disable a channel or change order of conversion sequencer, rank containing a previous channel setting can be overwritten by the new channel setting (or parameter number of conversions adjusted)

- ***uint32_t ADC_InjectionConfTypeDef::InjectedSamplingTime***

  Sampling time value to be set for the selected channel. Unit: ADC clock cycles. Conversion time is the addition of sampling time and processing time (12.5 ADC clock cycles at ADC resolution 12 bits, 10.5 cycles at 10 bits, 8.5 cycles at 8 bits, 6.5 cycles at 6 bits). This parameter can be a value of ***ADC_HAL_EC_CHANNEL_SAMPLINGTIME***. Caution: This parameter applies to a channel that can be used in a regular and/or injected group. It overwrites the last setting. Note: In case of usage of internal measurement channels (VrefInt/Vbat/TempSensor), sampling time constraints must be respected (sampling time can be adjusted in function of ADC clock frequency and sampling time setting) Refer to device datasheet for timings values.

- ***uint32_t ADC_InjectionConfTypeDef::InjectedSingleDiff***

  Selection of single-ended or differential input. In differential mode: Differential measurement is between the selected channel 'i' (positive input) and channel 'i+1' (negative input). Only channel 'i' has to be configured, channel 'i+1' is configured automatically. This parameter must be a value of ***ADC_HAL_EC_CHANNEL_SINGLE_DIFF_ENDING***. Caution: This parameter applies to a channel that can be used in a regular and/or injected group. It overwrites the last setting. Note: Refer to Reference Manual to ensure the selected channel is available in differential mode. Note: When configuring a channel 'i' in differential mode, the channel 'i+1' is not usable separately. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion). If ADC is enabled, this parameter setting is bypassed without error reporting (as it can be the expected behavior in case of another parameter update on the fly)

- ***uint32_t ADC_InjectionConfTypeDef::InjectedOffsetNumber***

  Selects the offset number. This parameter can be a value of ***ADC_HAL_EC_OFFSET_NB***. Caution: Only one offset is allowed per channel. This parameter overwrites the last setting.

- ***uint32_t ADC_InjectionConfTypeDef::InjectedOffset***

  Defines the offset to be subtracted from the raw converted data. Offset value must be a positive number. Maximum value depends on ADC resolution and oversampling ratio (in case of oversampling used). This parameter must be a number between Min_Data = 0x0000 and Max_Data = 0x3FFFC00 (corresponding to resolution 16 bit and oversampling ratio 1024). Note: This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).

- ***uint32_t ADC_InjectionConfTypeDef::InjectedOffsetRightShift***

  Specifies whether the 1 bit Right-shift feature is used or not. This parameter is applied only for 16-bit or 8-bit resolution. This parameter can be set to ENABLE or DISABLE.

- ***FunctionalState ADC_InjectionConfTypeDef::InjectedOffsetSignedSaturation***

  Specifies whether the Signed saturation feature is used or not. This parameter is applied only for 16-bit or 8-bit resolution. This parameter can be set to ENABLE or DISABLE.

- ***uint32_t ADC_InjectionConfTypeDef::InjectedNbrOfConversion***

  Specifies the number of ranks that will be converted within the ADC group injected sequencer. To use the injected group sequencer and convert several ranks, parameter 'ScanConvMode' must be enabled. This parameter must be a number between Min_Data = 1 and Max_Data = 4. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.

- ***FunctionalState ADC_InjectionConfTypeDef::InjectedDiscontinuousConvMode***

  Specifies whether the conversions sequence of ADC group injected is performed in Complete-sequence/ Discontinuous-sequence (main sequence subdivided in successive parts). Discontinuous mode is used only if sequencer is enabled (parameter 'ScanConvMode'). If sequencer is disabled, this parameter is discarded. Discontinuous mode can be enabled only if continuous mode is disabled. This parameter can be set to ENABLE or DISABLE. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion). Note: For injected group, discontinuous mode converts the sequence channel by channel (discontinuous length fixed to 1 rank). Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.

- ***FunctionalState ADC_InjectionConfTypeDef::AutoInjectedConv***

  Enables or disables the selected ADC group injected automatic conversion after regular one This parameter can be set to ENABLE or DISABLE. Note: To use Automatic injected conversion, discontinuous mode must be disabled ('DiscontinuousConvMode' and 'InjectedDiscontinuousConvMode' set to DISABLE) Note: To use Automatic injected conversion, injected group external triggers must be disabled ('ExternalTrigInjecConv' set to ADC_INJECTED_SOFTWARE_START) Note: In case of DMA used with regular group: if DMA configured in normal mode (single shot) JAUTO will be stopped upon DMA transfer complete. To maintain JAUTO always enabled, DMA must be configured in circular mode. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.
- ***FunctionalState ADC_InjectionConfTypeDef::QueueInjectedContext***

  Specifies whether the context queue feature is enabled. This parameter can be set to ENABLE or DISABLE. If context queue is enabled, injected sequencer&channels configurations are queued on up to 2 contexts. If a new injected context is set when queue is full, error is triggered by interruption and through function 'HAL_ADCEx_InjectedQueueOverflowCallback'. Caution: This feature request that the sequence is fully configured before injected conversion start. Therefore, configure channels with as many calls to **HAL_ADCEx_InjectedConfigChannel()** as the 'InjectedNbrOfConversion' parameter. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion).
- ***uint32_t ADC_InjectionConfTypeDef::ExternalTrigInjecConv***

  Selects the external event used to trigger the conversion start of injected group. If set to ADC_INJECTED_SOFTWARE_START, external triggers are disabled and software trigger is used instead. This parameter can be a value of ***ADC_injected_external_trigger_source***. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.
- ***uint32_t ADC_InjectionConfTypeDef::ExternalTrigInjecConvEdge***

  Selects the external trigger edge of injected group. This parameter can be a value of ***ADC_injected_external_trigger_edge***. If trigger source is set to ADC_INJECTED_SOFTWARE_START, this parameter is discarded. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.
- ***FunctionalState ADC_InjectionConfTypeDef::InjecOversamplingMode***

  Specifies whether the oversampling feature is enabled or disabled. This parameter can be set to ENABLE or DISABLE. Note: This parameter can be modified only if there is no conversion is ongoing (both ADSTART and JADSTART cleared).
- ***ADC_InjOversamplingTypeDef ADC_InjectionConfTypeDef::InjecOversampling***

  Specifies the Oversampling parameters. Caution: this setting overwrites the previous oversampling configuration if oversampling already enabled. Note: This parameter can be modified only if there is no conversion is ongoing (both ADSTART and JADSTART cleared).

9.1.3 ADC_MultiModeTypeDef

ADC_MultiModeTypeDef is defined in the stm32h7xx_hal_adc_ex.h

Data Fields

- ***uint32_t Mode***
- ***uint32_t DualModeData***
- ***uint32_t TwoSamplingDelay***

Field Documentation

- ***uint32_t ADC_MultiModeTypeDef::Mode***

  Configures the ADC to operate in independent or multimode. This parameter can be a value of ***ADC_HAL_EC_MULTI_MODE***.
- ***uint32_t ADC_MultiModeTypeDef::DualModeData***

  Configures the Dual ADC Mode Data Format: This parameter can be a value of ***ADCEx_Dual_Mode_Data_Format***

- ***uint32_t ADC_MultiModeTypeDef::TwoSamplingDelay***

  Configures the Delay between 2 sampling phases. This parameter can be a value of ***ADC_HAL_EC_MULTI_TWOSMP_DELAY***. Delay range depends on selected resolution: from 1 to 9 clock cycles for 16 bits, from 1 to 9 clock cycles for 14 bits from 1 to 8 clock cycles for 12 bits from 1 to 6 clock cycles for 10 bits from 1 to 6 clock cycles for 8 bits

9.2 ADCEx Firmware driver API description

The following section lists the various functions of the ADCEx library.

9.2.1 IO operation functions

This section provides functions allowing to:

- Perform the ADC self-calibration for single or differential ending.
- Get calibration factors for single or differential ending.
- Set calibration factors for single or differential ending.
- Start conversion of ADC group injected.
- Stop conversion of ADC group injected.
- Poll for conversion complete on ADC group injected.
- Get result of ADC group injected channel conversion.
- Start conversion of ADC group injected and enable interruptions.
- Stop conversion of ADC group injected and disable interruptions.
- When multimode feature is available, start multimode and enable DMA transfer.
- Stop multimode and disable ADC DMA transfer.
- Get result of multimode conversion.

This section contains the following APIs:

- ***HAL_ADCEx_Calibration_Start()***
- ***HAL_ADCEx_Calibration_GetValue()***
- ***HAL_ADCEx_LinearCalibration_GetValue()***
- ***HAL_ADCEx_Calibration_SetValue()***
- ***HAL_ADCEx_LinearCalibration_SetValue()***
- ***HAL_ADCEx_LinearCalibration_FactorLoad()***
- ***HAL_ADCEx_InjectedStart()***
- ***HAL_ADCEx_InjectedStop()***
- ***HAL_ADCEx_InjectedPollForConversion()***
- ***HAL_ADCEx_InjectedStart_IT()***
- ***HAL_ADCEx_InjectedStop_IT()***
- ***HAL_ADCEx_MultiModeStart_DMA()***
- ***HAL_ADCEx_MultiModeStop_DMA()***
- ***HAL_ADCEx_MultiModeGetValue()***
- ***HAL_ADCEx_InjectedGetValue()***
- ***HAL_ADCEx_InjectedConvCpltCallback()***
- ***HAL_ADCEx_InjectedQueueOverflowCallback()***
- ***HAL_ADCEx_LevelOutOfWindow2Callback()***
- ***HAL_ADCEx_LevelOutOfWindow3Callback()***
- ***HAL_ADCEx_EndOfSamplingCallback()***
- ***HAL_ADCEx_RegularStop()***
- ***HAL_ADCEx_RegularStop_IT()***
- ***HAL_ADCEx_RegularStop_DMA()***
- ***HAL_ADCEx_RegularMultiModeStop_DMA()***

9.2.2 Peripheral Control functions

This section provides functions allowing to:

- Configure channels on injected group
- Configure multimode when multimode feature is available
- Enable or Disable Injected Queue
- Disable ADC voltage regulator
- Enter ADC deep-power-down mode

This section contains the following APIs:

- ***HAL_ADCEx_InjectedConfigChannel()***
- ***HAL_ADCEx_MultiModeConfigChannel()***
- ***HAL_ADCEx_EnableInjectedQueue()***
- ***HAL_ADCEx_DisableInjectedQueue()***
- ***HAL_ADCEx_DisableVoltageRegulator()***
- ***HAL_ADCEx_EnterADCDeepPowerDownMode()***

9.2.3 Detailed description of functions

HAL_ADCEx_Calibration_Start

Function name

HAL_StatusTypeDef HAL_ADCEx_Calibration_Start (ADC_HandleTypeDef * hadc, uint32_t CalibrationMode, uint32_t SingleDiff)

Function description

Perform an ADC automatic self-calibration Calibration prerequisite: ADC must be disabled (execute this function before HAL_ADC_Start() or after HAL_ADC_Stop()).

Parameters

- **hadc:** ADC handle
- **CalibrationMode:** Selection of calibration offset or linear calibration offset.
  - ADC_CALIB_OFFSET Channel in mode calibration offset
  - ADC_CALIB_OFFSET_LINEARITY Channel in mode linear calibration offset
- **SingleDiff:** Selection of single-ended or differential input This parameter can be one of the following values:
  - ADC_SINGLE_ENDED Channel in mode input single ended
  - ADC_DIFFERENTIAL_ENDED Channel in mode input differential ended

Return values

- **HAL:** status

HAL_ADCEx_Calibration_GetValue

Function name

uint32_t HAL_ADCEx_Calibration_GetValue (ADC_HandleTypeDef * hadc, uint32_t SingleDiff)

Function description

Get the calibration factor.

Parameters

- **hadc:** ADC handle.
- **SingleDiff:** This parameter can be only:
  - ADC_SINGLE_ENDED Channel in mode input single ended
  - ADC_DIFFERENTIAL_ENDED Channel in mode input differential ended

Return values

- **Calibration:** value.

HAL_ADCEx_LinearCalibration_GetValue

Function name

HAL_StatusTypeDef HAL_ADCEx_LinearCalibration_GetValue (ADC_HandleTypeDef * hadc, uint32_t * LinearCalib_Buffer)

Function description

Get the calibration factor from automatic conversion result.

Parameters

- **hadc:** ADC handle
- **LinearCalib_Buffer:** Linear calibration factor

Return values

- **HAL:** state

HAL_ADCEx_Calibration_SetValue

Function name

HAL_StatusTypeDef HAL_ADCEx_Calibration_SetValue (ADC_HandleTypeDef * hadc, uint32_t SingleDiff, uint32_t CalibrationFactor)

Function description

Set the calibration factor to overwrite automatic conversion result.

Parameters

- **hadc:** ADC handle
- **SingleDiff:** This parameter can be only:
  - ADC_SINGLE_ENDED Channel in mode input single ended
  - ADC_DIFFERENTIAL_ENDED Channel in mode input differential ended
- **CalibrationFactor:** Calibration factor (coded on 7 bits maximum)

Return values

- **HAL:** state

HAL_ADCEx_LinearCalibration_SetValue

Function name

HAL_StatusTypeDef HAL_ADCEx_LinearCalibration_SetValue (ADC_HandleTypeDef * hadc, uint32_t * LinearCalib_Buffer)

Function description

Set the linear calibration factor.

Parameters

- **hadc:** ADC handle
- **LinearCalib_Buffer:** Linear calibration factor

Return values

- **HAL:** state

HAL_ADCEx_LinearCalibration_FactorLoad

Function name

HAL_StatusTypeDef HAL_ADCEx_LinearCalibration_FactorLoad (ADC_HandleTypeDef * hadc)

Function description

Load the calibration factor from engi bytes.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** state

HAL_ADCEx_InjectedStart

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedStart (ADC_HandleTypeDef * hadc)

Function description

Enable ADC, start conversion of injected group.

Parameters

- **hadc:** ADC handle.

Return values

- **HAL:** status

Notes

- Interruptions enabled in this function: None.
- Case of multimode enabled when multimode feature is available: HAL_ADCEx_InjectedStart() API must be called for ADC slave first, then for ADC master. For ADC slave, ADC is enabled only (conversion is not started). For ADC master, ADC is enabled and multimode conversion is started.

HAL_ADCEx_InjectedStop

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedStop (ADC_HandleTypeDef * hadc)

Function description

Stop conversion of injected channels.

Parameters

- **hadc:** ADC handle.

Return values

- **HAL:** status

Notes

- If ADC must be disabled and if conversion is on going on regular group, function HAL_ADC_Stop must be used to stop both injected and regular groups, and disable the ADC.
- If injected group mode auto-injection is enabled, function HAL_ADC_Stop must be used.
- In case of multimode enabled (when multimode feature is available), HAL_ADCEx_InjectedStop() must be called for ADC master first, then for ADC slave. For ADC master, conversion is stopped and ADC is disabled. For ADC slave, ADC is disabled only (conversion stop of ADC master has already stopped conversion of ADC slave).

HAL_ADCEx_InjectedPollForConversion

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedPollForConversion (ADC_HandleTypeDef * hadc, uint32_t Timeout)

Function description

Wait for injected group conversion to be completed.

Parameters

- **hadc:** ADC handle
- **Timeout:** Timeout value in millisecond.

Return values

- **HAL:** status

Notes

- Depending on hadc->Init.EOCSelection, JEOS or JEOC is checked and cleared depending on AUTDLY bit status.

HAL_ADCEx_InjectedStart_IT

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedStart_IT (ADC_HandleTypeDef * hadc)

Function description

Enable ADC, start conversion of injected group with interruption.

Parameters

- **hadc:** ADC handle.

Return values

- **HAL:** status.

Notes

- Interruptions enabled in this function according to initialization setting : JEOC (end of conversion) or JEOS (end of sequence)
- Case of multimode enabled (when multimode feature is enabled): HAL_ADCEx_InjectedStart_IT() API must be called for ADC slave first, then for ADC master. For ADC slave, ADC is enabled only (conversion is not started). For ADC master, ADC is enabled and multimode conversion is started.

HAL_ADCEx_InjectedStop_IT

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedStop_IT (ADC_HandleTypeDef * hadc)

Function description

Stop conversion of injected channels, disable interruption of end-of-conversion.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- If ADC must be disabled and if conversion is on going on regular group, function HAL_ADC_Stop must be used to stop both injected and regular groups, and disable the ADC.
- If injected group mode auto-injection is enabled, function HAL_ADC_Stop must be used.
- Case of multimode enabled (when multimode feature is available): HAL_ADCEx_InjectedStop_IT() API must be called for ADC master first, then for ADC slave. For ADC master, conversion is stopped and ADC is disabled. For ADC slave, ADC is disabled only (conversion stop of ADC master has already stopped conversion of ADC slave).
- In case of auto-injection mode, HAL_ADC_Stop() must be used.

HAL_ADCEx_MultiModeStart_DMA

Function name

HAL_StatusTypeDef HAL_ADCEx_MultiModeStart_DMA (ADC_HandleTypeDef * hadc, uint32_t * pData, uint32_t Length)

Function description

Enable ADC, start MultiMode conversion and transfer regular results through DMA.

Parameters

- **hadc:** ADC handle of ADC master (handle of ADC slave must not be used)
- **pData:** Destination Buffer address.
- **Length:** Length of data to be transferred from ADC peripheral to memory (in bytes).

Return values

- **HAL:** status

Notes

- Multimode must have been previously configured using HAL_ADCEx_MultiModeConfigChannel() function. Interruptions enabled in this function: overrun, DMA half transfer, DMA transfer complete. Each of these interruptions has its dedicated callback function.
- State field of Slave ADC handle is not updated in this configuration: user should not rely on it for information related to Slave regular conversions.

HAL_ADCEx_MultiModeStop_DMA

Function name

HAL_StatusTypeDef HAL_ADCEx_MultiModeStop_DMA (ADC_HandleTypeDef * hadc)

Function description

Stop multimode ADC conversion, disable ADC DMA transfer, disable ADC peripheral.

Parameters

- **hadc:** ADC handle of ADC master (handle of ADC slave must not be used)

Return values

- **HAL:** status

Notes

- Multimode is kept enabled after this function. MultiMode DMA bits (MDMA and DMACFG bits of common CCR register) are maintained. To disable Multimode (set with HAL_ADCEx_MultiModeConfigChannel()), ADC must be reinitialized using HAL_ADC_Init() or HAL_ADC_DeInit(), or the user can resort to HAL_ADCEx_DisableMultiMode() API.
- In case of DMA configured in circular mode, function HAL_ADC_Stop_DMA() must be called after this function with handle of ADC slave, to properly disable the DMA channel.

HAL_ADCEx_MultiModeGetValue

Function name

uint32_t HAL_ADCEx_MultiModeGetValue (ADC_HandleTypeDef * hadc)

Function description

Return the last ADC Master and Slave regular conversions results when in multimode configuration.

Parameters

- **hadc:** ADC handle of ADC Master (handle of ADC Slave must not be used)

Return values

- **The:** converted data values.

HAL_ADCEx_InjectedGetValue

Function name

uint32_t HAL_ADCEx_InjectedGetValue (ADC_HandleTypeDef * hadc, uint32_t InjectedRank)

Function description

Get ADC injected group conversion result.

Parameters

- **hadc:** ADC handle
- **InjectedRank:** the converted ADC injected rank. This parameter can be one of the following values:
  - ADC_INJECTED_RANK_1 ADC group injected rank 1
  - ADC_INJECTED_RANK_2 ADC group injected rank 2
  - ADC_INJECTED_RANK_3 ADC group injected rank 3
  - ADC_INJECTED_RANK_4 ADC group injected rank 4

Return values

- **ADC:** group injected conversion data

Notes

- Reading register JDRx automatically clears ADC flag JEOC (ADC group injected end of unitary conversion).
- This function does not clear ADC flag JEOS (ADC group injected end of sequence conversion) Occurrence of flag JEOS rising: If sequencer is composed of 1 rank, flag JEOS is equivalent to flag JEOC.If sequencer is composed of several ranks, during the scan sequence flag JEOC only is raised, at the end of the scan sequence both flags JEOC and EOS are raised. Flag JEOS must not be cleared by this function because it would not be compliant with low power features (feature low power auto-wait, not available on all STM32 families). To clear this flag, either use function: in programming model IT: HAL_ADC_IRQHandler(), in programming model polling: HAL_ADCEx_InjectedPollForConversion() or __HAL_ADC_CLEAR_FLAG(&hadc, ADC_FLAG_JEOS).

HAL_ADCEx_InjectedConvCpltCallback

Function name

void HAL_ADCEx_InjectedConvCpltCallback (ADC_HandleTypeDef * hadc)

Function description

Injected conversion complete callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADCEx_InjectedQueueOverflowCallback

Function name

void HAL_ADCEx_InjectedQueueOverflowCallback (ADC_HandleTypeDef * hadc)

Function description

Injected context queue overflow callback.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

Notes

- This callback is called if injected context queue is enabled (parameter "QueueInjectedContext" in injected channel configuration) and if a new injected context is set when queue is full (maximum 2 contexts).

HAL_ADCEx_LevelOutOfWindow2Callback

Function name

void HAL_ADCEx_LevelOutOfWindow2Callback (ADC_HandleTypeDef * hadc)

Function description

Analog watchdog 2 callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADCEx_LevelOutOfWindow3Callback

Function name

void HAL_ADCEx_LevelOutOfWindow3Callback (ADC_HandleTypeDef * hadc)

Function description

Analog watchdog 3 callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADCEx_EndOfSamplingCallback

Function name

void HAL_ADCEx_EndOfSamplingCallback (ADC_HandleTypeDef * hadc)

Function description

End Of Sampling callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADCEx_RegularStop

Function name

HAL_StatusTypeDef HAL_ADCEx_RegularStop (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of regular group (and injected channels in case of auto_injection mode), disable ADC peripheral if no conversion is on going on injected group.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

HAL_ADCEx_RegularStop_IT

Function name

HAL_StatusTypeDef HAL_ADCEx_RegularStop_IT (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of ADC groups regular and injected, disable interrution of end-of-conversion, disable ADC peripheral if no conversion is on going on injected group.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

HAL_ADCEx_RegularStop_DMA

Function name

HAL_StatusTypeDef HAL_ADCEx_RegularStop_DMA (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of regular group (and injected group in case of auto_injection mode), disable ADC DMA transfer, disable ADC peripheral if no conversion is on going on injected group.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

Notes

- HAL_ADCEx_RegularStop_DMA() function is dedicated to single-ADC mode only. For multimode (when multimode feature is available), HAL_ADCEx_RegularMultiModeStop_DMA() API must be used.

HAL_ADCEx_RegularMultiModeStop_DMA

Function name

HAL_StatusTypeDef HAL_ADCEx_RegularMultiModeStop_DMA (ADC_HandleTypeDef * hadc)

Function description

Stop DMA-based multimode ADC conversion, disable ADC DMA transfer, disable ADC peripheral if no injected conversion is on-going.

Parameters

- **hadc:** ADC handle of ADC master (handle of ADC slave must not be used)

Return values

- **HAL:** status

Notes

- Multimode is kept enabled after this function. Multimode DMA bits (MDMA and DMACFG bits of common CCR register) are maintained. To disable multimode (set with HAL_ADCEx_MultiModeConfigChannel()), ADC must be reinitialized using HAL_ADC_Init() or HAL_ADC_DeInit(), or the user can resort to HAL_ADCEx_DisableMultiMode() API.
- In case of DMA configured in circular mode, function HAL_ADCEx_RegularStop_DMA() must be called after this function with handle of ADC slave, to properly disable the DMA channel.

HAL_ADCEx_InjectedConfigChannel

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedConfigChannel (ADC_HandleTypeDef * hadc, ADC_InjectionConfTypeDef * sConfigInjected)

Function description

Configure a channel to be assigned to ADC group injected.

Parameters

- **hadc:** ADC handle
- **sConfigInjected:** Structure of ADC injected group and ADC channel for injected group.

Return values

- **HAL:** status

Notes

- Possibility to update parameters on the fly: This function initializes injected group, following calls to this function can be used to reconfigure some parameters of structure "ADC_InjectionConfTypeDef" on the fly, without resetting the ADC. The setting of these parameters is conditioned to ADC state: Refer to comments of structure "ADC_InjectionConfTypeDef".
- In case of usage of internal measurement channels: Vbat/VrefInt/TempSensor. These internal paths can be disabled using function HAL_ADC_DeInit().
- Caution: For Injected Context Queue use, a context must be fully defined before start of injected conversion. All channels are configured consecutively for the same ADC instance. Therefore, the number of calls to HAL_ADCEx_InjectedConfigChannel() must be equal to the value of parameter InjectedNbrOfConversion for each context. Example 1: If 1 context is intended to be used (or if there is no use of the Injected Queue Context feature) and if the context contains 3 injected ranks (InjectedNbrOfConversion = 3), HAL_ADCEx_InjectedConfigChannel() must be called once for each channel (i.e. 3 times) before starting a conversion. This function must not be called to configure a 4th injected channel: it would start a new context into context queue.Example 2: If 2 contexts are intended to be used and each of them contains 3 injected ranks (InjectedNbrOfConversion = 3), HAL_ADCEx_InjectedConfigChannel() must be called once for each channel and for each context (3 channels x 2 contexts = 6 calls). Conversion can start once the 1st context is set, that is after the first three HAL_ADCEx_InjectedConfigChannel() calls. The 2nd context can be set on the fly.

HAL_ADCEx_MultiModeConfigChannel

Function name

HAL_StatusTypeDef HAL_ADCEx_MultiModeConfigChannel (ADC_HandleTypeDef * hadc, ADC_MultiModeTypeDef * multimode)

Function description

Enable ADC multimode and configure multimode parameters.

Parameters

- **hadc:** Master ADC handle
- **multimode:** Structure of ADC multimode configuration

Return values

- **HAL:** status

Notes

- Possibility to update parameters on the fly: This function initializes multimode parameters, following calls to this function can be used to reconfigure some parameters of structure "ADC_MultiModeTypeDef" on the fly, without resetting the ADCs. The setting of these parameters is conditioned to ADC state. For parameters constraints, see comments of structure "ADC_MultiModeTypeDef".
- To move back configuration from multimode to single mode, ADC must be reset (using function HAL_ADC_Init()).

HAL_ADCEx_EnableInjectedQueue

Function name

HAL_StatusTypeDef HAL_ADCEx_EnableInjectedQueue (ADC_HandleTypeDef * hadc)

Function description

Enable Injected Queue.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- This function resets CFGR register JQDIS bit in order to enable the Injected Queue. JQDIS can be written only when ADSTART and JDSTART are both equal to 0 to ensure that no regular nor injected conversion is ongoing.

HAL_ADCEx_DisableInjectedQueue

Function name

HAL_StatusTypeDef HAL_ADCEx_DisableInjectedQueue (ADC_HandleTypeDef * hadc)

Function description

Disable Injected Queue.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- This function sets CFGR register JQDIS bit in order to disable the Injected Queue. JQDIS can be written only when ADSTART and JDSTART are both equal to 0 to ensure that no regular nor injected conversion is ongoing.

HAL_ADCEx_DisableVoltageRegulator

Function name

HAL_StatusTypeDef HAL_ADCEx_DisableVoltageRegulator (ADC_HandleTypeDef * hadc)

Function description

Disable ADC voltage regulator.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- Disabling voltage regulator allows to save power. This operation can be carried out only when ADC is disabled.
- To enable again the voltage regulator, the user is expected to resort to HAL_ADC_Init() API.

HAL_ADCEx_EnterADCDeepPowerDownMode

Function name

HAL_StatusTypeDef HAL_ADCEx_EnterADCDeepPowerDownMode (ADC_HandleTypeDef * hadc)

Function description

Enter ADC deep-power-down mode.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- This mode is achieved in setting DEEPPWD bit and allows to save power in reducing leakage currents. It is particularly interesting before entering stop modes.
- Setting DEEPPWD automatically clears ADVREGEN bit and disables the ADC voltage regulator. This means that this API encompasses HAL_ADCEx_DisableVoltageRegulator(). Additionally, the internal calibration is lost.
- To exit the ADC deep-power-down mode, the user is expected to resort to HAL_ADC_Init() API as well as to relaunch a calibration with HAL_ADCEx_Calibration_Start() API or to re-apply a previously saved calibration factor.

9.3 ADCEx Firmware driver defines

The following section lists the various define and macros of the module.

9.3.1 ADCEx

ADCEx

ADC Extended Calibration mode offset mode or linear mode

ADC_CALIB_OFFSET

ADC_CALIB_OFFSET_LINEARITY

ADC Extended Dual Mode Data Formatting

ADC_DUALMODEDATAFORMAT_DISABLED

Dual ADC mode without data packing: ADCx_CDR and ADCx_CDR2 registers not used

ADC_DUALMODEDATAFORMAT_32_10_BITS

Data formatting mode for 32 down to 10-bit resolution

ADC_DUALMODEDATAFORMAT_8_BITS

Data formatting mode for 8-bit resolution

ADC Extended Exported Macros

ADC_FORCE_MODE_INDEPENDENT

Description:

- Force ADC instance in multimode mode independent (multimode disable).

Parameters:

- __HANDLE__: ADC handle.

Return value:

- None

Notes:

- This macro must be used only in case of transition from multimode to mode independent and in case of unknown previous state, to ensure ADC configuration is in mode independent. Standard way of multimode configuration change is done from HAL ADC handle of ADC master using function "HAL_ADCEx_MultiModeConfigChannel(..., ADC_MODE_INDEPENDENT)")". Usage of this macro is not the Standard way of multimode configuration and can lead to have HAL ADC handles status misaligned. Usage of this macro must be limited to cases mentioned above.

ADC Extended Oversampling left Shift

ADC_LEFTBITSHIFT_NONE

ADC No bit shift

ADC_LEFTBITSHIFT_1

ADC 1 bit shift

ADC_LEFTBITSHIFT_2

ADC 2 bits shift

ADC_LEFTBITSHIFT_3

ADC 3 bits shift

ADC_LEFTBITSHIFT_4

ADC 4 bits shift

ADC_LEFTBITSHIFT_5

ADC 5 bits shift

ADC_LEFTBITSHIFT_6

ADC 6 bits shift

ADC_LEFTBITSHIFT_7

ADC 7 bits shift

ADC_LEFTBITSHIFT_8

ADC 8 bits shift

ADC_LEFTBITSHIFT_9

ADC 9 bits shift

ADC_LEFTBITSHIFT_10

ADC 10 bits shift

ADC_LEFTBITSHIFT_11

ADC 11 bits shift

ADC_LEFTBITSHIFT_12

ADC 12 bits shift

ADC_LEFTBITSHIFT_13

ADC 13 bits shift

ADC_LEFTBITSHIFT_14

ADC 14 bits shift

ADC_LEFTBITSHIFT_15

ADC 15 bits shift

10 HAL CEC Generic Driver

10.1 CEC Firmware driver registers structures

10.1.1 CEC_InitTypeDef

CEC_InitTypeDef is defined in the stm32h7xx_hal_cec.h

Data Fields

- ***uint32_t SignalFreeTime***
- ***uint32_t Tolerance***
- ***uint32_t BRERxStop***
- ***uint32_t BREErrorBitGen***
- ***uint32_t LBPEErrorBitGen***
- ***uint32_t BroadcastMsgNoErrorBitGen***
- ***uint32_t SignalFreeTimeOption***
- ***uint32_t ListenMode***
- ***uint16_t OwnAddress***
- ***uint8_t * RxBuffer***

Field Documentation

- ***uint32_t CEC_InitTypeDef::SignalFreeTime***

  Set SFT field, specifies the Signal Free Time. It can be one of CEC_Signal_Free_Time and belongs to the set {0,...,7} where 0x0 is the default configuration else means 0.5 + (SignalFreeTime - 1) nominal data bit periods
- ***uint32_t CEC_InitTypeDef::Tolerance***

  Set RXTOL bit, specifies the tolerance accepted on the received waveforms, it can be a value of CEC_Tolerance : it is either CEC_STANDARD_TOLERANCE or CEC_EXTENDED_TOLERANCE
- ***uint32_t CEC_InitTypeDef::BRERxStop***

  Set BRESTP bit CEC_BRERxStop : specifies whether or not a Bit Rising Error stops the reception. CEC_NO_RX_STOP_ON_BRE: reception is not stopped. CEC_RX_STOP_ON_BRE: reception is stopped.
- ***uint32_t CEC_InitTypeDef::BREErrorBitGen***

  Set BREGEN bit CEC_BREErrorBitGen : specifies whether or not an Error-Bit is generated on the CEC line upon Bit Rising Error detection. CEC_BRE_ERRORBIT_NO_GENERATION: no error-bit generation. CEC_BRE_ERRORBIT_GENERATION: error-bit generation if BRESTP is set.
- ***uint32_t CEC_InitTypeDef::LBPEErrorBitGen***

  Set LBPEGEN bit CEC_LBPEErrorBitGen : specifies whether or not an Error-Bit is generated on the CEC line upon Long Bit Period Error detection. CEC_LBPE_ERRORBIT_NO_GENERATION: no error-bit generation. CEC_LBPE_ERRORBIT_GENERATION: error-bit generation.
- ***uint32_t CEC_InitTypeDef::BroadcastMsgNoErrorBitGen***

  Set BRDNOGEN bit CEC_BroadCastMsgErrorBitGen : allows to avoid an Error-Bit generation on the CEC line upon an error detected on a broadcast message.It supersedes BREGEN and LBPEGEN bits for a broadcast message error handling. It can take two values:1) CEC_BROADCASTERROR_ERRORBIT_GENERATION. a) BRE detection: error-bit generation on the CEC line if BRESTP=CEC_RX_STOP_ON_BRE and BREGEN=CEC_BRE_ERRORBIT_NO_GENERATION. b) LBPE detection: error-bit generation on the CEC line if LBPGEN=CEC_LBPE_ERRORBIT_NO_GENERATION.2) CEC_BROADCASTERROR_NO_ERRORBIT_GENERATION. no error-bit generation in case neither a) nor b) are satisfied. Additionally, there is no error-bit generation in case of Short Bit Period Error detection in a broadcast message while LSTN bit is set.

- ***uint32_t CEC_InitTypeDef::SignalFreeTimeOption***
  Set SFTOP bit CEC_SFT_Option : specifies when SFT timer starts. CEC_SFT_START_ON_TXSOM SFT: timer starts when TXSOM is set by software. CEC_SFT_START_ON_TX_RX_END: SFT timer starts automatically at the end of message transmission/reception.
- ***uint32_t CEC_InitTypeDef::ListenMode***
  Set LSTN bit CEC_Listening_Mode : specifies device listening mode. It can take two values:CEC_REDUCED_LISTENING_MODE: CEC peripheral receives only message addressed to its own address (OAR). Messages addressed to different destination are ignored. Broadcast messages are always received.CEC_FULL_LISTENING_MODE: CEC peripheral receives messages addressed to its own address (OAR) with positive acknowledge. Messages addressed to different destination are received, but without interfering with the CEC bus: no acknowledge sent.
- ***uint16_t CEC_InitTypeDef::OwnAddress***
  Own addresses configuration This parameter can be a value of CEC_OWN_ADDRESS
- ***uint8_t* CEC_InitTypeDef::RxBuffer***
  CEC Rx buffer pointer

10.1.2 __CEC_HandleTypeDef

__CEC_HandleTypeDef is defined in the stm32h7xx_hal_cec.h

Data Fields

- ***CEC_TypeDef * Instance***
- ***CEC_InitTypeDef Init***
- ***const uint8_t * pTxBuffPtr***
- ***uint16_t TxXferCount***
- ***uint16_t RxXferSize***
- ***HAL_LockTypeDef Lock***
- ***HAL_CEC_StateTypeDef gState***
- ***HAL_CEC_StateTypeDef RxState***
- ***uint32_t ErrorCode***
- ***void(* TxCpltCallback***
- ***void(* RxCpltCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***CEC_TypeDef* __CEC_HandleTypeDef::Instance***
  CEC registers base address
- ***CEC_InitTypeDef __CEC_HandleTypeDef::Init***
  CEC communication parameters
- ***const uint8_t* __CEC_HandleTypeDef::pTxBuffPtr***
  Pointer to CEC Tx transfer Buffer
- ***uint16_t __CEC_HandleTypeDef::TxXferCount***
  CEC Tx Transfer Counter
- ***uint16_t __CEC_HandleTypeDef::RxXferSize***
  CEC Rx Transfer size, 0: header received only
- ***HAL_LockTypeDef __CEC_HandleTypeDef::Lock***
  Locking object
- ***HAL_CEC_StateTypeDef __CEC_HandleTypeDef::gState***
  CEC state information related to global Handle management and also related to Tx operations. This parameter can be a value of HAL_CEC_StateTypeDef
- ***HAL_CEC_StateTypeDef __CEC_HandleTypeDef::RxState***
  CEC state information related to Rx operations. This parameter can be a value of HAL_CEC_StateTypeDef

- ***uint32_t __CEC_HandleTypeDef::ErrorCode***
  For errors handling purposes, copy of ISR register in case error is reported
- ***void(* __CEC_HandleTypeDef::TxCpltCallback)(struct __CEC_HandleTypeDef *hcec)***
  CEC Tx Transfer completed callback
- ***void(* __CEC_HandleTypeDef::RxCpltCallback)(struct __CEC_HandleTypeDef *hcec, uint32_t RxFrameSize)***
  CEC Rx Transfer completed callback
- ***void(* __CEC_HandleTypeDef::ErrorCallback)(struct __CEC_HandleTypeDef *hcec)***
  CEC error callback
- ***void(* __CEC_HandleTypeDef::MspInitCallback)(struct __CEC_HandleTypeDef *hcec)***
  CEC Msp Init callback
- ***void(* __CEC_HandleTypeDef::MspDeInitCallback)(struct __CEC_HandleTypeDef *hcec)***
  CEC Msp DeInit callback

10.2 CEC Firmware driver API description

The following section lists the various functions of the CEC library.

10.2.1 How to use this driver

The CEC HAL driver can be used as follow:

1. Declare a CEC_HandleTypeDef handle structure.
2. Initialize the CEC low level resources by implementing the HAL_CEC_MspInit ()API:
   a. Enable the CEC interface clock.
   b. CEC pins configuration:
      ◦ Enable the clock for the CEC GPIOs.
      ◦ Configure these CEC pins as alternate function pull-up.
   c. NVIC configuration if you need to use interrupt process (HAL_CEC_Transmit_IT() and HAL_CEC_Receive_IT() APIs):
      ◦ Configure the CEC interrupt priority.
      ◦ Enable the NVIC CEC IRQ handle.
      ◦ The specific CEC interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros __HAL_CEC_ENABLE_IT() and __HAL_CEC_DISABLE_IT() inside the transmit and receive process.
3. Program the Signal Free Time (SFT) and SFT option, Tolerance, reception stop in in case of Bit Rising Error, Error-Bit generation conditions, device logical address and Listen mode in the hcec Init structure.
4. Initialize the CEC registers by calling the HAL_CEC_Init() API.

Note: This API (HAL_CEC_Init()) configures also the low level Hardware (GPIO, CLOCK, CORTEX...etc) by calling the customed HAL_CEC_MspInit() API.

Callback registration

10.2.2 Initialization and Configuration functions

This subsection provides a set of functions allowing to initialize the CEC

- The following parameters need to be configured:
  - SignalFreeTime
  - Tolerance
  - BRERxStop (RX stopped or not upon Bit Rising Error)
  - BREErrorBitGen (Error-Bit generation in case of Bit Rising Error)
  - LBPEErrorBitGen (Error-Bit generation in case of Long Bit Period Error)
  - BroadcastMsgNoErrorBitGen (Error-bit generation in case of broadcast message error)
  - SignalFreeTimeOption (SFT Timer start definition)
  - OwnAddress (CEC device address)
  - ListenMode

This section contains the following APIs:

- ***HAL_CEC_Init()***
- ***HAL_CEC_DeInit()***
- ***HAL_CEC_SetDeviceAddress()***
- ***HAL_CEC_MspInit()***
- ***HAL_CEC_MspDeInit()***
- ***HAL_CEC_RegisterCallback()***
- ***HAL_CEC_UnRegisterCallback()***
- ***HAL_CEC_RegisterRxCpltCallback()***
- ***HAL_CEC_UnRegisterRxCpltCallback()***

10.2.3 IO operation functions

This section contains the following APIs:

- ***HAL_CEC_Transmit_IT()***
- ***HAL_CEC_GetLastReceivedFrameSize()***
- ***HAL_CEC_ChangeRxBuffer()***
- ***HAL_CEC_IRQHandler()***
- ***HAL_CEC_TxCpltCallback()***
- ***HAL_CEC_RxCpltCallback()***
- ***HAL_CEC_ErrorCallback()***

10.2.4 Peripheral Control function

This subsection provides a set of functions allowing to control the CEC.

- HAL_CEC_GetState() API can be helpful to check in run-time the state of the CEC peripheral.
- HAL_CEC_GetError() API can be helpful to check in run-time the error of the CEC peripheral.

This section contains the following APIs:

- ***HAL_CEC_GetState()***
- ***HAL_CEC_GetError()***

10.2.5 Detailed description of functions

HAL_CEC_Init

Function name

HAL_StatusTypeDef HAL_CEC_Init (CEC_HandleTypeDef * hcec)

Function description

Initializes the CEC mode according to the specified parameters in the CEC_InitTypeDef and creates the associated handle .

Parameters

- **hcec:** CEC handle

Return values

- **HAL:** status

HAL_CEC_DeInit

Function name

HAL_StatusTypeDef HAL_CEC_DeInit (CEC_HandleTypeDef * hcec)

Function description

DeInitializes the CEC peripheral.

Parameters

- **hcec:** CEC handle

Return values

- **HAL:** status

HAL_CEC_SetDeviceAddress

Function name

HAL_StatusTypeDef HAL_CEC_SetDeviceAddress (CEC_HandleTypeDef * hcec, uint16_t CEC_OwnAddress)

Function description

Initializes the Own Address of the CEC device.

Parameters

- **hcec:** CEC handle
- **CEC_OwnAddress:** The CEC own address.

Return values

- **HAL:** status

HAL_CEC_MspInit

Function name

void HAL_CEC_MspInit (CEC_HandleTypeDef * hcec)

Function description

CEC MSP Init.

Parameters

- **hcec:** CEC handle

Return values

- **None:**

HAL_CEC_MspDeInit

Function name

void HAL_CEC_MspDeInit (CEC_HandleTypeDef * hcec)

Function description

CEC MSP DeInit.

Parameters

- **hcec:** CEC handle

Return values

- **None:**

HAL_CEC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_CEC_RegisterCallback (CEC_HandleTypeDef * hcec, HAL_CEC_CallbackIDTypeDef CallbackID, pCEC_CallbackTypeDef pCallback)

Function description

Register a User CEC Callback To be used instead of the weak predefined callback.

Parameters

- **hcec:** CEC handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_CEC_TX_CPLT_CB_ID Tx Complete callback ID
  - HAL_CEC_ERROR_CB_ID Error callback ID
  - HAL_CEC_MSPINIT_CB_ID MspInit callback ID
  - HAL_CEC_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_CEC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_CEC_UnRegisterCallback (CEC_HandleTypeDef * hcec, HAL_CEC_CallbackIDTypeDef CallbackID)

Function description

Unregister an CEC Callback CEC callback is redirected to the weak predefined callback.

Parameters

- **hcec:** uart handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_CEC_TX_CPLT_CB_ID Tx Complete callback ID
  - HAL_CEC_ERROR_CB_ID Error callback ID
  - HAL_CEC_MSPINIT_CB_ID MspInit callback ID
  - HAL_CEC_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **status:**

HAL_CEC_RegisterRxCpltCallback

Function name

HAL_StatusTypeDef HAL_CEC_RegisterRxCpltCallback (CEC_HandleTypeDef * hcec, pCEC_RxCallbackTypeDef pCallback)

Function description

Register CEC RX complete Callback To be used instead of the weak HAL_CEC_RxCpltCallback() predefined callback.

Parameters

- **hcec:** CEC handle
- **pCallback:** pointer to the Rx transfer compelete Callback function

Return values

- **HAL:** status

HAL_CEC_UnRegisterRxCpltCallback

Function name

HAL_StatusTypeDef HAL_CEC_UnRegisterRxCpltCallback (CEC_HandleTypeDef * hcec)

Function description

UnRegister CEC RX complete Callback CEC RX complete Callback is redirected to the weak HAL_CEC_RxCpltCallback() predefined callback.

Parameters

- **hcec:** CEC handle

Return values

- **HAL:** status

HAL_CEC_Transmit_IT

Function name

HAL_StatusTypeDef HAL_CEC_Transmit_IT (CEC_HandleTypeDef * hcec, uint8_t InitiatorAddress, uint8_t DestinationAddress, const uint8_t * pData, uint32_t Size)

Function description

Send data in interrupt mode.

Parameters

- **hcec:** CEC handle
- **InitiatorAddress:** Initiator address
- **DestinationAddress:** destination logical address
- **pData:** pointer to input byte data buffer
- **Size:** amount of data to be sent in bytes (without counting the header). 0 means only the header is sent (ping operation). Maximum TX size is 15 bytes (1 opcode and up to 14 operands).

Return values

- **HAL:** status

HAL_CEC_GetLastReceivedFrameSize

Function name

uint32_t HAL_CEC_GetLastReceivedFrameSize (const CEC_HandleTypeDef * hcec)

Function description

Get size of the received frame.

Parameters

- **hcec:** CEC handle

Return values

- **Frame:** size

HAL_CEC_ChangeRxBuffer

Function name

void HAL_CEC_ChangeRxBuffer (CEC_HandleTypeDef * hcec, uint8_t * Rxbuffer)

Function description

Change Rx Buffer.

Parameters

- **hcec:** CEC handle
- **Rxbuffer:** Rx Buffer

Return values

- **Frame:** size

Notes

- This function can be called only inside the HAL_CEC_RxCpltCallback()

HAL_CEC_IRQHandler

Function name

void HAL_CEC_IRQHandler (CEC_HandleTypeDef * hcec)

Function description

This function handles CEC interrupt requests.

Parameters

- **hcec:** CEC handle

Return values

- **None:**

HAL_CEC_TxCpltCallback

Function name

void HAL_CEC_TxCpltCallback (CEC_HandleTypeDef * hcec)

Function description

Tx Transfer completed callback.

Parameters

- **hcec:** CEC handle

Return values

- **None:**

HAL_CEC_RxCpltCallback

Function name

void HAL_CEC_RxCpltCallback (CEC_HandleTypeDef * hcec, uint32_t RxFrameSize)

Function description

Rx Transfer completed callback.

Parameters

- **hcec:** CEC handle
- **RxFrameSize:** Size of frame

Return values

- **None:**

HAL_CEC_ErrorCallback

Function name

void HAL_CEC_ErrorCallback (CEC_HandleTypeDef * hcec)

Function description

CEC error callbacks.

Parameters

- **hcec:** CEC handle

Return values

- **None:**

HAL_CEC_GetState

Function name

HAL_CEC_StateTypeDef HAL_CEC_GetState (const CEC_HandleTypeDef * hcec)

Function description

return the CEC state

Parameters

- **hcec:** pointer to a CEC_HandleTypeDef structure that contains the configuration information for the specified CEC module.

Return values

- **HAL:** state

HAL_CEC_GetError

Function name

uint32_t HAL_CEC_GetError (const CEC_HandleTypeDef * hcec)

Function description

Return the CEC error code.

Parameters

- **hcec:** pointer to a CEC_HandleTypeDef structure that contains the configuration information for the specified CEC.

Return values

- **CEC:** Error Code

10.3 CEC Firmware driver defines

The following section lists the various define and macros of the module.

10.3.1 CEC

CEC

CEC all RX or TX errors flags

CEC_ISR_ALL_ERROR

CEC Error Bit Generation if Bit Rise Error reported

CEC_BRE_ERRORBIT_NO_GENERATION

CEC_BRE_ERRORBIT_GENERATION

CEC Reception Stop on Error

CEC_NO_RX_STOP_ON_BRE

CEC_RX_STOP_ON_BRE

CEC Error Bit Generation on Broadcast message

CEC_BROADCASTERROR_ERRORBIT_GENERATION

CEC_BROADCASTERROR_NO_ERRORBIT_GENERATION

CEC Error Code

HAL_CEC_ERROR_NONE
no error

HAL_CEC_ERROR_RXOVR
CEC Rx-Overrun

HAL_CEC_ERROR_BRE
CEC Rx Bit Rising Error

HAL_CEC_ERROR_SBPE
CEC Rx Short Bit period Error

HAL_CEC_ERROR_LBPE
CEC Rx Long Bit period Error

HAL_CEC_ERROR_RXACKE
CEC Rx Missing Acknowledge

HAL_CEC_ERROR_ARBLST
CEC Arbitration Lost

HAL_CEC_ERROR_TXUDR

HAL_CEC_ERROR_TXACKE
CEC Tx Missing Acknowledge

HAL_CEC_ERROR_INVALID_CALLBACK
Invalid Callback Error

CEC Exported Macros

__HAL_CEC_RESET_HANDLE_STATE

Description:

- Reset CEC handle gstate & RxState.

Parameters:

- __HANDLE__: CEC handle.

Return value:

- None

__HAL_CEC_GET_FLAG

Description:

- Checks whether or not the specified CEC interrupt flag is set.

Parameters:

- __HANDLE__: specifies the CEC Handle.
- __FLAG__: specifies the flag to check.
  - CEC_FLAG_TXACKE: Tx Missing acknowledge Error
  - CEC_FLAG_TXERR: Tx Error.
  - CEC_FLAG_TXUDR: Tx-Buffer Underrun.
  - CEC_FLAG_TXEND: End of transmission (successful transmission of the last byte).
  - CEC_FLAG_TXBR: Tx-Byte Request.
  - CEC_FLAG_ARBLST: Arbitration Lost
  - CEC_FLAG_RXACKE: Rx-Missing Acknowledge
  - CEC_FLAG_LBPE: Rx Long period Error
  - CEC_FLAG_SBPE: Rx Short period Error
  - CEC_FLAG_BRE: Rx Bit Rising Error
  - CEC_FLAG_RXOVR: Rx Overrun.
  - CEC_FLAG_RXEND: End Of Reception.
  - CEC_FLAG_RXBR: Rx-Byte Received.

Return value:

- ITStatus

__HAL_CEC_CLEAR_FLAG

Description:

- Clears the interrupt or status flag when raised (write at 1)

Parameters:

- __HANDLE__: specifies the CEC Handle.
- __FLAG__: specifies the interrupt/status flag to clear. This parameter can be one of the following values:
  - CEC_FLAG_TXACKE: Tx Missing acknowledge Error
  - CEC_FLAG_TXERR: Tx Error.
  - CEC_FLAG_TXUDR: Tx-Buffer Underrun.
  - CEC_FLAG_TXEND: End of transmission (successful transmission of the last byte).
  - CEC_FLAG_TXBR: Tx-Byte Request.
  - CEC_FLAG_ARBLST: Arbitration Lost
  - CEC_FLAG_RXACKE: Rx-Missing Acknowledge
  - CEC_FLAG_LBPE: Rx Long period Error
  - CEC_FLAG_SBPE: Rx Short period Error
  - CEC_FLAG_BRE: Rx Bit Rising Error
  - CEC_FLAG_RXOVR: Rx Overrun.
  - CEC_FLAG_RXEND: End Of Reception.
  - CEC_FLAG_RXBR: Rx-Byte Received.

Return value:

- none

__HAL_CEC_ENABLE_IT

Description:

- Enables the specified CEC interrupt.

Parameters:

- __HANDLE__: specifies the CEC Handle.
- __INTERRUPT__: specifies the CEC interrupt to enable. This parameter can be one of the following values:
  - CEC_IT_TXACKE: Tx Missing acknowledge Error IT Enable
  - CEC_IT_TXERR: Tx Error IT Enable
  - CEC_IT_TXUDR: Tx-Buffer Underrun IT Enable
  - CEC_IT_TXEND: End of transmission IT Enable
  - CEC_IT_TXBR: Tx-Byte Request IT Enable
  - CEC_IT_ARBLST: Arbitration Lost IT Enable
  - CEC_IT_RXACKE: Rx-Missing Acknowledge IT Enable
  - CEC_IT_LBPE: Rx Long period Error IT Enable
  - CEC_IT_SBPE: Rx Short period Error IT Enable
  - CEC_IT_BRE: Rx Bit Rising Error IT Enable
  - CEC_IT_RXOVR: Rx Overrun IT Enable
  - CEC_IT_RXEND: End Of Reception IT Enable
  - CEC_IT_RXBR: Rx-Byte Received IT Enable

Return value:

- none

__HAL_CEC_DISABLE_IT

Description:

- Disables the specified CEC interrupt.

Parameters:

- __HANDLE__: specifies the CEC Handle.
- __INTERRUPT__: specifies the CEC interrupt to disable. This parameter can be one of the following values:
  - CEC_IT_TXACKE: Tx Missing acknowledge Error IT Enable
  - CEC_IT_TXERR: Tx Error IT Enable
  - CEC_IT_TXUDR: Tx-Buffer Underrun IT Enable
  - CEC_IT_TXEND: End of transmission IT Enable
  - CEC_IT_TXBR: Tx-Byte Request IT Enable
  - CEC_IT_ARBLST: Arbitration Lost IT Enable
  - CEC_IT_RXACKE: Rx-Missing Acknowledge IT Enable
  - CEC_IT_LBPE: Rx Long period Error IT Enable
  - CEC_IT_SBPE: Rx Short period Error IT Enable
  - CEC_IT_BRE: Rx Bit Rising Error IT Enable
  - CEC_IT_RXOVR: Rx Overrun IT Enable
  - CEC_IT_RXEND: End Of Reception IT Enable
  - CEC_IT_RXBR: Rx-Byte Received IT Enable

Return value:

- none

__HAL_CEC_GET_IT_SOURCE

Description:

- Checks whether or not the specified CEC interrupt is enabled.

Parameters:

- __HANDLE__: specifies the CEC Handle.
- __INTERRUPT__: specifies the CEC interrupt to check. This parameter can be one of the following values:
  - CEC_IT_TXACKE: Tx Missing acknowledge Error IT Enable
  - CEC_IT_TXERR: Tx Error IT Enable
  - CEC_IT_TXUDR: Tx-Buffer Underrun IT Enable
  - CEC_IT_TXEND: End of transmission IT Enable
  - CEC_IT_TXBR: Tx-Byte Request IT Enable
  - CEC_IT_ARBLST: Arbitration Lost IT Enable
  - CEC_IT_RXACKE: Rx-Missing Acknowledge IT Enable
  - CEC_IT_LBPE: Rx Long period Error IT Enable
  - CEC_IT_SBPE: Rx Short period Error IT Enable
  - CEC_IT_BRE: Rx Bit Rising Error IT Enable
  - CEC_IT_RXOVR: Rx Overrun IT Enable
  - CEC_IT_RXEND: End Of Reception IT Enable
  - CEC_IT_RXBR: Rx-Byte Received IT Enable

Return value:

- FlagStatus

__HAL_CEC_ENABLE

Description:

- Enables the CEC device.

Parameters:

- __HANDLE__: specifies the CEC Handle.

Return value:

- none

__HAL_CEC_DISABLE

Description:

- Disables the CEC device.

Parameters:

- __HANDLE__: specifies the CEC Handle.

Return value:

- none

__HAL_CEC_FIRST_BYTE_TX_SET

Description:

- Set Transmission Start flag.

Parameters:

- __HANDLE__: specifies the CEC Handle.

Return value:

- none

__HAL_CEC_LAST_BYTE_TX_SET

Description:

- Set Transmission End flag.

Parameters:

- __HANDLE__: specifies the CEC Handle.

Return value:

- none: If the CEC message consists of only one byte, TXEOM must be set before of TXSOM.

__HAL_CEC_GET_TRANSMISSION_START_FLAG

Description:

- Get Transmission Start flag.

Parameters:

- __HANDLE__: specifies the CEC Handle.

Return value:

- FlagStatus

__HAL_CEC_GET_TRANSMISSION_END_FLAG

Description:

- Get Transmission End flag.

Parameters:

- __HANDLE__: specifies the CEC Handle.

Return value:

- FlagStatus

__HAL_CEC_CLEAR_OAR

Description:

- Clear OAR register.

Parameters:

- __HANDLE__: specifies the CEC Handle.

Return value:

- none

__HAL_CEC_SET_OAR

Description:

- Set OAR register (without resetting previously set address in case of multi-address mode) To reset OAR,

Parameters:

- __HANDLE__: specifies the CEC Handle.
- __ADDRESS__: Own Address value (CEC logical address is identified by bit position)

Return value:

- none

11 HAL COMP Generic Driver

11.1 COMP Firmware driver registers structures

11.1.1 COMP_InitTypeDef

COMP_InitTypeDef is defined in the stm32h7xx_hal_comp.h

Data Fields

- ***uint32_t WindowMode***
- ***uint32_t Mode***
- ***uint32_t NonInvertingInput***
- ***uint32_t InvertingInput***
- ***uint32_t Hysteresis***
- ***uint32_t OutputPol***
- ***uint32_t BlankingSrce***
- ***uint32_t TriggerMode***

Field Documentation

- ***uint32_t COMP_InitTypeDef::WindowMode***

  Set window mode of a pair of comparators instances (2 consecutive instances odd and even COMP<x> and COMP<x+1>). Note: HAL COMP driver allows to set window mode from any COMP instance of the pair of COMP instances composing window mode. This parameter can be a value of ***COMP_WindowMode***
- ***uint32_t COMP_InitTypeDef::Mode***

  Set comparator operating mode to adjust power and speed. Note: For the characteritics of comparator power modes (propagation delay and power consumption), refer to device datasheet. This parameter can be a value of ***COMP_PowerMode***
- ***uint32_t COMP_InitTypeDef::NonInvertingInput***

  Set comparator input plus (non-inverting input). This parameter can be a value of ***COMP_InputPlus***
- ***uint32_t COMP_InitTypeDef::InvertingInput***

  Set comparator input minus (inverting input). This parameter can be a value of ***COMP_InputMinus***
- ***uint32_t COMP_InitTypeDef::Hysteresis***

  Set comparator hysteresis mode of the input minus. This parameter can be a value of ***COMP_Hysteresis***
- ***uint32_t COMP_InitTypeDef::OutputPol***

  Set comparator output polarity. This parameter can be a value of ***COMP_OutputPolarity***
- ***uint32_t COMP_InitTypeDef::BlankingSrce***

  Set comparator blanking source. This parameter can be a value of ***COMP_BlankingSrce***
- ***uint32_t COMP_InitTypeDef::TriggerMode***

  Set the comparator output triggering External Interrupt Line (EXTI). This parameter can be a value of ***COMP_EXTI_TriggerMode***

11.1.2 __COMP_HandleTypeDef

__COMP_HandleTypeDef is defined in the stm32h7xx_hal_comp.h

Data Fields

- ***COMP_TypeDef * Instance***
- ***COMP_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_COMP_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***void(* TriggerCallback***

- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***COMP_TypeDef* __COMP_HandleTypeDef::Instance***
  Register base address
- ***COMP_InitTypeDef __COMP_HandleTypeDef::Init***
  COMP required parameters
- ***HAL_LockTypeDef __COMP_HandleTypeDef::Lock***
  Locking object
- ***__IO HAL_COMP_StateTypeDef __COMP_HandleTypeDef::State***
  COMP communication state
- ***__IO uint32_t __COMP_HandleTypeDef::ErrorCode***
  COMP error code
- ***void(* __COMP_HandleTypeDef::TriggerCallback)(struct __COMP_HandleTypeDef *hcomp)***
  COMP trigger callback
- ***void(* __COMP_HandleTypeDef::MspInitCallback)(struct __COMP_HandleTypeDef *hcomp)***
  COMP Msp Init callback
- ***void(* __COMP_HandleTypeDef::MspDeInitCallback)(struct __COMP_HandleTypeDef *hcomp)***
  COMP Msp DeInit callback

11.2 COMP Firmware driver API description

The following section lists the various functions of the COMP library.

11.2.1 COMP Peripheral features

The STM32H7xx device family integrates two analog comparators instances COMP1 and COMP2:

1. The COMP input minus (inverting input) and input plus (non inverting input) can be set to internal references or to GPIO pins (refer to GPIO list in reference manual).
2. The COMP output level is available using HAL_COMP_GetOutputLevel() and can be redirected to other peripherals: GPIO pins (in mode alternate functions for comparator), timers. (refer to GPIO list in reference manual).
3. Pairs of comparators instances can be combined in window mode (2 consecutive instances odd and even COMP<x> and COMP<x+1>).
4. The comparators have interrupt capability through the EXTI controller with wake-up from sleep and stop modes:
   – COMP1 is internally connected to EXTI Line 20
   – COMP2 is internally connected to EXTI Line 21

From the corresponding IRQ handler, the right interrupt source can be retrieved using macro __HAL_COMP_COMP1_EXTI_GET_FLAG() and __HAL_COMP_COMP2_EXTI_GET_FLAG().

11.2.2 How to use this driver

This driver provides functions to configure and program the comparator instances of STM32H7xx devices. To use the comparator, perform the following steps:

1. Initialize the COMP low level resources by implementing the HAL_COMP_MspInit():
   – Configure the GPIO connected to comparator inputs plus and minus in analog mode using HAL_GPIO_Init().
   – If needed, configure the GPIO connected to comparator output in alternate function mode using HAL_GPIO_Init().
   – If required enable the COMP interrupt by configuring and enabling EXTI line in Interrupt mode and selecting the desired sensitivity level using HAL_GPIO_Init() function. After that enable the comparator interrupt vector using HAL_NVIC_EnableIRQ() function.

2. Configure the comparator using HAL_COMP_Init() function:
   – Select the input minus (inverting input)
   – Select the input plus (non-inverting input)
   – Select the hysteresis
   – Select the blanking source
   – Select the output polarity
   – Select the power mode
   – Select the window mode

Note: HAL_COMP_Init() calls internally __HAL_RCC_SYSCFG_CLK_ENABLE() to enable internal control clock of the comparators. However, this is a legacy strategy. Therefore, for compatibility anticipation, it is recommended to implement __HAL_RCC_SYSCFG_CLK_ENABLE() in "HAL_COMP_MspInit()". In STM32H7,COMP clock enable __HAL_RCC_COMP12_CLK_ENABLE() must be implemented by user in "HAL_COMP_MspInit()".

3. Reconfiguration on-the-fly of comparator can be done by calling again function HAL_COMP_Init() with new input structure parameters values.
4. Enable the comparator using HAL_COMP_Start() or HAL_COMP_Start_IT()to be enabled with the interrupt through NVIC of the CPU. Note: HAL_COMP_Start_IT() must be called after each interrupt otherwise the interrupt mode will stay disabled.
5. Use HAL_COMP_GetOutputLevel() or HAL_COMP_TriggerCallback() functions to manage comparator outputs(output level or events)
6. Disable the comparator using HAL_COMP_Stop() or HAL_COMP_Stop_IT() to disable the interrupt too.
7. De-initialize the comparator using HAL_COMP_DeInit() function.
8. For safety purpose, comparator configuration can be locked using HAL_COMP_Lock() function. The only way to unlock the comparator is a device hardware reset.

Callback registration

The compilation flag USE_HAL_COMP_REGISTER_CALLBACKS, when set to 1, allows the user to configure dynamically the driver callbacks. Use Functions HAL_COMP_RegisterCallback() to register an interrupt callback.

Function HAL_COMP_RegisterCallback() allows to register following callbacks:

- TriggerCallback : callback for COMP trigger.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_COMP_UnRegisterCallback to reset a callback to the default weak function.

HAL_COMP_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- TriggerCallback : callback for COMP trigger.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit.

By default, after the HAL_COMP_Init() and when the state is HAL_COMP_STATE_RESET all callbacks are set to the corresponding weak functions: example HAL_COMP_TriggerCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_COMP_Init()/ HAL_COMP_DeInit() only when these callbacks are null (not registered beforehand).

If MspInit or MspDeInit are not null, the HAL_COMP_Init()/ HAL_COMP_DeInit() keep and use the user MspInit/ MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in HAL_COMP_STATE_READY state only. Exception done MspInit/MspDeInit functions that can be registered/unregistered in HAL_COMP_STATE_READY or HAL_COMP_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/ DeInit.

Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_COMP_RegisterCallback() before calling HAL_COMP_DeInit() or HAL_COMP_Init() function.

When the compilation flag USE_HAL_COMP_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

11.2.3 Initialization and de-initialization functions

This section provides functions to initialize and de-initialize comparators

This section contains the following APIs:

- *HAL_COMP_Init()*
- *HAL_COMP_DeInit()*
- *HAL_COMP_MspInit()*
- *HAL_COMP_MspDeInit()*
- *HAL_COMP_RegisterCallback()*
- *HAL_COMP_UnRegisterCallback()*

11.2.4 IO operation functions

This section provides functions allowing to:

- Start a Comparator instance without interrupt.
- Stop a Comparator instance without interrupt.
- Start a Comparator instance with interrupt generation.
- Stop a Comparator instance with interrupt generation.

This section contains the following APIs:

- *HAL_COMP_Start()*
- *HAL_COMP_Stop()*
- *HAL_COMP_Start_IT()*
- *HAL_COMP_Stop_IT()*
- *HAL_COMP_IRQHandler()*

11.2.5 Peripheral Control functions

This subsection provides a set of functions allowing to control the comparators.

This section contains the following APIs:

- *HAL_COMP_Lock()*
- *HAL_COMP_GetOutputLevel()*
- *HAL_COMP_TriggerCallback()*

11.2.6 Peripheral State functions

This subsection permit to get in run-time the status of the peripheral.

This section contains the following APIs:

- *HAL_COMP_GetState()*
- *HAL_COMP_GetError()*

11.2.7 Detailed description of functions

HAL_COMP_Init

Function name

HAL_StatusTypeDef HAL_COMP_Init (COMP_HandleTypeDef * hcomp)

Function description

Initialize the COMP according to the specified parameters in the COMP_InitTypeDef and initialize the associated handle.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

Notes

- If the selected comparator is locked, initialization can't be performed. To unlock the configuration, perform a system reset.

HAL_COMP_DeInit

Function name

HAL_StatusTypeDef HAL_COMP_DeInit (COMP_HandleTypeDef * hcomp)

Function description

DeInitialize the COMP peripheral.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

Notes

- Deinitialization cannot be performed if the COMP configuration is locked. To unlock the configuration, perform a system reset.

HAL_COMP_MspInit

Function name

void HAL_COMP_MspInit (COMP_HandleTypeDef * hcomp)

Function description

Initialize the COMP MSP.

Parameters

- **hcomp:** COMP handle

Return values

- **None:**

HAL_COMP_MspDeInit

Function name

void HAL_COMP_MspDeInit (COMP_HandleTypeDef * hcomp)

Function description

DeInitialize the COMP MSP.

Parameters

- **hcomp:** COMP handle

Return values

- **None:**

HAL_COMP_RegisterCallback

Function name

HAL_StatusTypeDef HAL_COMP_RegisterCallback (COMP_HandleTypeDef * hcomp, HAL_COMP_CallbackIDTypeDef CallbackID, pCOMP_CallbackTypeDef pCallback)

Function description

Register a User COMP Callback To be used instead of the weak predefined callback.

Parameters

- **hcomp:** Pointer to a COMP_HandleTypeDef structure that contains the configuration information for the specified COMP.
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_COMP_TRIGGER_CB_ID Trigger callback ID
  - HAL_COMP_MSPINIT_CB_ID MspInit callback ID
  - HAL_COMP_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_COMP_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_COMP_UnRegisterCallback (COMP_HandleTypeDef * hcomp, HAL_COMP_CallbackIDTypeDef CallbackID)

Function description

Unregister a COMP Callback COMP callback is redirected to the weak predefined callback.

Parameters

- **hcomp:** Pointer to a COMP_HandleTypeDef structure that contains the configuration information for the specified COMP.
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_COMP_TRIGGER_CB_ID Trigger callback ID
  - HAL_COMP_MSPINIT_CB_ID MspInit callback ID
  - HAL_COMP_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_COMP_Start

Function name

HAL_StatusTypeDef HAL_COMP_Start (COMP_HandleTypeDef * hcomp)

Function description

Start the comparator.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

HAL_COMP_Stop

Function name

HAL_StatusTypeDef HAL_COMP_Stop (COMP_HandleTypeDef * hcomp)

Function description

Stop the comparator.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

HAL_COMP_Start_IT

Function name

HAL_StatusTypeDef HAL_COMP_Start_IT (COMP_HandleTypeDef * hcomp)

Function description

Enable the interrupt and start the comparator.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

HAL_COMP_Stop_IT

Function name

HAL_StatusTypeDef HAL_COMP_Stop_IT (COMP_HandleTypeDef * hcomp)

Function description

Disable the interrupt and Stop the comparator.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

HAL_COMP_IRQHandler

Function name

void HAL_COMP_IRQHandler (COMP_HandleTypeDef * hcomp)

Function description

Comparator IRQ Handler.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

HAL_COMP_Lock

Function name

HAL_StatusTypeDef HAL_COMP_Lock (COMP_HandleTypeDef * hcomp)

Function description

Lock the selected comparator configuration.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

Notes

- A system reset is required to unlock the comparator configuration.

HAL_COMP_GetOutputLevel

Function name

uint32_t HAL_COMP_GetOutputLevel (COMP_HandleTypeDef * hcomp)

Function description

Return the output level (high or low) of the selected comparator.

Parameters

- **hcomp:** COMP handle

Return values

- **Returns:** the selected comparator output level:
  - COMP_OUTPUT_LEVEL_LOW
  - COMP_OUTPUT_LEVEL_HIGH

Notes

- The output level depends on the selected polarity. If the polarity is not inverted: Comparator output is low when the input plus is at a lower voltage than the input minusComparator output is high when the input plus is at a higher voltage than the input minus If the polarity is inverted:Comparator output is high when the input plus is at a lower voltage than the input minusComparator output is low when the input plus is at a higher voltage than the input minus

HAL_COMP_TriggerCallback

Function name

void HAL_COMP_TriggerCallback (COMP_HandleTypeDef * hcomp)

Function description

Comparator trigger callback.

Parameters

- **hcomp:** COMP handle

Return values

- **None:**

HAL_COMP_GetState

Function name

HAL_COMP_StateTypeDef HAL_COMP_GetState (COMP_HandleTypeDef * hcomp)

Function description

Return the COMP handle state.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** state

HAL_COMP_GetError

Function name

uint32_t HAL_COMP_GetError (COMP_HandleTypeDef * hcomp)

Function description

Return the COMP error code.

Parameters

- **hcomp:** COMP handle

Return values

- **COMP:** error code

11.3 COMP Firmware driver defines

The following section lists the various define and macros of the module.

11.3.1 COMP

COMP

COMP Blanking Source

COMP_BLANKINGSRC_NONE

No blanking source

COMP_BLANKINGSRC_TIM1_OC5

TIM1 OC5 selected as blanking source for comparator

COMP_BLANKINGSRC_TIM2_OC3

TIM2 OC3 selected as blanking source for comparator

COMP_BLANKINGSRC_TIM3_OC3

TIM3 OC3 selected as blanking source for compartor

COMP_BLANKINGSRC_TIM3_OC4

TIM3 OC4 selected as blanking source for comparator

COMP_BLANKINGSRC_TIM8_OC5

TIM8 OC5 selected as blanking source for comparator

COMP_BLANKINGSRC_TIM15_OC1

TIM15 OC1 selected as blanking source for comparator

COMP Error Code

HAL_COMP_ERROR_NONE

No error

HAL_COMP_ERROR_INVALID_CALLBACK

Invalid Callback error

COMP Exported Macros

__HAL_COMP_ENABLE_OR

Description:

- Enable the specified bit in the Option register.

Parameters:

- __AF__: specifies the Alternate Function source selection . This parameter can be one of the following values:
  - COMP_OR_AFOPA6 : Alternate Function PA6 source selection
  - COMP_OR_AFOPA8 : Alternate Function PA8 source selection
  - COMP_OR_AFOPB12 : Alternate Function PB12 source selection
  - COMP_OR_AFOPE6 : Alternate Function PE6 source selection
  - COMP_OR_AFOPE15 : Alternate Function PE15 source selection
  - COMP_OR_AFOPG2 : Alternate Function PG2 source selection
  - COMP_OR_AFOPG3 : Alternate Function PG3 source selection
  - COMP_OR_AFOPG4 : Alternate Function PG4 source selection
  - COMP_OR_AFOPI1 : Alternate Function PI1 source selection
  - COMP_OR_AFOPI4 : Alternate Function PI4 source selection
  - COMP_OR_AFOPK2 : Alternate Function PK2 source selection

Return value:

- None

__HAL_COMP_DISABLE_OR

Description:

- Disable the specified bit in the Option register.

Parameters:

- __AF__: specifies the Alternate Function source selection . This parameter can be one of the following values:
  - COMP_OR_AFOPA6 : Alternate Function PA6 source selection
  - COMP_OR_AFOPA8 : Alternate Function PA8 source selection
  - COMP_OR_AFOPB12 : Alternate Function PB12 source selection
  - COMP_OR_AFOPE6 : Alternate Function PE6 source selection
  - COMP_OR_AFOPE15 : Alternate Function PE15 source selection
  - COMP_OR_AFOPG2 : Alternate Function PG2 source selection
  - COMP_OR_AFOPG3 : Alternate Function PG3 source selection
  - COMP_OR_AFOPG4 : Alternate Function PG4 source selection
  - COMP_OR_AFOPI1 : Alternate Function PI1 source selection
  - COMP_OR_AFOPI4 : Alternate Function PI4 source selection
  - COMP_OR_AFOPK2 : Alternate Function PK2 source selection

Return value:

- None

COMP Exported Types

COMP_STATE_BITFIELD_LOCK

COMP EXTI Lines

COMP_EXTI_LINE_COMP1

EXTI line 20 connected to COMP1 output

COMP_EXTI_LINE_COMP2

EXTI line 21 connected to COMP2 output

COMP_EXTI_IT

EXTI line event with interruption

COMP_EXTI_EVENT

EXTI line event only (without interruption)

COMP_EXTI_RISING

EXTI line event on rising edge

COMP_EXTI_FALLING

EXTI line event on falling edge

COMP external interrupt line management

__HAL_COMP_COMP1_EXTI_ENABLE_RISING_EDGE

Description:

- Enable the COMP1 EXTI line rising edge trigger.

Return value:

- None

__HAL_COMP_COMP1_EXTI_DISABLE_RISING_EDGE

Description:

- Disable the COMP1 EXTI line rising edge trigger.

Return value:

- None

__HAL_COMP_COMP1_EXTI_ENABLE_FALLING_EDGE

Description:

- Enable the COMP1 EXTI line falling edge trigger.

Return value:

- None

__HAL_COMP_COMP1_EXTI_DISABLE_FALLING_EDGE

Description:

- Disable the COMP1 EXTI line falling edge trigger.

Return value:

- None

__HAL_COMP_COMP1_EXTI_ENABLE_RISING_FALLING_EDGE

Description:

- Enable the COMP1 EXTI line rising & falling edge trigger.

Return value:

- None

__HAL_COMP_COMP1_EXTI_DISABLE_RISING_FALLING_EDGE

Description:

- Disable the COMP1 EXTI line rising & falling edge trigger.

Return value:

- None

__HAL_COMP_COMP1_EXTI_ENABLE_IT

Description:

- Enable the COMP1 EXTI line in interrupt mode.

Return value:

- None

__HAL_COMP_COMP1_EXTI_DISABLE_IT

Description:

- Disable the COMP1 EXTI line in interrupt mode.

Return value:

- None

__HAL_COMP_COMP1_EXTI_ENABLE_EVENT

Description:

- Enable the COMP1 EXTI Line in event mode.

Return value:

- None

__HAL_COMP_COMP1_EXTI_DISABLE_EVENT

Description:

- Disable the COMP1 EXTI Line in event mode.

Return value:

- None

__HAL_COMP_COMP1_EXTI_GET_FLAG

Description:

- Check whether the COMP1 EXTI line flag is set or not.

Return value:

- RESET: or SET

__HAL_COMP_COMP1_EXTI_CLEAR_FLAG

Description:

- Clear the COMP1 EXTI flag.

Return value:

- None

__HAL_COMP_COMP1_EXTI_GENERATE_SWIT

Description:

- Generate a software interrupt on the COMP1 EXTI line.

Return value:

- None

__HAL_COMP_COMP1_EXTID3_ENABLE_EVENT

Description:

- Enable the COMP1 D3 EXTI Line in event mode.

Return value:

- None

__HAL_COMP_COMP1_EXTID3_DISABLE_EVENT

Description:

- Disable the COMP1 D3 EXTI Line in event mode.

Return value:

- None

__HAL_COMP_COMP1_EXTID2_ENABLE_IT

Description:

- Enable the COMP1 D2 EXTI line in interrupt mode.

Return value:

- None

__HAL_COMP_COMP1_EXTID2_DISABLE_IT

Description:

- Disable the COMP1 D2 EXTI line in interrupt mode.

Return value:

- None

__HAL_COMP_COMP1_EXTID2_ENABLE_EVENT

Description:

- Enable the COMP1 D2 EXTI Line in event mode.

Return value:

- None

__HAL_COMP_COMP1_EXTID2_DISABLE_EVENT

Description:

- Disable the COMP1 D2 EXTI Line in event mode.

Return value:

- None

__HAL_COMP_COMP1_EXTID2_GET_FLAG

Description:

- Check whether the COMP1 D2 EXTI line flag is set or not.

Return value:

- RESET: or SET

__HAL_COMP_COMP1_EXTID2_CLEAR_FLAG

Description:

- Clear the COMP1 D2 EXTI flag.

Return value:

- None

__HAL_COMP_COMP2_EXTI_ENABLE_RISING_EDGE

Description:

- Enable the COMP2 EXTI line rising edge trigger.

Return value:

- None

__HAL_COMP_COMP2_EXTI_DISABLE_RISING_EDGE

Description:

- Disable the COMP2 EXTI line rising edge trigger.

Return value:

- None

__HAL_COMP_COMP2_EXTI_ENABLE_FALLING_EDGE

Description:

- Enable the COMP2 EXTI line falling edge trigger.

Return value:

- None

__HAL_COMP_COMP2_EXTI_DISABLE_FALLING_EDGE

Description:

- Disable the COMP2 EXTI line falling edge trigger.

Return value:

- None

__HAL_COMP_COMP2_EXTI_ENABLE_RISING_FALLING_EDGE

Description:

- Enable the COMP2 EXTI line rising & falling edge trigger.

Return value:

- None

__HAL_COMP_COMP2_EXTI_DISABLE_RISING_FALLING_EDGE

Description:

- Disable the COMP2 EXTI line rising & falling edge trigger.

Return value:

- None

__HAL_COMP_COMP2_EXTI_ENABLE_IT

Description:

- Enable the COMP2 EXTI line.

Return value:

- None

__HAL_COMP_COMP2_EXTI_DISABLE_IT

Description:

- Disable the COMP2 EXTI line.

Return value:

- None

__HAL_COMP_COMP2_EXTI_ENABLE_EVENT

Description:

- Enable the COMP2 EXTI Line in event mode.

Return value:

- None

__HAL_COMP_COMP2_EXTI_DISABLE_EVENT

Description:

- Disable the COMP2 EXTI Line in event mode.

Return value:

- None

__HAL_COMP_COMP2_EXTI_GET_FLAG

Description:

- Check whether the COMP2 EXTI line flag is set or not.

Return value:

- RESET: or SET

__HAL_COMP_COMP2_EXTI_CLEAR_FLAG

Description:

- Clear the the COMP2 EXTI flag.

Return value:

- None

__HAL_COMP_COMP2_EXTID3_ENABLE_EVENT

Description:

- Enable the COMP2 D3 EXTI Line in event mode.

Return value:

- None

__HAL_COMP_COMP2_EXTID3_DISABLE_EVENT

Description:

- Disable the COMP2 D3 EXTI Line in event mode.

Return value:

- None

__HAL_COMP_COMP2_EXTI_GENERATE_SWIT

Description:

- Generate a software interrupt on the COMP2 EXTI line.

Return value:

- None

__HAL_COMP_COMP2_EXTID2_ENABLE_IT

Description:

- Enable the COMP2 D2 EXTI line.

Return value:

- None

__HAL_COMP_COMP2_EXTID2_DISABLE_IT

Description:

- Disable the COMP2 D2 EXTI line.

Return value:

- None

__HAL_COMP_COMP2_EXTID2_ENABLE_EVENT

Description:

- Enable the COMP2 D2 EXTI Line in event mode.

Return value:

- None

__HAL_COMP_COMP2_EXTID2_DISABLE_EVENT

Description:

- Disable the COMP2 D2 EXTI Line in event mode.

Return value:

- None

__HAL_COMP_COMP2_EXTID2_GET_FLAG

Description:

- Check whether the COMP2 D2 EXTI line flag is set or not.

Return value:

- RESET: or SET

__HAL_COMP_COMP2_EXTID2_CLEAR_FLAG

Description:

- Clear the the COMP2 D2 EXTI flag.

Return value:

- None

__HAL_COMP_GET_IT_SOURCE

Description:

- Checks if the specified COMP interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: specifies the COMP Handle. This parameter can be COMP1 where x: 1 or 2 to select the COMP peripheral.
- __INTERRUPT__: specifies the COMP interrupt source to check. This parameter can be one of the following values:
  - COMP_IT_EN: Comparator interrupt enable

Return value:

- The: new state of __IT__ (TRUE or FALSE)

__HAL_COMP_GET_FLAG

Description:

- Checks whether the specified COMP flag is set or not.

Parameters:

- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - COMP_FLAG_C1I: Comparator 1 Interrupt Flag
  - COMP_FLAG_C2I: Comparator 2 Interrupt Flag

Return value:

- The: new state of __FLAG__ (TRUE or FALSE)

__HAL_COMP_CLEAR_FLAG

Description:

- Clears the specified COMP pending flag.

Parameters:

- __FLAG__: specifies the flag to check. This parameter can be any combination of the following values:
  - COMP_CLEAR_C1IF : Clear Comparator 1 Interrupt Flag
  - COMP_CLEAR_C2IF : Clear Comparator 2 Interrupt Flag

Return value:

- None

__HAL_COMP_CLEAR_C1IFLAG

Description:

- Clear the COMP C1I flag.

Return value:

- None

__HAL_COMP_CLEAR_C2IFLAG

Description:

- Clear the COMP C2I flag.

Return value:

- None

__HAL_COMP_ENABLE_IT

Description:

- Enable the specified COMP interrupt.

Parameters:

- __HANDLE__: specifies the COMP Handle.
- __INTERRUPT__: specifies the COMP interrupt source to enable. This parameter can be one of the following values:
  - COMP_CFGRx_ITEN : Comparator interrupt

Return value:

- None

__HAL_COMP_DISABLE_IT

Description:

- Disable the specified COMP interrupt.

Parameters:

- __HANDLE__: specifies the COMP Handle.
- __INTERRUPT__: specifies the COMP interrupt source to enable. This parameter can be one of the following values:
  - COMP_CFGRx_ITEN : Comparator interrupt

Return value:

- None

COMP output to EXTI

COMP_TRIGGERMODE_NONE

Comparator output triggering no External Interrupt Line

COMP_TRIGGERMODE_IT_RISING

Comparator output triggering External Interrupt Line event with interruption, on rising edge

COMP_TRIGGERMODE_IT_FALLING

Comparator output triggering External Interrupt Line event with interruption, on falling edge

COMP_TRIGGERMODE_IT_RISING_FALLING

Comparator output triggering External Interrupt Line event with interruption, on both rising and falling edges

COMP_TRIGGERMODE_EVENT_RISING

Comparator output triggering External Interrupt Line event only (without interruption), on rising edge

COMP_TRIGGERMODE_EVENT_FALLING

Comparator output triggering External Interrupt Line event only (without interruption), on falling edge

COMP_TRIGGERMODE_EVENT_RISING_FALLING

Comparator output triggering External Interrupt Line event only (without interruption), on both rising and falling edges

COMP Flag

COMP_FLAG_C1I

Comparator 1 Interrupt Flag

COMP_FLAG_C2I

Comparator 2 Interrupt Flag

COMP_FLAG_LOCK

Lock flag

COMP Private macros to get EXTI line associated with Comparators

COMP_GET_EXTI_LINE

Description:

- Get the specified EXTI line for a comparator instance.

Parameters:

- __INSTANCE__: specifies the COMP instance.

Return value:

- value: of

COMP Handle Management

__HAL_COMP_RESET_HANDLE_STATE

Description:

- Reset COMP handle state.

Parameters:

- __HANDLE__: COMP handle

Return value:

- None

COMP_CLEAR_ERRORCODE

Description:

- Clear COMP error code (set it to no error code "HAL_COMP_ERROR_NONE").

Parameters:

- __HANDLE__: COMP handle

Return value:

- None

__HAL_COMP_ENABLE

Description:

- Enable the specified comparator.

Parameters:

- __HANDLE__: COMP handle

Return value:

- None

__HAL_COMP_DISABLE

Description:

- Disable the specified comparator.

Parameters:

- __HANDLE__: COMP handle

Return value:

- None

__HAL_COMP_LOCK

Description:

- Lock the specified comparator configuration.

Parameters:

- __HANDLE__: COMP handle

Return value:

- None

Notes:

- Using this macro induce HAL COMP handle state machine being no more in line with COMP instance state. To keep HAL COMP handle state machine updated, it is recommended to use function "HAL_COMP_Lock')".

__HAL_COMP_IS_LOCKED

Description:

- Check whether the specified comparator is locked.

Parameters:

- __HANDLE__: COMP handle

Return value:

- Value: 0 if COMP instance is not locked, value 1 if COMP instance is locked

COMP hysteresis

COMP_HYSTERESIS_NONE

No hysteresis

COMP_HYSTERESIS_LOW

Hysteresis level low

COMP_HYSTERESIS_MEDIUM

Hysteresis level medium

COMP_HYSTERESIS_HIGH

Hysteresis level high

COMP input minus (inverting input)

COMP_INPUT_MINUS_1_4VREFINT

Comparator input minus connected to 1/4 VrefInt

COMP_INPUT_MINUS_1_2VREFINT

Comparator input minus connected to 1/2 VrefInt

COMP_INPUT_MINUS_3_4VREFINT

Comparator input minus connected to 3/4 VrefInt

COMP_INPUT_MINUS_VREFINT

Comparator input minus connected to VrefInt

COMP_INPUT_MINUS_DAC1_CH1

Comparator input minus connected to DAC1 channel 1 (DAC_OUT1)

COMP_INPUT_MINUS_DAC1_CH2

Comparator input minus connected to DAC1 channel 2 (DAC_OUT2)

COMP_INPUT_MINUS_IO1

Comparator input minus connected to IO1 (pin PB1 for COMP1, pin PE10 for COMP2)

COMP_INPUT_MINUS_IO2

Comparator input minus connected to IO2 (pin PC4 for COMP1, pin PE7 for COMP2)

COMP input plus (non-inverting input)

COMP_INPUT_PLUS_IO1

Comparator input plus connected to IO1 (pin PB0 for COMP1, pin PE9 for COMP2)

COMP_INPUT_PLUS_IO2

Comparator input plus connected to IO2 (pin PB2 for COMP1, pin PE11 for COMP2)

COMP Interrupts Definitions

COMP_IT_EN

COMP private macros to check input parameters

IS_COMP_WINDOWMODE

IS_COMP_POWERMODE

IS_COMP_INPUT_PLUS

IS_COMP_INPUT_MINUS

IS_COMP_HYSTERESIS

IS_COMP_OUTPUTPOL

IS_COMP_BLANKINGSRCE

IS_COMP_TRIGGERMODE

IS_COMP_OUTPUT_LEVEL

COMP Interruption Clear Flags

COMP_CLEAR_C1IF

Clear Comparator 1 Interrupt Flag

COMP_CLEAR_C2IF

Clear Comparator 2 Interrupt Flag

COMP Output Level

COMP_OUTPUT_LEVEL_LOW

COMP_OUTPUT_LEVEL_HIGH

COMP Output Polarity

COMP_OUTPUTPOL_NONINVERTED

COMP output level is not inverted (comparator output is high when the input plus is at a higher voltage than the input minus)

COMP_OUTPUTPOL_INVERTED

COMP output level is inverted (comparator output is low when the input plus is at a higher voltage than the input minus)

COMP power mode

COMP_POWERMODE_HIGHSPEED

High Speed

COMP_POWERMODE_MEDIUMSPEED

Medium Speed

COMP_POWERMODE_ULTRALOWPOWER

Ultra-low power mode

COMP Window Mode

COMP_WINDOWMODE_DISABLE

Window mode disable: Comparators instances pair COMP1 and COMP2 are independent

COMP_WINDOWMODE_COMP1_INPUT_PLUS_COMMON

Window mode enable: Comparators instances pair COMP1 and COMP2 have their input plus connected together. The common input is COMP1 input plus (COMP2 input plus is no more accessible).

12 HAL CORDIC Generic Driver

12.1 CORDIC Firmware driver registers structures

12.1.1 __CORDIC_HandleTypeDef

__CORDIC_HandleTypeDef is defined in the stm32h7xx_hal_cordic.h

Data Fields

- ***CORDIC_TypeDef * Instance***
- ***const int32_t * pInBuff***
- ***int32_t * pOutBuff***
- ***uint32_t NbCalcToOrder***
- ***uint32_t NbCalcToGet***
- ***uint32_t DMADirection***
- ***DMA_HandleTypeDef * hdmaIn***
- ***DMA_HandleTypeDef * hdmaOut***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_CORDIC_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***void(* ErrorCallback***
- ***void(* CalculateCpltCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***CORDIC_TypeDef* __CORDIC_HandleTypeDef::Instance***
  Register base address
- ***const int32_t* __CORDIC_HandleTypeDef::pInBuff***
  Pointer to CORDIC input data buffer
- ***int32_t* __CORDIC_HandleTypeDef::pOutBuff***
  Pointer to CORDIC output data buffer
- ***uint32_t __CORDIC_HandleTypeDef::NbCalcToOrder***
  Remaining number of calculation to order
- ***uint32_t __CORDIC_HandleTypeDef::NbCalcToGet***
  Remaining number of calculation result to get
- ***uint32_t __CORDIC_HandleTypeDef::DMADirection***
  Direction of CORDIC DMA transfers
- ***DMA_HandleTypeDef* __CORDIC_HandleTypeDef::hdmaIn***
  CORDIC peripheral input data DMA handle parameters
- ***DMA_HandleTypeDef* __CORDIC_HandleTypeDef::hdmaOut***
  CORDIC peripheral output data DMA handle parameters
- ***HAL_LockTypeDef __CORDIC_HandleTypeDef::Lock***
  CORDIC locking object
- ***__IO HAL_CORDIC_StateTypeDef __CORDIC_HandleTypeDef::State***
  CORDIC state
- ***__IO uint32_t __CORDIC_HandleTypeDef::ErrorCode***
  CORDIC peripheral error code This parameter can be a value of ***CORDIC_Error_Code***

- ***void(* __CORDIC_HandleTypeDef::ErrorCallback)(struct __CORDIC_HandleTypeDef *hcordic)***
  CORDIC error callback
- ***void(* __CORDIC_HandleTypeDef::CalculateCpltCallback)(struct __CORDIC_HandleTypeDef *hcordic)***
  CORDIC calculate complete callback
- ***void(* __CORDIC_HandleTypeDef::MspInitCallback)(struct __CORDIC_HandleTypeDef *hcordic)***
  CORDIC Msp Init callback
- ***void(* __CORDIC_HandleTypeDef::MspDeInitCallback)(struct __CORDIC_HandleTypeDef *hcordic)***
  CORDIC Msp DeInit callback

12.1.2 CORDIC_ConfigTypeDef

CORDIC_ConfigTypeDef is defined in the stm32h7xx_hal_cordic.h

Data Fields

- ***uint32_t Function***
- ***uint32_t Scale***
- ***uint32_t InSize***
- ***uint32_t OutSize***
- ***uint32_t NbWrite***
- ***uint32_t NbRead***
- ***uint32_t Precision***

Field Documentation

- ***uint32_t CORDIC_ConfigTypeDef::Function***
  Function This parameter can be a value of ***CORDIC_Function***
- ***uint32_t CORDIC_ConfigTypeDef::Scale***
  Scaling factor This parameter can be a value of ***CORDIC_Scale***
- ***uint32_t CORDIC_ConfigTypeDef::InSize***
  Width of input data This parameter can be a value of ***CORDIC_In_Size***
- ***uint32_t CORDIC_ConfigTypeDef::OutSize***
  Width of output data This parameter can be a value of ***CORDIC_Out_Size***
- ***uint32_t CORDIC_ConfigTypeDef::NbWrite***
  Number of 32-bit write expected for one calculation This parameter can be a value of ***CORDIC_Nb_Write***
- ***uint32_t CORDIC_ConfigTypeDef::NbRead***
  Number of 32-bit read expected after one calculation This parameter can be a value of ***CORDIC_Nb_Read***
- ***uint32_t CORDIC_ConfigTypeDef::Precision***
  Number of cycles for calculation This parameter can be a value of ***CORDIC_Precision_In_Cycles_Number***

12.2 CORDIC Firmware driver API description

The following section lists the various functions of the CORDIC library.

12.2.1 How to use this driver

The CORDIC HAL driver can be used as follows:

1. Initialize the CORDIC low level resources by implementing the HAL_CORDIC_MspInit():
   - Enable the CORDIC interface clock using __HAL_RCC_CORDIC_CLK_ENABLE()
   - In case of using interrupts (e.g. HAL_CORDIC_Calculate_IT())
     - Configure the CORDIC interrupt priority using HAL_NVIC_SetPriority()
     - Enable the CORDIC IRQ handler using HAL_NVIC_EnableIRQ()
     - In CORDIC IRQ handler, call HAL_CORDIC_IRQHandler()
   - In case of using DMA to control data transfer (e.g. HAL_CORDIC_Calculate_DMA())
     - Enable the DMA2 interface clock using __HAL_RCC_DMA2_CLK_ENABLE()
     - Configure and enable two DMA channels one for managing data transfer from memory to peripheral (input channel) and another channel for managing data transfer from peripheral to memory (output channel)
     - Associate the initialized DMA handle to the CORDIC DMA handle using __HAL_LINKDMA()
     - Configure the priority and enable the NVIC for the transfer complete interrupt on the two DMA channels. Resort to HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ()
2. Initialize the CORDIC HAL using HAL_CORDIC_Init(). This function
   - resorts to HAL_CORDIC_MspInit() for low-level initialization,
3. Configure CORDIC processing (calculation) using HAL_CORDIC_Configure(). This function configures:
   - Processing functions: Cosine, Sine, Phase, Modulus, Arctangent, Hyperbolic cosine, Hyperbolic sine, Hyperbolic arctangent, Natural log, Square root
   - Scaling factor: 1 to 2exp(-7)
   - Width of input data: 32 bits input data size (Q1.31 format) or 16 bits input data size (Q1.15 format)
   - Width of output data: 32 bits output data size (Q1.31 format) or 16 bits output data size (Q1.15 format)
   - Number of 32-bit write expected for one calculation: One 32-bits write or Two 32-bit write
   - Number of 32-bit read expected after one calculation: One 32-bits read or Two 32-bit read
   - Precision: 1 to 15 cycles for calculation (the more cycles, the better precision)
4. Four processing (calculation) functions are available:
   - Polling mode: processing API is blocking function i.e. it processes the data and wait till the processing is finished API is HAL_CORDIC_Calculate
   - Polling Zero-overhead mode: processing API is blocking function i.e. it processes the data and wait till the processing is finished A bit faster than standard polling mode, but blocking also AHB bus API is HAL_CORDIC_CalculateZO
   - Interrupt mode: processing API is not blocking functions i.e. it processes the data under interrupt API is HAL_CORDIC_Calculate_IT
   - DMA mode: processing API is not blocking functions and the CPU is not used for data transfer, i.e. the data transfer is ensured by DMA API is HAL_CORDIC_Calculate_DMA
5. Call HAL_CORDIC_DeInit() to de-initialize the CORDIC peripheral. This function
   - resorts to HAL_CORDIC_MspDeInit() for low-level de-initialization,

Callback registration

12.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the CORDIC peripheral and the associated handle
- DeInitialize the CORDIC peripheral
- Initialize the CORDIC MSP (MCU Specific Package)
- De-Initialize the CORDIC MSP

This section contains the following APIs:

- ***HAL_CORDIC_Init()***
- ***HAL_CORDIC_DeInit()***
- ***HAL_CORDIC_MspInit()***
- ***HAL_CORDIC_MspDeInit()***

- *HAL_CORDIC_RegisterCallback()*
- *HAL_CORDIC_UnRegisterCallback()*
- *HAL_CORDIC_RegisterCallback()*

12.2.3 Peripheral Control functions

This section provides functions allowing to:

- Configure the CORDIC peripheral: function, precision, scaling factor, number of input data and output data, size of input data and output data.
- Calculate output data of CORDIC processing on input date, using the existing CORDIC configuration

Four processing functions are available for calculation:

- Polling mode
- Polling mode, with Zero-Overhead register access
- Interrupt mode
- DMA mode

This section contains the following APIs:

- *HAL_CORDIC_Configure()*
- *HAL_CORDIC_Calculate()*
- *HAL_CORDIC_CalculateZO()*
- *HAL_CORDIC_Calculate_IT()*
- *HAL_CORDIC_Calculate_DMA()*

12.2.4 Callback functions

This section provides Interruption and DMA callback functions:

- DMA or Interrupt calculate complete
- DMA or Interrupt error

This section contains the following APIs:

- *HAL_CORDIC_ErrorCallback()*
- *HAL_CORDIC_CalculateCpltCallback()*

12.2.5 IRQ handler management

This section provides IRQ handler function.

This section contains the following APIs:

- *HAL_CORDIC_IRQHandler()*

12.2.6 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- *HAL_CORDIC_GetState()*
- *HAL_CORDIC_GetError()*

12.2.7 Detailed description of functions

HAL_CORDIC_Init

Function name

HAL_StatusTypeDef HAL_CORDIC_Init (CORDIC_HandleTypeDef * hcordic)

Function description

Initialize the CORDIC peripheral and the associated handle.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure.

Return values

- **HAL:** status

HAL_CORDIC_DeInit

Function name

HAL_StatusTypeDef HAL_CORDIC_DeInit (CORDIC_HandleTypeDef * hcordic)

Function description

DeInitialize the CORDIC peripheral.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure.

Return values

- **HAL:** status

HAL_CORDIC_MspInit

Function name

void HAL_CORDIC_MspInit (CORDIC_HandleTypeDef * hcordic)

Function description

Initialize the CORDIC MSP.

Parameters

- **hcordic:** CORDIC handle

Return values

- **None:**

HAL_CORDIC_MspDeInit

Function name

void HAL_CORDIC_MspDeInit (CORDIC_HandleTypeDef * hcordic)

Function description

DeInitialize the CORDIC MSP.

Parameters

- **hcordic:** CORDIC handle

Return values

- **None:**

HAL_CORDIC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_CORDIC_RegisterCallback (CORDIC_HandleTypeDef * hcordic, HAL_CORDIC_CallbackIDTypeDef CallbackID, pCORDIC_CallbackTypeDef pCallback)

Function description

HAL_CORDIC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_CORDIC_UnRegisterCallback (CORDIC_HandleTypeDef * hcordic, HAL_CORDIC_CallbackIDTypeDef CallbackID)

Function description

Unregister a CORDIC CallBack.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_CORDIC_ERROR_CB_ID error Callback ID
  - HAL_CORDIC_CALCULATE_CPLT_CB_ID calculate complete Callback ID
  - HAL_CORDIC_MSPINIT_CB_ID MspInit callback ID
  - HAL_CORDIC_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_CORDIC_Configure

Function name

HAL_StatusTypeDef HAL_CORDIC_Configure (CORDIC_HandleTypeDef * hcordic, const CORDIC_ConfigTypeDef * sConfig)

Function description

Configure the CORDIC processing according to the specified parameters in the CORDIC_ConfigTypeDef structure.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module
- **sConfig:** pointer to a CORDIC_ConfigTypeDef structure that contains the CORDIC configuration information.

Return values

- **HAL:** status

HAL_CORDIC_Calculate

Function name

HAL_StatusTypeDef HAL_CORDIC_Calculate (CORDIC_HandleTypeDef * hcordic, const int32_t * pInBuff, int32_t * pOutBuff, uint32_t NbCalc, uint32_t Timeout)

Function description

Carry out data of CORDIC processing in polling mode, according to the existing CORDIC configuration.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module.
- **pInBuff:** Pointer to buffer containing input data for CORDIC processing.
- **pOutBuff:** Pointer to buffer where output data of CORDIC processing will be stored.
- **NbCalc:** Number of CORDIC calculation to process.
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CORDIC_CalculateZO

Function name

HAL_StatusTypeDef HAL_CORDIC_CalculateZO (CORDIC_HandleTypeDef * hcordic, const int32_t * pInBuff, int32_t * pOutBuff, uint32_t NbCalc, uint32_t Timeout)

Function description

Carry out data of CORDIC processing in Zero-Overhead mode (output data being read soon as input data are written), according to the existing CORDIC configuration.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module.
- **pInBuff:** Pointer to buffer containing input data for CORDIC processing.
- **pOutBuff:** Pointer to buffer where output data of CORDIC processing will be stored.
- **NbCalc:** Number of CORDIC calculation to process.
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CORDIC_Calculate_IT

Function name

HAL_StatusTypeDef HAL_CORDIC_Calculate_IT (CORDIC_HandleTypeDef * hcordic, const int32_t * pInBuff, int32_t * pOutBuff, uint32_t NbCalc)

Function description

Carry out data of CORDIC processing in interrupt mode, according to the existing CORDIC configuration.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module.
- **pInBuff:** Pointer to buffer containing input data for CORDIC processing.
- **pOutBuff:** Pointer to buffer where output data of CORDIC processing will be stored.
- **NbCalc:** Number of CORDIC calculation to process.

Return values

- **HAL:** status

HAL_CORDIC_Calculate_DMA

Function name

HAL_StatusTypeDef HAL_CORDIC_Calculate_DMA (CORDIC_HandleTypeDef * hcordic, const int32_t * pInBuff, int32_t * pOutBuff, uint32_t NbCalc, uint32_t DMADirection)

Function description

Carry out input and/or output data of CORDIC processing in DMA mode, according to the existing CORDIC configuration.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module.
- **pInBuff:** Pointer to buffer containing input data for CORDIC processing.
- **pOutBuff:** Pointer to buffer where output data of CORDIC processing will be stored.
- **NbCalc:** Number of CORDIC calculation to process.
- **DMADirection:** Direction of DMA transfers. This parameter can be one of the following values:
  – CORDIC DMA direction CORDIC DMA direction

Return values

- **HAL:** status

Notes

- pInBuff or pOutBuff is unused in case of unique DMADirection transfer, and can be set to NULL value in this case.
- pInBuff and pOutBuff buffers must be 32-bit aligned to ensure a correct DMA transfer to and from the Peripheral.

HAL_CORDIC_ErrorCallback

Function name

void HAL_CORDIC_ErrorCallback (CORDIC_HandleTypeDef * hcordic)

Function description

CORDIC error callback.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module

Return values

- **None:**

HAL_CORDIC_CalculateCpltCallback

Function name

void HAL_CORDIC_CalculateCpltCallback (CORDIC_HandleTypeDef * hcordic)

Function description

CORDIC calculate complete callback.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module

Return values

- **None:**

HAL_CORDIC_IRQHandler

Function name

void HAL_CORDIC_IRQHandler (CORDIC_HandleTypeDef * hcordic)

Function description

Handle CORDIC interrupt request.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module

Return values

- **None:**

HAL_CORDIC_GetState

Function name

HAL_CORDIC_StateTypeDef HAL_CORDIC_GetState (const CORDIC_HandleTypeDef * hcordic)

Function description

Return the CORDIC handle state.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module

Return values

- **HAL:** state

HAL_CORDIC_GetError

Function name

uint32_t HAL_CORDIC_GetError (const CORDIC_HandleTypeDef * hcordic)

Function description

Return the CORDIC peripheral error.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module

Return values

- **Error:** bit-map

Notes

- The returned error is a bit-map combination of possible errors

12.3 CORDIC Firmware driver defines

The following section lists the various define and macros of the module.

12.3.1 CORDIC

CORDIC

DMA Read Request Enable bit

CORDIC_DMA_REN

DMA Read requests enable

DMA Write Request Enable bit

CORDIC_DMA_WEN

DMA Write channel enable

CORDIC DMA direction

CORDIC_DMA_DIR_NONE

DMA direction : none

CORDIC_DMA_DIR_IN

DMA direction : Input of CORDIC

CORDIC_DMA_DIR_OUT

DMA direction : Output of CORDIC

CORDIC_DMA_DIR_IN_OUT

DMA direction : Input and Output of CORDIC

CORDIC Error code

HAL_CORDIC_ERROR_NONE

No error

HAL_CORDIC_ERROR_PARAM

Wrong parameter error

HAL_CORDIC_ERROR_NOT_READY

Peripheral not ready

HAL_CORDIC_ERROR_TIMEOUT

Timeout error

HAL_CORDIC_ERROR_DMA

DMA error

HAL_CORDIC_ERROR_INVALID_CALLBACK

Invalid Callback error

CORDIC Exported Macros

__HAL_CORDIC_RESET_HANDLE_STATE

Description:

- Reset CORDIC handle state.

Parameters:

- __HANDLE__: CORDIC handle

Return value:

- None

__HAL_CORDIC_ENABLE_IT

Description:

- Enable the CORDIC interrupt when result is ready.

Parameters:

- __HANDLE__: CORDIC handle.
- __INTERRUPT__: CORDIC Interrupt. This parameter can be one of the following values:
  - CORDIC_IT_IEN Enable Interrupt

Return value:

- None

__HAL_CORDIC_DISABLE_IT

Description:

- Disable the CORDIC interrupt.

Parameters:

- __HANDLE__: CORDIC handle.
- __INTERRUPT__: CORDIC Interrupt. This parameter can be one of the following values:
  - CORDIC_IT_IEN Enable Interrupt

Return value:

- None

__HAL_CORDIC_GET_IT

Description:

- Check whether the specified CORDIC interrupt occurred or not.

Parameters:

- __HANDLE__: CORDIC handle.
- __INTERRUPT__: CORDIC interrupt to check

Return value:

- SET: (interrupt occurred) or RESET (interrupt did not occurred)

__HAL_CORDIC_CLEAR_IT

Description:

- Clear specified CORDIC interrupt status.

Parameters:

- __HANDLE__: CORDIC handle.
- __INTERRUPT__: CORDIC interrupt to clear

Return value:

- None

__HAL_CORDIC_GET_FLAG

Description:

- Check whether the specified CORDIC status flag is set or not.

Parameters:

- __HANDLE__: CORDIC handle.
- __FLAG__: CORDIC flag to check This parameter can be one of the following values:
  - CORDIC_FLAG_RRDY Result Ready Flag

Return value:

- SET: (flag is set) or RESET (flag is reset)

__HAL_CORDIC_CLEAR_FLAG

Description:

- Clear specified CORDIC status flag.

Parameters:

- __HANDLE__: CORDIC handle.
- __FLAG__: CORDIC flag to clear This parameter can be one of the following values:
  - CORDIC_FLAG_RRDY Result Ready Flag

Return value:

- None

__HAL_CORDIC_GET_IT_SOURCE

Description:

- Check whether the specified CORDIC interrupt is enabled or not.

Parameters:

- __HANDLE__: CORDIC handle.
- __INTERRUPT__: CORDIC interrupt to check This parameter can be one of the following values:
  - CORDIC_IT_IEN Enable Interrupt

Return value:

- FlagStatus

CORDIC status flags

CORDIC_FLAG_RRDY

Result Ready Flag

CORDIC Function

CORDIC_FUNCTION_COSINE

Cosine

CORDIC_FUNCTION_SINE

Sine

CORDIC_FUNCTION_PHASE

Phase

CORDIC_FUNCTION_MODULUS

Modulus

CORDIC_FUNCTION_ARCTANGENT

Arctangent

CORDIC_FUNCTION_HCOSINE

Hyperbolic Cosine

CORDIC_FUNCTION_HSINE

Hyperbolic Sine

CORDIC_FUNCTION_HARCTANGENT

Hyperbolic Arctangent

CORDIC_FUNCTION_NATURALLOG

Natural Logarithm

CORDIC_FUNCTION_SQUAREROOT

Square Root

CORDIC Interrupts Enable bit

CORDIC_IT_IEN

Result ready interrupt enable

CORDIC input data size

CORDIC_INSIZE_32BITS

32 bits input data size (Q1.31 format)

CORDIC_INSIZE_16BITS

16 bits input data size (Q1.15 format)

CORDIC Number of 32-bit read required after one calculation

CORDIC_NBREAD_1

One 32-bits read containing either only one 32-bit data output (Q1.31 format), or two 16-bit data output (Q1.15 format) packed in one 32 bits Data

CORDIC_NBREAD_2

Two 32-bit Data containing two 32-bits data output (Q1.31 format)

CORDIC Number of 32-bit write required for one calculation

CORDIC_NBWRITE_1

One 32-bits write containing either only one 32-bit data input (Q1.31 format), or two 16-bit data input (Q1.15 format) packed in one 32 bits Data

CORDIC_NBWRITE_2

Two 32-bit write containing two 32-bits data input (Q1.31 format)

CORDIC Results Size

CORDIC_OUTSIZE_32BITS

32 bits output data size (Q1.31 format)

CORDIC_OUTSIZE_16BITS

16 bits output data size (Q1.15 format)

13 HAL CORTEX Generic Driver

13.1 CORTEX Firmware driver API description

The following section lists the various functions of the CORTEX library.

13.1.1 How to use this driver

How to configure Interrupts using CORTEX HAL driver

This section provides functions allowing to configure the NVIC interrupts (IRQ). The Cortex-M exceptions are managed by CMSIS functions.

1. Configure the NVIC Priority Grouping using HAL_NVIC_SetPriorityGrouping() function according to the following table.
2. Configure the priority of the selected IRQ Channels using HAL_NVIC_SetPriority().
3. Enable the selected IRQ Channels using HAL_NVIC_EnableIRQ().
4. please refer to programming manual for details in how to configure priority.

Note: When the NVIC_PRIORITYGROUP_0 is selected, IRQ preemption is no more possible. The pending IRQ priority will be managed only by the sub priority.

Note: IRQ priority order (sorted by highest to lowest priority):

- *Lowest preemption priority*
- *Lowest sub priority*
- *Lowest hardware priority (IRQ number)*

How to configure Systick using CORTEX HAL driver

Setup SysTick Timer for time base.

- The HAL_SYSTICK_Config() function calls the SysTick_Config() function which is a CMSIS function that:
  - Configures the SysTick Reload register with value passed as function parameter.
  - Configures the SysTick IRQ priority to the lowest value (0x0F).
  - Resets the SysTick Counter register.
  - Configures the SysTick Counter clock source to be Core Clock Source (HCLK).
  - Enables the SysTick Interrupt.
  - Starts the SysTick Counter.
- You can change the SysTick Clock source to be HCLK_Div8 by calling the macro HAL_SYSTICK_CLKSourceConfig(SYSTICK_CLKSOURCE_HCLK_DIV8) just after the HAL_SYSTICK_Config() function call. The HAL_SYSTICK_CLKSourceConfig() macro is defined inside the stm32h7xx_hal_cortex.h file.
- You can change the SysTick IRQ priority by calling the HAL_NVIC_SetPriority(SysTick_IRQn,...) function just after the HAL_SYSTICK_Config() function call. The HAL_NVIC_SetPriority() call the NVIC_SetPriority() function which is a CMSIS function.
- To adjust the SysTick time base, use the following formula: Reload Value = SysTick Counter Clock (Hz) x Desired Time base (s)
  - Reload Value is the parameter to be passed for HAL_SYSTICK_Config() function
  - Reload Value should not exceed 0xFFFFFF

13.1.2 Initialization and de-initialization functions

This section provides the CORTEX HAL driver functions allowing to configure Interrupts Systick functionalities

This section contains the following APIs:

- ***HAL_NVIC_SetPriorityGrouping()***

- *HAL_NVIC_SetPriority()*
- *HAL_NVIC_EnableIRQ()*
- *HAL_NVIC_DisableIRQ()*
- *HAL_NVIC_SystemReset()*
- *HAL_SYSTICK_Config()*

13.1.3 Peripheral Control functions

This subsection provides a set of functions allowing to control the CORTEX (NVIC, SYSTICK, MPU) functionalities.

This section contains the following APIs:

- *HAL_NVIC_GetPriorityGrouping()*
- *HAL_NVIC_GetPriority()*
- *HAL_NVIC_SetPendingIRQ()*
- *HAL_NVIC_GetPendingIRQ()*
- *HAL_NVIC_ClearPendingIRQ()*
- *HAL_NVIC_GetActive()*
- *HAL_SYSTICK_CLKSourceConfig()*
- *HAL_SYSTICK_IRQHandler()*
- *HAL_SYSTICK_Callback()*
- *HAL_GetCurrentCPUID()*

13.1.4 Detailed description of functions

HAL_NVIC_SetPriorityGrouping

Function name

void HAL_NVIC_SetPriorityGrouping (uint32_t PriorityGroup)

Function description

Sets the priority grouping field (preemption priority and subpriority) using the required unlock sequence.

Parameters

- **PriorityGroup:** The priority grouping bits length. This parameter can be one of the following values:
  - NVIC_PRIORITYGROUP_0: 0 bits for preemption priority 4 bits for subpriority
  - NVIC_PRIORITYGROUP_1: 1 bits for preemption priority 3 bits for subpriority
  - NVIC_PRIORITYGROUP_2: 2 bits for preemption priority 2 bits for subpriority
  - NVIC_PRIORITYGROUP_3: 3 bits for preemption priority 1 bits for subpriority
  - NVIC_PRIORITYGROUP_4: 4 bits for preemption priority 0 bits for subpriority

Return values

- **None:**

Notes

- When the NVIC_PriorityGroup_0 is selected, IRQ preemption is no more possible. The pending IRQ priority will be managed only by the subpriority.

HAL_NVIC_SetPriority

Function name

void HAL_NVIC_SetPriority (IRQn_Type IRQn, uint32_t PreemptPriority, uint32_t SubPriority)

Function description

Sets the priority of an interrupt.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32h7xxxx.h))
- **PreemptPriority:** The preemption priority for the IRQn channel. This parameter can be a value between 0 and 15 A lower priority value indicates a higher priority
- **SubPriority:** the subpriority level for the IRQ channel. This parameter can be a value between 0 and 15 A lower priority value indicates a higher priority.

Return values

- **None:**

HAL_NVIC_EnableIRQ

Function name

void HAL_NVIC_EnableIRQ (IRQn_Type IRQn)

Function description

Enables a device specific interrupt in the NVIC interrupt controller.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32h7xxxx.h))

Return values

- **None:**

Notes

- To configure interrupts priority correctly, the NVIC_PriorityGroupConfig() function should be called before.

HAL_NVIC_DisableIRQ

Function name

void HAL_NVIC_DisableIRQ (IRQn_Type IRQn)

Function description

Disables a device specific interrupt in the NVIC interrupt controller.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32h7xxxx.h))

Return values

- **None:**

HAL_NVIC_SystemReset

Function name

void HAL_NVIC_SystemReset (void)

Function description

Initiates a system reset request to reset the MCU.

Return values

- **None:**

HAL_SYSTICK_Config

Function name

uint32_t HAL_SYSTICK_Config (uint32_t TicksNumb)

Function description

Initializes the System Timer and its interrupt, and starts the System Tick Timer.

Parameters

- **TicksNumb:** Specifies the ticks Number of ticks between two interrupts.

Return values

- **status:** - 0 Function succeeded.
  - 1 Function failed.

HAL_NVIC_GetPriorityGrouping

Function name

uint32_t HAL_NVIC_GetPriorityGrouping (void)

Function description

Gets the priority grouping field from the NVIC Interrupt Controller.

Return values

- **Priority:** grouping field (SCB->AIRCR [10:8] PRIGROUP field)

HAL_NVIC_GetPriority

Function name

void HAL_NVIC_GetPriority (IRQn_Type IRQn, uint32_t PriorityGroup, uint32_t * pPreemptPriority, uint32_t * pSubPriority)

Function description

Gets the priority of an interrupt.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32h7xxxx.h))
- **PriorityGroup:** the priority grouping bits length. This parameter can be one of the following values:
  - NVIC_PRIORITYGROUP_0: 0 bits for preemption priority 4 bits for subpriority
  - NVIC_PRIORITYGROUP_1: 1 bits for preemption priority 3 bits for subpriority
  - NVIC_PRIORITYGROUP_2: 2 bits for preemption priority 2 bits for subpriority
  - NVIC_PRIORITYGROUP_3: 3 bits for preemption priority 1 bits for subpriority
  - NVIC_PRIORITYGROUP_4: 4 bits for preemption priority 0 bits for subpriority
- **pPreemptPriority:** Pointer on the Preemptive priority value (starting from 0).
- **pSubPriority:** Pointer on the Subpriority value (starting from 0).

Return values

- **None:**

HAL_NVIC_GetPendingIRQ

Function name

uint32_t HAL_NVIC_GetPendingIRQ (IRQn_Type IRQn)

Function description

Gets Pending Interrupt (reads the pending register in the NVIC and returns the pending bit for the specified interrupt).

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32h7xxxx.h))

Return values

- **status:** - 0 Interrupt status is not pending.
  - 1 Interrupt status is pending.

HAL_NVIC_SetPendingIRQ

Function name

void HAL_NVIC_SetPendingIRQ (IRQn_Type IRQn)

Function description

Sets Pending bit of an external interrupt.

Parameters

- **IRQn:** External interrupt number This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32h7xxxx.h))

Return values

- **None:**

HAL_NVIC_ClearPendingIRQ

Function name

void HAL_NVIC_ClearPendingIRQ (IRQn_Type IRQn)

Function description

Clears the pending bit of an external interrupt.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32h7xxxx.h))

Return values

- **None:**

HAL_NVIC_GetActive

Function name

uint32_t HAL_NVIC_GetActive (IRQn_Type IRQn)

Function description

Gets active interrupt (reads the active register in NVIC and returns the active bit).

Parameters

- **IRQn:** External interrupt number This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32h7xxxx.h))

Return values

- **status:** - 0 Interrupt status is not pending.
  - 1 Interrupt status is pending.

HAL_SYSTICK_CLKSourceConfig

Function name

void HAL_SYSTICK_CLKSourceConfig (uint32_t CLKSource)

Function description

Configures the SysTick clock source.

Parameters

- **CLKSource:** specifies the SysTick clock source. This parameter can be one of the following values:
  - SYSTICK_CLKSOURCE_HCLK_DIV8: AHB clock divided by 8 selected as SysTick clock source.
  - SYSTICK_CLKSOURCE_HCLK: AHB clock selected as SysTick clock source.

Return values

- **None:**

HAL_SYSTICK_IRQHandler

Function name

void HAL_SYSTICK_IRQHandler (void)

Function description

This function handles SYSTICK interrupt request.

Return values

- **None:**

HAL_SYSTICK_Callback

Function name

void HAL_SYSTICK_Callback (void)

Function description

SYSTICK callback.

Return values

- **None:**

HAL_GetCurrentCPUID

Function name

uint32_t HAL_GetCurrentCPUID (void)

Function description

Returns the current CPU ID.

Return values

- **CPU:** identifier

13.2 CORTEX Firmware driver defines

The following section lists the various define and macros of the module.

13.2.1 CORTEX

CORTEX

CORTEX_CPU_Identifier

CM7_CPUID

CM4_CPUID

CORTEX Preemption Priority Group

NVIC_PRIORITYGROUP_0

0 bits for pre-emption priority 4 bits for subpriority

NVIC_PRIORITYGROUP_1

1 bits for pre-emption priority 3 bits for subpriority

NVIC_PRIORITYGROUP_2

2 bits for pre-emption priority 2 bits for subpriority

NVIC_PRIORITYGROUP_3

3 bits for pre-emption priority 1 bits for subpriority

NVIC_PRIORITYGROUP_4

4 bits for pre-emption priority 0 bits for subpriority

CORTEX _SysTick clock source

SYSTICK_CLKSOURCE_HCLK_DIV8

SYSTICK_CLKSOURCE_HCLK

14 HAL CRC Generic Driver

14.1 CRC Firmware driver registers structures

14.1.1 CRC_InitTypeDef

CRC_InitTypeDef is defined in the stm32h7xx_hal_crc.h

Data Fields

- ***uint8_t DefaultPolynomialUse***
- ***uint8_t DefaultInitValueUse***
- ***uint32_t GeneratingPolynomial***
- ***uint32_t CRCLength***
- ***uint32_t InitValue***
- ***uint32_t InputDataInversionMode***
- ***uint32_t OutputDataInversionMode***

Field Documentation

- ***uint8_t CRC_InitTypeDef::DefaultPolynomialUse***

  This parameter is a value of ***CRC_Default_Polynomial*** and indicates if default polynomial is used. If set to DEFAULT_POLYNOMIAL_ENABLE, resort to default X^32 + X^26 + X^23 + X^22 + X^16 + X^12 + X^11 + X^10 +X^8 + X^7 + X^5 + X^4 + X^2+ X +1. In that case, there is no need to set GeneratingPolynomial field. If otherwise set to DEFAULT_POLYNOMIAL_DISABLE, GeneratingPolynomial and CRCLength fields must be set.

- ***uint8_t CRC_InitTypeDef::DefaultInitValueUse***

  This parameter is a value of ***CRC_Default_InitValue_Use*** and indicates if default init value is used. If set to DEFAULT_INIT_VALUE_ENABLE, resort to default 0xFFFFFFFF value. In that case, there is no need to set InitValue field. If otherwise set to DEFAULT_INIT_VALUE_DISABLE, InitValue field must be set.

- ***uint32_t CRC_InitTypeDef::GeneratingPolynomial***

  Set CRC generating polynomial as a 7, 8, 16 or 32-bit long value for a polynomial degree respectively equal to 7, 8, 16 or 32. This field is written in normal, representation e.g., for a polynomial of degree 7, X^7 + X^6 + X^5 + X^2 + 1 is written 0x65. No need to specify it if DefaultPolynomialUse is set to DEFAULT_POLYNOMIAL_ENABLE.

- ***uint32_t CRC_InitTypeDef::CRCLength***

  This parameter is a value of ***CRC_Polynomial_Sizes*** and indicates CRC length. Value can be either one of
  - **CRC_POLYLENGTH_32B** (32-bit CRC),
  - **CRC_POLYLENGTH_16B** (16-bit CRC),
  - **CRC_POLYLENGTH_8B** (8-bit CRC),
  - **CRC_POLYLENGTH_7B** (7-bit CRC).

- ***uint32_t CRC_InitTypeDef::InitValue***

  Init value to initiate CRC computation. No need to specify it if DefaultInitValueUse is set to DEFAULT_INIT_VALUE_ENABLE.

- ***uint32_t CRC_InitTypeDef::InputDataInversionMode***

  This parameter is a value of ***CRCEx_Input_Data_Inversion*** and specifies input data inversion mode. Can be either one of the following values
  - **CRC_INPUTDATA_INVERSION_NONE** no input data inversion
  - **CRC_INPUTDATA_INVERSION_BYTE** byte-wise inversion, 0x1A2B3C4D becomes 0x58D43CB2
  - **CRC_INPUTDATA_INVERSION_HALFWORD** halfword-wise inversion, 0x1A2B3C4D becomes 0xD458B23C
  - **CRC_INPUTDATA_INVERSION_WORD** word-wise inversion, 0x1A2B3C4D becomes 0xB23CD458

- ***uint32_t CRC_InitTypeDef::OutputDataInversionMode***

  This parameter is a value of ***CRCEx_Output_Data_Inversion*** and specifies output data (i.e. CRC) inversion mode. Can be either
  - **CRC_OUTPUTDATA_INVERSION_DISABLE** no CRC inversion,
  - **CRC_OUTPUTDATA_INVERSION_ENABLE** CRC 0x11223344 is converted into 0x22CC4488

14.1.2 CRC_HandleTypeDef

CRC_HandleTypeDef is defined in the stm32h7xx_hal_crc.h

Data Fields

- ***CRC_TypeDef * Instance***
- ***CRC_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_CRC_StateTypeDef State***
- ***uint32_t InputDataFormat***

Field Documentation

- ***CRC_TypeDef* CRC_HandleTypeDef::Instance***

  Register base address
- ***CRC_InitTypeDef CRC_HandleTypeDef::Init***

  CRC configuration parameters
- ***HAL_LockTypeDef CRC_HandleTypeDef::Lock***

  CRC Locking object
- ***__IO HAL_CRC_StateTypeDef CRC_HandleTypeDef::State***

  CRC communication state
- ***uint32_t CRC_HandleTypeDef::InputDataFormat***

  This parameter is a value of ***CRC_Input_Buffer_Format*** and specifies input data format. Can be either
  - **CRC_INPUTDATA_FORMAT_BYTES** input data is a stream of bytes (8-bit data)
  - **CRC_INPUTDATA_FORMAT_HALFWORDS** input data is a stream of half-words (16-bit data)
  - **CRC_INPUTDATA_FORMAT_WORDS** input data is a stream of words (32-bit data)

  Note that constant CRC_INPUT_FORMAT_UNDEFINED is defined but an initialization error must occur if InputBufferFormat is not one of the three values listed above

14.2 CRC Firmware driver API description

The following section lists the various functions of the CRC library.

14.2.1 How to use this driver

- Enable CRC AHB clock using __HAL_RCC_CRC_CLK_ENABLE();
- Initialize CRC calculator
  - specify generating polynomial (peripheral default or non-default one)
  - specify initialization value (peripheral default or non-default one)
  - specify input data format
  - specify input or output data inversion mode if any
- Use HAL_CRC_Accumulate() function to compute the CRC value of the input data buffer starting with the previously computed CRC as initialization value
- Use HAL_CRC_Calculate() function to compute the CRC value of the input data buffer starting with the defined initialization value (default or non-default) to initiate CRC calculation

14.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the CRC according to the specified parameters in the CRC_InitTypeDef and create the associated handle
- DeInitialize the CRC peripheral
- Initialize the CRC MSP (MCU Specific Package)
- DeInitialize the CRC MSP

This section contains the following APIs:

- ***HAL_CRC_Init()***
- ***HAL_CRC_DeInit()***
- ***HAL_CRC_MspInit()***
- ***HAL_CRC_MspDeInit()***

14.2.3 Peripheral Control functions

This section provides functions allowing to:

- compute the 7, 8, 16 or 32-bit CRC value of an 8, 16 or 32-bit data buffer using combination of the previous CRC value and the new one.

or

- compute the 7, 8, 16 or 32-bit CRC value of an 8, 16 or 32-bit data buffer independently of the previous CRC value.

This section contains the following APIs:

- ***HAL_CRC_Accumulate()***
- ***HAL_CRC_Calculate()***

14.2.4 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- ***HAL_CRC_GetState()***

14.2.5 Detailed description of functions

HAL_CRC_Init

Function name

HAL_StatusTypeDef HAL_CRC_Init (CRC_HandleTypeDef * hcrc)

Function description

Initialize the CRC according to the specified parameters in the CRC_InitTypeDef and create the associated handle.

Parameters

- **hcrc:** CRC handle

Return values

- **HAL:** status

HAL_CRC_DeInit

Function name

HAL_StatusTypeDef HAL_CRC_DeInit (CRC_HandleTypeDef * hcrc)

Function description

DeInitialize the CRC peripheral.

Parameters

- **hcrc:** CRC handle

Return values

- **HAL:** status

HAL_CRC_MspInit

Function name

void HAL_CRC_MspInit (CRC_HandleTypeDef * hcrc)

Function description

Initializes the CRC MSP.

Parameters

- **hcrc:** CRC handle

Return values

- **None:**

HAL_CRC_MspDeInit

Function name

void HAL_CRC_MspDeInit (CRC_HandleTypeDef * hcrc)

Function description

DeInitialize the CRC MSP.

Parameters

- **hcrc:** CRC handle

Return values

- **None:**

HAL_CRC_Accumulate

Function name

uint32_t HAL_CRC_Accumulate (CRC_HandleTypeDef * hcrc, uint32_t pBuffer, uint32_t BufferLength)

Function description

Compute the 7, 8, 16 or 32-bit CRC value of an 8, 16 or 32-bit data buffer starting with the previously computed CRC as initialization value.

Parameters

- **hcrc:** CRC handle
- **pBuffer:** pointer to the input data buffer, exact input data format is provided by hcrc->InputDataFormat.
- **BufferLength:** input data buffer length (number of bytes if pBuffer type is * uint8_t, number of half-words if pBuffer type is * uint16_t, number of words if pBuffer type is * uint32_t).

Return values

- **uint32_t:** CRC (returned value LSBs for CRC shorter than 32 bits)

Notes

- By default, the API expects a uint32_t pointer as input buffer parameter. Input buffer pointers with other types simply need to be cast in uint32_t and the API will internally adjust its input data processing based on the handle field hcrc->InputDataFormat.

HAL_CRC_Calculate

Function name

uint32_t HAL_CRC_Calculate (CRC_HandleTypeDef * hcrc, uint32_t pBuffer, uint32_t BufferLength)

Function description

Compute the 7, 8, 16 or 32-bit CRC value of an 8, 16 or 32-bit data buffer starting with hcrc->Instance->INIT as initialization value.

Parameters

- **hcrc:** CRC handle
- **pBuffer:** pointer to the input data buffer, exact input data format is provided by hcrc->InputDataFormat.
- **BufferLength:** input data buffer length (number of bytes if pBuffer type is * uint8_t, number of half-words if pBuffer type is * uint16_t, number of words if pBuffer type is * uint32_t).

Return values

- **uint32_t:** CRC (returned value LSBs for CRC shorter than 32 bits)

Notes

- By default, the API expects a uint32_t pointer as input buffer parameter. Input buffer pointers with other types simply need to be cast in uint32_t and the API will internally adjust its input data processing based on the handle field hcrc->InputDataFormat.

HAL_CRC_GetState

Function name

HAL_CRC_StateTypeDef HAL_CRC_GetState (CRC_HandleTypeDef * hcrc)

Function description

Return the CRC handle state.

Parameters

- **hcrc:** CRC handle

Return values

- **HAL:** state

14.3 CRC Firmware driver defines

The following section lists the various define and macros of the module.

14.3.1 CRC

CRC

Default CRC computation initialization value

DEFAULT_CRC_INITVALUE

Initial CRC default value

Indicates whether or not default init value is used

DEFAULT_INIT_VALUE_ENABLE

Enable initial CRC default value

DEFAULT_INIT_VALUE_DISABLE

Disable initial CRC default value

Indicates whether or not default polynomial is used

DEFAULT_POLYNOMIAL_ENABLE

Enable default generating polynomial 0x04C11DB7

DEFAULT_POLYNOMIAL_DISABLE

Disable default generating polynomial 0x04C11DB7

Default CRC generating polynomial

DEFAULT_CRC32_POLY

X^32 + X^26 + X^23 + X^22 + X^16 + X^12 + X^11 + X^10 +X^8 + X^7 + X^5 + X^4 + X^2+ X +1

CRC Exported Macros

__HAL_CRC_RESET_HANDLE_STATE

Description:

- Reset CRC handle state.

Parameters:

- __HANDLE__: CRC handle.

Return value:

- None

__HAL_CRC_DR_RESET

Description:

- Reset CRC Data Register.

Parameters:

- __HANDLE__: CRC handle

Return value:

- None

__HAL_CRC_INITIALCRCVALUE_CONFIG

Description:

- Set CRC INIT non-default value.

Parameters:

- __HANDLE__: CRC handle
- __INIT__: 32-bit initial value

Return value:

- None

__HAL_CRC_SET_IDR

Description:

- Store data in the Independent Data (ID) register.

Parameters:

- __HANDLE__: CRC handle
- __VALUE__: Value to be stored in the ID register

Return value:

- None

Notes:

- Refer to the Reference Manual to get the authorized __VALUE__ length in bits

__HAL_CRC_GET_IDR

Description:

- Return the data stored in the Independent Data (ID) register.

Parameters:

- __HANDLE__: CRC handle

Return value:

- Value: of the ID register

Notes:

- Refer to the Reference Manual to get the authorized __VALUE__ length in bits

Input Buffer Format

CRC_INPUTDATA_FORMAT_UNDEFINED

Undefined input data format

CRC_INPUTDATA_FORMAT_BYTES

Input data in byte format

CRC_INPUTDATA_FORMAT_HALFWORDS

Input data in half-word format

CRC_INPUTDATA_FORMAT_WORDS

Input data in word format

Polynomial sizes to configure the peripheral

CRC_POLYLENGTH_32B

Resort to a 32-bit long generating polynomial

CRC_POLYLENGTH_16B

Resort to a 16-bit long generating polynomial

CRC_POLYLENGTH_8B

Resort to a 8-bit long generating polynomial

CRC_POLYLENGTH_7B

Resort to a 7-bit long generating polynomial

CRC polynomial possible sizes actual definitions

HAL_CRC_LENGTH_32B

32-bit long CRC

HAL_CRC_LENGTH_16B

16-bit long CRC

HAL_CRC_LENGTH_8B

8-bit long CRC

HAL_CRC_LENGTH_7B

7-bit long CRC

15 HAL CRC Extension Driver

15.1 CRCEx Firmware driver API description

The following section lists the various functions of the CRCEx library.

15.1.1 How to use this driver

- Set user-defined generating polynomial through HAL_CRCEx_Polynomial_Set()
- Configure Input or Output data inversion

15.1.2 Extended configuration functions

This section provides functions allowing to:

- Configure the generating polynomial
- Configure the input data inversion
- Configure the output data inversion

This section contains the following APIs:

- ***HAL_CRCEx_Polynomial_Set()***
- ***HAL_CRCEx_Input_Data_Reverse()***
- ***HAL_CRCEx_Output_Data_Reverse()***

15.1.3 Detailed description of functions

HAL_CRCEx_Polynomial_Set

Function name

HAL_StatusTypeDef HAL_CRCEx_Polynomial_Set (CRC_HandleTypeDef * hcrc, uint32_t Pol, uint32_t PolyLength)

Function description

Initialize the CRC polynomial if different from default one.

Parameters

- **hcrc:** CRC handle
- **Pol:** CRC generating polynomial (7, 8, 16 or 32-bit long). This parameter is written in normal representation, e.g.
  - for a polynomial of degree 7, X^7 + X^6 + X^5 + X^2 + 1 is written 0x65
  - for a polynomial of degree 16, X^16 + X^12 + X^5 + 1 is written 0x1021
- **PolyLength:** CRC polynomial length. This parameter can be one of the following values:
  - CRC_POLYLENGTH_7B 7-bit long CRC (generating polynomial of degree 7)
  - CRC_POLYLENGTH_8B 8-bit long CRC (generating polynomial of degree 8)
  - CRC_POLYLENGTH_16B 16-bit long CRC (generating polynomial of degree 16)
  - CRC_POLYLENGTH_32B 32-bit long CRC (generating polynomial of degree 32)

Return values

- **HAL:** status

HAL_CRCEx_Input_Data_Reverse

Function name

HAL_StatusTypeDef HAL_CRCEx_Input_Data_Reverse (CRC_HandleTypeDef * hcrc, uint32_t InputReverseMode)

Function description

Set the Reverse Input data mode.

Parameters

- **hcrc:** CRC handle
- **InputReverseMode:** Input Data inversion mode. This parameter can be one of the following values:
  - CRC_INPUTDATA_INVERSION_NONE no change in bit order (default value)
  - CRC_INPUTDATA_INVERSION_BYTE Byte-wise bit reversal
  - CRC_INPUTDATA_INVERSION_HALFWORD HalfWord-wise bit reversal
  - CRC_INPUTDATA_INVERSION_WORD Word-wise bit reversal

Return values

- **HAL:** status

HAL_CRCEx_Output_Data_Reverse

Function name

HAL_StatusTypeDef HAL_CRCEx_Output_Data_Reverse (CRC_HandleTypeDef * hcrc, uint32_t OutputReverseMode)

Function description

Set the Reverse Output data mode.

Parameters

- **hcrc:** CRC handle
- **OutputReverseMode:** Output Data inversion mode. This parameter can be one of the following values:
  - CRC_OUTPUTDATA_INVERSION_DISABLE no CRC inversion (default value)
  - CRC_OUTPUTDATA_INVERSION_ENABLE bit-level inversion (e.g. for a 8-bit CRC: 0xB5 becomes 0xAD)

Return values

- **HAL:** status

15.2 CRCEx Firmware driver defines

The following section lists the various define and macros of the module.

15.2.1 CRCEx

CRCEx

CRC Extended Exported Macros

__HAL_CRC_OUTPUTREVERSAL_ENABLE

Description:

- Set CRC output reversal.

Parameters:

- __HANDLE__: CRC handle

Return value:

- None

__HAL_CRC_OUTPUTREVERSAL_DISABLE

Description:

- Unset CRC output reversal.

Parameters:

- __HANDLE__: CRC handle

Return value:

- None

__HAL_CRC_POLYNOMIAL_CONFIG

Description:

- Set CRC non-default polynomial.

Parameters:

- __HANDLE__: CRC handle
- __POLYNOMIAL__: 7, 8, 16 or 32-bit polynomial

Return value:

- None

Input Data Inversion Modes

CRC_INPUTDATA_INVERSION_NONE

No input data inversion

CRC_INPUTDATA_INVERSION_BYTE

Byte-wise input data inversion

CRC_INPUTDATA_INVERSION_HALFWORD

HalfWord-wise input data inversion

CRC_INPUTDATA_INVERSION_WORD

Word-wise input data inversion

Output Data Inversion Modes

CRC_OUTPUTDATA_INVERSION_DISABLE

No output data inversion

CRC_OUTPUTDATA_INVERSION_ENABLE

Bit-wise output data inversion

16 HAL CRYP Generic Driver

16.1 CRYP Firmware driver registers structures

16.1.1 CRYP_ConfigTypeDef

CRYP_ConfigTypeDef is defined in the stm32h7xx_hal_cryp.h

Data Fields

- ***uint32_t DataType***
- ***uint32_t KeySize***
- ***uint32_t * pKey***
- ***uint32_t * pInitVect***
- ***uint32_t Algorithm***
- ***uint32_t * Header***

- ***uint32_t DataWidthUnit***
- ***uint32_t HeaderWidthUnit***
- ***uint32_t KeyIVConfigSkip***

Field Documentation

- ***uint32_t CRYP_ConfigTypeDef::DataType***
  no swap(32-bit data), halfword swap(16-bit data), byte swap(8-bit data) or bit swap(1-bit data).this parameter can be a value of ***CRYP_Data_Type***
- ***uint32_t CRYP_ConfigTypeDef::KeySize***
  Used only in AES mode : 128, 192 or 256 bit key length in CRYP1. This parameter can be a value of ***CRYP_Key_Size***
- ***uint32_t* CRYP_ConfigTypeDef::pKey***
  The key used for encryption/decryption
- ***uint32_t* CRYP_ConfigTypeDef::pInitVect***
  The initialization vector used also as initialization counter in CTR mode
- ***uint32_t CRYP_ConfigTypeDef::Algorithm***
  DES/ TDES Algorithm ECB/CBC AES Algorithm ECB/CBC/CTR/GCM or CCM This parameter can be a value of ***CRYP_Algorithm_Mode***
- ***uint32_t* CRYP_ConfigTypeDef::Header***
  used only in AES GCM and CCM Algorithm for authentication, GCM : also known as Additional Authentication Data CCM : named B1 composed of the associated data length and Associated Data.
- ***uint32_t CRYP_ConfigTypeDef::HeaderSize***
  The size of header buffer
- ***uint32_t* CRYP_ConfigTypeDef::B0***
  B0 is first authentication block used only in AES CCM mode
- ***uint32_t CRYP_ConfigTypeDef::DataWidthUnit***
  Payload data Width Unit, this parameter can be value of ***CRYP_Data_Width_Unit***
- ***uint32_t CRYP_ConfigTypeDef::HeaderWidthUnit***
  Header Width Unit, this parameter can be value of ***CRYP_Header_Width_Unit***
- ***uint32_t CRYP_ConfigTypeDef::KeyIVConfigSkip***
  CRYP peripheral Key and IV configuration skip, to configure Key and Initialization Vector only once and to skip configuration for consecutive processing. This parameter can be a value of ***CRYP_Configuration_Skip***

16.1.2 __CRYP_HandleTypeDef

__CRYP_HandleTypeDef is defined in the stm32h7xx_hal_cryp.h

  Counter of output data
- ***uint16_t __CRYP_HandleTypeDef::Size***
  length of input data in word or in byte, according to DataWidthUnit
- ***uint32_t __CRYP_HandleTypeDef::Phase***
  CRYP peripheral phase
- ***DMA_HandleTypeDef* __CRYP_HandleTypeDef::hdmain***
  CRYP In DMA handle parameters
- ***DMA_HandleTypeDef* __CRYP_HandleTypeDef::hdmaout***
  CRYP Out DMA handle parameters

- ***HAL_LockTypeDef __CRYP_HandleTypeDef::Lock***
  CRYP locking object
- ***__IO HAL_CRYP_STATETypeDef __CRYP_HandleTypeDef::State***
  CRYP peripheral state
- ***__IO uint32_t __CRYP_HandleTypeDef::ErrorCode***
  CRYP peripheral error code
- ***uint32_t __CRYP_HandleTypeDef::Version***
  CRYP1 IP version
- ***uint32_t __CRYP_HandleTypeDef::KeyIVConfig***
  CRYP peripheral Key and IV configuration flag, used when configuration can be skipped
- ***uint32_t __CRYP_HandleTypeDef::SizesSum***
  Sum of successive payloads lengths (in bytes), stored for a single signature computation after several messages processing
- ***void(* __CRYP_HandleTypeDef::InCpltCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Input FIFO transfer completed callback
- ***void(* __CRYP_HandleTypeDef::OutCpltCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Output FIFO transfer completed callback
- ***void(* __CRYP_HandleTypeDef::ErrorCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Error callback
- ***void(* __CRYP_HandleTypeDef::MspInitCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Msp Init callback
- ***void(* __CRYP_HandleTypeDef::MspDeInitCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Msp DeInit callback

16.2 CRYP Firmware driver API description

The following section lists the various functions of the CRYP library.

16.2.1 How to use this driver

The CRYP HAL driver can be used in CRYP IP as follows:

1. Initialize the CRYP low level resources by implementing the HAL_CRYP_MspInit():
   a. Enable the CRYP interface clock using __HAL_RCC_CRYP_CLK_ENABLE()
   b. In case of using interrupts (e.g. HAL_CRYP_Encrypt_IT())
      - Configure the CRYP interrupt priority using HAL_NVIC_SetPriority()
      - Enable the CRYP IRQ handler using HAL_NVIC_EnableIRQ()
      - In CRYP IRQ handler, call HAL_CRYP_IRQHandler()
   c. In case of using DMA to control data transfer (e.g. HAL_CRYP_Encrypt_DMA())
      - Enable the DMAx interface clock using __RCC_DMAx_CLK_ENABLE()
      - Configure and enable two DMA streams one for managing data transfer from memory to peripheral (input stream) and another stream for managing data transfer from peripheral to memory (output stream)
      - Associate the initialized DMA handle to the CRYP DMA handle using __HAL_LINKDMA()
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the two DMA Streams. The output stream should have higher priority than the input stream HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ()

2. Initialize the CRYP according to the specified parameters :
   a. The data type: bit swap(1-bit data), byte swap(8-bit data), half word swap(16-bit data) or no swap(32-bit data).
   b. The key size: 128, 192 or 256.
   c. The AlgoMode DES/ TDES Algorithm ECB/CBC or AES Algorithm ECB/CBC/CTR/GCM or CCM.
   d. The initialization vector (counter). It is not used in ECB mode.
   e. The key buffer used for encryption/decryption.
   f. The Header used only in AES GCM and CCM Algorithm for authentication.
   g. The HeaderSize The size of header buffer in word.
   h. The B0 block is the first authentication block used only in AES CCM mode.
3. Three processing (encryption/decryption) functions are available:
   a. Polling mode: encryption and decryption APIs are blocking functions i.e. they process the data and wait till the processing is finished, e.g. HAL_CRYP_Encrypt & HAL_CRYP_Decrypt
   b. Interrupt mode: encryption and decryption APIs are not blocking functions i.e. they process the data under interrupt, e.g. HAL_CRYP_Encrypt_IT & HAL_CRYP_Decrypt_IT
   c. DMA mode: encryption and decryption APIs are not blocking functions i.e. the data transfer is ensured by DMA, e.g. HAL_CRYP_Encrypt_DMA & HAL_CRYP_Decrypt_DMA
4. When the processing function is called at first time after HAL_CRYP_Init() the CRYP peripheral is configured and processes the buffer in input. At second call, no need to Initialize the CRYP, user have to get current configuration via HAL_CRYP_GetConfig() API, then only HAL_CRYP_SetConfig() is requested to set new parametres, finally user can start encryption/decryption.
5. Call HAL_CRYP_DeInit() to deinitialize the CRYP peripheral.
6. To process a single message with consecutive calls to HAL_CRYP_Encrypt() or HAL_CRYP_Decrypt() without having to configure again the Key or the Initialization Vector between each API call, the field KeyIVConfigSkip of the initialization structure must be set to CRYP_KEYIVCONFIG_ONCE. Same is true for consecutive calls of HAL_CRYP_Encrypt_IT(), HAL_CRYP_Decrypt_IT(), HAL_CRYP_Encrypt_DMA() or HAL_CRYP_Decrypt_DMA().

The cryptographic processor supports following standards:

1. The data encryption standard (DES) and Triple-DES (TDES) supported only by CRYP1 IP:
   a. 64-bit data block processing
   b. chaining modes supported :
      - Electronic Code Book(ECB)
      - Cipher Block Chaining (CBC)
   c. keys length supported :64-bit, 128-bit and 192-bit.
2. The advanced encryption standard (AES) supported by CRYP1:
   a. 128-bit data block processing
   b. chaining modes supported :
      - Electronic Code Book(ECB)
      - Cipher Block Chaining (CBC)
      - Counter mode (CTR)
      - Galois/counter mode (GCM/GMAC)
      - Counter with Cipher Block Chaining-Message(CCM)
   c. keys length Supported :
      - for CRYP1 IP: 128-bit, 192-bit and 256-bit.

This section describes the AES Galois/counter mode (GCM) supported by both CRYP1 IP:

1. Algorithm supported :
   a. Galois/counter mode (GCM)
   b. Galois message authentication code (GMAC) :is exactly the same as GCM algorithm composed only by an header.

2. Four phases are performed in GCM :
   a. Init phase: IP prepares the GCM hash subkey (H) and do the IV processing
   b. Header phase: IP processes the Additional Authenticated Data (AAD), with hash computation only.
   c. Payload phase: IP processes the plaintext (P) with hash computation + keystream encryption + data XORing. It works in a similar way for ciphertext (C).
   d. Final phase: IP generates the authenticated tag (T) using the last block of data. HAL_CRYPEx_AESGCM_GenerateAuthTAG API used in this phase to generate 4 words which correspond to the Tag. user should consider only part of this 4 words, if Tag length is less than 128 bits.
3. structure of message construction in GCM is defined as below :
   a. 16 bytes Initial Counter Block (ICB)composed of IV and counter
   b. The authenticated header A (also knows as Additional Authentication Data AAD) this part of the message is only authenticated, not encrypted.
   c. The plaintext message P is both authenticated and encrypted as ciphertext. GCM standard specifies that ciphertext has same bit length as the plaintext.
   d. The last block is composed of the length of A (on 64 bits) and the length of ciphertext (on 64 bits)

This section describe The AES Counter with Cipher Block Chaining-Message Authentication Code (CCM) supported by both CRYP1 IP:

1. Specific parameters for CCM :
   a. B0 block : According to NIST Special Publication 800-38C, The first block B0 is formatted as follows, where l(m) is encoded in most-significant-byte first order(see below table 3)
      - Q: a bit string representation of the octet length of P (plaintext)
      - q The octet length of the binary representation of the octet length of the payload
      - A nonce (N), n The octet length of the where n+q=15.
      - Flags: most significant octet containing four flags for control information,
      - t The octet length of the MAC.
   b. B1 block (header) : associated data length(a) concatenated with Associated Data (A) the associated data length expressed in bytes (a) defined as below:
      - If 0 < a < 216-28, then it is encoded as [a]16, i.e. two octets
      - If 216-28 < a < 232, then it is encoded as 0xff || 0xfe || [a]32, i.e. six octets
      - If 232 < a < 264, then it is encoded as 0xff || 0xff || [a]64, i.e. ten octets
   c. CTRx block : control blocks
      - Generation of CTR1 from first block B0 information : equal to B0 with first 5 bits zeroed and most significant bits storing octet length of P also zeroed, then incremented by one (see below Table 4)
      - Generation of CTR0: same as CTR1 with bit[0] set to zero.
2. Four phases are performed in CCM for CRYP1 IP:
   a. Init phase: IP prepares the GCM hash subkey (H) and do the IV processing
   b. Header phase: IP processes the Additional Authenticated Data (AAD), with hash computation only.
   c. Payload phase: IP processes the plaintext (P) with hash computation + keystream encryption + data XORing. It works in a similar way for ciphertext (C).
   d. Final phase: IP generates the authenticated tag (T) using the last block of data. HAL_CRYPEx_AESCCM_GenerateAuthTAG API used in this phase to generate 4 words which correspond to the Tag. user should consider only part of this 4 words, if Tag length is less than 128 bits

Callback registration

The compilation define USE_HAL_CRYP_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions @ref HAL_CRYP_RegisterCallback() or HAL_CRYP_RegisterXXXCallback() to register an interrupt callback.

Function @ref HAL_CRYP_RegisterCallback() allows to register following callbacks:

- InCpltCallback : Input FIFO transfer completed callback.
- OutCpltCallback : Output FIFO transfer completed callback.
- ErrorCallback : callback for error detection.
- MspInitCallback : CRYP MspInit.

- MspDeInitCallback : CRYP MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function @ref HAL_CRYP_UnRegisterCallback() to reset a callback to the default weak function. @ref HAL_CRYP_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- InCpltCallback : Input FIFO transfer completed callback.
- OutCpltCallback : Output FIFO transfer completed callback.
- ErrorCallback : callback for error detection.
- MspInitCallback : CRYP MspInit.
- MspDeInitCallback : CRYP MspDeInit.

By default, after the @ref HAL_CRYP_Init() and when the state is HAL_CRYP_STATE_RESET all callbacks are set to the corresponding weak functions : examples @ref HAL_CRYP_InCpltCallback() , @ref HAL_CRYP_OutCpltCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak function in the @ref HAL_CRYP_Init()/ @ref HAL_CRYP_DeInit() only when these callbacks are null (not registered beforehand). if not, MspInit or MspDeInit are not null, the @ref HAL_CRYP_Init() / @ref HAL_CRYP_DeInit() keep and use the user MspInit/MspDeInit functions (registered beforehand)

Callbacks can be registered/unregistered in HAL_CRYP_STATE_READY state only. Exception done MspInit/MspDeInit callbacks that can be registered/unregistered in HAL_CRYP_STATE_READY or HAL_CRYP_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/ DeInit. In that case first register the MspInit/MspDeInit user callbacks using @ref HAL_CRYP_RegisterCallback() before calling @ref HAL_CRYP_DeInit() or @ref HAL_CRYP_Init() function.

When The compilation define USE_HAL_CRYP_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

16.2.2 Initialization, de-initialization and Set and Get configuration functions

This section provides functions allowing to:

- Initialize the CRYP
- DeInitialize the CRYP
- Initialize the CRYP MSP
- DeInitialize the CRYP MSP
- configure CRYP (HAL_CRYP_SetConfig) with the specified parameters in the CRYP_ConfigTypeDef Parameters which are configured in This section are :
  - Key size
  - Data Type : 32,16, 8 or 1bit
  - AlgoMode : for CRYP1 IP ECB and CBC in DES/TDES Standard ECB,CBC,CTR,GCM/GMAC and CCM in AES Standard.
- Get CRYP configuration (HAL_CRYP_GetConfig) from the specified parameters in the CRYP_HandleTypeDef

This section contains the following APIs:

- ***HAL_CRYP_Init()***
- ***HAL_CRYP_DeInit()***
- ***HAL_CRYP_SetConfig()***
- ***HAL_CRYP_GetConfig()***
- ***HAL_CRYP_MspInit()***
- ***HAL_CRYP_MspDeInit()***
- ***HAL_CRYP_RegisterCallback()***
- ***HAL_CRYP_UnRegisterCallback()***

16.2.3 Encrypt Decrypt functions

This section provides API allowing to Encrypt/Decrypt Data following Standard DES/TDES or AES, and Algorithm configured by the user:

- Standard DES/TDES only supported by CRYP1 IP, below list of Algorithm supported :
  - Electronic Code Book(ECB)
  - Cipher Block Chaining (CBC)
- Standard AES supported by CRYP1 IP , list of Algorithm supported:
  - Electronic Code Book(ECB)
  - Cipher Block Chaining (CBC)
  - Counter mode (CTR)
  - Cipher Block Chaining (CBC)
  - Counter mode (CTR)
  - Galois/counter mode (GCM)
  - Counter with Cipher Block Chaining-Message(CCM)

Three processing functions are available:

- Polling mode : HAL_CRYP_Encrypt & HAL_CRYP_Decrypt
- Interrupt mode : HAL_CRYP_Encrypt_IT & HAL_CRYP_Decrypt_IT
- DMA mode : HAL_CRYP_Encrypt_DMA & HAL_CRYP_Decrypt_DMA

This section contains the following APIs:

- ***HAL_CRYP_Encrypt()***
- ***HAL_CRYP_Decrypt()***
- ***HAL_CRYP_Encrypt_IT()***
- ***HAL_CRYP_Decrypt_IT()***
- ***HAL_CRYP_Encrypt_DMA()***
- ***HAL_CRYP_Decrypt_DMA()***

16.2.4 CRYP IRQ handler management

This section provides CRYP IRQ handler and callback functions.

- HAL_CRYP_IRQHandler CRYP interrupt request
- HAL_CRYP_InCpltCallback input data transfer complete callback
- HAL_CRYP_OutCpltCallback output data transfer complete callback
- HAL_CRYP_ErrorCallback CRYP error callback
- HAL_CRYP_GetState return the CRYP state
- HAL_CRYP_GetError return the CRYP error code

This section contains the following APIs:

- ***HAL_CRYP_IRQHandler()***
- ***HAL_CRYP_GetError()***
- ***HAL_CRYP_GetState()***
- ***HAL_CRYP_InCpltCallback()***
- ***HAL_CRYP_OutCpltCallback()***
- ***HAL_CRYP_ErrorCallback()***

16.2.5 Detailed description of functions

HAL_CRYP_Init

Function name

HAL_StatusTypeDef HAL_CRYP_Init (CRYP_HandleTypeDef * hcryp)

Function description

Initializes the CRYP according to the specified parameters in the CRYP_ConfigTypeDef and creates the associated handle.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **HAL:** status

HAL_CRYP_DeInit

Function name

HAL_StatusTypeDef HAL_CRYP_DeInit (CRYP_HandleTypeDef * hcryp)

Function description

De-Initializes the CRYP peripheral.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **HAL:** status

HAL_CRYP_MspInit

Function name

void HAL_CRYP_MspInit (CRYP_HandleTypeDef * hcryp)

Function description

Initializes the CRYP MSP.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **None:**

HAL_CRYP_MspDeInit

Function name

void HAL_CRYP_MspDeInit (CRYP_HandleTypeDef * hcryp)

Function description

DeInitializes CRYP MSP.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **None:**

HAL_CRYP_SetConfig

Function name

HAL_StatusTypeDef HAL_CRYP_SetConfig (CRYP_HandleTypeDef * hcryp, CRYP_ConfigTypeDef * pConf)

Function description

Configure the CRYP according to the specified parameters in the CRYP_ConfigTypeDef.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure
- **pConf:** pointer to a CRYP_ConfigTypeDef structure that contains the configuration information for CRYP module

Return values

- **HAL:** status

HAL_CRYP_GetConfig

Function name

HAL_StatusTypeDef HAL_CRYP_GetConfig (CRYP_HandleTypeDef * hcryp, CRYP_ConfigTypeDef * pConf)

Function description

Get CRYP Configuration parameters in associated handle.

Parameters

- **pConf:** pointer to a CRYP_ConfigTypeDef structure
- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **HAL:** status

HAL_CRYP_RegisterCallback

Function name

HAL_StatusTypeDef HAL_CRYP_RegisterCallback (CRYP_HandleTypeDef * hcryp, HAL_CRYP_CallbackIDTypeDef CallbackID, pCRYP_CallbackTypeDef pCallback)

Function description

Register a User CRYP Callback To be used instead of the weak predefined callback.

Parameters

- **hcryp:** cryp handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_CRYP_INPUT_COMPLETE_CB_ID Input FIFO transfer completed callback ID
  - HAL_CRYP_OUTPUT_COMPLETE_CB_ID Output FIFO transfer completed callback ID
  - HAL_CRYP_ERROR_CB_ID Rx Half Error callback ID
  - HAL_CRYP_MSPINIT_CB_ID MspInit callback ID
  - HAL_CRYP_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

HAL_CRYP_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_CRYP_UnRegisterCallback (CRYP_HandleTypeDef * hcryp, HAL_CRYP_CallbackIDTypeDef CallbackID)

Function description

Unregister an CRYP Callback CRYP callback is redirected to the weak predefined callback.

Parameters

- **hcryp:** cryp handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_CRYP_INPUT_COMPLETE_CB_ID Input FIFO transfer completed callback ID
  - HAL_CRYP_OUTPUT_COMPLETE_CB_ID Output FIFO transfer completed callback ID
  - HAL_CRYP_ERROR_CB_ID Rx Half Error callback ID
  - HAL_CRYP_MSPINIT_CB_ID MspInit callback ID
  - HAL_CRYP_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **status:**

HAL_CRYP_Encrypt

Function name

HAL_StatusTypeDef HAL_CRYP_Encrypt (CRYP_HandleTypeDef * hcryp, uint32_t * Input, uint16_t Size, uint32_t * Output, uint32_t Timeout)

Function description

Encryption mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **Input:** Pointer to the input buffer (plaintext)
- **Size:** Length of the plaintext buffer either in word or in byte, according to DataWidthUnit.
- **Output:** Pointer to the output buffer(ciphertext)
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CRYP_Decrypt

Function name

HAL_StatusTypeDef HAL_CRYP_Decrypt (CRYP_HandleTypeDef * hcryp, uint32_t * Input, uint16_t Size, uint32_t * Output, uint32_t Timeout)

Function description

Decryption mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **Input:** Pointer to the input buffer (ciphertext)
- **Size:** Length of the plaintext buffer either in word or in byte, according to DataWidthUnit
- **Output:** Pointer to the output buffer(plaintext)
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CRYP_Encrypt_IT

Function name

HAL_StatusTypeDef HAL_CRYP_Encrypt_IT (CRYP_HandleTypeDef * hcryp, uint32_t * Input, uint16_t Size, uint32_t * Output)

Function description

Encryption in interrupt mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **Input:** Pointer to the input buffer (plaintext)
- **Size:** Length of the plaintext buffer either in word or in byte, according to DataWidthUnit
- **Output:** Pointer to the output buffer(ciphertext)

Return values

- **HAL:** status

HAL_CRYP_Decrypt_IT

Function name

HAL_StatusTypeDef HAL_CRYP_Decrypt_IT (CRYP_HandleTypeDef * hcryp, uint32_t * Input, uint16_t Size, uint32_t * Output)

Function description

Decryption in itnterrupt mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **Input:** Pointer to the input buffer (ciphertext)
- **Size:** Length of the plaintext buffer either in word or in byte, according to DataWidthUnit
- **Output:** Pointer to the output buffer(plaintext)

Return values

- **HAL:** status

HAL_CRYP_Encrypt_DMA

Function name

HAL_StatusTypeDef HAL_CRYP_Encrypt_DMA (CRYP_HandleTypeDef * hcryp, uint32_t * Input, uint16_t Size, uint32_t * Output)

Function description

Encryption in DMA mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **Input:** Pointer to the input buffer (plaintext)
- **Size:** Length of the plaintext buffer either in word or in byte, according to DataWidthUnit
- **Output:** Pointer to the output buffer(ciphertext)

Return values

- **HAL:** status

HAL_CRYP_Decrypt_DMA

Function name

HAL_StatusTypeDef HAL_CRYP_Decrypt_DMA (CRYP_HandleTypeDef * hcryp, uint32_t * Input, uint16_t Size, uint32_t * Output)

Function description

Decryption in DMA mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **Input:** Pointer to the input buffer (ciphertext)
- **Size:** Length of the plaintext buffer either in word or in byte, according to DataWidthUnit
- **Output:** Pointer to the output buffer(plaintext)

Return values

- **HAL:** status

HAL_CRYP_IRQHandler

Function name

void HAL_CRYP_IRQHandler (CRYP_HandleTypeDef * hcryp)

Function description

This function handles cryptographic interrupt request.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **None:**

HAL_CRYP_GetState

Function name

HAL_CRYP_STATETypeDef HAL_CRYP_GetState (CRYP_HandleTypeDef * hcryp)

Function description

Returns the CRYP state.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module.

Return values

- **HAL:** state

HAL_CRYP_InCpltCallback

Function name

void HAL_CRYP_InCpltCallback (CRYP_HandleTypeDef * hcryp)

Function description

Input FIFO transfer completed callback.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module.

Return values

- **None:**

HAL_CRYP_OutCpltCallback

Function name

void HAL_CRYP_OutCpltCallback (CRYP_HandleTypeDef * hcryp)

Function description

Output FIFO transfer completed callback.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module.

Return values

- **None:**

HAL_CRYP_ErrorCallback

Function name

void HAL_CRYP_ErrorCallback (CRYP_HandleTypeDef * hcryp)

Function description

CRYP error callback.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module.

Return values

- **None:**

HAL_CRYP_GetError

Function name

uint32_t HAL_CRYP_GetError (CRYP_HandleTypeDef * hcryp)

Function description

Return the CRYP error code.

Parameters

- **hcryp:** : pointer to a CRYP_HandleTypeDef structure that contains the configuration information for the CRYP IP

Return values

- **CRYP:** error code

16.3 CRYP Firmware driver defines

The following section lists the various define and macros of the module.

16.3.1 CRYP

CRYP

CRYP Algorithm Mode

CRYP_DES_ECB

CRYP_DES_CBC

CRYP_TDES_ECB

CRYP_TDES_CBC

CRYP_AES_ECB

CRYP_AES_CBC

CRYP_AES_CTR

CRYP_AES_GCM

CRYP_AES_CCM

CRYP Key and IV Configuration Skip Mode

CRYP_KEYIVCONFIG_ALWAYS

Peripheral Key and IV configuration to do systematically

CRYP_KEYIVCONFIG_ONCE

Peripheral Key and IV configuration to do only once

CRYP Data Type

CRYP_NO_SWAP

CRYP_HALFWORD_SWAP

CRYP_BYTE_SWAP

CRYP_BIT_SWAP

CRYP Data Width Unit

CRYP_DATAWIDTHUNIT_WORD

By default, size unit is word

CRYP_DATAWIDTHUNIT_BYTE

Size unit is byte, but all input will be loaded in HW CRYPT IP by block of 4 words

CRYP Error Definition

HAL_CRYP_ERROR_NONE

No error

HAL_CRYP_ERROR_WRITE

Write error

HAL_CRYP_ERROR_READ

Read error

HAL_CRYP_ERROR_DMA

DMA error

HAL_CRYP_ERROR_BUSY

Busy flag error

HAL_CRYP_ERROR_TIMEOUT

Timeout error

HAL_CRYP_ERROR_NOT_SUPPORTED

Not supported mode

HAL_CRYP_ERROR_AUTH_TAG_SEQUENCE

Sequence are not respected only for GCM or CCM

HAL_CRYP_ERROR_INVALID_CALLBACK

Invalid Callback error

CRYP Exported Macros

__HAL_CRYP_RESET_HANDLE_STATE

Description:

- Reset CRYP handle state.

Parameters:

- __HANDLE__: specifies the CRYP handle.

Return value:

- None

__HAL_CRYP_ENABLE

Description:

- Enable/Disable the CRYP peripheral.

Parameters:

- __HANDLE__: specifies the CRYP handle.

Return value:

- None

__HAL_CRYP_DISABLE

CRYP_FLAG_MASK

Description:

- Check whether the specified CRYP status flag is set or not.

Parameters:

- __FLAG__: specifies the flag to check. This parameter can be one of the following values for CRYP:
  - CRYP_FLAG_BUSY: The CRYP core is currently processing a block of data or a key preparation (for AES decryption).
  - CRYP_FLAG_IFEM: Input FIFO is empty
  - CRYP_FLAG_IFNF: Input FIFO is not full
  - CRYP_FLAG_INRIS: Input FIFO service raw interrupt is pending
  - CRYP_FLAG_OFNE: Output FIFO is not empty
  - CRYP_FLAG_OFFU: Output FIFO is full
  - CRYP_FLAG_OUTRIS: Input FIFO service raw interrupt is pending

Return value:

- The: state of __FLAG__ (TRUE or FALSE).

__HAL_CRYP_GET_FLAG

__HAL_CRYP_GET_IT

Description:

- Check whether the specified CRYP interrupt is set or not.

Parameters:

- __HANDLE__: specifies the CRYP handle.
- __INTERRUPT__: specifies the interrupt to check. This parameter can be one of the following values for CRYP:
  - CRYP_IT_INI: Input FIFO service masked interrupt status
  - CRYP_IT_OUTI: Output FIFO service masked interrupt status

Return value:

- The: state of __INTERRUPT__ (TRUE or FALSE).

__HAL_CRYP_ENABLE_IT

Description:

- Enable the CRYP interrupt.

Parameters:

- __HANDLE__: specifies the CRYP handle.
- __INTERRUPT__: CRYP Interrupt. This parameter can be one of the following values for CRYP: @ CRYP_IT_INI : Input FIFO service interrupt mask. @ CRYP_IT_OUTI : Output FIFO service interrupt mask.CRYP interrupt.

Return value:

- None

__HAL_CRYP_DISABLE_IT

Description:

- Disable the CRYP interrupt.

Parameters:

- __HANDLE__: specifies the CRYP handle.
- __INTERRUPT__: CRYP Interrupt. This parameter can be one of the following values for CRYP: @ CRYP_IT_INI : Input FIFO service interrupt mask. @ CRYP_IT_OUTI : Output FIFO service interrupt mask.CRYP interrupt.

Return value:

- None

CRYP Flags

CRYP_FLAG_IFEM

Input FIFO is empty

CRYP_FLAG_IFNF

Input FIFO is not Full

CRYP_FLAG_OFNE

Output FIFO is not empty

CRYP_FLAG_OFFU

Output FIFO is Full

CRYP_FLAG_BUSY

The CRYP core is currently processing a block of data or a key preparation (for AES decryption).

CRYP_FLAG_OUTRIS

Output FIFO service raw interrupt status

CRYP_FLAG_INRIS

Input FIFO service raw interrupt status

CRYP Header Width Unit

CRYP_HEADERWIDTHUNIT_WORD

By default, header size unit is word

CRYP_HEADERWIDTHUNIT_BYTE

Size unit is byte, but all input will be loaded in HW CRYPT IP by block of 4 words

CRYP Interrupt

CRYP_IT_INI

Input FIFO Interrupt

CRYP_IT_OUTI

Output FIFO Interrupt

CRYP Private macros to check input parameters

IS_CRYP_ALGORITHM

IS_CRYP_KEYSIZE

IS_CRYP_DATATYPE

IS_CRYP_INIT

CRYP Key Size

CRYP_KEYSIZE_128B

CRYP_KEYSIZE_192B

CRYP_KEYSIZE_256B

17 HAL CRYP Extension Driver

17.1 CRYPEx Firmware driver API description

The following section lists the various functions of the CRYPEx library.

17.1.1 How to use this driver

The CRYP extension HAL driver can be used after AES-GCM or AES-CCM Encryption/Decryption to get the authentication messages.

17.1.2 Extended AES processing functions

This section provides functions allowing to generate the authentication TAG in Polling mode

- HAL_CRYPEx_AESGCM_GenerateAuthTAG
- HAL_CRYPEx_AESCCM_GenerateAuthTAG they should be used after Encrypt/Decrypt operation.

This section contains the following APIs:

- ***HAL_CRYPEx_AESGCM_GenerateAuthTAG()***
- ***HAL_CRYPEx_AESCCM_GenerateAuthTAG()***

17.1.3 Detailed description of functions

HAL_CRYPEx_AESGCM_GenerateAuthTAG

Function name

HAL_StatusTypeDef HAL_CRYPEx_AESGCM_GenerateAuthTAG (CRYP_HandleTypeDef * hcryp, uint32_t * AuthTag, uint32_t Timeout)

Function description

generate the GCM authentication TAG.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **AuthTag:** Pointer to the authentication buffer the AuthTag generated here is 128bits length, if the TAG length is less than 128bits, user should consider only the valid part of AuthTag buffer which correspond exactly to TAG length.
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_CRYPEx_AESCCM_GenerateAuthTAG

Function name

HAL_StatusTypeDef HAL_CRYPEx_AESCCM_GenerateAuthTAG (CRYP_HandleTypeDef * hcryp, uint32_t * AuthTag, uint32_t Timeout)

Function description

AES CCM Authentication TAG generation.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **AuthTag:** Pointer to the authentication buffer the AuthTag generated here is 128bits length, if the TAG length is less than 128bits, user should consider only the valid part of AuthTag buffer which correspond exactly to TAG length.
- **Timeout:** Timeout duration

Return values

- **HAL:** status

18 HAL DAC Generic Driver

18.1 DAC Firmware driver registers structures

18.1.1 __DAC_HandleTypeDef

__DAC_HandleTypeDef is defined in the stm32h7xx_hal_dac.h

Data Fields

- ***DAC_TypeDef * Instance***
- ***__IO HAL_DAC_StateTypeDef State***
- ***HAL_LockTypeDef Lock***
- ***DMA_HandleTypeDef * DMA_Handle1***
- ***DMA_HandleTypeDef * DMA_Handle2***
- ***__IO uint32_t ErrorCode***
- ***void(* ConvCpltCallbackCh1***
- ***void(* ConvHalfCpltCallbackCh1***
- ***void(* ErrorCallbackCh1***
- ***void(* DMAUnderrunCallbackCh1***
- ***void(* ConvCpltCallbackCh2***
- ***void(* ConvHalfCpltCallbackCh2***
- ***void(* ErrorCallbackCh2***
- ***void(* DMAUnderrunCallbackCh2***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***DAC_TypeDef* __DAC_HandleTypeDef::Instance***
  Register base address
- ***__IO HAL_DAC_StateTypeDef __DAC_HandleTypeDef::State***
  DAC communication state
- ***HAL_LockTypeDef __DAC_HandleTypeDef::Lock***
  DAC locking object
- ***DMA_HandleTypeDef* __DAC_HandleTypeDef::DMA_Handle1***
  Pointer DMA handler for channel 1
- ***DMA_HandleTypeDef* __DAC_HandleTypeDef::DMA_Handle2***
  Pointer DMA handler for channel 2
- ***__IO uint32_t __DAC_HandleTypeDef::ErrorCode***
  DAC Error code
- ***void(* __DAC_HandleTypeDef::ConvCpltCallbackCh1)(struct __DAC_HandleTypeDef *hdac)***
- ***void(* __DAC_HandleTypeDef::ConvHalfCpltCallbackCh1)(struct __DAC_HandleTypeDef *hdac)***
- ***void(* __DAC_HandleTypeDef::ErrorCallbackCh1)(struct __DAC_HandleTypeDef *hdac)***
- ***void(* __DAC_HandleTypeDef::DMAUnderrunCallbackCh1)(struct __DAC_HandleTypeDef *hdac)***
- ***void(* __DAC_HandleTypeDef::ConvCpltCallbackCh2)(struct __DAC_HandleTypeDef *hdac)***
- ***void(* __DAC_HandleTypeDef::ConvHalfCpltCallbackCh2)(struct __DAC_HandleTypeDef *hdac)***
- ***void(* __DAC_HandleTypeDef::ErrorCallbackCh2)(struct __DAC_HandleTypeDef *hdac)***
- ***void(* __DAC_HandleTypeDef::DMAUnderrunCallbackCh2)(struct __DAC_HandleTypeDef *hdac)***

- *void(* __DAC_HandleTypeDef::MspInitCallback)(struct __DAC_HandleTypeDef *hdac)*
- *void(* __DAC_HandleTypeDef::MspDeInitCallback)(struct __DAC_HandleTypeDef *hdac)*

18.1.2 DAC_SampleAndHoldConfTypeDef

DAC_SampleAndHoldConfTypeDef is defined in the stm32h7xx_hal_dac.h

Data Fields

- *uint32_t DAC_SampleTime*
- *uint32_t DAC_HoldTime*
- *uint32_t DAC_RefreshTime*

Field Documentation

- *uint32_t DAC_SampleAndHoldConfTypeDef::DAC_SampleTime*

  Specifies the Sample time for the selected channel. This parameter applies when DAC_SampleAndHold is DAC_SAMPLEANDHOLD_ENABLE. This parameter must be a number between Min_Data = 0 and Max_Data = 1023
- *uint32_t DAC_SampleAndHoldConfTypeDef::DAC_HoldTime*

  Specifies the hold time for the selected channel This parameter applies when DAC_SampleAndHold is DAC_SAMPLEANDHOLD_ENABLE. This parameter must be a number between Min_Data = 0 and Max_Data = 1023
- *uint32_t DAC_SampleAndHoldConfTypeDef::DAC_RefreshTime*

  Specifies the refresh time for the selected channel This parameter applies when DAC_SampleAndHold is DAC_SAMPLEANDHOLD_ENABLE. This parameter must be a number between Min_Data = 0 and Max_Data = 255

18.1.3 DAC_ChannelConfTypeDef

DAC_ChannelConfTypeDef is defined in the stm32h7xx_hal_dac.h

Data Fields

- *uint32_t DAC_SampleAndHold*
- *uint32_t DAC_Trigger*
- *uint32_t DAC_OutputBuffer*
- *uint32_t DAC_ConnectOnChipPeripheral*
- *uint32_t DAC_UserTrimming*
- *uint32_t DAC_TrimmingValue*
- *DAC_SampleAndHoldConfTypeDef DAC_SampleAndHoldConfig*

Field Documentation

- *uint32_t DAC_ChannelConfTypeDef::DAC_SampleAndHold*

  Specifies whether the DAC mode. This parameter can be a value of ***DAC_SampleAndHold***
- *uint32_t DAC_ChannelConfTypeDef::DAC_Trigger*

  Specifies the external trigger for the selected DAC channel. This parameter can be a value of ***DAC_trigger_selection***
- *uint32_t DAC_ChannelConfTypeDef::DAC_OutputBuffer*

  Specifies whether the DAC channel output buffer is enabled or disabled. This parameter can be a value of ***DAC_output_buffer***
- *uint32_t DAC_ChannelConfTypeDef::DAC_ConnectOnChipPeripheral*

  Specifies whether the DAC output is connected or not to on chip peripheral . This parameter can be a value of ***DAC_ConnectOnChipPeripheral***
- *uint32_t DAC_ChannelConfTypeDef::DAC_UserTrimming*

  Specifies the trimming mode This parameter must be a value of ***DAC_UserTrimming*** DAC_UserTrimming is either factory or user trimming
- *uint32_t DAC_ChannelConfTypeDef::DAC_TrimmingValue*

  Specifies the offset trimming value i.e. when DAC_SampleAndHold is DAC_TRIMMING_USER. This parameter must be a number between Min_Data = 1 and Max_Data = 31

- ***DAC_SampleAndHoldConfTypeDef DAC_ChannelConfTypeDef::DAC_SampleAndHoldConfig***
  Sample and Hold settings

18.2 DAC Firmware driver API description

The following section lists the various functions of the DAC library.

18.2.1 DAC Peripheral features

DAC Channels

STM32H7 devices integrate two 12-bit Digital Analog Converters The 2 converters (i.e. channel1 & channel2) can be used independently or simultaneously (dual mode):

1. DAC channel1 with DAC_OUT1 (PA4) as output or connected to on-chip peripherals (ex. OPAMPs, comparators).
2. DAC channel2 with DAC_OUT2 (PA5) as output or connected to on-chip peripherals (ex. OPAMPs, comparators).

DAC Triggers

Digital to Analog conversion can be non-triggered using DAC_TRIGGER_NONE and DAC_OUT1/DAC_OUT2 is available once writing to DHRx register.

Digital to Analog conversion can be triggered by:

1. External event: EXTI Line 9 (any GPIOx_PIN_9) using DAC_TRIGGER_EXT_IT9. The used pin (GPIOx_PIN_9) must be configured in input mode.
2. Timers TRGO: TIM1, TIM2, TIM4, TIM5, TIM6, TIM7, TIM8, TIM15, TIM23 and TIM24 (DAC_TRIGGER_T1_TRGO, DAC_TRIGGER_T2_TRGO...)
3. Low Power Timers TRGO: LPTIM1, LPTIM2 and LPTIM3 (DAC_TRIGGER_LPTIM1_OUT, DAC_TRIGGER_LPTIM2_OUT)
4. High Resolution Timer TRGO: HRTIM1 (DAC_TRIGGER_HR1_TRGO1, DAC_TRIGGER_HR1_TRGO2)
5. Software using DAC_TRIGGER_SOFTWARE

DAC Buffer mode feature

Each DAC channel integrates an output buffer that can be used to reduce the output impedance, and to drive external loads directly without having to add an external operational amplifier. To enable, the output buffer use sConfig.DAC_OutputBuffer = DAC_OUTPUTBUFFER_ENABLE;

Note: Refer to the device datasheet for more details about output impedance value with and without output buffer.

GPIO configurations guidelines

When a DAC channel is used (ex channel1 on PA4) and the other is not (ex channel2 on PA5 is configured in Analog and disabled). Channel1 may disturb channel2 as coupling effect. Note that there is no coupling on channel2 as soon as channel2 is turned on. Coupling on adjacent channel could be avoided as follows: when unused PA5 is configured as INPUT PULL-UP or DOWN. PA5 is configured in ANALOG just before it is turned on.

DAC Sample and Hold feature

For each converter, 2 modes are supported: normal mode and "sample and hold" mode (i.e. low power mode). In the sample and hold mode, the DAC core converts data, then holds the converted voltage on a capacitor. When not converting, the DAC cores and buffer are completely turned off between samples and the DAC output is tri-stated, therefore reducing the overall power consumption. A new stabilization period is needed before each new conversion. The sample and hold allow setting internal or external voltage @ low power consumption cost (output value can be at any given rate either by CPU or DMA). The Sample and hold block and registers uses either LSI & run in several power modes: run mode, sleep mode, low power run, low power sleep mode & stop1 mode. Low power stop1 mode allows only static conversion. To enable Sample and Hold mode Enable LSI using HAL_RCC_OscConfig with RCC_OSCILLATORTYPE_LSI & RCC_LSI_ON parameters. Use DAC_InitStructure.DAC_SampleAndHold = DAC_SAMPLEANDHOLD_ENABLE; & DAC_ChannelConfTypeDef.DAC_SampleAndHoldConfig.DAC_SampleTime, DAC_HoldTime & DAC_RefreshTime;

DAC calibration feature

1. The 2 converters (channel1 & channel2) provide calibration capabilities.
   - Calibration aims at correcting some offset of output buffer.
   - The DAC uses either factory calibration settings OR user defined calibration (trimming) settings (i.e. trimming mode).
   - The user defined settings can be figured out using self calibration handled by HAL_DACEx_SelfCalibrate.
   - HAL_DACEx_SelfCalibrate:
     - Runs automatically the calibration.
     - Enables the user trimming mode
     - Updates a structure with trimming values with fresh calibration results. The user may store the calibration results for larger (ex monitoring the trimming as a function of temperature for instance)

DAC wave generation feature

Both DAC channels can be used to generate

1. Noise wave
2. Triangle wave

DAC data format

The DAC data format can be:

1. 8-bit right alignment using DAC_ALIGN_8B_R
2. 12-bit left alignment using DAC_ALIGN_12B_L
3. 12-bit right alignment using DAC_ALIGN_12B_R

DAC data value to voltage correspondence

The analog output voltage on each DAC channel pin is determined by the following equation:

DAC_OUTx = VREF+ * DOR / 4095

- with DOR is the Data Output Register

VREF+ is the input voltage reference (refer to the device datasheet)

e.g. To set DAC_OUT1 to 0.7V, use

- Assuming that VREF+ = 3.3V, DAC_OUT1 = (3.3 * 868) / 4095 = 0.7V

DMA requests

A DMA request can be generated when an external trigger (but not a software trigger) occurs if DMA requests are enabled using HAL_DAC_Start_DMA(). DMA requests are mapped as following:

1. DAC channel1: mapped on DMA_REQUEST_DAC1_CH1
2. DAC channel2: mapped on DMA_REQUEST_DAC1_CH2

Note: For Dual mode and specific signal (Triangle and noise) generation please refer to Extended Features Driver description

18.2.2 How to use this driver

- DAC APB clock must be enabled to get write access to DAC registers using HAL_DAC_Init()
- Configure DAC_OUTx (DAC_OUT1: PA4, DAC_OUT2: PA5) in analog mode.
- Configure the DAC channel using HAL_DAC_ConfigChannel() function.
- Enable the DAC channel using HAL_DAC_Start() or HAL_DAC_Start_DMA() functions.

Calibration mode IO operation

- Retrieve the factory trimming (calibration settings) using HAL_DACEx_GetTrimOffset()
- Run the calibration using HAL_DACEx_SelfCalibrate()
- Update the trimming while DAC running using HAL_DACEx_SetUserTrimming()

Polling mode IO operation

- Start the DAC peripheral using HAL_DAC_Start()
- To read the DAC last data output value, use the HAL_DAC_GetValue() function.
- Stop the DAC peripheral using HAL_DAC_Stop()

DMA mode IO operation

- Start the DAC peripheral using HAL_DAC_Start_DMA(), at this stage the user specify the length of data to be transferred at each end of conversion First issued trigger will start the conversion of the value previously set by HAL_DAC_SetValue().
- At the middle of data transfer HAL_DAC_ConvHalfCpltCallbackCh1() or HAL_DACEx_ConvHalfCpltCallbackCh2() function is executed and user can add his own code by customization of function pointer HAL_DAC_ConvHalfCpltCallbackCh1() or HAL_DACEx_ConvHalfCpltCallbackCh2()
- At The end of data transfer HAL_DAC_ConvCpltCallbackCh1() or HAL_DACEx_ConvHalfCpltCallbackCh2() function is executed and user can add his own code by customization of function pointer HAL_DAC_ConvCpltCallbackCh1() or HAL_DACEx_ConvHalfCpltCallbackCh2()
- In case of transfer Error, HAL_DAC_ErrorCallbackCh1() function is executed and user can add his own code by customization of function pointer HAL_DAC_ErrorCallbackCh1
- In case of DMA underrun, DAC interruption triggers and execute internal function HAL_DAC_IRQHandler. HAL_DAC_DMAUnderrunCallbackCh1() or HAL_DACEx_DMAUnderrunCallbackCh2() function is executed and user can add his own code by customization of function pointer HAL_DAC_DMAUnderrunCallbackCh1() or HAL_DACEx_DMAUnderrunCallbackCh2() and add his own code by customization of function pointer HAL_DAC_ErrorCallbackCh1()
- Stop the DAC peripheral using HAL_DAC_Stop_DMA()

Callback registration

The compilation define USE_HAL_DAC_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_DAC_RegisterCallback() to register a user callback, it allows to register following callbacks:

- ConvCpltCallbackCh1 : callback when a half transfer is completed on Ch1.
- ConvHalfCpltCallbackCh1 : callback when a transfer is completed on Ch1.
- ErrorCallbackCh1 : callback when an error occurs on Ch1.
- DMAUnderrunCallbackCh1 : callback when an underrun error occurs on Ch1.
- ConvCpltCallbackCh2 : callback when a half transfer is completed on Ch2.
- ConvHalfCpltCallbackCh2 : callback when a transfer is completed on Ch2.
- ErrorCallbackCh2 : callback when an error occurs on Ch2.
- DMAUnderrunCallbackCh2 : callback when an underrun error occurs on Ch2.
- MspInitCallback : DAC MspInit.

- MspDeInitCallback : DAC MspdeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. Use function HAL_DAC_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. It allows to reset following callbacks:
- ConvCpltCallbackCh1 : callback when a half transfer is completed on Ch1.
- ConvHalfCpltCallbackCh1 : callback when a transfer is completed on Ch1.
- ErrorCallbackCh1 : callback when an error occurs on Ch1.
- DMAUnderrunCallbackCh1 : callback when an underrun error occurs on Ch1.
- ConvCpltCallbackCh2 : callback when a half transfer is completed on Ch2.
- ConvHalfCpltCallbackCh2 : callback when a transfer is completed on Ch2.
- ErrorCallbackCh2 : callback when an error occurs on Ch2.
- DMAUnderrunCallbackCh2 : callback when an underrun error occurs on Ch2.
- MspInitCallback : DAC MspInit.
- MspDeInitCallback : DAC MspdeInit.
- All Callbacks This function) takes as parameters the HAL peripheral handle and the Callback ID. By default, after the HAL_DAC_Init and if the state is HAL_DAC_STATE_RESET all callbacks are reset to the corresponding legacy weak (surcharged) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (surcharged) functions in the HAL_DAC_Init and HAL_DAC_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_DAC_Init and HAL_DAC_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_DAC_RegisterCallback before calling HAL_DAC_DeInit or HAL_DAC_Init function. When The compilation define USE_HAL_DAC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

DAC HAL driver macros list

Below the list of most used macros in DAC HAL driver.

- __HAL_DAC_ENABLE : Enable the DAC peripheral
- __HAL_DAC_DISABLE : Disable the DAC peripheral
- __HAL_DAC_CLEAR_FLAG: Clear the DAC's pending flags
- __HAL_DAC_GET_FLAG: Get the selected DAC's flag status

Note: You can refer to the DAC HAL driver header file for more useful macros

18.2.3 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize and configure the DAC.
- De-initialize the DAC.

This section contains the following APIs:

- ***HAL_DAC_Init()***
- ***HAL_DAC_DeInit()***
- ***HAL_DAC_MspInit()***
- ***HAL_DAC_MspDeInit()***
- ***HAL_DAC_RegisterCallback()***
- ***HAL_DAC_UnRegisterCallback()***

18.2.4 IO operation functions

This section provides functions allowing to:

- Start conversion.
- Stop conversion.
- Start conversion and enable DMA transfer.

- Stop conversion and disable DMA transfer.
- Get result of conversion.

This section contains the following APIs:

- *HAL_DAC_Start()*
- *HAL_DAC_Stop()*
- *HAL_DAC_Start_DMA()*
- *HAL_DAC_Stop_DMA()*
- *HAL_DAC_IRQHandler()*
- *HAL_DAC_SetValue()*
- *HAL_DAC_ConvCpltCallbackCh1()*
- *HAL_DAC_ConvHalfCpltCallbackCh1()*
- *HAL_DAC_ErrorCallbackCh1()*
- *HAL_DAC_DMAUnderrunCallbackCh1()*
- *HAL_DAC_RegisterCallback()*
- *HAL_DAC_UnRegisterCallback()*

18.2.5 Peripheral Control functions

This section provides functions allowing to:

- Configure channels.
- Set the specified data holding register value for DAC channel.

This section contains the following APIs:

- *HAL_DAC_GetValue()*
- *HAL_DAC_ConfigChannel()*

18.2.6 Peripheral State and Errors functions

This subsection provides functions allowing to

- Check the DAC state.
- Check the DAC Errors.

This section contains the following APIs:

- *HAL_DAC_GetState()*
- *HAL_DAC_GetError()*

18.2.7 Detailed description of functions

HAL_DAC_Init

Function name

HAL_StatusTypeDef HAL_DAC_Init (DAC_HandleTypeDef * hdac)

Function description

Initialize the DAC peripheral according to the specified parameters in the DAC_InitStruct and initialize the associated handle.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **HAL:** status

HAL_DAC_DeInit

Function name

HAL_StatusTypeDef HAL_DAC_DeInit (DAC_HandleTypeDef * hdac)

Function description

Deinitialize the DAC peripheral registers to their default reset values.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **HAL:** status

HAL_DAC_MspInit

Function name

void HAL_DAC_MspInit (DAC_HandleTypeDef * hdac)

Function description

Initialize the DAC MSP.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_MspDeInit

Function name

void HAL_DAC_MspDeInit (DAC_HandleTypeDef * hdac)

Function description

DeInitialize the DAC MSP.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_Start

Function name

HAL_StatusTypeDef HAL_DAC_Start (DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Enables DAC and starts conversion of channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **HAL:** status

HAL_DAC_Stop

Function name

HAL_StatusTypeDef HAL_DAC_Stop (DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Disables DAC and stop conversion of channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **HAL:** status

HAL_DAC_Start_DMA

Function name

HAL_StatusTypeDef HAL_DAC_Start_DMA (DAC_HandleTypeDef * hdac, uint32_t Channel, uint32_t * pData, uint32_t Length, uint32_t Alignment)

Function description

Enables DAC and starts conversion of channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected
- **pData:** The source Buffer address.
- **Length:** The length of data to be transferred from memory to DAC peripheral
- **Alignment:** Specifies the data alignment for DAC channel. This parameter can be one of the following values:
  - DAC_ALIGN_8B_R: 8bit right data alignment selected
  - DAC_ALIGN_12B_L: 12bit left data alignment selected
  - DAC_ALIGN_12B_R: 12bit right data alignment selected

Return values

- **HAL:** status

HAL_DAC_Stop_DMA

Function name

HAL_StatusTypeDef HAL_DAC_Stop_DMA (DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Disables DAC and stop conversion of channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **HAL:** status

HAL_DAC_IRQHandler

Function name

void HAL_DAC_IRQHandler (DAC_HandleTypeDef * hdac)

Function description

Handles DAC interrupt request This function uses the interruption of DMA underrun.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_SetValue

Function name

HAL_StatusTypeDef HAL_DAC_SetValue (DAC_HandleTypeDef * hdac, uint32_t Channel, uint32_t Alignment, uint32_t Data)

Function description

Set the specified data holding register value for DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected
- **Alignment:** Specifies the data alignment. This parameter can be one of the following values:
  - DAC_ALIGN_8B_R: 8bit right data alignment selected
  - DAC_ALIGN_12B_L: 12bit left data alignment selected
  - DAC_ALIGN_12B_R: 12bit right data alignment selected
- **Data:** Data to be loaded in the selected data holding register.

Return values

- **HAL:** status

HAL_DAC_ConvCpltCallbackCh1

Function name

void HAL_DAC_ConvCpltCallbackCh1 (DAC_HandleTypeDef * hdac)

Function description

Conversion complete callback in non-blocking mode for Channel1.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_ConvHalfCpltCallbackCh1

Function name

void HAL_DAC_ConvHalfCpltCallbackCh1 (DAC_HandleTypeDef * hdac)

Function description

Conversion half DMA transfer callback in non-blocking mode for Channel1.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_ErrorCallbackCh1

Function name

void HAL_DAC_ErrorCallbackCh1 (DAC_HandleTypeDef * hdac)

Function description

Error DAC callback for Channel1.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_DMAUnderrunCallbackCh1

Function name

void HAL_DAC_DMAUnderrunCallbackCh1 (DAC_HandleTypeDef * hdac)

Function description

DMA underrun DAC callback for channel1.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DAC_RegisterCallback (DAC_HandleTypeDef * hdac, HAL_DAC_CallbackIDTypeDef CallbackID, pDAC_CallbackTypeDef pCallback)

Function description

Register a User DAC Callback To be used instead of the weak (surcharged) predefined callback.

Parameters

- **hdac:** DAC handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_DAC_ERROR_INVALID_CALLBACK DAC Error Callback ID
  - HAL_DAC_CH1_COMPLETE_CB_ID DAC CH1 Complete Callback ID
  - HAL_DAC_CH1_HALF_COMPLETE_CB_ID DAC CH1 Half Complete Callback ID
  - HAL_DAC_CH1_ERROR_ID DAC CH1 Error Callback ID
  - HAL_DAC_CH1_UNDERRUN_CB_ID DAC CH1 UnderRun Callback ID
  - HAL_DAC_CH2_COMPLETE_CB_ID DAC CH2 Complete Callback ID
  - HAL_DAC_CH2_HALF_COMPLETE_CB_ID DAC CH2 Half Complete Callback ID
  - HAL_DAC_CH2_ERROR_ID DAC CH2 Error Callback ID
  - HAL_DAC_CH2_UNDERRUN_CB_ID DAC CH2 UnderRun Callback ID
  - HAL_DAC_MSPINIT_CB_ID DAC MSP Init Callback ID
  - HAL_DAC_MSPDEINIT_CB_ID DAC MSP DeInit Callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

HAL_DAC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DAC_UnRegisterCallback (DAC_HandleTypeDef * hdac, HAL_DAC_CallbackIDTypeDef CallbackID)

Function description

Unregister a User DAC Callback DAC Callback is redirected to the weak (surcharged) predefined callback.

Parameters

- **hdac:** DAC handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_DAC_CH1_COMPLETE_CB_ID DAC CH1 transfer Complete Callback ID
  - HAL_DAC_CH1_HALF_COMPLETE_CB_ID DAC CH1 Half Complete Callback ID
  - HAL_DAC_CH1_ERROR_ID DAC CH1 Error Callback ID
  - HAL_DAC_CH1_UNDERRUN_CB_ID DAC CH1 UnderRun Callback ID
  - HAL_DAC_CH2_COMPLETE_CB_ID DAC CH2 Complete Callback ID
  - HAL_DAC_CH2_HALF_COMPLETE_CB_ID DAC CH2 Half Complete Callback ID
  - HAL_DAC_CH2_ERROR_ID DAC CH2 Error Callback ID
  - HAL_DAC_CH2_UNDERRUN_CB_ID DAC CH2 UnderRun Callback ID
  - HAL_DAC_MSPINIT_CB_ID DAC MSP Init Callback ID
  - HAL_DAC_MSPDEINIT_CB_ID DAC MSP DeInit Callback ID
  - HAL_DAC_ALL_CB_ID DAC All callbacks

Return values

- **status:**

HAL_DAC_GetValue

Function name

uint32_t HAL_DAC_GetValue (DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Returns the last data output value of the selected DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **The:** selected DAC channel data output value.

HAL_DAC_ConfigChannel

Function name

HAL_StatusTypeDef HAL_DAC_ConfigChannel (DAC_HandleTypeDef * hdac, DAC_ChannelConfTypeDef * sConfig, uint32_t Channel)

Function description

Configures the selected DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **sConfig:** DAC configuration structure.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **HAL:** status

HAL_DAC_GetState

Function name

HAL_DAC_StateTypeDef HAL_DAC_GetState (DAC_HandleTypeDef * hdac)

Function description

return the DAC handle state

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **HAL:** state

HAL_DAC_GetError

Function name

uint32_t HAL_DAC_GetError (DAC_HandleTypeDef * hdac)

Function description

Return the DAC error code.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **DAC:** Error Code

DAC_DMAConvCpltCh1

Function name

void DAC_DMAConvCpltCh1 (DMA_HandleTypeDef * hdma)

Function description

DMA conversion complete callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

DAC_DMAErrorCh1

Function name

void DAC_DMAErrorCh1 (DMA_HandleTypeDef * hdma)

Function description

DMA error callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

DAC_DMAHalfConvCpltCh1

Function name

void DAC_DMAHalfConvCpltCh1 (DMA_HandleTypeDef * hdma)

Function description

DMA half transfer complete callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

18.3 DAC Firmware driver defines

The following section lists the various define and macros of the module.

18.3.1 DAC

DAC

DAC Channel selection

HAL_DAC_ERROR_TIMEOUT

Timeout error

HAL_DAC_ERROR_INVALID_CALLBACK

Invalid callback error

DAC Exported Macros

__HAL_DAC_RESET_HANDLE_STATE

Description:

- Reset DAC handle state.

Parameters:

- __HANDLE__: specifies the DAC handle.

Return value:

- None

__HAL_DAC_ENABLE

Description:

- Enable the DAC channel.

Parameters:

- __HANDLE__: specifies the DAC handle.
- __DAC_Channel__: specifies the DAC channel

Return value:

- None

__HAL_DAC_DISABLE

Description:

- Disable the DAC channel.

Parameters:

- __HANDLE__: specifies the DAC handle
- __DAC_Channel__: specifies the DAC channel.

Return value:

- None

DAC_DHR12R1_ALIGNMENT

Description:

- Set DHR12R1 alignment.

Parameters:

- __ALIGNMENT__: specifies the DAC alignment

Return value:

- None

DAC_DHR12R2_ALIGNMENT

Description:

- Set DHR12R2 alignment.

Parameters:

- __ALIGNMENT__: specifies the DAC alignment

Return value:

- None

DAC_DHR12RD_ALIGNMENT

Description:

- Set DHR12RD alignment.

Parameters:

- __ALIGNMENT__: specifies the DAC alignment

Return value:

- None

__HAL_DAC_ENABLE_IT

Description:

- Enable the DAC interrupt.

Parameters:

- __HANDLE__: specifies the DAC handle
- __INTERRUPT__: specifies the DAC interrupt. This parameter can be any combination of the following values:
  - DAC_IT_DMAUDR1 DAC channel 1 DMA underrun interrupt
  - DAC_IT_DMAUDR2 DAC channel 2 DMA underrun interrupt

Return value:

- None

__HAL_DAC_DISABLE_IT

Description:

- Disable the DAC interrupt.

Parameters:

- __HANDLE__: specifies the DAC handle
- __INTERRUPT__: specifies the DAC interrupt. This parameter can be any combination of the following values:
  - DAC_IT_DMAUDR1 DAC channel 1 DMA underrun interrupt
  - DAC_IT_DMAUDR2 DAC channel 2 DMA underrun interrupt

Return value:

- None

__HAL_DAC_GET_IT_SOURCE

Description:

- Check whether the specified DAC interrupt source is enabled or not.

Parameters:

- __HANDLE__: DAC handle
- __INTERRUPT__: DAC interrupt source to check This parameter can be any combination of the following values:
  - DAC_IT_DMAUDR1 DAC channel 1 DMA underrun interrupt
  - DAC_IT_DMAUDR2 DAC channel 2 DMA underrun interrupt

Return value:

- State: of interruption (SET or RESET)

__HAL_DAC_GET_FLAG

Description:

- Get the selected DAC's flag status.

Parameters:

- __HANDLE__: specifies the DAC handle.
- __FLAG__: specifies the DAC flag to get. This parameter can be any combination of the following values:
  - DAC_FLAG_DMAUDR1 DAC channel 1 DMA underrun flag
  - DAC_FLAG_DMAUDR2 DAC channel 2 DMA underrun flag

Return value:

- None

__HAL_DAC_CLEAR_FLAG

Description:

- Clear the DAC's flag.

Parameters:

- __HANDLE__: specifies the DAC handle.
- __FLAG__: specifies the DAC flag to clear. This parameter can be any combination of the following values:
  - DAC_FLAG_DMAUDR1 DAC channel 1 DMA underrun flag
  - DAC_FLAG_DMAUDR2 DAC channel 2 DMA underrun flag

Return value:

- None

19 HAL DAC Extension Driver

19.1 DACEx Firmware driver API description

The following section lists the various functions of the DACEx library.

19.1.1 How to use this driver

Dual mode IO operation

- Use HAL_DACEx_DualStart() to enable both channel and start conversion for dual mode operation. If software trigger is selected, using HAL_DACEx_DualStart() will start the conversion of the value previously set by HAL_DACEx_DualSetValue().
- Use HAL_DACEx_DualStop() to disable both channel and stop conversion for dual mode operation.
- Use HAL_DACEx_DualStart_DMA() to enable both channel and start conversion for dual mode operation using DMA to feed DAC converters. First issued trigger will start the conversion of the value previously set by HAL_DACEx_DualSetValue(). The same callbacks that are used in single mode are called in dual mode to notify transfer completion (half complete or complete), errors or underrun.
- Use HAL_DACEx_DualStop_DMA() to disable both channel and stop conversion for dual mode operation using DMA to feed DAC converters.
- When Dual mode is enabled (i.e. DAC Channel1 and Channel2 are used simultaneously) : Use HAL_DACEx_DualGetValue() to get digital data to be converted and use HAL_DACEx_DualSetValue() to set digital value to converted simultaneously in Channel 1 and Channel 2.

Signal generation operation

- Use HAL_DACEx_TriangleWaveGenerate() to generate Triangle signal.
- Use HAL_DACEx_NoiseWaveGenerate() to generate Noise signal.
- HAL_DACEx_SelfCalibrate to calibrate one DAC channel.
- HAL_DACEx_SetUserTrimming to set user trimming value.
- HAL_DACEx_GetTrimOffset to retrieve trimming value (factory setting after reset, user setting if HAL_DACEx_SetUserTrimming have been used at least one time after reset).

19.1.2 Extended features functions

This section provides functions allowing to:

- Start conversion.
- Stop conversion.
- Start conversion and enable DMA transfer.
- Stop conversion and disable DMA transfer.
- Get result of conversion.
- Get result of dual mode conversion.

This section contains the following APIs:

- ***HAL_DACEx_DualStart()***
- ***HAL_DACEx_DualStop()***
- ***HAL_DACEx_DualStart_DMA()***
- ***HAL_DACEx_DualStop_DMA()***
- ***HAL_DACEx_TriangleWaveGenerate()***
- ***HAL_DACEx_NoiseWaveGenerate()***
- ***HAL_DACEx_DualSetValue()***
- ***HAL_DACEx_ConvCpltCallbackCh2()***

- *HAL_DACEx_ConvHalfCpltCallbackCh2()*
- *HAL_DACEx_ErrorCallbackCh2()*
- *HAL_DACEx_DMAUnderrunCallbackCh2()*
- *HAL_DACEx_SelfCalibrate()*
- *HAL_DACEx_SetUserTrimming()*
- *HAL_DACEx_GetTrimOffset()*
- *HAL_DACEx_DualGetValue()*

19.1.3 Peripheral Control functions

This section provides functions allowing to:

- Set the specified data holding register value for DAC channel.

This section contains the following APIs:

- *HAL_DACEx_DualGetValue()*
- *HAL_DACEx_SelfCalibrate()*
- *HAL_DACEx_SetUserTrimming()*
- *HAL_DACEx_GetTrimOffset()*

19.1.4 Detailed description of functions

HAL_DACEx_TriangleWaveGenerate

Function name

HAL_StatusTypeDef HAL_DACEx_TriangleWaveGenerate (DAC_HandleTypeDef * hdac, uint32_t Channel, uint32_t Amplitude)

Function description

Enable or disable the selected DAC channel wave generation.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected
- **Amplitude:** Select max triangle amplitude. This parameter can be one of the following values:
  - DAC_TRIANGLEAMPLITUDE_1: Select max triangle amplitude of 1
  - DAC_TRIANGLEAMPLITUDE_3: Select max triangle amplitude of 3
  - DAC_TRIANGLEAMPLITUDE_7: Select max triangle amplitude of 7
  - DAC_TRIANGLEAMPLITUDE_15: Select max triangle amplitude of 15
  - DAC_TRIANGLEAMPLITUDE_31: Select max triangle amplitude of 31
  - DAC_TRIANGLEAMPLITUDE_63: Select max triangle amplitude of 63
  - DAC_TRIANGLEAMPLITUDE_127: Select max triangle amplitude of 127
  - DAC_TRIANGLEAMPLITUDE_255: Select max triangle amplitude of 255
  - DAC_TRIANGLEAMPLITUDE_511: Select max triangle amplitude of 511
  - DAC_TRIANGLEAMPLITUDE_1023: Select max triangle amplitude of 1023
  - DAC_TRIANGLEAMPLITUDE_2047: Select max triangle amplitude of 2047
  - DAC_TRIANGLEAMPLITUDE_4095: Select max triangle amplitude of 4095

Return values

- **HAL:** status

HAL_DACEx_NoiseWaveGenerate

Function name

HAL_StatusTypeDef HAL_DACEx_NoiseWaveGenerate (DAC_HandleTypeDef * hdac, uint32_t Channel, uint32_t Amplitude)

Function description

Enable or disable the selected DAC channel wave generation.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected
- **Amplitude:** Unmask DAC channel LFSR for noise wave generation. This parameter can be one of the following values:
  - DAC_LFSRUNMASK_BIT0: Unmask DAC channel LFSR bit0 for noise wave generation
  - DAC_LFSRUNMASK_BITS1_0: Unmask DAC channel LFSR bit[1:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS2_0: Unmask DAC channel LFSR bit[2:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS3_0: Unmask DAC channel LFSR bit[3:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS4_0: Unmask DAC channel LFSR bit[4:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS5_0: Unmask DAC channel LFSR bit[5:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS6_0: Unmask DAC channel LFSR bit[6:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS7_0: Unmask DAC channel LFSR bit[7:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS8_0: Unmask DAC channel LFSR bit[8:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS9_0: Unmask DAC channel LFSR bit[9:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS10_0: Unmask DAC channel LFSR bit[10:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS11_0: Unmask DAC channel LFSR bit[11:0] for noise wave generation

Return values

- **HAL:** status

HAL_DACEx_DualStart

Function name

HAL_StatusTypeDef HAL_DACEx_DualStart (DAC_HandleTypeDef * hdac)

Function description

Enables DAC and starts conversion of both channels.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **HAL:** status

HAL_DACEx_DualStop

Function name

HAL_StatusTypeDef HAL_DACEx_DualStop (DAC_HandleTypeDef * hdac)

Function description

Disables DAC and stop conversion of both channels.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **HAL:** status

HAL_DACEx_DualStart_DMA

Function name

HAL_StatusTypeDef HAL_DACEx_DualStart_DMA (DAC_HandleTypeDef * hdac, uint32_t Channel, uint32_t * pData, uint32_t Length, uint32_t Alignment)

Function description

Enables DAC and starts conversion of both channel 1 and 2 of the same DAC.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The DAC channel that will request data from DMA. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected
- **pData:** The destination peripheral Buffer address.
- **Length:** The length of data to be transferred from memory to DAC peripheral
- **Alignment:** Specifies the data alignment for DAC channel. This parameter can be one of the following values:
  - DAC_ALIGN_8B_R: 8bit right data alignment selected
  - DAC_ALIGN_12B_L: 12bit left data alignment selected
  - DAC_ALIGN_12B_R: 12bit right data alignment selected

Return values

- **HAL:** status

HAL_DACEx_DualStop_DMA

Function name

HAL_StatusTypeDef HAL_DACEx_DualStop_DMA (DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Disables DAC and stop conversion both channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The DAC channel that requests data from DMA. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **HAL:** status

HAL_DACEx_DualSetValue

Function name

HAL_StatusTypeDef HAL_DACEx_DualSetValue (DAC_HandleTypeDef * hdac, uint32_t Alignment, uint32_t Data1, uint32_t Data2)

Function description

Set the specified data holding register value for dual DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Alignment:** Specifies the data alignment for dual channel DAC. This parameter can be one of the following values: DAC_ALIGN_8B_R: 8bit right data alignment selected DAC_ALIGN_12B_L: 12bit left data alignment selected DAC_ALIGN_12B_R: 12bit right data alignment selected
- **Data1:** Data for DAC Channel1 to be loaded in the selected data holding register.
- **Data2:** Data for DAC Channel2 to be loaded in the selected data holding register.

Return values

- **HAL:** status

Notes

- In dual mode, a unique register access is required to write in both DAC channels at the same time.

HAL_DACEx_DualGetValue

Function name

uint32_t HAL_DACEx_DualGetValue (DAC_HandleTypeDef * hdac)

Function description

Return the last data output value of the selected DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **The:** selected DAC channel data output value.

HAL_DACEx_ConvCpltCallbackCh2

Function name

void HAL_DACEx_ConvCpltCallbackCh2 (DAC_HandleTypeDef * hdac)

Function description

Conversion complete callback in non-blocking mode for Channel2.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DACEx_ConvHalfCpltCallbackCh2

Function name

void HAL_DACEx_ConvHalfCpltCallbackCh2 (DAC_HandleTypeDef * hdac)

Function description

Conversion half DMA transfer callback in non-blocking mode for Channel2.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DACEx_ErrorCallbackCh2

Function name

void HAL_DACEx_ErrorCallbackCh2 (DAC_HandleTypeDef * hdac)

Function description

Error DAC callback for Channel2.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DACEx_DMAUnderrunCallbackCh2

Function name

void HAL_DACEx_DMAUnderrunCallbackCh2 (DAC_HandleTypeDef * hdac)

Function description

DMA underrun DAC callback for Channel2.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DACEx_SelfCalibrate

Function name

HAL_StatusTypeDef HAL_DACEx_SelfCalibrate (DAC_HandleTypeDef * hdac, DAC_ChannelConfTypeDef * sConfig, uint32_t Channel)

Function description

Run the self calibration of one DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **sConfig:** DAC channel configuration structure.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **Updates:** DAC_TrimmingValue. , DAC_UserTrimming set to DAC_UserTrimming
- **HAL:** status

Notes

- Calibration runs about 7 ms.

HAL_DACEx_SetUserTrimming

Function name

HAL_StatusTypeDef HAL_DACEx_SetUserTrimming (DAC_HandleTypeDef * hdac, DAC_ChannelConfTypeDef * sConfig, uint32_t Channel, uint32_t NewTrimmingValue)

Function description

Set the trimming mode and trimming value (user trimming mode applied).

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **sConfig:** DAC configuration structure updated with new DAC trimming value.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected
- **NewTrimmingValue:** DAC new trimming value

Return values

- **HAL:** status

HAL_DACEx_GetTrimOffset

Function name

uint32_t HAL_DACEx_GetTrimOffset (DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Return the DAC trimming value.

Parameters

- **hdac:** DAC handle
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **Trimming:** value : range: 0->31

DAC_DMAConvCpltCh2

Function name

void DAC_DMAConvCpltCh2 (DMA_HandleTypeDef * hdma)

Function description

DMA conversion complete callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

DAC_DMAErrorCh2

Function name

void DAC_DMAErrorCh2 (DMA_HandleTypeDef * hdma)

Function description

DMA error callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

DAC_DMAHalfConvCpltCh2

Function name

void DAC_DMAHalfConvCpltCh2 (DMA_HandleTypeDef * hdma)

Function description

DMA half transfer complete callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

19.2 DACEx Firmware driver defines

The following section lists the various define and macros of the module.

19.2.1 DACEx

DACEx

DACEx lfsrunmask triangle amplitude

DAC_LFSRUNMASK_BIT0

Unmask DAC channel LFSR bit0 for noise wave generation

DAC_LFSRUNMASK_BITS1_0

Unmask DAC channel LFSR bit[1:0] for noise wave generation

DAC_LFSRUNMASK_BITS2_0

Unmask DAC channel LFSR bit[2:0] for noise wave generation

DAC_LFSRUNMASK_BITS3_0

Unmask DAC channel LFSR bit[3:0] for noise wave generation

DAC_LFSRUNMASK_BITS4_0

Unmask DAC channel LFSR bit[4:0] for noise wave generation

DAC_LFSRUNMASK_BITS5_0

Unmask DAC channel LFSR bit[5:0] for noise wave generation

DAC_LFSRUNMASK_BITS6_0

Unmask DAC channel LFSR bit[6:0] for noise wave generation

DAC_LFSRUNMASK_BITS7_0

Unmask DAC channel LFSR bit[7:0] for noise wave generation

DAC_LFSRUNMASK_BITS8_0

Unmask DAC channel LFSR bit[8:0] for noise wave generation

DAC_LFSRUNMASK_BITS9_0

Unmask DAC channel LFSR bit[9:0] for noise wave generation

DAC_LFSRUNMASK_BITS10_0

Unmask DAC channel LFSR bit[10:0] for noise wave generation

DAC_LFSRUNMASK_BITS11_0

Unmask DAC channel LFSR bit[11:0] for noise wave generation

DAC_TRIANGLEAMPLITUDE_1

Select max triangle amplitude of 1

DAC_TRIANGLEAMPLITUDE_3

Select max triangle amplitude of 3

DAC_TRIANGLEAMPLITUDE_7

Select max triangle amplitude of 7

DAC_TRIANGLEAMPLITUDE_15

Select max triangle amplitude of 15

DAC_TRIANGLEAMPLITUDE_31

Select max triangle amplitude of 31

DAC_TRIANGLEAMPLITUDE_63

Select max triangle amplitude of 63

DAC_TRIANGLEAMPLITUDE_127

Select max triangle amplitude of 127

DAC_TRIANGLEAMPLITUDE_255

Select max triangle amplitude of 255

DAC_TRIANGLEAMPLITUDE_511

Select max triangle amplitude of 511

DAC_TRIANGLEAMPLITUDE_1023

Select max triangle amplitude of 1023

DAC_TRIANGLEAMPLITUDE_2047

Select max triangle amplitude of 2047

DAC_TRIANGLEAMPLITUDE_4095

Select max triangle amplitude of 4095

20 HAL DCMI Generic Driver

20.1 DCMI Firmware driver registers structures

20.1.1 DCMI_CodesInitTypeDef

DCMI_CodesInitTypeDef is defined in the stm32h7xx_hal_dcmi.h

Data Fields

- ***uint8_t FrameStartCode***
- ***uint8_t LineStartCode***
- ***uint8_t LineEndCode***
- ***uint8_t FrameEndCode***

Field Documentation

- ***uint8_t DCMI_CodesInitTypeDef::FrameStartCode***
  Specifies the code of the frame start delimiter.
- ***uint8_t DCMI_CodesInitTypeDef::LineStartCode***
  Specifies the code of the line start delimiter.
- ***uint8_t DCMI_CodesInitTypeDef::LineEndCode***
  Specifies the code of the line end delimiter.
- ***uint8_t DCMI_CodesInitTypeDef::FrameEndCode***
  Specifies the code of the frame end delimiter.

20.1.2 DCMI_SyncUnmaskTypeDef

DCMI_SyncUnmaskTypeDef is defined in the stm32h7xx_hal_dcmi.h

Data Fields

- ***uint8_t FrameStartUnmask***
- ***uint8_t LineStartUnmask***
- ***uint8_t LineEndUnmask***
- ***uint8_t FrameEndUnmask***

Field Documentation

- ***uint8_t DCMI_SyncUnmaskTypeDef::FrameStartUnmask***
  Specifies the frame start delimiter unmask.
- ***uint8_t DCMI_SyncUnmaskTypeDef::LineStartUnmask***
  Specifies the line start delimiter unmask.
- ***uint8_t DCMI_SyncUnmaskTypeDef::LineEndUnmask***
  Specifies the line end delimiter unmask.
- ***uint8_t DCMI_SyncUnmaskTypeDef::FrameEndUnmask***
  Specifies the frame end delimiter unmask.

20.1.3 DCMI_InitTypeDef

DCMI_InitTypeDef is defined in the stm32h7xx_hal_dcmi.h

Data Fields

- ***uint32_t SynchroMode***
- ***uint32_t PCKPolarity***
- ***uint32_t VSPolarity***
- ***uint32_t HSPolarity***
- ***uint32_t CaptureRate***

- ***uint32_t ExtendedDataMode***
- ***DCMI_CodesInitTypeDef SyncroCode***
- ***uint32_t JPEGMode***
- ***uint32_t ByteSelectMode***
- ***uint32_t ByteSelectStart***
- ***uint32_t LineSelectMode***
- ***uint32_t LineSelectStart***

Field Documentation

- ***uint32_t DCMI_InitTypeDef::SynchroMode***

  Specifies the Synchronization Mode: Hardware or Embedded. This parameter can be a value of ***DCMI_Synchronization_Mode***
- ***uint32_t DCMI_InitTypeDef::PCKPolarity***

  Specifies the Pixel clock polarity: Falling or Rising. This parameter can be a value of ***DCMI_PIXCK_Polarity***
- ***uint32_t DCMI_InitTypeDef::VSPolarity***

  Specifies the Vertical synchronization polarity: High or Low. This parameter can be a value of ***DCMI_VSYNC_Polarity***
- ***uint32_t DCMI_InitTypeDef::HSPolarity***

  Specifies the Horizontal synchronization polarity: High or Low. This parameter can be a value of ***DCMI_HSYNC_Polarity***
- ***uint32_t DCMI_InitTypeDef::CaptureRate***

  Specifies the frequency of frame capture: All, 1/2 or 1/4. This parameter can be a value of ***DCMI_Capture_Rate***
- ***uint32_t DCMI_InitTypeDef::ExtendedDataMode***

  Specifies the data width: 8-bit, 10-bit, 12-bit or 14-bit. This parameter can be a value of ***DCMI_Extended_Data_Mode***
- ***DCMI_CodesInitTypeDef DCMI_InitTypeDef::SyncroCode***

  Specifies the code of the line/frame start delimiter and the line/frame end delimiter
- ***uint32_t DCMI_InitTypeDef::JPEGMode***

  Enable or Disable the JPEG mode. This parameter can be a value of ***DCMI_MODE_JPEG***
- ***uint32_t DCMI_InitTypeDef::ByteSelectMode***

  Specifies the data to be captured by the interface This parameter can be a value of ***DCMI_Byte_Select_Mode***
- ***uint32_t DCMI_InitTypeDef::ByteSelectStart***

  Specifies if the data to be captured by the interface is even or odd This parameter can be a value of ***DCMI_Byte_Select_Start***
- ***uint32_t DCMI_InitTypeDef::LineSelectMode***

  Specifies the line of data to be captured by the interface This parameter can be a value of ***DCMI_Line_Select_Mode***
- ***uint32_t DCMI_InitTypeDef::LineSelectStart***

  Specifies if the line of data to be captured by the interface is even or odd This parameter can be a value of ***DCMI_Line_Select_Start***

20.1.4 __DCMI_HandleTypeDef

__DCMI_HandleTypeDef is defined in the stm32h7xx_hal_dcmi.h

Data Fields

- ***DCMI_TypeDef * Instance***
- ***DCMI_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_DCMI_StateTypeDef State***
- ***__IO uint32_t XferCount***
- ***__IO uint32_t XferSize***

- ***uint32_t XferTransferNumber***
- ***uint32_t pBuffPtr***
- ***DMA_HandleTypeDef * DMA_Handle***
- ***__IO uint32_t ErrorCode***
- ***void(* FrameEventCallback***
- ***void(* VsyncEventCallback***
- ***void(* LineEventCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***DCMI_TypeDef* __DCMI_HandleTypeDef::Instance***
  DCMI Register base address
- ***DCMI_InitTypeDef __DCMI_HandleTypeDef::Init***
  DCMI parameters
- ***HAL_LockTypeDef __DCMI_HandleTypeDef::Lock***
  DCMI locking object
- ***__IO HAL_DCMI_StateTypeDef __DCMI_HandleTypeDef::State***
  DCMI state
- ***__IO uint32_t __DCMI_HandleTypeDef::XferCount***
  DMA transfer counter
- ***__IO uint32_t __DCMI_HandleTypeDef::XferSize***
  DMA transfer size
- ***uint32_t __DCMI_HandleTypeDef::XferTransferNumber***
  DMA transfer number
- ***uint32_t __DCMI_HandleTypeDef::pBuffPtr***
  Pointer to DMA output buffer
- ***DMA_HandleTypeDef* __DCMI_HandleTypeDef::DMA_Handle***
  Pointer to the DMA handler
- ***__IO uint32_t __DCMI_HandleTypeDef::ErrorCode***
  DCMI Error code
- ***void(* __DCMI_HandleTypeDef::FrameEventCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Frame Event Callback
- ***void(* __DCMI_HandleTypeDef::VsyncEventCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Vsync Event Callback
- ***void(* __DCMI_HandleTypeDef::LineEventCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Line Event Callback
- ***void(* __DCMI_HandleTypeDef::ErrorCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Error Callback
- ***void(* __DCMI_HandleTypeDef::MspInitCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Msp Init callback
- ***void(* __DCMI_HandleTypeDef::MspDeInitCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Msp DeInit callback

20.2 DCMI Firmware driver API description

The following section lists the various functions of the DCMI library.

20.2.1 How to use this driver

The sequence below describes how to use this driver to capture image from a camera module connected to the DCMI Interface. This sequence does not take into account the configuration of the camera module, which should be made before to configure and enable the DCMI to capture images.

1. Program the required configuration through following parameters: horizontal and vertical polarity, pixel clock polarity, Capture Rate, Synchronization Mode, code of the frame delimiter and data width using HAL_DCMI_Init() function.
2. Configure the selected DMA stream to transfer Data from DCMI DR register to the destination memory buffer.
3. Program the required configuration through following parameters: DCMI mode, destination memory Buffer address and the data length and enable capture using HAL_DCMI_Start_DMA() function.
4. Optionally, configure and Enable the CROP feature to select a rectangular window from the received image using HAL_DCMI_ConfigCrop() and HAL_DCMI_EnableCrop() functions
5. The capture can be stopped using HAL_DCMI_Stop() function.
6. To control DCMI state you can use the function HAL_DCMI_GetState().

Callback registration

DCMI HAL driver macros list

Below the list of most used macros in DCMI HAL driver.

- __HAL_DCMI_ENABLE: Enable the DCMI peripheral.
- __HAL_DCMI_DISABLE: Disable the DCMI peripheral.
- __HAL_DCMI_GET_FLAG: Get the DCMI pending flags.
- __HAL_DCMI_CLEAR_FLAG: Clear the DCMI pending flags.
- __HAL_DCMI_ENABLE_IT: Enable the specified DCMI interrupts.
- __HAL_DCMI_DISABLE_IT: Disable the specified DCMI interrupts.
- __HAL_DCMI_GET_IT_SOURCE: Check whether the specified DCMI interrupt has occurred or not.

Note: You can refer to the DCMI HAL driver header file for more useful macros

20.2.2 Initialization and Configuration functions

This section provides functions allowing to:

- Initialize and configure the DCMI
- De-initialize the DCMI

This section contains the following APIs:

- ***HAL_DCMI_Init()***
- ***HAL_DCMI_DeInit()***
- ***HAL_DCMI_MspInit()***
- ***HAL_DCMI_MspDeInit()***
- ***HAL_DCMI_RegisterCallback()***
- ***HAL_DCMI_UnRegisterCallback()***

20.2.3 IO operation functions

This section provides functions allowing to:

- Configure destination address and data length and Enables DCMI DMA request and enables DCMI capture
- Stop the DCMI capture.
- Handles DCMI interrupt request.

This section contains the following APIs:

- ***HAL_DCMI_Start_DMA()***
- ***HAL_DCMI_Stop()***
- ***HAL_DCMI_Suspend()***
- ***HAL_DCMI_Resume()***

- *HAL_DCMI_IRQHandler()*
- *HAL_DCMI_ErrorCallback()*
- *HAL_DCMI_LineEventCallback()*
- *HAL_DCMI_VsyncEventCallback()*
- *HAL_DCMI_FrameEventCallback()*

20.2.4 Peripheral Control functions

This section provides functions allowing to:

- Configure the CROP feature.
- Enable/Disable the CROP feature.
- Set embedded synchronization delimiters unmasks.

This section contains the following APIs:

- *HAL_DCMI_ConfigCrop()*
- *HAL_DCMI_DisableCrop()*
- *HAL_DCMI_EnableCrop()*
- *HAL_DCMI_ConfigSyncUnmask()*

20.2.5 Peripheral State and Errors functions

This subsection provides functions allowing to

- Check the DCMI state.
- Get the specific DCMI error flag.

This section contains the following APIs:

- *HAL_DCMI_GetState()*
- *HAL_DCMI_GetError()*
- *HAL_DCMI_RegisterCallback()*
- *HAL_DCMI_UnRegisterCallback()*

20.2.6 Detailed description of functions

HAL_DCMI_Init

Function name

HAL_StatusTypeDef HAL_DCMI_Init (DCMI_HandleTypeDef * hdcmi)

Function description

Initializes the DCMI according to the specified parameters in the DCMI_InitTypeDef and create the associated handle.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_DeInit

Function name

HAL_StatusTypeDef HAL_DCMI_DeInit (DCMI_HandleTypeDef * hdcmi)

Function description

Deinitializes the DCMI peripheral registers to their default reset values.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_MspInit

Function name

void HAL_DCMI_MspInit (DCMI_HandleTypeDef * hdcmi)

Function description

Initializes the DCMI MSP.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_MspDeInit

Function name

void HAL_DCMI_MspDeInit (DCMI_HandleTypeDef * hdcmi)

Function description

DeInitializes the DCMI MSP.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DCMI_RegisterCallback (DCMI_HandleTypeDef * hdcmi, HAL_DCMI_CallbackIDTypeDef CallbackID, pDCMI_CallbackTypeDef pCallback)

Function description

Register a User DCMI Callback To be used instead of the weak predefined callback.

Parameters

- **hdcmi:** DCMI handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_DCMI_LINE_EVENT_CB_ID Line Event callback ID
  - HAL_DCMI_FRAME_EVENT_CB_ID Frame Event callback ID
  - HAL_DCMI_VSYNC_EVENT_CB_ID Vsync Event callback ID
  - HAL_DCMI_ERROR_CB_ID Error callback ID
  - HAL_DCMI_MSPINIT_CB_ID MspInit callback ID
  - HAL_DCMI_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_DCMI_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DCMI_UnRegisterCallback (DCMI_HandleTypeDef * hdcmi, HAL_DCMI_CallbackIDTypeDef CallbackID)

Function description

Unregister a DCMI Callback DCMI callback is redirected to the weak predefined callback.

Parameters

- **hdcmi:** DCMI handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_DCMI_LINE_EVENT_CB_ID Line Event callback ID
  - HAL_DCMI_FRAME_EVENT_CB_ID Frame Event callback ID
  - HAL_DCMI_VSYNC_EVENT_CB_ID Vsync Event callback ID
  - HAL_DCMI_ERROR_CB_ID Error callback ID
  - HAL_DCMI_MSPINIT_CB_ID MspInit callback ID
  - HAL_DCMI_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_DCMI_Start_DMA

Function name

HAL_StatusTypeDef HAL_DCMI_Start_DMA (DCMI_HandleTypeDef * hdcmi, uint32_t DCMI_Mode, uint32_t pData, uint32_t Length)

Function description

Enables DCMI DMA request and enables DCMI capture.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.
- **DCMI_Mode:** DCMI capture mode snapshot or continuous grab.
- **pData:** The destination memory Buffer address (LCD Frame buffer).
- **Length:** The length of capture to be transferred.

Return values

- **HAL:** status

HAL_DCMI_Stop

Function name

HAL_StatusTypeDef HAL_DCMI_Stop (DCMI_HandleTypeDef * hdcmi)

Function description

Disable DCMI DMA request and Disable DCMI capture.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_Suspend

Function name

HAL_StatusTypeDef HAL_DCMI_Suspend (DCMI_HandleTypeDef * hdcmi)

Function description

Suspend DCMI capture.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_Resume

Function name

HAL_StatusTypeDef HAL_DCMI_Resume (DCMI_HandleTypeDef * hdcmi)

Function description

Resume DCMI capture.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_ErrorCallback

Function name

void HAL_DCMI_ErrorCallback (DCMI_HandleTypeDef * hdcmi)

Function description

Error DCMI callback.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_LineEventCallback

Function name

void HAL_DCMI_LineEventCallback (DCMI_HandleTypeDef * hdcmi)

Function description

Line Event callback.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_FrameEventCallback

Function name

void HAL_DCMI_FrameEventCallback (DCMI_HandleTypeDef * hdcmi)

Function description

Frame Event callback.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_VsyncEventCallback

Function name

void HAL_DCMI_VsyncEventCallback (DCMI_HandleTypeDef * hdcmi)

Function description

VSYNC Event callback.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_IRQHandler

Function name

void HAL_DCMI_IRQHandler (DCMI_HandleTypeDef * hdcmi)

Function description

Handles DCMI interrupt request.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for the DCMI.

Return values

- **None:**

HAL_DCMI_ConfigCrop

Function name

HAL_StatusTypeDef HAL_DCMI_ConfigCrop (DCMI_HandleTypeDef * hdcmi, uint32_t X0, uint32_t Y0, uint32_t XSize, uint32_t YSize)

Function description

Configure the DCMI CROP coordinate.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.
- **YSize:** DCMI Line number
- **XSize:** DCMI Pixel per line
- **X0:** DCMI window X offset
- **Y0:** DCMI window Y offset

Return values

- **HAL:** status

HAL_DCMI_EnableCrop

Function name

HAL_StatusTypeDef HAL_DCMI_EnableCrop (DCMI_HandleTypeDef * hdcmi)

Function description

Enable the Crop feature.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_DisableCrop

Function name

HAL_StatusTypeDef HAL_DCMI_DisableCrop (DCMI_HandleTypeDef * hdcmi)

Function description

Disable the Crop feature.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_ConfigSyncUnmask

Function name

HAL_StatusTypeDef HAL_DCMI_ConfigSyncUnmask (DCMI_HandleTypeDef * hdcmi, DCMI_SyncUnmaskTypeDef * SyncUnmask)

Function description

Set embedded synchronization delimiters unmasks.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.
- **SyncUnmask:** pointer to a DCMI_SyncUnmaskTypeDef structure that contains the embedded synchronization delimiters unmasks.

Return values

- **HAL:** status

HAL_DCMI_GetState

Function name

HAL_DCMI_StateTypeDef HAL_DCMI_GetState (DCMI_HandleTypeDef * hdcmi)

Function description

Return the DCMI state.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** state

HAL_DCMI_GetError

Function name

uint32_t HAL_DCMI_GetError (DCMI_HandleTypeDef * hdcmi)

Function description

Return the DCMI error code.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **DCMI:** Error Code

20.3 DCMI Firmware driver defines

The following section lists the various define and macros of the module.

20.3.1 DCMI

DCMI

DCMI Byte Select Mode

DCMI_BSM_ALL

Interface captures all received data

DCMI_BSM_OTHER

Interface captures every other byte from the received data

DCMI_BSM_ALTERNATE_4

Interface captures one byte out of four

DCMI_BSM_ALTERNATE_2

Interface captures two bytes out of four

DCMI Byte Select Start

DCMI_OEBS_ODD

Interface captures first data from the frame/line start, second one being dropped

DCMI_OEBS_EVEN

Interface captures second data from the frame/line start, first one being dropped

DCMI Capture Mode

DCMI_MODE_CONTINUOUS

The received data are transferred continuously into the destination memory through the DMA

DCMI_MODE_SNAPSHOT

Once activated, the interface waits for the start of frame and then transfers a single frame through the DMA

DCMI Capture Rate

DCMI_CR_ALL_FRAME

All frames are captured

DCMI_CR_ALTERNATE_2_FRAME

Every alternate frame captured

DCMI_CR_ALTERNATE_4_FRAME

One frame in 4 frames captured

DCMI Error Code

HAL_DCMI_ERROR_NONE

No error

HAL_DCMI_ERROR_OVR

Overrun error

HAL_DCMI_ERROR_SYNC

Synchronization error

HAL_DCMI_ERROR_TIMEOUT

Timeout error

HAL_DCMI_ERROR_DMA

DMA error

HAL_DCMI_ERROR_INVALID_CALLBACK

Invalid Callback error

DCMI Exported Macros

__HAL_DCMI_RESET_HANDLE_STATE

Description:

- Reset DCMI handle state.

Parameters:

- __HANDLE__: specifies the DCMI handle.

Return value:

- None

__HAL_DCMI_ENABLE

Description:

- Enable the DCMI.

Parameters:

- __HANDLE__: DCMI handle

Return value:

- None

__HAL_DCMI_DISABLE

Description:

- Disable the DCMI.

Parameters:

- __HANDLE__: DCMI handle

Return value:

- None

__HAL_DCMI_GET_FLAG

Description:

- Get the DCMI pending flag.

Parameters:

- __HANDLE__: DCMI handle
- __FLAG__: Get the specified flag. This parameter can be one of the following values (no combination allowed)
  - DCMI_FLAG_HSYNC: HSYNC pin state (active line / synchronization between lines)
  - DCMI_FLAG_VSYNC: VSYNC pin state (active frame / synchronization between frames)
  - DCMI_FLAG_FNE: FIFO empty flag
  - DCMI_FLAG_FRAMERI: Frame capture complete flag mask
  - DCMI_FLAG_OVRRI: Overrun flag mask
  - DCMI_FLAG_ERRRI: Synchronization error flag mask
  - DCMI_FLAG_VSYNCRI: VSYNC flag mask
  - DCMI_FLAG_LINERI: Line flag mask
  - DCMI_FLAG_FRAMEMI: DCMI Capture complete masked interrupt status
  - DCMI_FLAG_OVRMI: DCMI Overrun masked interrupt status
  - DCMI_FLAG_ERRMI: DCMI Synchronization error masked interrupt status
  - DCMI_FLAG_VSYNCMI: DCMI VSYNC masked interrupt status
  - DCMI_FLAG_LINEMI: DCMI Line masked interrupt status

Return value:

- The: state of FLAG.

__HAL_DCMI_CLEAR_FLAG

Description:

- Clear the DCMI pending flags.

Parameters:

- __HANDLE__: DCMI handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - DCMI_FLAG_FRAMERI: Frame capture complete flag mask
  - DCMI_FLAG_OVFRI: Overflow flag mask
  - DCMI_FLAG_ERRRI: Synchronization error flag mask
  - DCMI_FLAG_VSYNCRI: VSYNC flag mask
  - DCMI_FLAG_LINERI: Line flag mask

Return value:

- None

__HAL_DCMI_ENABLE_IT

Description:

- Enable the specified DCMI interrupts.

Parameters:

- __HANDLE__: DCMI handle
- __INTERRUPT__: specifies the DCMI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DCMI_IT_FRAME: Frame capture complete interrupt mask
  - DCMI_IT_OVF: Overflow interrupt mask
  - DCMI_IT_ERR: Synchronization error interrupt mask
  - DCMI_IT_VSYNC: VSYNC interrupt mask
  - DCMI_IT_LINE: Line interrupt mask

Return value:

- None

__HAL_DCMI_DISABLE_IT

Description:

- Disable the specified DCMI interrupts.

Parameters:

- __HANDLE__: DCMI handle
- __INTERRUPT__: specifies the DCMI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DCMI_IT_FRAME: Frame capture complete interrupt mask
  - DCMI_IT_OVF: Overflow interrupt mask
  - DCMI_IT_ERR: Synchronization error interrupt mask
  - DCMI_IT_VSYNC: VSYNC interrupt mask
  - DCMI_IT_LINE: Line interrupt mask

Return value:

- None

__HAL_DCMI_GET_IT_SOURCE

Description:

- Check whether the specified DCMI interrupt has occurred or not.

Parameters:

- __HANDLE__: DCMI handle
- __INTERRUPT__: specifies the DCMI interrupt source to check. This parameter can be one of the following values:
  - DCMI_IT_FRAME: Frame capture complete interrupt mask
  - DCMI_IT_OVF: Overflow interrupt mask
  - DCMI_IT_ERR: Synchronization error interrupt mask
  - DCMI_IT_VSYNC: VSYNC interrupt mask
  - DCMI_IT_LINE: Line interrupt mask

Return value:

- The: state of INTERRUPT.

DCMI Extended Data Mode

DCMI_EXTEND_DATA_8B

Interface captures 8-bit data on every pixel clock

DCMI_EXTEND_DATA_10B

Interface captures 10-bit data on every pixel clock

DCMI_EXTEND_DATA_12B

Interface captures 12-bit data on every pixel clock

DCMI_EXTEND_DATA_14B

Interface captures 14-bit data on every pixel clock

DCMI Flags

DCMI_FLAG_HSYNC

HSYNC pin state (active line / synchronization between lines)

DCMI_FLAG_VSYNC

VSYNC pin state (active frame / synchronization between frames)

DCMI_FLAG_FNE

FIFO not empty flag

DCMI_FLAG_FRAMERI

Frame capture complete interrupt flag

DCMI_FLAG_OVRRI

Overrun interrupt flag

DCMI_FLAG_ERRRI

Synchronization error interrupt flag

DCMI_FLAG_VSYNCRI

VSYNC interrupt flag

DCMI_FLAG_LINERI

Line interrupt flag

DCMI_FLAG_FRAMEMI

DCMI Frame capture complete masked interrupt status

DCMI_FLAG_OVRMI

DCMI Overrun masked interrupt status

DCMI_FLAG_ERRMI

DCMI Synchronization error masked interrupt status

DCMI_FLAG_VSYNCMI

DCMI VSYNC masked interrupt status

DCMI_FLAG_LINEMI

DCMI Line masked interrupt status

DCMI HSYNC Polarity

DCMI_HSPOLARITY_LOW

Horizontal synchronization active Low

DCMI_HSPOLARITY_HIGH

Horizontal synchronization active High

DCMI interrupt sources

DCMI_IT_FRAME

Capture complete interrupt

DCMI_IT_OVR

Overrun interrupt

DCMI_IT_ERR

Synchronization error interrupt

DCMI_IT_VSYNC

VSYNC interrupt

DCMI_IT_LINE

Line interrupt

DCMI Line Select Mode

DCMI_LSM_ALL

Interface captures all received lines

DCMI_LSM_ALTERNATE_2

Interface captures one line out of two

DCMI Line Select Start

DCMI_OELS_ODD

Interface captures first line from the frame start, second one being dropped

DCMI_OELS_EVEN

Interface captures second line from the frame start, first one being dropped

DCMI MODE JPEG

DCMI_JPEG_DISABLE

Mode JPEG Disabled

DCMI_JPEG_ENABLE

Mode JPEG Enabled

DCMI PIXCK Polarity

DCMI_PCKPOLARITY_FALLING

Pixel clock active on Falling edge

DCMI_PCKPOLARITY_RISING

Pixel clock active on Rising edge

DCMI Synchronization Mode

DCMI_SYNCHRO_HARDWARE

Hardware synchronization data capture (frame/line start/stop) is synchronized with the HSYNC/VSYNC signals

DCMI_SYNCHRO_EMBEDDED

Embedded synchronization data capture is synchronized with synchronization codes embedded in the data flow

DCMI VSYNC Polarity

DCMI_VSPOLARITY_LOW

Vertical synchronization active Low

DCMI_VSPOLARITY_HIGH

Vertical synchronization active High

DCMI Window Coordinate

DCMI_WINDOW_COORDINATE

Window coordinate

DCMI Window Height

DCMI_WINDOW_HEIGHT

Window Height

21 HAL DFSDM Generic Driver

21.1 DFSDM Firmware driver registers structures

21.1.1 DFSDM_Channel_OutputClockTypeDef

DFSDM_Channel_OutputClockTypeDef is defined in the stm32h7xx_hal_dfsdm.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t Selection***
- ***uint32_t Divider***

Field Documentation

- ***FunctionalState DFSDM_Channel_OutputClockTypeDef::Activation***
  Output clock enable/disable
- ***uint32_t DFSDM_Channel_OutputClockTypeDef::Selection***
  Output clock is system clock or audio clock. This parameter can be a value of ***DFSDM_Channel_OuputClock***
- ***uint32_t DFSDM_Channel_OutputClockTypeDef::Divider***
  Output clock divider. This parameter must be a number between Min_Data = 2 and Max_Data = 256

21.1.2 DFSDM_Channel_InputTypeDef

DFSDM_Channel_InputTypeDef is defined in the stm32h7xx_hal_dfsdm.h

Data Fields

- ***uint32_t Multiplexer***
- ***uint32_t DataPacking***
- ***uint32_t Pins***

Field Documentation

- ***uint32_t DFSDM_Channel_InputTypeDef::Multiplexer***
  Input is external serial inputs, internal register or ADC output. This parameter can be a value of ***DFSDM_Channel_InputMultiplexer***
- ***uint32_t DFSDM_Channel_InputTypeDef::DataPacking***
  Standard, interleaved or dual mode for internal register. This parameter can be a value of ***DFSDM_Channel_DataPacking***
- ***uint32_t DFSDM_Channel_InputTypeDef::Pins***
  Input pins are taken from same or following channel. This parameter can be a value of ***DFSDM_Channel_InputPins***

21.1.3 DFSDM_Channel_SerialInterfaceTypeDef

DFSDM_Channel_SerialInterfaceTypeDef is defined in the stm32h7xx_hal_dfsdm.h

Data Fields

- ***uint32_t Type***
- ***uint32_t SpiClock***

Field Documentation

- ***uint32_t DFSDM_Channel_SerialInterfaceTypeDef::Type***
  SPI or Manchester modes. This parameter can be a value of ***DFSDM_Channel_SerialInterfaceType***
- ***uint32_t DFSDM_Channel_SerialInterfaceTypeDef::SpiClock***
  SPI clock select (external or internal with different sampling point). This parameter can be a value of ***DFSDM_Channel_SpiClock***

21.1.4 DFSDM_Channel_AwdTypeDef

DFSDM_Channel_AwdTypeDef is defined in the stm32h7xx_hal_dfsdm.h

Data Fields

- ***uint32_t FilterOrder***
- ***uint32_t Oversampling***

Field Documentation

- ***uint32_t DFSDM_Channel_AwdTypeDef::FilterOrder***
  Analog watchdog Sinc filter order. This parameter can be a value of ***DFSDM_Channel_AwdFilterOrder***
- ***uint32_t DFSDM_Channel_AwdTypeDef::Oversampling***
  Analog watchdog filter oversampling ratio. This parameter must be a number between Min_Data = 1 and Max_Data = 32

21.1.5 DFSDM_Channel_InitTypeDef

DFSDM_Channel_InitTypeDef is defined in the stm32h7xx_hal_dfsdm.h

Data Fields

- ***DFSDM_Channel_OutputClockTypeDef OutputClock***
- ***DFSDM_Channel_InputTypeDef Input***
- ***DFSDM_Channel_SerialInterfaceTypeDef SerialInterface***
- ***DFSDM_Channel_AwdTypeDef Awd***
- ***int32_t Offset***
- ***uint32_t RightBitShift***

Field Documentation

- ***DFSDM_Channel_OutputClockTypeDef DFSDM_Channel_InitTypeDef::OutputClock***
  DFSDM channel output clock parameters
- ***DFSDM_Channel_InputTypeDef DFSDM_Channel_InitTypeDef::Input***
  DFSDM channel input parameters
- ***DFSDM_Channel_SerialInterfaceTypeDef DFSDM_Channel_InitTypeDef::SerialInterface***
  DFSDM channel serial interface parameters
- ***DFSDM_Channel_AwdTypeDef DFSDM_Channel_InitTypeDef::Awd***
  DFSDM channel analog watchdog parameters
- ***int32_t DFSDM_Channel_InitTypeDef::Offset***
  DFSDM channel offset. This parameter must be a number between Min_Data = -8388608 and Max_Data = 8388607
- ***uint32_t DFSDM_Channel_InitTypeDef::RightBitShift***
  DFSDM channel right bit shift. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0x1F

21.1.6 __DFSDM_Channel_HandleTypeDef

__DFSDM_Channel_HandleTypeDef is defined in the stm32h7xx_hal_dfsdm.h

Data Fields

- ***DFSDM_Channel_TypeDef * Instance***
- ***DFSDM_Channel_InitTypeDef Init***
- ***HAL_DFSDM_Channel_StateTypeDef State***
- ***void(* CkabCallback***
- ***void(* ScdCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***DFSDM_Channel_TypeDef* __DFSDM_Channel_HandleTypeDef::Instance***
  DFSDM channel instance
- ***DFSDM_Channel_InitTypeDef __DFSDM_Channel_HandleTypeDef::Init***
  DFSDM channel init parameters
- ***HAL_DFSDM_Channel_StateTypeDef __DFSDM_Channel_HandleTypeDef::State***
  DFSDM channel state
- ***void(* __DFSDM_Channel_HandleTypeDef::CkabCallback)(struct __DFSDM_Channel_HandleTypeDef *hdfsdm_channel)***
  DFSDM channel clock absence detection callback
- ***void(* __DFSDM_Channel_HandleTypeDef::ScdCallback)(struct __DFSDM_Channel_HandleTypeDef *hdfsdm_channel)***
  DFSDM channel short circuit detection callback
- ***void(* __DFSDM_Channel_HandleTypeDef::MspInitCallback)(struct __DFSDM_Channel_HandleTypeDef *hdfsdm_channel)***
  DFSDM channel MSP init callback
- ***void(* __DFSDM_Channel_HandleTypeDef::MspDeInitCallback)(struct __DFSDM_Channel_HandleTypeDef *hdfsdm_channel)***
  DFSDM channel MSP de-init callback

21.1.7 DFSDM_Filter_RegularParamTypeDef

DFSDM_Filter_RegularParamTypeDef is defined in the stm32h7xx_hal_dfsdm.h

Data Fields

- ***uint32_t Trigger***
- ***FunctionalState FastMode***
- ***FunctionalState DmaMode***

Field Documentation

- ***uint32_t DFSDM_Filter_RegularParamTypeDef::Trigger***
  Trigger used to start regular conversion: software or synchronous. This parameter can be a value of ***DFSDM_Filter_Trigger***
- ***FunctionalState DFSDM_Filter_RegularParamTypeDef::FastMode***
  Enable/disable fast mode for regular conversion
- ***FunctionalState DFSDM_Filter_RegularParamTypeDef::DmaMode***
  Enable/disable DMA for regular conversion

21.1.8 DFSDM_Filter_InjectedParamTypeDef

DFSDM_Filter_InjectedParamTypeDef is defined in the stm32h7xx_hal_dfsdm.h

Data Fields

- ***uint32_t Trigger***
- ***FunctionalState ScanMode***
- ***FunctionalState DmaMode***
- ***uint32_t ExtTrigger***
- ***uint32_t ExtTriggerEdge***

Field Documentation

- ***uint32_t DFSDM_Filter_InjectedParamTypeDef::Trigger***
  Trigger used to start injected conversion: software, external or synchronous. This parameter can be a value of ***DFSDM_Filter_Trigger***
- ***FunctionalState DFSDM_Filter_InjectedParamTypeDef::ScanMode***
  Enable/disable scanning mode for injected conversion
- ***FunctionalState DFSDM_Filter_InjectedParamTypeDef::DmaMode***
  Enable/disable DMA for injected conversion

- ***uint32_t DFSDM_Filter_InjectedParamTypeDef::ExtTrigger***
  External trigger. This parameter can be a value of ***DFSDM_Filter_ExtTrigger***
- ***uint32_t DFSDM_Filter_InjectedParamTypeDef::ExtTriggerEdge***
  External trigger edge: rising, falling or both. This parameter can be a value of ***DFSDM_Filter_ExtTriggerEdge***

21.1.9 DFSDM_Filter_FilterParamTypeDef

DFSDM_Filter_FilterParamTypeDef is defined in the stm32h7xx_hal_dfsdm.h

Data Fields

- ***uint32_t SincOrder***
- ***uint32_t Oversampling***
- ***uint32_t IntOversampling***

Field Documentation

- ***uint32_t DFSDM_Filter_FilterParamTypeDef::SincOrder***
  Sinc filter order. This parameter can be a value of ***DFSDM_Filter_SincOrder***
- ***uint32_t DFSDM_Filter_FilterParamTypeDef::Oversampling***
  Filter oversampling ratio. This parameter must be a number between Min_Data = 1 and Max_Data = 1024
- ***uint32_t DFSDM_Filter_FilterParamTypeDef::IntOversampling***
  Integrator oversampling ratio. This parameter must be a number between Min_Data = 1 and Max_Data = 256

21.1.10 DFSDM_Filter_InitTypeDef

DFSDM_Filter_InitTypeDef is defined in the stm32h7xx_hal_dfsdm.h

Data Fields

- ***DFSDM_Filter_RegularParamTypeDef RegularParam***
- ***DFSDM_Filter_InjectedParamTypeDef InjectedParam***
- ***DFSDM_Filter_FilterParamTypeDef FilterParam***

Field Documentation

- ***DFSDM_Filter_RegularParamTypeDef DFSDM_Filter_InitTypeDef::RegularParam***
  DFSDM regular conversion parameters
- ***DFSDM_Filter_InjectedParamTypeDef DFSDM_Filter_InitTypeDef::InjectedParam***
  DFSDM injected conversion parameters
- ***DFSDM_Filter_FilterParamTypeDef DFSDM_Filter_InitTypeDef::FilterParam***
  DFSDM filter parameters

21.1.11 __DFSDM_Filter_HandleTypeDef

__DFSDM_Filter_HandleTypeDef is defined in the stm32h7xx_hal_dfsdm.h

Data Fields

- ***DFSDM_Filter_TypeDef * Instance***
- ***DFSDM_Filter_InitTypeDef Init***
- ***DMA_HandleTypeDef * hdmaReg***
- ***DMA_HandleTypeDef * hdmaInj***
- ***uint32_t RegularContMode***
- ***uint32_t RegularTrigger***
- ***uint32_t InjectedTrigger***
- ***uint32_t ExtTriggerEdge***
- ***FunctionalState InjectedScanMode***
- ***uint32_t InjectedChannelsNbr***
- ***uint32_t InjConvRemaining***

- ***HAL_DFSDM_Filter_StateTypeDef State***
- ***uint32_t ErrorCode***
- ***void(* AwdCallback***
- ***void(* RegConvCpltCallback***
- ***void(* RegConvHalfCpltCallback***
- ***void(* InjConvCpltCallback***
- ***void(* InjConvHalfCpltCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***DFSDM_Filter_TypeDef* __DFSDM_Filter_HandleTypeDef::Instance***
  DFSDM filter instance
- ***DFSDM_Filter_InitTypeDef __DFSDM_Filter_HandleTypeDef::Init***
  DFSDM filter init parameters
- ***DMA_HandleTypeDef* __DFSDM_Filter_HandleTypeDef::hdmaReg***
  Pointer on DMA handler for regular conversions
- ***DMA_HandleTypeDef* __DFSDM_Filter_HandleTypeDef::hdmaInj***
  Pointer on DMA handler for injected conversions
- ***uint32_t __DFSDM_Filter_HandleTypeDef::RegularContMode***
  Regular conversion continuous mode
- ***uint32_t __DFSDM_Filter_HandleTypeDef::RegularTrigger***
  Trigger used for regular conversion
- ***uint32_t __DFSDM_Filter_HandleTypeDef::InjectedTrigger***
  Trigger used for injected conversion
- ***uint32_t __DFSDM_Filter_HandleTypeDef::ExtTriggerEdge***
  Rising, falling or both edges selected
- ***FunctionalState __DFSDM_Filter_HandleTypeDef::InjectedScanMode***
  Injected scanning mode
- ***uint32_t __DFSDM_Filter_HandleTypeDef::InjectedChannelsNbr***
  Number of channels in injected sequence
- ***uint32_t __DFSDM_Filter_HandleTypeDef::InjConvRemaining***
  Injected conversions remaining
- ***HAL_DFSDM_Filter_StateTypeDef __DFSDM_Filter_HandleTypeDef::State***
  DFSDM filter state
- ***uint32_t __DFSDM_Filter_HandleTypeDef::ErrorCode***
  DFSDM filter error code
- ***void(* __DFSDM_Filter_HandleTypeDef::AwdCallback)(struct __DFSDM_Filter_HandleTypeDef *hdfsdm_filter, uint32_t Channel, uint32_t Threshold)***
  DFSDM filter analog watchdog callback
- ***void(* __DFSDM_Filter_HandleTypeDef::RegConvCpltCallback)(struct __DFSDM_Filter_HandleTypeDef *hdfsdm_filter)***
  DFSDM filter regular conversion complete callback
- ***void(* __DFSDM_Filter_HandleTypeDef::RegConvHalfCpltCallback)(struct __DFSDM_Filter_HandleTypeDef *hdfsdm_filter)***
  DFSDM filter half regular conversion complete callback
- ***void(* __DFSDM_Filter_HandleTypeDef::InjConvCpltCallback)(struct __DFSDM_Filter_HandleTypeDef *hdfsdm_filter)***
  DFSDM filter injected conversion complete callback

- ***void(* __DFSDM_Filter_HandleTypeDef::InjConvHalfCpltCallback)(struct __DFSDM_Filter_HandleTypeDef *hdfsdm_filter)***
  DFSDM filter half injected conversion complete callback
- ***void(* __DFSDM_Filter_HandleTypeDef::ErrorCallback)(struct __DFSDM_Filter_HandleTypeDef *hdfsdm_filter)***
  DFSDM filter error callback
- ***void(* __DFSDM_Filter_HandleTypeDef::MspInitCallback)(struct __DFSDM_Filter_HandleTypeDef *hdfsdm_filter)***
  DFSDM filter MSP init callback
- ***void(* __DFSDM_Filter_HandleTypeDef::MspDeInitCallback)(struct __DFSDM_Filter_HandleTypeDef *hdfsdm_filter)***
  DFSDM filter MSP de-init callback

21.1.12 DFSDM_Filter_AwdParamTypeDef

DFSDM_Filter_AwdParamTypeDef is defined in the stm32h7xx_hal_dfsdm.h

Data Fields

- ***uint32_t DataSource***
- ***uint32_t Channel***
- ***int32_t HighThreshold***
- ***int32_t LowThreshold***
- ***uint32_t HighBreakSignal***
- ***uint32_t LowBreakSignal***

Field Documentation

- ***uint32_t DFSDM_Filter_AwdParamTypeDef::DataSource***
  Values from digital filter or from channel watchdog filter. This parameter can be a value of ***DFSDM_Filter_AwdDataSource***
- ***uint32_t DFSDM_Filter_AwdParamTypeDef::Channel***
  Analog watchdog channel selection. This parameter can be a values combination of ***DFSDM_Channel_Selection***
- ***int32_t DFSDM_Filter_AwdParamTypeDef::HighThreshold***
  High threshold for the analog watchdog. This parameter must be a number between Min_Data = -8388608 and Max_Data = 8388607
- ***int32_t DFSDM_Filter_AwdParamTypeDef::LowThreshold***
  Low threshold for the analog watchdog. This parameter must be a number between Min_Data = -8388608 and Max_Data = 8388607
- ***uint32_t DFSDM_Filter_AwdParamTypeDef::HighBreakSignal***
  Break signal assigned to analog watchdog high threshold event. This parameter can be a values combination of ***DFSDM_BreakSignals***
- ***uint32_t DFSDM_Filter_AwdParamTypeDef::LowBreakSignal***
  Break signal assigned to analog watchdog low threshold event. This parameter can be a values combination of ***DFSDM_BreakSignals***

21.2 DFSDM Firmware driver API description

The following section lists the various functions of the DFSDM library.

21.2.1 How to use this driver

Channel initialization

1. User has first to initialize channels (before filters initialization).

2. As prerequisite, fill in the HAL_DFSDM_ChannelMspInit() :
   – Enable DFSDMz clock interface with __HAL_RCC_DFSDMz_CLK_ENABLE().
   – Enable the clocks for the DFSDMz GPIOS with __HAL_RCC_GPIOx_CLK_ENABLE().
   – Configure these DFSDMz pins in alternate mode using HAL_GPIO_Init().
   – If interrupt mode is used, enable and configure DFSDMz_FLT0 global interrupt with HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ().
3. Configure the output clock, input, serial interface, analog watchdog, offset and data right bit shift parameters for this channel using the HAL_DFSDM_ChannelInit() function.

Channel clock absence detector

1. Start clock absence detector using HAL_DFSDM_ChannelCkabStart() or HAL_DFSDM_ChannelCkabStart_IT().
2. In polling mode, use HAL_DFSDM_ChannelPollForCkab() to detect the clock absence.
3. In interrupt mode, HAL_DFSDM_ChannelCkabCallback() will be called if clock absence is detected.
4. Stop clock absence detector using HAL_DFSDM_ChannelCkabStop() or HAL_DFSDM_ChannelCkabStop_IT().
5. Please note that the same mode (polling or interrupt) has to be used for all channels because the channels are sharing the same interrupt.
6. Please note also that in interrupt mode, if clock absence detector is stopped for one channel, interrupt will be disabled for all channels.

Channel short circuit detector

1. Start short circuit detector using HAL_DFSDM_ChannelScdStart() or or HAL_DFSDM_ChannelScdStart_IT().
2. In polling mode, use HAL_DFSDM_ChannelPollForScd() to detect short circuit.
3. In interrupt mode, HAL_DFSDM_ChannelScdCallback() will be called if short circuit is detected.
4. Stop short circuit detector using HAL_DFSDM_ChannelScdStop() or or HAL_DFSDM_ChannelScdStop_IT().
5. Please note that the same mode (polling or interrupt) has to be used for all channels because the channels are sharing the same interrupt.
6. Please note also that in interrupt mode, if short circuit detector is stopped for one channel, interrupt will be disabled for all channels.

Channel analog watchdog value

1. Get analog watchdog filter value of a channel using HAL_DFSDM_ChannelGetAwdValue().

Channel offset value

1. Modify offset value of a channel using HAL_DFSDM_ChannelModifyOffset().

Filter initialization

1. After channel initialization, user has to init filters.
2. As prerequisite, fill in the HAL_DFSDM_FilterMspInit() :
   – If interrupt mode is used , enable and configure DFSDMz_FLTx global interrupt with HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ(). Please note that DFSDMz_FLT0 global interrupt could be already enabled if interrupt is used for channel.
   – If DMA mode is used, configure DMA with HAL_DMA_Init() and link it with DFSDMz filter handle using __HAL_LINKDMA().
3. Configure the regular conversion, injected conversion and filter parameters for this filter using the HAL_DFSDM_FilterInit() function.

Filter regular channel conversion

1. Select regular channel and enable/disable continuous mode using HAL_DFSDM_FilterConfigRegChannel().

2. Start regular conversion using HAL_DFSDM_FilterRegularStart(), HAL_DFSDM_FilterRegularStart_IT(), HAL_DFSDM_FilterRegularStart_DMA() or HAL_DFSDM_FilterRegularMsbStart_DMA().
3. In polling mode, use HAL_DFSDM_FilterPollForRegConversion() to detect the end of regular conversion.
4. In interrupt mode, HAL_DFSDM_FilterRegConvCpltCallback() will be called at the end of regular conversion.
5. Get value of regular conversion and corresponding channel using HAL_DFSDM_FilterGetRegularValue().
6. In DMA mode, HAL_DFSDM_FilterRegConvHalfCpltCallback() and HAL_DFSDM_FilterRegConvCpltCallback() will be called respectively at the half transfer and at the transfer complete. Please note that HAL_DFSDM_FilterRegConvHalfCpltCallback() will be called only in DMA circular mode.
7. Stop regular conversion using HAL_DFSDM_FilterRegularStop(), HAL_DFSDM_FilterRegularStop_IT() or HAL_DFSDM_FilterRegularStop_DMA().

Filter injected channels conversion

1. Select injected channels using HAL_DFSDM_FilterConfigInjChannel().
2. Start injected conversion using HAL_DFSDM_FilterInjectedStart(), HAL_DFSDM_FilterInjectedStart_IT(), HAL_DFSDM_FilterInjectedStart_DMA() or HAL_DFSDM_FilterInjectedMsbStart_DMA().
3. In polling mode, use HAL_DFSDM_FilterPollForInjConversion() to detect the end of injected conversion.
4. In interrupt mode, HAL_DFSDM_FilterInjConvCpltCallback() will be called at the end of injected conversion.
5. Get value of injected conversion and corresponding channel using HAL_DFSDM_FilterGetInjectedValue().
6. In DMA mode, HAL_DFSDM_FilterInjConvHalfCpltCallback() and HAL_DFSDM_FilterInjConvCpltCallback() will be called respectively at the half transfer and at the transfer complete. Please note that HAL_DFSDM_FilterInjConvCpltCallback() will be called only in DMA circular mode.
7. Stop injected conversion using HAL_DFSDM_FilterInjectedStop(), HAL_DFSDM_FilterInjectedStop_IT() or HAL_DFSDM_FilterInjectedStop_DMA().

Filter analog watchdog

1. Start filter analog watchdog using HAL_DFSDM_FilterAwdStart_IT().
2. HAL_DFSDM_FilterAwdCallback() will be called if analog watchdog occurs.
3. Stop filter analog watchdog using HAL_DFSDM_FilterAwdStop_IT().

Filter extreme detector

1. Start filter extreme detector using HAL_DFSDM_FilterExdStart().
2. Get extreme detector maximum value using HAL_DFSDM_FilterGetExdMaxValue().
3. Get extreme detector minimum value using HAL_DFSDM_FilterGetExdMinValue().
4. Start filter extreme detector using HAL_DFSDM_FilterExdStop().

Filter conversion time

1. Get conversion time value using HAL_DFSDM_FilterGetConvTimeValue().

Callback registration

The compilation define USE_HAL_DFSDM_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use functions HAL_DFSDM_Channel_RegisterCallback(), HAL_DFSDM_Filter_RegisterCallback() or HAL_DFSDM_Filter_RegisterAwdCallback() to register a user callback.

Function HAL_DFSDM_Channel_RegisterCallback() allows to register following callbacks:

- CkabCallback : DFSDM channel clock absence detection callback.
- ScdCallback : DFSDM channel short circuit detection callback.
- MspInitCallback : DFSDM channel MSP init callback.
- MspDeInitCallback : DFSDM channel MSP de-init callback.

This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Function HAL_DFSDM_Filter_RegisterCallback() allows to register following callbacks:

- RegConvCpltCallback : DFSDM filter regular conversion complete callback.
- RegConvHalfCpltCallback : DFSDM filter half regular conversion complete callback.
- InjConvCpltCallback : DFSDM filter injected conversion complete callback.
- InjConvHalfCpltCallback : DFSDM filter half injected conversion complete callback.
- ErrorCallback : DFSDM filter error callback.
- MspInitCallback : DFSDM filter MSP init callback.
- MspDeInitCallback : DFSDM filter MSP de-init callback.

This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

For specific DFSDM filter analog watchdog callback use dedicated register callback: HAL_DFSDM_Filter_RegisterAwdCallback().

Use functions HAL_DFSDM_Channel_UnRegisterCallback() or HAL_DFSDM_Filter_UnRegisterCallback() to reset a callback to the default weak function.

HAL_DFSDM_Channel_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID.

This function allows to reset following callbacks:

- CkabCallback : DFSDM channel clock absence detection callback.
- ScdCallback : DFSDM channel short circuit detection callback.
- MspInitCallback : DFSDM channel MSP init callback.
- MspDeInitCallback : DFSDM channel MSP de-init callback.

HAL_DFSDM_Filter_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID.

This function allows to reset following callbacks:

- RegConvCpltCallback : DFSDM filter regular conversion complete callback.
- RegConvHalfCpltCallback : DFSDM filter half regular conversion complete callback.
- InjConvCpltCallback : DFSDM filter injected conversion complete callback.
- InjConvHalfCpltCallback : DFSDM filter half injected conversion complete callback.
- ErrorCallback : DFSDM filter error callback.
- MspInitCallback : DFSDM filter MSP init callback.
- MspDeInitCallback : DFSDM filter MSP de-init callback.

For specific DFSDM filter analog watchdog callback use dedicated unregister callback: HAL_DFSDM_Filter_UnRegisterAwdCallback().

By default, after the call of init function and if the state is RESET all callbacks are reset to the corresponding legacy weak functions: examples HAL_DFSDM_ChannelScdCallback(), HAL_DFSDM_FilterErrorCallback(). Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak functions in the init and de-init only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the init and de-init keep and use the user MspInit/MspDeInit callbacks (registered beforehand)

Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the init/de-init. In that case first register the MspInit/MspDeInit user callbacks using HAL_DFSDM_Channel_RegisterCallback() or HAL_DFSDM_Filter_RegisterCallback() before calling init or de-init function.

When The compilation define USE_HAL_DFSDM_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak callbacks are used.

21.2.2 Channel initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the DFSDM channel.
- De-initialize the DFSDM channel.

This section contains the following APIs:

- ***HAL_DFSDM_ChannelInit()***
- ***HAL_DFSDM_ChannelDeInit()***

- *HAL_DFSDM_ChannelMspInit()*
- *HAL_DFSDM_ChannelMspDeInit()*
- *HAL_DFSDM_Channel_RegisterCallback()*
- *HAL_DFSDM_Channel_UnRegisterCallback()*

21.2.3 Channel operation functions

This section provides functions allowing to:

- Manage clock absence detector feature.
- Manage short circuit detector feature.
- Get analog watchdog value.
- Modify offset value.

This section contains the following APIs:

- *HAL_DFSDM_ChannelCkabStart()*
- *HAL_DFSDM_ChannelPollForCkab()*
- *HAL_DFSDM_ChannelCkabStop()*
- *HAL_DFSDM_ChannelCkabStart_IT()*
- *HAL_DFSDM_ChannelCkabCallback()*
- *HAL_DFSDM_ChannelCkabStop_IT()*
- *HAL_DFSDM_ChannelScdStart()*
- *HAL_DFSDM_ChannelPollForScd()*
- *HAL_DFSDM_ChannelScdStop()*
- *HAL_DFSDM_ChannelScdStart_IT()*
- *HAL_DFSDM_ChannelScdCallback()*
- *HAL_DFSDM_ChannelScdStop_IT()*
- *HAL_DFSDM_ChannelGetAwdValue()*
- *HAL_DFSDM_ChannelModifyOffset()*

21.2.4 Channel state function

This section provides function allowing to:

- Get channel handle state.

This section contains the following APIs:

- *HAL_DFSDM_ChannelGetState()*

21.2.5 Filter initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the DFSDM filter.
- De-initialize the DFSDM filter.

This section contains the following APIs:

- *HAL_DFSDM_FilterInit()*
- *HAL_DFSDM_FilterDeInit()*
- *HAL_DFSDM_FilterMspInit()*
- *HAL_DFSDM_FilterMspDeInit()*
- *HAL_DFSDM_Filter_RegisterCallback()*
- *HAL_DFSDM_Filter_UnRegisterCallback()*
- *HAL_DFSDM_Filter_RegisterAwdCallback()*
- *HAL_DFSDM_Filter_UnRegisterAwdCallback()*

21.2.6 Filter control functions

This section provides functions allowing to:

- Select channel and enable/disable continuous mode for regular conversion.
- Select channels for injected conversion.

This section contains the following APIs:

- ***HAL_DFSDM_FilterConfigRegChannel()***
- ***HAL_DFSDM_FilterConfigInjChannel()***

21.2.7 Filter operation functions

This section provides functions allowing to:

- Start conversion of regular/injected channel.
- Poll for the end of regular/injected conversion.
- Stop conversion of regular/injected channel.
- Start conversion of regular/injected channel and enable interrupt.
- Call the callback functions at the end of regular/injected conversions.
- Stop conversion of regular/injected channel and disable interrupt.
- Start conversion of regular/injected channel and enable DMA transfer.
- Stop conversion of regular/injected channel and disable DMA transfer.
- Start analog watchdog and enable interrupt.
- Call the callback function when analog watchdog occurs.
- Stop analog watchdog and disable interrupt.
- Start extreme detector.
- Stop extreme detector.
- Get result of regular channel conversion.
- Get result of injected channel conversion.
- Get extreme detector maximum and minimum values.
- Get conversion time.
- Handle DFSDM interrupt request.

This section contains the following APIs:

- ***HAL_DFSDM_FilterRegularStart()***
- ***HAL_DFSDM_FilterPollForRegConversion()***
- ***HAL_DFSDM_FilterRegularStop()***
- ***HAL_DFSDM_FilterRegularStart_IT()***
- ***HAL_DFSDM_FilterRegularStop_IT()***
- ***HAL_DFSDM_FilterRegularStart_DMA()***
- ***HAL_DFSDM_FilterRegularMsbStart_DMA()***
- ***HAL_DFSDM_FilterRegularStop_DMA()***
- ***HAL_DFSDM_FilterGetRegularValue()***
- ***HAL_DFSDM_FilterInjectedStart()***
- ***HAL_DFSDM_FilterPollForInjConversion()***
- ***HAL_DFSDM_FilterInjectedStop()***
- ***HAL_DFSDM_FilterInjectedStart_IT()***
- ***HAL_DFSDM_FilterInjectedStop_IT()***
- ***HAL_DFSDM_FilterInjectedStart_DMA()***
- ***HAL_DFSDM_FilterInjectedMsbStart_DMA()***
- ***HAL_DFSDM_FilterInjectedStop_DMA()***
- ***HAL_DFSDM_FilterGetInjectedValue()***
- ***HAL_DFSDM_FilterAwdStart_IT()***
- ***HAL_DFSDM_FilterAwdStop_IT()***
- ***HAL_DFSDM_FilterExdStart()***

- *HAL_DFSDM_FilterExdStop()*
- *HAL_DFSDM_FilterGetExdMaxValue()*
- *HAL_DFSDM_FilterGetExdMinValue()*
- *HAL_DFSDM_FilterGetConvTimeValue()*
- *HAL_DFSDM_IRQHandler()*
- *HAL_DFSDM_FilterRegConvCpltCallback()*
- *HAL_DFSDM_FilterRegConvHalfCpltCallback()*
- *HAL_DFSDM_FilterInjConvCpltCallback()*
- *HAL_DFSDM_FilterInjConvHalfCpltCallback()*
- *HAL_DFSDM_FilterAwdCallback()*
- *HAL_DFSDM_FilterErrorCallback()*

21.2.8 Filter state functions

This section provides functions allowing to:

- Get the DFSDM filter state.
- Get the DFSDM filter error.

This section contains the following APIs:

- *HAL_DFSDM_FilterGetState()*
- *HAL_DFSDM_FilterGetError()*

21.2.9 Detailed description of functions

HAL_DFSDM_ChannelInit

Function name

HAL_StatusTypeDef HAL_DFSDM_ChannelInit (DFSDM_Channel_HandleTypeDef * hdfsdm_channel)

Function description

Initialize the DFSDM channel according to the specified parameters in the DFSDM_ChannelInitTypeDef structure and initialize the associated handle.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.

Return values

- **HAL:** status.

HAL_DFSDM_ChannelDeInit

Function name

HAL_StatusTypeDef HAL_DFSDM_ChannelDeInit (DFSDM_Channel_HandleTypeDef * hdfsdm_channel)

Function description

De-initialize the DFSDM channel.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.

Return values

- **HAL:** status.

HAL_DFSDM_ChannelMspInit

Function name

void HAL_DFSDM_ChannelMspInit (DFSDM_Channel_HandleTypeDef * hdfsdm_channel)

Function description

Initialize the DFSDM channel MSP.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.

Return values

- **None:**

HAL_DFSDM_ChannelMspDeInit

Function name

void HAL_DFSDM_ChannelMspDeInit (DFSDM_Channel_HandleTypeDef * hdfsdm_channel)

Function description

De-initialize the DFSDM channel MSP.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.

Return values

- **None:**

HAL_DFSDM_Channel_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DFSDM_Channel_RegisterCallback (DFSDM_Channel_HandleTypeDef * hdfsdm_channel, HAL_DFSDM_Channel_CallbackIDTypeDef CallbackID, pDFSDM_Channel_CallbackTypeDef pCallback)

Function description

Register a user DFSDM channel callback to be used instead of the weak predefined callback.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.
- **CallbackID:** ID of the callback to be registered. This parameter can be one of the following values:
  - HAL_DFSDM_CHANNEL_CKAB_CB_ID clock absence detection callback ID.
  - HAL_DFSDM_CHANNEL_SCD_CB_ID short circuit detection callback ID.
  - HAL_DFSDM_CHANNEL_MSPINIT_CB_ID MSP init callback ID.
  - HAL_DFSDM_CHANNEL_MSPDEINIT_CB_ID MSP de-init callback ID.
- **pCallback:** pointer to the callback function.

Return values

- **HAL:** status.

HAL_DFSDM_Channel_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DFSDM_Channel_UnRegisterCallback (DFSDM_Channel_HandleTypeDef * hdfsdm_channel, HAL_DFSDM_Channel_CallbackIDTypeDef CallbackID)

Function description

Unregister a user DFSDM channel callback.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.
- **CallbackID:** ID of the callback to be unregistered. This parameter can be one of the following values:
  - HAL_DFSDM_CHANNEL_CKAB_CB_ID clock absence detection callback ID.
  - HAL_DFSDM_CHANNEL_SCD_CB_ID short circuit detection callback ID.
  - HAL_DFSDM_CHANNEL_MSPINIT_CB_ID MSP init callback ID.
  - HAL_DFSDM_CHANNEL_MSPDEINIT_CB_ID MSP de-init callback ID.

Return values

- **HAL:** status.

HAL_DFSDM_ChannelCkabStart

Function name

HAL_StatusTypeDef HAL_DFSDM_ChannelCkabStart (DFSDM_Channel_HandleTypeDef * hdfsdm_channel)

Function description

This function allows to start clock absence detection in polling mode.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.

Return values

- **HAL:** status

Notes

- Same mode has to be used for all channels.
- If clock is not available on this channel during 5 seconds, clock absence detection will not be activated and function will return HAL_TIMEOUT error.

HAL_DFSDM_ChannelCkabStart_IT

Function name

HAL_StatusTypeDef HAL_DFSDM_ChannelCkabStart_IT (DFSDM_Channel_HandleTypeDef * hdfsdm_channel)

Function description

This function allows to start clock absence detection in interrupt mode.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.

Return values

- **HAL:** status

Notes

- Same mode has to be used for all channels.
- If clock is not available on this channel during 5 seconds, clock absence detection will not be activated and function will return HAL_TIMEOUT error.

HAL_DFSDM_ChannelCkabStop

Function name

HAL_StatusTypeDef HAL_DFSDM_ChannelCkabStop (DFSDM_Channel_HandleTypeDef * hdfsdm_channel)

Function description

This function allows to stop clock absence detection in polling mode.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.

Return values

- **HAL:** status

HAL_DFSDM_ChannelCkabStop_IT

Function name

HAL_StatusTypeDef HAL_DFSDM_ChannelCkabStop_IT (DFSDM_Channel_HandleTypeDef * hdfsdm_channel)

Function description

This function allows to stop clock absence detection in interrupt mode.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.

Return values

- **HAL:** status

Notes

- Interrupt will be disabled for all channels

HAL_DFSDM_ChannelScdStart

Function name

HAL_StatusTypeDef HAL_DFSDM_ChannelScdStart (DFSDM_Channel_HandleTypeDef * hdfsdm_channel, uint32_t Threshold, uint32_t BreakSignal)

Function description

This function allows to start short circuit detection in polling mode.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.
- **Threshold:** Short circuit detector threshold. This parameter must be a number between Min_Data = 0 and Max_Data = 255.
- **BreakSignal:** Break signals assigned to short circuit event. This parameter can be a values combination of DFSDM break signals.

Return values

- **HAL:** status

Notes

- Same mode has to be used for all channels

HAL_DFSDM_ChannelScdStart_IT

Function name

HAL_StatusTypeDef HAL_DFSDM_ChannelScdStart_IT (DFSDM_Channel_HandleTypeDef * hdfsdm_channel, uint32_t Threshold, uint32_t BreakSignal)

Function description

This function allows to start short circuit detection in interrupt mode.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.
- **Threshold:** Short circuit detector threshold. This parameter must be a number between Min_Data = 0 and Max_Data = 255.
- **BreakSignal:** Break signals assigned to short circuit event. This parameter can be a values combination of DFSDM break signals.

Return values

- **HAL:** status

Notes

- Same mode has to be used for all channels

HAL_DFSDM_ChannelScdStop

Function name

HAL_StatusTypeDef HAL_DFSDM_ChannelScdStop (DFSDM_Channel_HandleTypeDef * hdfsdm_channel)

Function description

This function allows to stop short circuit detection in polling mode.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.

Return values

- **HAL:** status

HAL_DFSDM_ChannelScdStop_IT

Function name

HAL_StatusTypeDef HAL_DFSDM_ChannelScdStop_IT (DFSDM_Channel_HandleTypeDef * hdfsdm_channel)

Function description

This function allows to stop short circuit detection in interrupt mode.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.

Return values

- **HAL:** status

Notes

- Interrupt will be disabled for all channels

HAL_DFSDM_ChannelGetAwdValue

Function name

int16_t HAL_DFSDM_ChannelGetAwdValue (const DFSDM_Channel_HandleTypeDef * hdfsdm_channel)

Function description

This function allows to get channel analog watchdog value.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.

Return values

- **Channel:** analog watchdog value.

HAL_DFSDM_ChannelModifyOffset

Function name

HAL_StatusTypeDef HAL_DFSDM_ChannelModifyOffset (DFSDM_Channel_HandleTypeDef * hdfsdm_channel, int32_t Offset)

Function description

This function allows to modify channel offset value.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.
- **Offset:** DFSDM channel offset. This parameter must be a number between Min_Data = -8388608 and Max_Data = 8388607.

Return values

- **HAL:** status.

HAL_DFSDM_ChannelPollForCkab

Function name

HAL_StatusTypeDef HAL_DFSDM_ChannelPollForCkab (const DFSDM_Channel_HandleTypeDef * hdfsdm_channel, uint32_t Timeout)

Function description

This function allows to poll for the clock absence detection.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.
- **Timeout:** Timeout value in milliseconds.

Return values

- **HAL:** status

HAL_DFSDM_ChannelPollForScd

Function name

HAL_StatusTypeDef HAL_DFSDM_ChannelPollForScd (const DFSDM_Channel_HandleTypeDef * hdfsdm_channel, uint32_t Timeout)

Function description

This function allows to poll for the short circuit detection.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.
- **Timeout:** Timeout value in milliseconds.

Return values

- **HAL:** status

HAL_DFSDM_ChannelCkabCallback

Function name

void HAL_DFSDM_ChannelCkabCallback (DFSDM_Channel_HandleTypeDef * hdfsdm_channel)

Function description

Clock absence detection callback.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.

Return values

- **None:**

HAL_DFSDM_ChannelScdCallback

Function name

void HAL_DFSDM_ChannelScdCallback (DFSDM_Channel_HandleTypeDef * hdfsdm_channel)

Function description

Short circuit detection callback.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.

Return values

- **None:**

HAL_DFSDM_ChannelGetState

Function name

HAL_DFSDM_Channel_StateTypeDef HAL_DFSDM_ChannelGetState (const DFSDM_Channel_HandleTypeDef * hdfsdm_channel)

Function description

This function allows to get the current DFSDM channel handle state.

Parameters

- **hdfsdm_channel:** DFSDM channel handle.

Return values

- **DFSDM:** channel state.

HAL_DFSDM_FilterInit

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterInit (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

Initialize the DFSDM filter according to the specified parameters in the DFSDM_FilterInitTypeDef structure and initialize the associated handle.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **HAL:** status.

HAL_DFSDM_FilterDeInit

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterDeInit (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

De-initializes the DFSDM filter.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **HAL:** status.

HAL_DFSDM_FilterMspInit

Function name

void HAL_DFSDM_FilterMspInit (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

Initializes the DFSDM filter MSP.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **None:**

HAL_DFSDM_FilterMspDeInit

Function name

void HAL_DFSDM_FilterMspDeInit (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

De-initializes the DFSDM filter MSP.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **None:**

HAL_DFSDM_Filter_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DFSDM_Filter_RegisterCallback (DFSDM_Filter_HandleTypeDef * hdfsdm_filter, HAL_DFSDM_Filter_CallbackIDTypeDef CallbackID, pDFSDM_Filter_CallbackTypeDef pCallback)

Function description

Register a user DFSDM filter callback to be used instead of the weak predefined callback.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **CallbackID:** ID of the callback to be registered. This parameter can be one of the following values:
  - HAL_DFSDM_FILTER_REGCONV_COMPLETE_CB_ID regular conversion complete callback ID.
  - HAL_DFSDM_FILTER_REGCONV_HALFCOMPLETE_CB_ID half regular conversion complete callback ID.
  - HAL_DFSDM_FILTER_INJCONV_COMPLETE_CB_ID injected conversion complete callback ID.
  - HAL_DFSDM_FILTER_INJCONV_HALFCOMPLETE_CB_ID half injected conversion complete callback ID.
  - HAL_DFSDM_FILTER_ERROR_CB_ID error callback ID.
  - HAL_DFSDM_FILTER_MSPINIT_CB_ID MSP init callback ID.
  - HAL_DFSDM_FILTER_MSPDEINIT_CB_ID MSP de-init callback ID.
- **pCallback:** pointer to the callback function.

Return values

- **HAL:** status.

HAL_DFSDM_Filter_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DFSDM_Filter_UnRegisterCallback (DFSDM_Filter_HandleTypeDef * hdfsdm_filter, HAL_DFSDM_Filter_CallbackIDTypeDef CallbackID)

Function description

Unregister a user DFSDM filter callback.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **CallbackID:** ID of the callback to be unregistered. This parameter can be one of the following values:
  - HAL_DFSDM_FILTER_REGCONV_COMPLETE_CB_ID regular conversion complete callback ID.
  - HAL_DFSDM_FILTER_REGCONV_HALFCOMPLETE_CB_ID half regular conversion complete callback ID.
  - HAL_DFSDM_FILTER_INJCONV_COMPLETE_CB_ID injected conversion complete callback ID.
  - HAL_DFSDM_FILTER_INJCONV_HALFCOMPLETE_CB_ID half injected conversion complete callback ID.
  - HAL_DFSDM_FILTER_ERROR_CB_ID error callback ID.
  - HAL_DFSDM_FILTER_MSPINIT_CB_ID MSP init callback ID.
  - HAL_DFSDM_FILTER_MSPDEINIT_CB_ID MSP de-init callback ID.

Return values

- **HAL:** status.

HAL_DFSDM_Filter_RegisterAwdCallback

Function name

HAL_StatusTypeDef HAL_DFSDM_Filter_RegisterAwdCallback (DFSDM_Filter_HandleTypeDef * hdfsdm_filter, pDFSDM_Filter_AwdCallbackTypeDef pCallback)

Function description

Register a user DFSDM filter analog watchdog callback to be used instead of the weak predefined callback.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **pCallback:** pointer to the DFSDM filter analog watchdog callback function.

Return values

- **HAL:** status.

HAL_DFSDM_Filter_UnRegisterAwdCallback

Function name

HAL_StatusTypeDef HAL_DFSDM_Filter_UnRegisterAwdCallback (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

Unregister a user DFSDM filter analog watchdog callback.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **HAL:** status.

HAL_DFSDM_FilterConfigRegChannel

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterConfigRegChannel (DFSDM_Filter_HandleTypeDef * hdfsdm_filter, uint32_t Channel, uint32_t ContinuousMode)

Function description

This function allows to select channel and to enable/disable continuous mode for regular conversion.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **Channel:** Channel for regular conversion. This parameter can be a value of DFSDM Channel Selection.
- **ContinuousMode:** Enable/disable continuous mode for regular conversion. This parameter can be a value of DFSDM Continuous Mode.

Return values

- **HAL:** status

HAL_DFSDM_FilterConfigInjChannel

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterConfigInjChannel (DFSDM_Filter_HandleTypeDef * hdfsdm_filter, uint32_t Channel)

Function description

This function allows to select channels for injected conversion.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **Channel:** Channels for injected conversion. This parameter can be a values combination of DFSDM Channel Selection.

Return values

- **HAL:** status

HAL_DFSDM_FilterRegularStart

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterRegularStart (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

This function allows to start regular conversion in polling mode.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **HAL:** status

Notes

- This function should be called only when DFSDM filter instance is in idle state or if injected conversion is ongoing.

HAL_DFSDM_FilterRegularStart_IT

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterRegularStart_IT (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

This function allows to start regular conversion in interrupt mode.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **HAL:** status

Notes

- This function should be called only when DFSDM filter instance is in idle state or if injected conversion is ongoing.

HAL_DFSDM_FilterRegularStart_DMA

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterRegularStart_DMA (DFSDM_Filter_HandleTypeDef * hdfsdm_filter, int32_t * pData, uint32_t Length)

Function description

This function allows to start regular conversion in DMA mode.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **pData:** The destination buffer address.
- **Length:** The length of data to be transferred from DFSDM filter to memory.

Return values

- **HAL:** status

Notes

- This function should be called only when DFSDM filter instance is in idle state or if injected conversion is ongoing. Please note that data on buffer will contain signed regular conversion value on 24 most significant bits and corresponding channel on 3 least significant bits.

HAL_DFSDM_FilterRegularMsbStart_DMA

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterRegularMsbStart_DMA (DFSDM_Filter_HandleTypeDef * hdfsdm_filter, int16_t * pData, uint32_t Length)

Function description

This function allows to start regular conversion in DMA mode and to get only the 16 most significant bits of conversion.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **pData:** The destination buffer address.
- **Length:** The length of data to be transferred from DFSDM filter to memory.

Return values

- **HAL:** status

Notes

- This function should be called only when DFSDM filter instance is in idle state or if injected conversion is ongoing. Please note that data on buffer will contain signed 16 most significant bits of regular conversion.

HAL_DFSDM_FilterRegularStop

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterRegularStop (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

This function allows to stop regular conversion in polling mode.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **HAL:** status

Notes

- This function should be called only if regular conversion is ongoing.

HAL_DFSDM_FilterRegularStop_IT

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterRegularStop_IT (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

This function allows to stop regular conversion in interrupt mode.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **HAL:** status

Notes

- This function should be called only if regular conversion is ongoing.

HAL_DFSDM_FilterRegularStop_DMA

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterRegularStop_DMA (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

This function allows to stop regular conversion in DMA mode.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **HAL:** status

Notes

- This function should be called only if regular conversion is ongoing.

HAL_DFSDM_FilterInjectedStart

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterInjectedStart (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

This function allows to start injected conversion in polling mode.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **HAL:** status

Notes

- This function should be called only when DFSDM filter instance is in idle state or if regular conversion is ongoing.

HAL_DFSDM_FilterInjectedStart_IT

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterInjectedStart_IT (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

This function allows to start injected conversion in interrupt mode.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **HAL:** status

Notes

- This function should be called only when DFSDM filter instance is in idle state or if regular conversion is ongoing.

HAL_DFSDM_FilterInjectedStart_DMA

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterInjectedStart_DMA (DFSDM_Filter_HandleTypeDef * hdfsdm_filter, int32_t * pData, uint32_t Length)

Function description

This function allows to start injected conversion in DMA mode.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **pData:** The destination buffer address.
- **Length:** The length of data to be transferred from DFSDM filter to memory.

Return values

- **HAL:** status

Notes

- This function should be called only when DFSDM filter instance is in idle state or if regular conversion is ongoing. Please note that data on buffer will contain signed injected conversion value on 24 most significant bits and corresponding channel on 3 least significant bits.

HAL_DFSDM_FilterInjectedMsbStart_DMA

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterInjectedMsbStart_DMA (DFSDM_Filter_HandleTypeDef * hdfsdm_filter, int16_t * pData, uint32_t Length)

Function description

This function allows to start injected conversion in DMA mode and to get only the 16 most significant bits of conversion.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **pData:** The destination buffer address.
- **Length:** The length of data to be transferred from DFSDM filter to memory.

Return values

- **HAL:** status

Notes

- This function should be called only when DFSDM filter instance is in idle state or if regular conversion is ongoing. Please note that data on buffer will contain signed 16 most significant bits of injected conversion.

HAL_DFSDM_FilterInjectedStop

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterInjectedStop (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

This function allows to stop injected conversion in polling mode.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **HAL:** status

Notes

- This function should be called only if injected conversion is ongoing.

HAL_DFSDM_FilterInjectedStop_IT

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterInjectedStop_IT (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

This function allows to stop injected conversion in interrupt mode.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **HAL:** status

Notes

- This function should be called only if injected conversion is ongoing.

HAL_DFSDM_FilterInjectedStop_DMA

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterInjectedStop_DMA (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

This function allows to stop injected conversion in DMA mode.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **HAL:** status

Notes

- This function should be called only if injected conversion is ongoing.

HAL_DFSDM_FilterAwdStart_IT

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterAwdStart_IT (DFSDM_Filter_HandleTypeDef * hdfsdm_filter, const DFSDM_Filter_AwdParamTypeDef * awdParam)

Function description

This function allows to start filter analog watchdog in interrupt mode.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **awdParam:** DFSDM filter analog watchdog parameters.

Return values

- **HAL:** status

HAL_DFSDM_FilterAwdStop_IT

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterAwdStop_IT (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

This function allows to stop filter analog watchdog in interrupt mode.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **HAL:** status

HAL_DFSDM_FilterExdStart

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterExdStart (DFSDM_Filter_HandleTypeDef * hdfsdm_filter, uint32_t Channel)

Function description

This function allows to start extreme detector feature.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **Channel:** Channels where extreme detector is enabled. This parameter can be a values combination of DFSDM Channel Selection.

Return values

- **HAL:** status

HAL_DFSDM_FilterExdStop

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterExdStop (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

This function allows to stop extreme detector feature.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **HAL:** status

HAL_DFSDM_FilterGetRegularValue

Function name

int32_t HAL_DFSDM_FilterGetRegularValue (const DFSDM_Filter_HandleTypeDef * hdfsdm_filter, uint32_t * Channel)

Function description

This function allows to get regular conversion value.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **Channel:** Corresponding channel of regular conversion.

Return values

- **Regular:** conversion value

HAL_DFSDM_FilterGetInjectedValue

Function name

int32_t HAL_DFSDM_FilterGetInjectedValue (const DFSDM_Filter_HandleTypeDef * hdfsdm_filter, uint32_t * Channel)

Function description

This function allows to get injected conversion value.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **Channel:** Corresponding channel of injected conversion.

Return values

- **Injected:** conversion value

HAL_DFSDM_FilterGetExdMaxValue

Function name

int32_t HAL_DFSDM_FilterGetExdMaxValue (const DFSDM_Filter_HandleTypeDef * hdfsdm_filter, uint32_t * Channel)

Function description

This function allows to get extreme detector maximum value.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **Channel:** Corresponding channel.

Return values

- **Extreme:** detector maximum value This value is between Min_Data = -8388608 and Max_Data = 8388607.

HAL_DFSDM_FilterGetExdMinValue

Function name

int32_t HAL_DFSDM_FilterGetExdMinValue (const DFSDM_Filter_HandleTypeDef * hdfsdm_filter, uint32_t * Channel)

Function description

This function allows to get extreme detector minimum value.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **Channel:** Corresponding channel.

Return values

- **Extreme:** detector minimum value This value is between Min_Data = -8388608 and Max_Data = 8388607.

HAL_DFSDM_FilterGetConvTimeValue

Function name

uint32_t HAL_DFSDM_FilterGetConvTimeValue (const DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

This function allows to get conversion time value.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **Conversion:** time value

Notes

- To get time in second, this value has to be divided by DFSDM clock frequency.

HAL_DFSDM_IRQHandler

Function name

void HAL_DFSDM_IRQHandler (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

This function handles the DFSDM interrupts.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **None:**

HAL_DFSDM_FilterPollForRegConversion

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterPollForRegConversion (DFSDM_Filter_HandleTypeDef * hdfsdm_filter, uint32_t Timeout)

Function description

This function allows to poll for the end of regular conversion.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **Timeout:** Timeout value in milliseconds.

Return values

- **HAL:** status

Notes

- This function should be called only if regular conversion is ongoing.

HAL_DFSDM_FilterPollForInjConversion

Function name

HAL_StatusTypeDef HAL_DFSDM_FilterPollForInjConversion (DFSDM_Filter_HandleTypeDef * hdfsdm_filter, uint32_t Timeout)

Function description

This function allows to poll for the end of injected conversion.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **Timeout:** Timeout value in milliseconds.

Return values

- **HAL:** status

Notes

- This function should be called only if injected conversion is ongoing.

HAL_DFSDM_FilterRegConvCpltCallback

Function name

void HAL_DFSDM_FilterRegConvCpltCallback (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

Regular conversion complete callback.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **None:**

Notes

- In interrupt mode, user has to read conversion value in this function using HAL_DFSDM_FilterGetRegularValue.

HAL_DFSDM_FilterRegConvHalfCpltCallback

Function name

void HAL_DFSDM_FilterRegConvHalfCpltCallback (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

Half regular conversion complete callback.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **None:**

HAL_DFSDM_FilterInjConvCpltCallback

Function name

void HAL_DFSDM_FilterInjConvCpltCallback (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

Injected conversion complete callback.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **None:**

Notes

- In interrupt mode, user has to read conversion value in this function using HAL_DFSDM_FilterGetInjectedValue.

HAL_DFSDM_FilterInjConvHalfCpltCallback

Function name

void HAL_DFSDM_FilterInjConvHalfCpltCallback (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

Half injected conversion complete callback.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **None:**

HAL_DFSDM_FilterAwdCallback

Function name

void HAL_DFSDM_FilterAwdCallback (DFSDM_Filter_HandleTypeDef * hdfsdm_filter, uint32_t Channel, uint32_t Threshold)

Function description

Filter analog watchdog callback.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.
- **Channel:** Corresponding channel.
- **Threshold:** Low or high threshold has been reached.

Return values

- **None:**

HAL_DFSDM_FilterErrorCallback

Function name

void HAL_DFSDM_FilterErrorCallback (DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

Error callback.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **None:**

HAL_DFSDM_FilterGetState

Function name

HAL_DFSDM_Filter_StateTypeDef HAL_DFSDM_FilterGetState (const DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

This function allows to get the current DFSDM filter handle state.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **DFSDM:** filter state.

HAL_DFSDM_FilterGetError

Function name

uint32_t HAL_DFSDM_FilterGetError (const DFSDM_Filter_HandleTypeDef * hdfsdm_filter)

Function description

This function allows to get the current DFSDM filter error.

Parameters

- **hdfsdm_filter:** DFSDM filter handle.

Return values

- **DFSDM:** filter error code.

21.3 DFSDM Firmware driver defines

The following section lists the various define and macros of the module.

21.3.1 DFSDM

DFSDM

DFSDM analog watchdog threshold

DFSDM_AWD_HIGH_THRESHOLD

Analog watchdog high threshold

DFSDM_AWD_LOW_THRESHOLD

Analog watchdog low threshold

DFSDM break signals

DFSDM_NO_BREAK_SIGNAL

No break signal

DFSDM_BREAK_SIGNAL_0

Break signal 0

DFSDM_BREAK_SIGNAL_1

Break signal 1

DFSDM_BREAK_SIGNAL_2

Break signal 2

DFSDM_BREAK_SIGNAL_3

Break signal 3

DFSDM channel analog watchdog filter order

DFSDM_CHANNEL_FASTSINC_ORDER

FastSinc filter type

DFSDM_CHANNEL_SINC1_ORDER

Sinc 1 filter type

DFSDM_CHANNEL_SINC2_ORDER

Sinc 2 filter type

DFSDM_CHANNEL_SINC3_ORDER

Sinc 3 filter type

DFSDM channel input data packing

DFSDM_CHANNEL_STANDARD_MODE

Standard data packing mode

DFSDM_CHANNEL_INTERLEAVED_MODE

Interleaved data packing mode

DFSDM_CHANNEL_DUAL_MODE

Dual data packing mode

DFSDM channel input multiplexer

DFSDM_CHANNEL_EXTERNAL_INPUTS

Data are taken from external inputs

DFSDM_CHANNEL_ADC_OUTPUT

Data are taken from ADC output

DFSDM_CHANNEL_INTERNAL_REGISTER

Data are taken from internal register

DFSDM channel input pins

DFSDM_CHANNEL_SAME_CHANNEL_PINS

Input from pins on same channel

DFSDM_CHANNEL_FOLLOWING_CHANNEL_PINS

Input from pins on following channel

DFSDM channel output clock selection

DFSDM_CHANNEL_OUTPUT_CLOCK_SYSTEM

Source for output clock is system clock

DFSDM_CHANNEL_OUTPUT_CLOCK_AUDIO

Source for output clock is audio clock

DFSDM Channel Selection

DFSDM_CHANNEL_0

DFSDM_CHANNEL_1

DFSDM_CHANNEL_2

DFSDM_CHANNEL_3

DFSDM_CHANNEL_4

DFSDM_CHANNEL_5

DFSDM_CHANNEL_6

DFSDM_CHANNEL_7

DFSDM channel serial interface type

DFSDM_CHANNEL_SPI_RISING

SPI with rising edge

DFSDM_CHANNEL_SPI_FALLING

SPI with falling edge

DFSDM_CHANNEL_MANCHESTER_RISING

Manchester with rising edge

DFSDM_CHANNEL_MANCHESTER_FALLING

Manchester with falling edge

DFSDM channel SPI clock selection

DFSDM_CHANNEL_SPI_CLOCK_EXTERNAL

External SPI clock

DFSDM_CHANNEL_SPI_CLOCK_INTERNAL

Internal SPI clock

DFSDM_CHANNEL_SPI_CLOCK_INTERNAL_DIV2_FALLING

Internal SPI clock divided by 2, falling edge

DFSDM_CHANNEL_SPI_CLOCK_INTERNAL_DIV2_RISING

Internal SPI clock divided by 2, rising edge

DFSDM Continuous Mode

DFSDM_CONTINUOUS_CONV_OFF

Conversion are not continuous

DFSDM_CONTINUOUS_CONV_ON

Conversion are continuous

DFSDM Exported Macros

__HAL_DFSDM_CHANNEL_RESET_HANDLE_STATE

Description:

- Reset DFSDM channel handle state.

Parameters:

- __HANDLE__: DFSDM channel handle.

Return value:

- None

__HAL_DFSDM_FILTER_RESET_HANDLE_STATE

Description:

- Reset DFSDM filter handle state.

Parameters:

- __HANDLE__: DFSDM filter handle.

Return value:

- None

DFSDM filter analog watchdog data source

DFSDM_FILTER_AWD_FILTER_DATA

From digital filter

DFSDM_FILTER_AWD_CHANNEL_DATA

From analog watchdog channel

DFSDM filter error code

DFSDM_FILTER_ERROR_NONE

No error

DFSDM_FILTER_ERROR_REGULAR_OVERRUN

Overrun occurs during regular conversion

DFSDM_FILTER_ERROR_INJECTED_OVERRUN

Overrun occurs during injected conversion

DFSDM_FILTER_ERROR_DMA

DMA error occurs

DFSDM_FILTER_ERROR_INVALID_CALLBACK

Invalid callback error occurs

DFSDM filter external trigger

DFSDM_FILTER_EXT_TRIG_TIM1_TRGO

For all DFSDM filters

DFSDM_FILTER_EXT_TRIG_TIM1_TRGO2

For all DFSDM filters

DFSDM_FILTER_EXT_TRIG_TIM8_TRGO

For all DFSDM filters

DFSDM_FILTER_EXT_TRIG_TIM8_TRGO2

For all DFSDM filters

DFSDM_FILTER_EXT_TRIG_TIM3_TRGO

For all DFSDM filters

DFSDM_FILTER_EXT_TRIG_TIM4_TRGO

For all DFSDM filters

DFSDM_FILTER_EXT_TRIG_TIM16_OC1

For all DFSDM filters

DFSDM_FILTER_EXT_TRIG_TIM6_TRGO

For all DFSDM filters

DFSDM_FILTER_EXT_TRIG_TIM7_TRGO

For all DFSDM filters

DFSDM_FILTER_EXT_TRIG_HRTIM1_ADCTRG1

DFSDM_FILTER_EXT_TRIG_HRTIM1_ADCTRG3

DFSDM_FILTER_EXT_TRIG_EXTI11

For all DFSDM filters

DFSDM_FILTER_EXT_TRIG_EXTI15

For all DFSDM filters

DFSDM_FILTER_EXT_TRIG_LPTIM1_OUT

For all DFSDM filters

DFSDM_FILTER_EXT_TRIG_LPTIM2_OUT

For all DFSDM filters

DFSDM_FILTER_EXT_TRIG_LPTIM3_OUT

For all DFSDM filters

DFSDM filter external trigger edge

DFSDM_FILTER_EXT_TRIG_RISING_EDGE

External rising edge

DFSDM_FILTER_EXT_TRIG_FALLING_EDGE

External falling edge

DFSDM_FILTER_EXT_TRIG_BOTH_EDGES

External rising and falling edges

DFSDM filter sinc order

DFSDM_FILTER_FASTSINC_ORDER

FastSinc filter type

DFSDM_FILTER_SINC1_ORDER

Sinc 1 filter type

DFSDM_FILTER_SINC2_ORDER

Sinc 2 filter type

DFSDM_FILTER_SINC3_ORDER

Sinc 3 filter type

DFSDM_FILTER_SINC4_ORDER

Sinc 4 filter type

DFSDM_FILTER_SINC5_ORDER

Sinc 5 filter type

DFSDM filter conversion trigger

DFSDM_FILTER_SW_TRIGGER

Software trigger

DFSDM_FILTER_SYNC_TRIGGER

Synchronous with DFSDM_FLT0

DFSDM_FILTER_EXT_TRIGGER

External trigger (only for injected conversion)

22 HAL DMA2D Generic Driver

22.1 DMA2D Firmware driver registers structures

22.1.1 DMA2D_CLUTCfgTypeDef

DMA2D_CLUTCfgTypeDef is defined in the stm32h7xx_hal_dma2d.h

Data Fields

- ***uint32_t * pCLUT***
- ***uint32_t CLUTColorMode***
- ***uint32_t Size***

Field Documentation

- ***uint32_t* DMA2D_CLUTCfgTypeDef::pCLUT***
  Configures the DMA2D CLUT memory address.
- ***uint32_t DMA2D_CLUTCfgTypeDef::CLUTColorMode***
  Configures the DMA2D CLUT color mode. This parameter can be one value of ***DMA2D_CLUT_CM***.
- ***uint32_t DMA2D_CLUTCfgTypeDef::Size***
  Configures the DMA2D CLUT size. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.

22.1.2 DMA2D_InitTypeDef

DMA2D_InitTypeDef is defined in the stm32h7xx_hal_dma2d.h

Data Fields

- ***uint32_t Mode***
- ***uint32_t ColorMode***
- ***uint32_t OutputOffset***
- ***uint32_t AlphaInverted***
- ***uint32_t RedBlueSwap***
- ***uint32_t BytesSwap***
- ***uint32_t LineOffsetMode***

Field Documentation

- ***uint32_t DMA2D_InitTypeDef::Mode***
  Configures the DMA2D transfer mode. This parameter can be one value of ***DMA2D_Mode***.
- ***uint32_t DMA2D_InitTypeDef::ColorMode***
  Configures the color format of the output image. This parameter can be one value of ***DMA2D_Output_Color_Mode***.
- ***uint32_t DMA2D_InitTypeDef::OutputOffset***
  Specifies the Offset value. This parameter must be a number between Min_Data = 0x0000 and Max_Data = 0x3FFF.
- ***uint32_t DMA2D_InitTypeDef::AlphaInverted***
  Select regular or inverted alpha value for the output pixel format converter. This parameter can be one value of ***DMA2D_Alpha_Inverted***.
- ***uint32_t DMA2D_InitTypeDef::RedBlueSwap***
  Select regular mode (RGB or ARGB) or swap mode (BGR or ABGR) for the output pixel format converter. This parameter can be one value of ***DMA2D_RB_Swap***.
- ***uint32_t DMA2D_InitTypeDef::BytesSwap***
  Select byte regular mode or bytes swap mode (two by two). This parameter can be one value of ***DMA2D_Bytes_Swap***.

- ***uint32_t DMA2D_InitTypeDef::LineOffsetMode***

  Configures how is expressed the line offset for the foreground, background and output. This parameter can be one value of ***DMA2D_Line_Offset_Mode***.

22.1.3 DMA2D_LayerCfgTypeDef

DMA2D_LayerCfgTypeDef is defined in the stm32h7xx_hal_dma2d.h

Data Fields

- ***uint32_t InputOffset***
- ***uint32_t InputColorMode***
- ***uint32_t AlphaMode***
- ***uint32_t InputAlpha***
- ***uint32_t AlphaInverted***
- ***uint32_t RedBlueSwap***
- ***uint32_t ChromaSubSampling***

Field Documentation

- ***uint32_t DMA2D_LayerCfgTypeDef::InputOffset***

  Configures the DMA2D foreground or background offset. This parameter must be a number between Min_Data = 0x0000 and Max_Data = 0x3FFF.
- ***uint32_t DMA2D_LayerCfgTypeDef::InputColorMode***

  Configures the DMA2D foreground or background color mode. This parameter can be one value of ***DMA2D_Input_Color_Mode***.
- ***uint32_t DMA2D_LayerCfgTypeDef::AlphaMode***

  Configures the DMA2D foreground or background alpha mode. This parameter can be one value of ***DMA2D_Alpha_Mode***.
- ***uint32_t DMA2D_LayerCfgTypeDef::InputAlpha***

  Specifies the DMA2D foreground or background alpha value and color value in case of A8 or A4 color mode. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF except for the color modes detailed below.

  Note:

  – In case of A8 or A4 color mode (ARGB), this parameter must be a number between Min_Data = 0x00000000 and Max_Data = 0xFFFFFFFF where
    - InputAlpha[24:31] is the alpha value ALPHA[0:7]
    - InputAlpha[16:23] is the red value RED[0:7]
    - InputAlpha[8:15] is the green value GREEN[0:7]
    - InputAlpha[0:7] is the blue value BLUE[0:7].
- ***uint32_t DMA2D_LayerCfgTypeDef::AlphaInverted***

  Select regular or inverted alpha value. This parameter can be one value of ***DMA2D_Alpha_Inverted***.
- ***uint32_t DMA2D_LayerCfgTypeDef::RedBlueSwap***

  Select regular mode (RGB or ARGB) or swap mode (BGR or ABGR). This parameter can be one value of ***DMA2D_RB_Swap***.
- ***uint32_t DMA2D_LayerCfgTypeDef::ChromaSubSampling***

  Configure the chroma sub-sampling mode for the YCbCr color mode This parameter can be one value of ***DMA2D_Chroma_Sub_Sampling***

22.1.4 __DMA2D_HandleTypeDef

__DMA2D_HandleTypeDef is defined in the stm32h7xx_hal_dma2d.h

Data Fields

- ***DMA2D_TypeDef * Instance***
- ***DMA2D_InitTypeDef Init***
- ***void(* XferCpltCallback***
- ***void(* XferErrorCallback***

- ***void(* LineEventCallback***
- ***void(* CLUTLoadingCpltCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***
- ***DMA2D_LayerCfgTypeDef LayerCfg***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_DMA2D_StateTypeDef State***
- ***__IO uint32_t ErrorCode***

Field Documentation

- ***DMA2D_TypeDef* __DMA2D_HandleTypeDef::Instance***
  DMA2D register base address.
- ***DMA2D_InitTypeDef __DMA2D_HandleTypeDef::Init***
  DMA2D communication parameters.
- ***void(* __DMA2D_HandleTypeDef::XferCpltCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D transfer complete callback.
- ***void(* __DMA2D_HandleTypeDef::XferErrorCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D transfer error callback.
- ***void(* __DMA2D_HandleTypeDef::LineEventCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D line event callback.
- ***void(* __DMA2D_HandleTypeDef::CLUTLoadingCpltCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D CLUT loading completion callback
- ***void(* __DMA2D_HandleTypeDef::MspInitCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D Msp Init callback.
- ***void(* __DMA2D_HandleTypeDef::MspDeInitCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D Msp DeInit callback.
- ***DMA2D_LayerCfgTypeDef __DMA2D_HandleTypeDef::LayerCfg[MAX_DMA2D_LAYER]***
  DMA2D Layers parameters
- ***HAL_LockTypeDef __DMA2D_HandleTypeDef::Lock***
  DMA2D lock.
- ***__IO HAL_DMA2D_StateTypeDef __DMA2D_HandleTypeDef::State***
  DMA2D transfer state.
- ***__IO uint32_t __DMA2D_HandleTypeDef::ErrorCode***
  DMA2D error code.

22.2 DMA2D Firmware driver API description

The following section lists the various functions of the DMA2D library.

22.2.1 How to use this driver

1. Program the required configuration through the following parameters: the transfer mode, the output color mode and the output offset using HAL_DMA2D_Init() function.
2. Program the required configuration through the following parameters: the input color mode, the input color, the input alpha value, the alpha mode, the red/blue swap mode, the inverted alpha mode and the input offset using HAL_DMA2D_ConfigLayer() function for foreground or/and background layer.

Polling mode IO operation

1. Configure pdata parameter (explained hereafter), destination and data length and enable the transfer using HAL_DMA2D_Start().
2. Wait for end of transfer using HAL_DMA2D_PollForTransfer(), at this stage user can specify the value of timeout according to his end application.

Interrupt mode IO operation

1. Configure pdata parameter, destination and data length and enable the transfer using HAL_DMA2D_Start_IT().
2. Use HAL_DMA2D_IRQHandler() called under DMA2D_IRQHandler() interrupt subroutine.
3. At the end of data transfer HAL_DMA2D_IRQHandler() function is executed and user can add his own function by customization of function pointer XferCpltCallback (member of DMA2D handle structure).
4. In case of error, the HAL_DMA2D_IRQHandler() function calls the callback XferErrorCallback.

Note: In Register-to-Memory transfer mode, pdata parameter is the register color, in Memory-to-memory or Memory-to-Memory with pixel format conversion pdata is the source address.

Note: Configure the foreground source address, the background source address, the destination and data length then Enable the transfer using HAL_DMA2D_BlendingStart() in polling mode and HAL_DMA2D_BlendingStart_IT() in interrupt mode.

Note: HAL_DMA2D_BlendingStart() and HAL_DMA2D_BlendingStart_IT() functions are used if the memory to memory with blending transfer mode is selected.

5. Optionally, configure and enable the CLUT using HAL_DMA2D_CLUTLoad() in polling mode or HAL_DMA2D_CLUTLoad_IT() in interrupt mode.
6. Optionally, configure the line watermark in using the API HAL_DMA2D_ProgramLineEvent().
7. Optionally, configure the dead time value in the AHB clock cycle inserted between two consecutive accesses on the AHB master port in using the API HAL_DMA2D_ConfigDeadTime() and enable/disable the functionality with the APIs HAL_DMA2D_EnableDeadTime() or HAL_DMA2D_DisableDeadTime().
8. The transfer can be suspended, resumed and aborted using the following functions: HAL_DMA2D_Suspend(), HAL_DMA2D_Resume(), HAL_DMA2D_Abort().
9. The CLUT loading can be suspended, resumed and aborted using the following functions: HAL_DMA2D_CLUTLoading_Suspend(), HAL_DMA2D_CLUTLoading_Resume(), HAL_DMA2D_CLUTLoading_Abort().
10. To control the DMA2D state, use the following function: HAL_DMA2D_GetState().
11. To read the DMA2D error code, use the following function: HAL_DMA2D_GetError().

DMA2D HAL driver macros list

Below the list of most used macros in DMA2D HAL driver :

- __HAL_DMA2D_ENABLE: Enable the DMA2D peripheral.
- __HAL_DMA2D_GET_FLAG: Get the DMA2D pending flags.
- __HAL_DMA2D_CLEAR_FLAG: Clear the DMA2D pending flags.
- __HAL_DMA2D_ENABLE_IT: Enable the specified DMA2D interrupts.
- __HAL_DMA2D_DISABLE_IT: Disable the specified DMA2D interrupts.
- __HAL_DMA2D_GET_IT_SOURCE: Check whether the specified DMA2D interrupt is enabled or not.

Callback registration

1. The compilation define USE_HAL_DMA2D_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use function @ref HAL_DMA2D_RegisterCallback() to register a user callback.
2. Function @ref HAL_DMA2D_RegisterCallback() allows to register following callbacks: (+) XferCpltCallback : callback for transfer complete. (+) XferErrorCallback : callback for transfer error. (+) LineEventCallback : callback for line event. (+) CLUTLoadingCpltCallback : callback for CLUT loading completion. (+) MspInitCallback : DMA2D MspInit. (+) MspDeInitCallback : DMA2D MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.
3. Use function @ref HAL_DMA2D_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. @ref HAL_DMA2D_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks: (+) XferCpltCallback : callback for transfer complete. (+) XferErrorCallback : callback for transfer error. (+) LineEventCallback : callback for line event. (+) CLUTLoadingCpltCallback : callback for CLUT loading completion. (+) MspInitCallback : DMA2D MspInit. (+) MspDeInitCallback : DMA2D MspDeInit.

4. By default, after the @ref HAL_DMA2D_Init and if the state is HAL_DMA2D_STATE_RESET all callbacks are reset to the corresponding legacy weak (surcharged) functions: examples @ref HAL_DMA2D_LineEventCallback(), @ref HAL_DMA2D_CLUTLoadingCpltCallback() Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (surcharged) functions in the @ref HAL_DMA2D_Init and @ref HAL_DMA2D_DeInit only when these callbacks are null (not registered beforehand) If not, MspInit or MspDeInit are not null, the @ref HAL_DMA2D_Init and @ref HAL_DMA2D_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand). Exception as well for Transfer Completion and Transfer Error callbacks that are not defined as weak (surcharged) functions. They must be defined by the user to be resorted to. Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using @ref HAL_DMA2D_RegisterCallback before calling @ref HAL_DMA2D_DeInit or @ref HAL_DMA2D_Init function. When The compilation define USE_HAL_DMA2D_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

(#) The compilation define USE_HAL_DMA2D_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use function @ref HAL_DMA2D_RegisterCallback() to register a user callback. (#) Function @ref HAL_DMA2D_RegisterCallback() allows to register following callbacks:

- XferCpltCallback : callback for transfer complete.
- XferErrorCallback : callback for transfer error.
- LineEventCallback : callback for line event.
- CLUTLoadingCpltCallback : callback for CLUT loading completion.
- MspInitCallback : DMA2D MspInit.
- MspDeInitCallback : DMA2D MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. (#) Use function @ref HAL_DMA2D_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. @ref HAL_DMA2D_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:
- XferCpltCallback : callback for transfer complete.
- XferErrorCallback : callback for transfer error.
- LineEventCallback : callback for line event.
- CLUTLoadingCpltCallback : callback for CLUT loading completion.
- MspInitCallback : DMA2D MspInit.
- MspDeInitCallback : DMA2D MspDeInit. (#) By default, after the @ref HAL_DMA2D_Init and if the state is HAL_DMA2D_STATE_RESET all callbacks are reset to the corresponding legacy weak (surcharged) functions: examples @ref HAL_DMA2D_LineEventCallback(), @ref HAL_DMA2D_CLUTLoadingCpltCallback() Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (surcharged) functions in the @ref HAL_DMA2D_Init and @ref HAL_DMA2D_DeInit only when these callbacks are null (not registered beforehand) If not, MspInit or MspDeInit are not null, the @ref HAL_DMA2D_Init and @ref HAL_DMA2D_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand). Exception as well for Transfer Completion and Transfer Error callbacks that are not defined as weak (surcharged) functions. They must be defined by the user to be resorted to. Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using @ref HAL_DMA2D_RegisterCallback before calling @ref HAL_DMA2D_DeInit or @ref HAL_DMA2D_Init function. When The compilation define USE_HAL_DMA2D_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

Note: You can refer to the DMA2D HAL driver header file for more useful macros

22.2.2 Initialization and Configuration functions

This section provides functions allowing to:

- Initialize and configure the DMA2D
- De-initialize the DMA2D

This section contains the following APIs:

- *HAL_DMA2D_Init()*
- *HAL_DMA2D_DeInit()*
- *HAL_DMA2D_MspInit()*
- *HAL_DMA2D_MspDeInit()*
- *HAL_DMA2D_RegisterCallback()*
- *HAL_DMA2D_UnRegisterCallback()*

22.2.3 IO operation functions

This section provides functions allowing to:

- Configure the pdata, destination address and data size then start the DMA2D transfer.
- Configure the source for foreground and background, destination address and data size then start a MultiBuffer DMA2D transfer.
- Configure the pdata, destination address and data size then start the DMA2D transfer with interrupt.
- Configure the source for foreground and background, destination address and data size then start a MultiBuffer DMA2D transfer with interrupt.
- Abort DMA2D transfer.
- Suspend DMA2D transfer.
- Resume DMA2D transfer.
- Enable CLUT transfer.
- Configure CLUT loading then start transfer in polling mode.
- Configure CLUT loading then start transfer in interrupt mode.
- Abort DMA2D CLUT loading.
- Suspend DMA2D CLUT loading.
- Resume DMA2D CLUT loading.
- Poll for transfer complete.
- handle DMA2D interrupt request.
- Transfer watermark callback.
- CLUT Transfer Complete callback.

This section contains the following APIs:

- *HAL_DMA2D_Start()*
- *HAL_DMA2D_Start_IT()*
- *HAL_DMA2D_BlendingStart()*
- *HAL_DMA2D_BlendingStart_IT()*
- *HAL_DMA2D_Abort()*
- *HAL_DMA2D_Suspend()*
- *HAL_DMA2D_Resume()*
- *HAL_DMA2D_EnableCLUT()*
- *HAL_DMA2D_CLUTStartLoad()*
- *HAL_DMA2D_CLUTStartLoad_IT()*
- *HAL_DMA2D_CLUTLoad()*
- *HAL_DMA2D_CLUTLoad_IT()*
- *HAL_DMA2D_CLUTLoading_Abort()*
- *HAL_DMA2D_CLUTLoading_Suspend()*
- *HAL_DMA2D_CLUTLoading_Resume()*
- *HAL_DMA2D_PollForTransfer()*
- *HAL_DMA2D_IRQHandler()*
- *HAL_DMA2D_LineEventCallback()*
- *HAL_DMA2D_CLUTLoadingCpltCallback()*

22.2.4 Peripheral Control functions

This section provides functions allowing to:

- Configure the DMA2D foreground or background layer parameters.
- Configure the DMA2D CLUT transfer.
- Configure the line watermark
- Configure the dead time value.
- Enable or disable the dead time value functionality.

This section contains the following APIs:

- ***HAL_DMA2D_ConfigLayer()***
- ***HAL_DMA2D_ConfigCLUT()***
- ***HAL_DMA2D_ProgramLineEvent()***
- ***HAL_DMA2D_EnableDeadTime()***
- ***HAL_DMA2D_DisableDeadTime()***
- ***HAL_DMA2D_ConfigDeadTime()***

22.2.5 Peripheral State and Errors functions

This subsection provides functions allowing to:

- Get the DMA2D state
- Get the DMA2D error code

This section contains the following APIs:

- ***HAL_DMA2D_GetState()***
- ***HAL_DMA2D_GetError()***

22.2.6 Detailed description of functions

HAL_DMA2D_Init

Function name

HAL_StatusTypeDef HAL_DMA2D_Init (DMA2D_HandleTypeDef * hdma2d)

Function description

Initialize the DMA2D according to the specified parameters in the DMA2D_InitTypeDef and create the associated handle.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **HAL:** status

HAL_DMA2D_DeInit

Function name

HAL_StatusTypeDef HAL_DMA2D_DeInit (DMA2D_HandleTypeDef * hdma2d)

Function description

Deinitializes the DMA2D peripheral registers to their default reset values.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **None:**

HAL_DMA2D_MspInit

Function name

void HAL_DMA2D_MspInit (DMA2D_HandleTypeDef * hdma2d)

Function description

Initializes the DMA2D MSP.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **None:**

HAL_DMA2D_MspDeInit

Function name

void HAL_DMA2D_MspDeInit (DMA2D_HandleTypeDef * hdma2d)

Function description

DeInitializes the DMA2D MSP.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **None:**

HAL_DMA2D_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DMA2D_RegisterCallback (DMA2D_HandleTypeDef * hdma2d, HAL_DMA2D_CallbackIDTypeDef CallbackID, pDMA2D_CallbackTypeDef pCallback)

Function description

Register a User DMA2D Callback To be used instead of the weak (surcharged) predefined callback.

Parameters

- **hdma2d:** DMA2D handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_DMA2D_TRANSFERCOMPLETE_CB_ID DMA2D transfer complete Callback ID
  - HAL_DMA2D_TRANSFERERROR_CB_ID DMA2D transfer error Callback ID
  - HAL_DMA2D_LINEEVENT_CB_ID DMA2D line event Callback ID
  - HAL_DMA2D_CLUTLOADINGCPLT_CB_ID DMA2D CLUT loading completion Callback ID
  - HAL_DMA2D_MSPINIT_CB_ID DMA2D MspInit callback ID
  - HAL_DMA2D_MSPDEINIT_CB_ID DMA2D MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

Notes

- No weak predefined callbacks are defined for HAL_DMA2D_TRANSFERCOMPLETE_CB_ID or HAL_DMA2D_TRANSFERERROR_CB_ID

HAL_DMA2D_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DMA2D_UnRegisterCallback (DMA2D_HandleTypeDef * hdma2d, HAL_DMA2D_CallbackIDTypeDef CallbackID)

Function description

Unregister a DMA2D Callback DMA2D Callback is redirected to the weak (surcharged) predefined callback.

Parameters

- **hdma2d:** DMA2D handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_DMA2D_TRANSFERCOMPLETE_CB_ID DMA2D transfer complete Callback ID
  - HAL_DMA2D_TRANSFERERROR_CB_ID DMA2D transfer error Callback ID
  - HAL_DMA2D_LINEEVENT_CB_ID DMA2D line event Callback ID
  - HAL_DMA2D_CLUTLOADINGCPLT_CB_ID DMA2D CLUT loading completion Callback ID
  - HAL_DMA2D_MSPINIT_CB_ID DMA2D MspInit callback ID
  - HAL_DMA2D_MSPDEINIT_CB_ID DMA2D MspDeInit callback ID

Return values

- **status:**

Notes

- No weak predefined callbacks are defined for HAL_DMA2D_TRANSFERCOMPLETE_CB_ID or HAL_DMA2D_TRANSFERERROR_CB_ID

HAL_DMA2D_Start

Function name

HAL_StatusTypeDef HAL_DMA2D_Start (DMA2D_HandleTypeDef * hdma2d, uint32_t pdata, uint32_t DstAddress, uint32_t Width, uint32_t Height)

Function description

Start the DMA2D Transfer.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **pdata:** Configure the source memory Buffer address if Memory-to-Memory or Memory-to-Memory with pixel format conversion mode is selected, or configure the color value if Register-to-Memory mode is selected.
- **DstAddress:** The destination memory Buffer address.
- **Width:** The width of data to be transferred from source to destination (expressed in number of pixels per line).
- **Height:** The height of data to be transferred from source to destination (expressed in number of lines).

Return values

- **HAL:** status

HAL_DMA2D_BlendingStart

Function name

HAL_StatusTypeDef HAL_DMA2D_BlendingStart (DMA2D_HandleTypeDef * hdma2d, uint32_t SrcAddress1, uint32_t SrcAddress2, uint32_t DstAddress, uint32_t Width, uint32_t Height)

Function description

Start the multi-source DMA2D Transfer.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **SrcAddress1:** The source memory Buffer address for the foreground layer.
- **SrcAddress2:** The source memory Buffer address for the background layer.
- **DstAddress:** The destination memory Buffer address.
- **Width:** The width of data to be transferred from source to destination (expressed in number of pixels per line).
- **Height:** The height of data to be transferred from source to destination (expressed in number of lines).

Return values

- **HAL:** status

HAL_DMA2D_Start_IT

Function name

HAL_StatusTypeDef HAL_DMA2D_Start_IT (DMA2D_HandleTypeDef * hdma2d, uint32_t pdata, uint32_t DstAddress, uint32_t Width, uint32_t Height)

Function description

Start the DMA2D Transfer with interrupt enabled.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **pdata:** Configure the source memory Buffer address if the Memory-to-Memory or Memory-to-Memory with pixel format conversion mode is selected, or configure the color value if Register-to-Memory mode is selected.
- **DstAddress:** The destination memory Buffer address.
- **Width:** The width of data to be transferred from source to destination (expressed in number of pixels per line).
- **Height:** The height of data to be transferred from source to destination (expressed in number of lines).

Return values

- **HAL:** status

HAL_DMA2D_BlendingStart_IT

Function name

HAL_StatusTypeDef HAL_DMA2D_BlendingStart_IT (DMA2D_HandleTypeDef * hdma2d, uint32_t SrcAddress1, uint32_t SrcAddress2, uint32_t DstAddress, uint32_t Width, uint32_t Height)

Function description

Start the multi-source DMA2D Transfer with interrupt enabled.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **SrcAddress1:** The source memory Buffer address for the foreground layer.
- **SrcAddress2:** The source memory Buffer address for the background layer.
- **DstAddress:** The destination memory Buffer address.
- **Width:** The width of data to be transferred from source to destination (expressed in number of pixels per line).
- **Height:** The height of data to be transferred from source to destination (expressed in number of lines).

Return values

- **HAL:** status

HAL_DMA2D_Suspend

Function name

HAL_StatusTypeDef HAL_DMA2D_Suspend (DMA2D_HandleTypeDef * hdma2d)

Function description

Suspend the DMA2D Transfer.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **HAL:** status

HAL_DMA2D_Resume

Function name

HAL_StatusTypeDef HAL_DMA2D_Resume (DMA2D_HandleTypeDef * hdma2d)

Function description

Resume the DMA2D Transfer.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **HAL:** status

HAL_DMA2D_Abort

Function name

HAL_StatusTypeDef HAL_DMA2D_Abort (DMA2D_HandleTypeDef * hdma2d)

Function description

Abort the DMA2D Transfer.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **HAL:** status

HAL_DMA2D_EnableCLUT

Function name

HAL_StatusTypeDef HAL_DMA2D_EnableCLUT (DMA2D_HandleTypeDef * hdma2d, uint32_t LayerIdx)

Function description

Enable the DMA2D CLUT Transfer.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

HAL_DMA2D_CLUTStartLoad

Function name

HAL_StatusTypeDef HAL_DMA2D_CLUTStartLoad (DMA2D_HandleTypeDef * hdma2d, DMA2D_CLUTCfgTypeDef * CLUTCfg, uint32_t LayerIdx)

Function description

Start DMA2D CLUT Loading.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **CLUTCfg:** Pointer to a DMA2D_CLUTCfgTypeDef structure that contains the configuration information for the color look up table.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

HAL_DMA2D_CLUTStartLoad_IT

Function name

HAL_StatusTypeDef HAL_DMA2D_CLUTStartLoad_IT (DMA2D_HandleTypeDef * hdma2d, DMA2D_CLUTCfgTypeDef * CLUTCfg, uint32_t LayerIdx)

Function description

Start DMA2D CLUT Loading with interrupt enabled.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **CLUTCfg:** Pointer to a DMA2D_CLUTCfgTypeDef structure that contains the configuration information for the color look up table.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

HAL_DMA2D_CLUTLoad

Function name

HAL_StatusTypeDef HAL_DMA2D_CLUTLoad (DMA2D_HandleTypeDef * hdma2d, DMA2D_CLUTCfgTypeDef CLUTCfg, uint32_t LayerIdx)

Function description

Start DMA2D CLUT Loading.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **CLUTCfg:** Pointer to a DMA2D_CLUTCfgTypeDef structure that contains the configuration information for the color look up table.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

Notes

- API obsolete and maintained for compatibility with legacy. User is invited to resort to HAL_DMA2D_CLUTStartLoad() instead to benefit from code compactness, code size and improved heap usage.

HAL_DMA2D_CLUTLoad_IT

Function name

HAL_StatusTypeDef HAL_DMA2D_CLUTLoad_IT (DMA2D_HandleTypeDef * hdma2d, DMA2D_CLUTCfgTypeDef CLUTCfg, uint32_t LayerIdx)

Function description

Start DMA2D CLUT Loading with interrupt enabled.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **CLUTCfg:** Pointer to a DMA2D_CLUTCfgTypeDef structure that contains the configuration information for the color look up table.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

Notes

- API obsolete and maintained for compatibility with legacy. User is invited to resort to HAL_DMA2D_CLUTStartLoad_IT() instead to benefit from code compactness, code size and improved heap usage.

HAL_DMA2D_CLUTLoading_Abort

Function name

HAL_StatusTypeDef HAL_DMA2D_CLUTLoading_Abort (DMA2D_HandleTypeDef * hdma2d, uint32_t LayerIdx)

Function description

Abort the DMA2D CLUT loading.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

HAL_DMA2D_CLUTLoading_Suspend

Function name

HAL_StatusTypeDef HAL_DMA2D_CLUTLoading_Suspend (DMA2D_HandleTypeDef * hdma2d, uint32_t LayerIdx)

Function description

Suspend the DMA2D CLUT loading.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

HAL_DMA2D_CLUTLoading_Resume

Function name

HAL_StatusTypeDef HAL_DMA2D_CLUTLoading_Resume (DMA2D_HandleTypeDef * hdma2d, uint32_t LayerIdx)

Function description

Resume the DMA2D CLUT loading.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

HAL_DMA2D_PollForTransfer

Function name

HAL_StatusTypeDef HAL_DMA2D_PollForTransfer (DMA2D_HandleTypeDef * hdma2d, uint32_t Timeout)

Function description

Polling for transfer complete or CLUT loading.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_DMA2D_IRQHandler

Function name

void HAL_DMA2D_IRQHandler (DMA2D_HandleTypeDef * hdma2d)

Function description

Handle DMA2D interrupt request.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **HAL:** status

HAL_DMA2D_LineEventCallback

Function name

void HAL_DMA2D_LineEventCallback (DMA2D_HandleTypeDef * hdma2d)

Function description

Transfer watermark callback.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **None:**

HAL_DMA2D_CLUTLoadingCpltCallback

Function name

void HAL_DMA2D_CLUTLoadingCpltCallback (DMA2D_HandleTypeDef * hdma2d)

Function description

CLUT Transfer Complete callback.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **None:**

HAL_DMA2D_ConfigLayer

Function name

HAL_StatusTypeDef HAL_DMA2D_ConfigLayer (DMA2D_HandleTypeDef * hdma2d, uint32_t LayerIdx)

Function description

Configure the DMA2D Layer according to the specified parameters in the DMA2D_HandleTypeDef.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

HAL_DMA2D_ConfigCLUT

Function name

HAL_StatusTypeDef HAL_DMA2D_ConfigCLUT (DMA2D_HandleTypeDef * hdma2d, DMA2D_CLUTCfgTypeDef CLUTCfg, uint32_t LayerIdx)

Function description

Configure the DMA2D CLUT Transfer.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **CLUTCfg:** Pointer to a DMA2D_CLUTCfgTypeDef structure that contains the configuration information for the color look up table.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

Notes

- API obsolete and maintained for compatibility with legacy. User is invited to resort to HAL_DMA2D_CLUTStartLoad() instead to benefit from code compactness, code size and improved heap usage.

HAL_DMA2D_ProgramLineEvent

Function name

HAL_StatusTypeDef HAL_DMA2D_ProgramLineEvent (DMA2D_HandleTypeDef * hdma2d, uint32_t Line)

Function description

Configure the line watermark.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **Line:** Line Watermark configuration (maximum 16-bit long value expected).

Return values

- **HAL:** status

Notes

- HAL_DMA2D_ProgramLineEvent() API enables the transfer watermark interrupt.
- The transfer watermark interrupt is disabled once it has occurred.

HAL_DMA2D_EnableDeadTime

Function name

HAL_StatusTypeDef HAL_DMA2D_EnableDeadTime (DMA2D_HandleTypeDef * hdma2d)

Function description

Enable DMA2D dead time feature.

Parameters

- **hdma2d:** DMA2D handle.

Return values

- **HAL:** status

HAL_DMA2D_DisableDeadTime

Function name

HAL_StatusTypeDef HAL_DMA2D_DisableDeadTime (DMA2D_HandleTypeDef * hdma2d)

Function description

Disable DMA2D dead time feature.

Parameters

- **hdma2d:** DMA2D handle.

Return values

- **HAL:** status

HAL_DMA2D_ConfigDeadTime

Function name

HAL_StatusTypeDef HAL_DMA2D_ConfigDeadTime (DMA2D_HandleTypeDef * hdma2d, uint8_t DeadTime)

Function description

Configure dead time.

Parameters

- **hdma2d:** DMA2D handle.
- **DeadTime:** dead time value.

Return values

- **HAL:** status

Notes

- The dead time value represents the guaranteed minimum number of cycles between two consecutive transactions on the AHB bus.

HAL_DMA2D_GetState

Function name

HAL_DMA2D_StateTypeDef HAL_DMA2D_GetState (DMA2D_HandleTypeDef * hdma2d)

Function description

Return the DMA2D state.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **HAL:** state

HAL_DMA2D_GetError

Function name

uint32_t HAL_DMA2D_GetError (DMA2D_HandleTypeDef * hdma2d)

Function description

Return the DMA2D error code.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for DMA2D.

Return values

- **DMA2D:** Error Code

22.3 DMA2D Firmware driver defines

The following section lists the various define and macros of the module.

22.3.1 DMA2D

DMA2D

DMA2D Alpha Inversion

DMA2D_REGULAR_ALPHA

No modification of the alpha channel value

DMA2D_INVERTED_ALPHA

Invert the alpha channel value

DMA2D Alpha Mode

DMA2D_NO_MODIF_ALPHA

No modification of the alpha channel value

DMA2D_REPLACE_ALPHA

Replace original alpha channel value by programmed alpha value

DMA2D_COMBINE_ALPHA

Replace original alpha channel value by programmed alpha value with original alpha channel value

DMA2D Bytes Swap

DMA2D_BYTES_REGULAR

Bytes in regular order in output FIFO

DMA2D_BYTES_SWAP

Bytes are swapped two by two in output FIFO

DMA2D Chroma Sub Sampling

DMA2D_NO_CSS

No chroma sub-sampling 4:4:4

DMA2D_CSS_422

chroma sub-sampling 4:2:2

DMA2D_CSS_420

chroma sub-sampling 4:2:0

DMA2D CLUT Color Mode

DMA2D_CCM_ARGB8888

ARGB8888 DMA2D CLUT color mode

DMA2D_CCM_RGB888

RGB888 DMA2D CLUT color mode

DMA2D CLUT Size

DMA2D_CLUT_SIZE

DMA2D maximum CLUT size

DMA2D Color Value

DMA2D_COLOR_VALUE

Color value mask

DMA2D Error Code

HAL_DMA2D_ERROR_NONE

No error

HAL_DMA2D_ERROR_TE

Transfer error

HAL_DMA2D_ERROR_CE

Configuration error

HAL_DMA2D_ERROR_CAE

CLUT access error

HAL_DMA2D_ERROR_TIMEOUT

Timeout error

HAL_DMA2D_ERROR_INVALID_CALLBACK

Invalid callback error

DMA2D Exported Macros

__HAL_DMA2D_RESET_HANDLE_STATE

Description:

- Reset DMA2D handle state.

Parameters:

- __HANDLE__: specifies the DMA2D handle.

Return value:

- None

__HAL_DMA2D_ENABLE

Description:

- Enable the DMA2D.

Parameters:

- __HANDLE__: DMA2D handle

Return value:

- None.

__HAL_DMA2D_GET_FLAG

Description:

- Get the DMA2D pending flags.

Parameters:

- __HANDLE__: DMA2D handle
- __FLAG__: flag to check. This parameter can be any combination of the following values:
  - DMA2D_FLAG_CE: Configuration error flag
  - DMA2D_FLAG_CTC: CLUT transfer complete flag
  - DMA2D_FLAG_CAE: CLUT access error flag
  - DMA2D_FLAG_TW: Transfer Watermark flag
  - DMA2D_FLAG_TC: Transfer complete flag
  - DMA2D_FLAG_TE: Transfer error flag

Return value:

- The: state of FLAG.

__HAL_DMA2D_CLEAR_FLAG

Description:

- Clear the DMA2D pending flags.

Parameters:

- __HANDLE__: DMA2D handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - DMA2D_FLAG_CE: Configuration error flag
  - DMA2D_FLAG_CTC: CLUT transfer complete flag
  - DMA2D_FLAG_CAE: CLUT access error flag
  - DMA2D_FLAG_TW: Transfer Watermark flag
  - DMA2D_FLAG_TC: Transfer complete flag
  - DMA2D_FLAG_TE: Transfer error flag

Return value:

- None

__HAL_DMA2D_ENABLE_IT

Description:

- Enable the specified DMA2D interrupts.

Parameters:

- __HANDLE__: DMA2D handle
- __INTERRUPT__: specifies the DMA2D interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DMA2D_IT_CE: Configuration error interrupt mask
  - DMA2D_IT_CTC: CLUT transfer complete interrupt mask
  - DMA2D_IT_CAE: CLUT access error interrupt mask
  - DMA2D_IT_TW: Transfer Watermark interrupt mask
  - DMA2D_IT_TC: Transfer complete interrupt mask
  - DMA2D_IT_TE: Transfer error interrupt mask

Return value:

- None

__HAL_DMA2D_DISABLE_IT

Description:

- Disable the specified DMA2D interrupts.

Parameters:

- __HANDLE__: DMA2D handle
- __INTERRUPT__: specifies the DMA2D interrupt sources to be disabled. This parameter can be any combination of the following values:
  - DMA2D_IT_CE: Configuration error interrupt mask
  - DMA2D_IT_CTC: CLUT transfer complete interrupt mask
  - DMA2D_IT_CAE: CLUT access error interrupt mask
  - DMA2D_IT_TW: Transfer Watermark interrupt mask
  - DMA2D_IT_TC: Transfer complete interrupt mask
  - DMA2D_IT_TE: Transfer error interrupt mask

Return value:

- None

__HAL_DMA2D_GET_IT_SOURCE

Description:

- Check whether the specified DMA2D interrupt source is enabled or not.

Parameters:

- __HANDLE__: DMA2D handle
- __INTERRUPT__: specifies the DMA2D interrupt source to check. This parameter can be one of the following values:
  - DMA2D_IT_CE: Configuration error interrupt mask
  - DMA2D_IT_CTC: CLUT transfer complete interrupt mask
  - DMA2D_IT_CAE: CLUT access error interrupt mask
  - DMA2D_IT_TW: Transfer Watermark interrupt mask
  - DMA2D_IT_TC: Transfer complete interrupt mask
  - DMA2D_IT_TE: Transfer error interrupt mask

Return value:

- The: state of INTERRUPT source.

23 HAL DMA Generic Driver

23.1 DMA Firmware driver registers structures

23.1.1 DMA_InitTypeDef

DMA_InitTypeDef is defined in the stm32h7xx_hal_dma.h

Data Fields

- ***uint32_t Request***
- ***uint32_t Direction***
- ***uint32_t PeriphInc***
- ***uint32_t MemInc***
- ***uint32_t PeriphDataAlignment***
- ***uint32_t MemDataAlignment***
- ***uint32_t Mode***
- ***uint32_t Priority***
- ***uint32_t FIFOMode***
- ***uint32_t FIFOThreshold***
- ***uint32_t MemBurst***
- ***uint32_t PeriphBurst***

Field Documentation

- ***uint32_t DMA_InitTypeDef::Request***

  Specifies the request selected for the specified stream. This parameter can be a value of ***DMA_Request_selection***
- ***uint32_t DMA_InitTypeDef::Direction***

  Specifies if the data will be transferred from memory to peripheral, from memory to memory or from peripheral to memory. This parameter can be a value of ***DMA_Data_transfer_direction***
- ***uint32_t DMA_InitTypeDef::PeriphInc***

  Specifies whether the Peripheral address register should be incremented or not. This parameter can be a value of ***DMA_Peripheral_incremented_mode***
- ***uint32_t DMA_InitTypeDef::MemInc***

  Specifies whether the memory address register should be incremented or not. This parameter can be a value of ***DMA_Memory_incremented_mode***
- ***uint32_t DMA_InitTypeDef::PeriphDataAlignment***

  Specifies the Peripheral data width. This parameter can be a value of ***DMA_Peripheral_data_size***
- ***uint32_t DMA_InitTypeDef::MemDataAlignment***

  Specifies the Memory data width. This parameter can be a value of ***DMA_Memory_data_size***
- ***uint32_t DMA_InitTypeDef::Mode***

  Specifies the operation mode of the DMAy Streamx. This parameter can be a value of ***DMA_mode***

  Note:

  – The circular buffer mode cannot be used if the memory-to-memory data transfer is configured on the selected Stream
- ***uint32_t DMA_InitTypeDef::Priority***

  Specifies the software priority for the DMAy Streamx. This parameter can be a value of ***DMA_Priority_level***

- ***uint32_t DMA_InitTypeDef::FIFOMode***

  Specifies if the FIFO mode or Direct mode will be used for the specified stream. This parameter can be a value of ***DMA_FIFO_direct_mode***

  Note:

  – The Direct mode (FIFO mode disabled) cannot be used if the memory-to-memory data transfer is configured on the selected stream
- ***uint32_t DMA_InitTypeDef::FIFOThreshold***

  Specifies the FIFO threshold level. This parameter can be a value of ***DMA_FIFO_threshold_level***
- ***uint32_t DMA_InitTypeDef::MemBurst***

  Specifies the Burst transfer configuration for the memory transfers. It specifies the amount of data to be transferred in a single non interruptible transaction. This parameter can be a value of ***DMA_Memory_burst***

  Note:

  – The burst mode is possible only if the address Increment mode is enabled.
- ***uint32_t DMA_InitTypeDef::PeriphBurst***

  Specifies the Burst transfer configuration for the peripheral transfers. It specifies the amount of data to be transferred in a single non interruptible transaction. This parameter can be a value of ***DMA_Peripheral_burst***

  Note:

  – The burst mode is possible only if the address Increment mode is enabled.

23.1.2 __DMA_HandleTypeDef

__DMA_HandleTypeDef is defined in the stm32h7xx_hal_dma.h

  DMAMUX request generator Status mask

23.2 DMA Firmware driver API description

The following section lists the various functions of the DMA library.

23.2.1 How to use this driver

1. Enable and configure the peripheral to be connected to the DMA Stream (except for internal SRAM/ FLASH memories: no initialization is necessary) please refer to Reference manual for connection between peripherals and DMA requests .
2. For a given Stream, program the required configuration through the following parameters: Transfer Direction, Source and Destination data formats, Circular, Normal or peripheral flow control mode, Stream Priority level, Source and Destination Increment mode, FIFO mode and its Threshold (if needed), Burst mode for Source and/or Destination (if needed) using HAL_DMA_Init() function.

Polling mode IO operation

- Use HAL_DMA_Start() to start DMA transfer after the configuration of Source address and destination address and the Length of data to be transferred

- Use HAL_DMA_PollForTransfer() to poll for the end of current transfer, in this case a fixed Timeout can be configured by User depending from his application.

Interrupt mode IO operation

- Configure the DMA interrupt priority using HAL_NVIC_SetPriority()
- Enable the DMA IRQ handler using HAL_NVIC_EnableIRQ()
- Use HAL_DMA_Start_IT() to start DMA transfer after the configuration of Source address and destination address and the Length of data to be transferred. In this case the DMA interrupt is configured
- Use HAL_DMA_IRQHandler() called under DMA_IRQHandler() Interrupt subroutine
- At the end of data transfer HAL_DMA_IRQHandler() function is executed and user can add his own function by customization of function pointer XferCpltCallback and XferErrorCallback (i.e a member of DMA handle structure).

1. Use HAL_DMA_GetState() function to return the DMA state and HAL_DMA_GetError() in case of error detection.
2. Use HAL_DMA_Abort() function to abort the current transfer

Note: In Memory-to-Memory transfer mode, Circular mode is not allowed.

Note: The FIFO is used mainly to reduce bus usage and to allow data packing/unpacking: it is possible to set different Data Sizes for the Peripheral and the Memory (ie. you can set Half-Word data size for the peripheral to access its data register and set Word data size for the Memory to gain in access time. Each two half words will be packed and written in a single access to a Word in the Memory).

Note: When FIFO is disabled, it is not allowed to configure different Data Sizes for Source and Destination. In this case the Peripheral Data Size will be applied to both Source and Destination.

DMA HAL driver macros list

Below the list of most used macros in DMA HAL driver.

- __HAL_DMA_ENABLE: Enable the specified DMA Stream.
- __HAL_DMA_DISABLE: Disable the specified DMA Stream.
- __HAL_DMA_GET_FS: Return the current DMA Stream FIFO filled level.
- __HAL_DMA_ENABLE_IT: Enable the specified DMA Stream interrupts.
- __HAL_DMA_DISABLE_IT: Disable the specified DMA Stream interrupts.
- __HAL_DMA_GET_IT_SOURCE: Check whether the specified DMA Stream interrupt has occurred or not.

Note: You can refer to the DMA HAL driver header file for more useful macros.

23.2.2 Initialization and de-initialization functions

This section provides functions allowing to initialize the DMA Stream source and destination incrementation and data sizes, transfer direction, circular/normal mode selection, memory-to-memory mode selection and Stream priority value.

The HAL_DMA_Init() function follows the DMA configuration procedures as described in reference manual. The HAL_DMA_DeInit function allows to deinitialize the DMA stream.

This section contains the following APIs:

- ***HAL_DMA_Init()***
- ***HAL_DMA_DeInit()***

23.2.3 IO operation functions

This section provides functions allowing to:

- Configure the source, destination address and data length and Start DMA transfer
- Configure the source, destination address and data length and Start DMA transfer with interrupt
- Register and Unregister DMA callbacks
- Abort DMA transfer
- Poll for transfer complete

- Handle DMA interrupt request

This section contains the following APIs:

- *HAL_DMA_Start()*
- *HAL_DMA_Start_IT()*
- *HAL_DMA_Abort()*
- *HAL_DMA_Abort_IT()*
- *HAL_DMA_PollForTransfer()*
- *HAL_DMA_IRQHandler()*
- *HAL_DMA_RegisterCallback()*
- *HAL_DMA_UnRegisterCallback()*

23.2.4 State and Errors functions

This subsection provides functions allowing to

- Check the DMA state
- Get error code

This section contains the following APIs:

- *HAL_DMA_GetState()*
- *HAL_DMA_GetError()*

23.2.5 Detailed description of functions

HAL_DMA_Init

Function name

HAL_StatusTypeDef HAL_DMA_Init (DMA_HandleTypeDef * hdma)

Function description

Initialize the DMA according to the specified parameters in the DMA_InitTypeDef and create the associated handle.

Parameters

- **hdma:** Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.

Return values

- **HAL:** status

HAL_DMA_DeInit

Function name

HAL_StatusTypeDef HAL_DMA_DeInit (DMA_HandleTypeDef * hdma)

Function description

DeInitializes the DMA peripheral.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.

Return values

- **HAL:** status

HAL_DMA_Start

Function name

HAL_StatusTypeDef HAL_DMA_Start (DMA_HandleTypeDef * hdma, uint32_t SrcAddress, uint32_t DstAddress, uint32_t DataLength)

Function description

Starts the DMA Transfer.

Parameters

- **hdma:** : pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.
- **SrcAddress:** The source memory Buffer address
- **DstAddress:** The destination memory Buffer address
- **DataLength:** The length of data to be transferred from source to destination

Return values

- **HAL:** status

HAL_DMA_Start_IT

Function name

HAL_StatusTypeDef HAL_DMA_Start_IT (DMA_HandleTypeDef * hdma, uint32_t SrcAddress, uint32_t DstAddress, uint32_t DataLength)

Function description

Start the DMA Transfer with interrupt enabled.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.
- **SrcAddress:** The source memory Buffer address
- **DstAddress:** The destination memory Buffer address
- **DataLength:** The length of data to be transferred from source to destination

Return values

- **HAL:** status

HAL_DMA_Abort

Function name

HAL_StatusTypeDef HAL_DMA_Abort (DMA_HandleTypeDef * hdma)

Function description

Aborts the DMA Transfer.

Parameters

- **hdma:** : pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.

Return values

- **HAL:** status

Notes

- After disabling a DMA Stream, a check for wait until the DMA Stream is effectively disabled is added. If a Stream is disabled while a data transfer is ongoing, the current data will be transferred and the Stream will be effectively disabled only after the transfer of this single data is finished.

HAL_DMA_Abort_IT

Function name

HAL_StatusTypeDef HAL_DMA_Abort_IT (DMA_HandleTypeDef * hdma)

Function description

Aborts the DMA Transfer in Interrupt mode.

Parameters

- **hdma:** : pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.

Return values

- **HAL:** status

HAL_DMA_PollForTransfer

Function name

HAL_StatusTypeDef HAL_DMA_PollForTransfer (DMA_HandleTypeDef * hdma, HAL_DMA_LevelCompleteTypeDef CompleteLevel, uint32_t Timeout)

Function description

Polling for transfer complete.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.
- **CompleteLevel:** Specifies the DMA level complete.
- **Timeout:** Timeout duration.

Return values

- **HAL:** status

Notes

- The polling mode is kept in this version for legacy. it is recommended to use the IT model instead. This model could be used for debug purpose.
- The HAL_DMA_PollForTransfer API cannot be used in circular and double buffering mode (automatic circular mode).

HAL_DMA_IRQHandler

Function name

void HAL_DMA_IRQHandler (DMA_HandleTypeDef * hdma)

Function description

Handles DMA interrupt request.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.

Return values

- **None:**

HAL_DMA_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DMA_RegisterCallback (DMA_HandleTypeDef * hdma, HAL_DMA_CallbackIDTypeDef CallbackID, void(*)(DMA_HandleTypeDef *_hdma) pCallback)

Function description

Register callbacks.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.
- **CallbackID:** User Callback identifier a DMA_HandleTypeDef structure as parameter.
- **pCallback:** pointer to private callback function which has pointer to a DMA_HandleTypeDef structure as parameter.

Return values

- **HAL:** status

HAL_DMA_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DMA_UnRegisterCallback (DMA_HandleTypeDef * hdma, HAL_DMA_CallbackIDTypeDef CallbackID)

Function description

UnRegister callbacks.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.
- **CallbackID:** User Callback identifier a HAL_DMA_CallbackIDTypeDef ENUM as parameter.

Return values

- **HAL:** status

HAL_DMA_GetState

Function name

HAL_DMA_StateTypeDef HAL_DMA_GetState (DMA_HandleTypeDef * hdma)

Function description

Returns the DMA state.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.

Return values

- **HAL:** state

HAL_DMA_GetError

Function name

uint32_t HAL_DMA_GetError (DMA_HandleTypeDef * hdma)

Function description

Return the DMA error code.

Parameters

- **hdma:** : pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.

Return values

- **DMA:** Error Code

23.3 DMA Firmware driver defines

The following section lists the various define and macros of the module.

23.3.1 DMA

DMA

DMA Data transfer direction

DMA_PERIPH_TO_MEMORY

Peripheral to memory direction

DMA_MEMORY_TO_PERIPH

Memory to peripheral direction

DMA_MEMORY_TO_MEMORY

Memory to memory direction

DMA Error Code

HAL_DMA_ERROR_NONE

No error

HAL_DMA_ERROR_TE

Transfer error

HAL_DMA_ERROR_FE

FIFO error

HAL_DMA_ERROR_DME

Direct Mode error

HAL_DMA_ERROR_TIMEOUT

Timeout error

HAL_DMA_ERROR_PARAM

Parameter error

HAL_DMA_ERROR_NO_XFER

Abort requested with no Xfer ongoing

HAL_DMA_ERROR_NOT_SUPPORTED

Not supported mode

HAL_DMA_ERROR_SYNC

DMAMUX sync overrun error

HAL_DMA_ERROR_REQGEN

DMAMUX request generator overrun error

HAL_DMA_ERROR_BUSY

DMA Busy error

DMA Exported Macros

__HAL_DMA_RESET_HANDLE_STATE

Description:

- Reset DMA handle state.

Parameters:

- __HANDLE__: specifies the DMA handle.

Return value:

- None

__HAL_DMA_GET_FS

Description:

- Return the current DMA Stream FIFO filled level.

Parameters:

- __HANDLE__: DMA handle

Return value:

- The: FIFO filling state.
  - DMA_FIFOStatus_Less1QuarterFull: when FIFO is less than 1 quarter-full and not empty.
  - DMA_FIFOStatus_1QuarterFull: if more than 1 quarter-full.
  - DMA_FIFOStatus_HalfFull: if more than 1 half-full.
  - DMA_FIFOStatus_3QuartersFull: if more than 3 quarters-full.
  - DMA_FIFOStatus_Empty: when FIFO is empty
  - DMA_FIFOStatus_Full: when FIFO is full

__HAL_DMA_ENABLE

Description:

- Enable the specified DMA Stream.

Parameters:

- __HANDLE__: DMA handle

Return value:

- None

__HAL_DMA_DISABLE

Description:

- Disable the specified DMA Stream.

Parameters:

- __HANDLE__: DMA handle

Return value:

- None

__HAL_DMA_GET_TC_FLAG_INDEX

Description:

- Return the current DMA Stream transfer complete flag.

Parameters:

- __HANDLE__: DMA handle

Return value:

- The: specified transfer complete flag index.

__HAL_DMA_GET_HT_FLAG_INDEX

Description:

- Return the current DMA Stream half transfer complete flag.

Parameters:

- __HANDLE__: DMA handle

Return value:

- The: specified half transfer complete flag index.

__HAL_DMA_GET_TE_FLAG_INDEX

Description:

- Return the current DMA Stream transfer error flag.

Parameters:

- __HANDLE__: DMA handle

Return value:

- The: specified transfer error flag index.

__HAL_DMA_GET_FE_FLAG_INDEX

Description:

- Return the current DMA Stream FIFO error flag.

Parameters:

- __HANDLE__: DMA handle

Return value:

- The: specified FIFO error flag index.

__HAL_DMA_GET_DME_FLAG_INDEX

Description:

- Return the current DMA Stream direct mode error flag.

Parameters:

- __HANDLE__: DMA handle

Return value:

- The: specified direct mode error flag index.

__HAL_BDMA_GET_GI_FLAG_INDEX

Description:

- Returns the current BDMA Channel Global interrupt flag.

Parameters:

- __HANDLE__: DMA handle

Return value:

- The: specified transfer error flag index.

__HAL_DMA_GET_FLAG

Description:

- Get the DMA Stream pending flags.

Parameters:

- __HANDLE__: DMA handle
- __FLAG__: Get the specified flag. This parameter can be any combination of the following values:
  - DMA_FLAG_TCIFx: Transfer complete flag.
  - DMA_FLAG_HTIFx: Half transfer complete flag.
  - DMA_FLAG_TEIFx: Transfer error flag.
  - DMA_FLAG_DMEIFx: Direct mode error flag.
  - DMA_FLAG_FEIFx: FIFO error flag. Where x can be 0_4, 1_5, 2_6 or 3_7 to select the DMA Stream flag.

Return value:

- The: state of FLAG (SET or RESET).

__HAL_DMA_CLEAR_FLAG

Description:

- Clear the DMA Stream pending flags.

Parameters:

- __HANDLE__: DMA handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - DMA_FLAG_TCIFx: Transfer complete flag.
  - DMA_FLAG_HTIFx: Half transfer complete flag.
  - DMA_FLAG_TEIFx: Transfer error flag.
  - DMA_FLAG_DMEIFx: Direct mode error flag.
  - DMA_FLAG_FEIFx: FIFO error flag. Where x can be 0_4, 1_5, 2_6 or 3_7 to select the DMA Stream flag.

Return value:

- None

DMA_TO_BDMA_IT

__HAL_BDMA_CHANNEL_ENABLE_IT

__HAL_DMA_STREAM_ENABLE_IT

__HAL_DMA_ENABLE_IT

Description:

- Enable the specified DMA Stream interrupts.

Parameters:

- __HANDLE__: DMA handle
- __INTERRUPT__: specifies the DMA interrupt sources to be enabled or disabled. This parameter can be one of the following values:
  - DMA_IT_TC: Transfer complete interrupt mask.
  - DMA_IT_HT: Half transfer complete interrupt mask.
  - DMA_IT_TE: Transfer error interrupt mask.
  - DMA_IT_FE: FIFO error interrupt mask.
  - DMA_IT_DME: Direct mode error interrupt.

Return value:

- None

__HAL_BDMA_CHANNEL_DISABLE_IT

__HAL_DMA_STREAM_DISABLE_IT

__HAL_DMA_DISABLE_IT

Description:

- Disable the specified DMA Stream interrupts.

Parameters:

- __HANDLE__: DMA handle
- __INTERRUPT__: specifies the DMA interrupt sources to be enabled or disabled. This parameter can be one of the following values:
  - DMA_IT_TC: Transfer complete interrupt mask.
  - DMA_IT_HT: Half transfer complete interrupt mask.
  - DMA_IT_TE: Transfer error interrupt mask.
  - DMA_IT_FE: FIFO error interrupt mask.
  - DMA_IT_DME: Direct mode error interrupt.

Return value:

- None

__HAL_BDMA_CHANNEL_GET_IT_SOURCE

__HAL_DMA_STREAM_GET_IT_SOURCE

__HAL_DMA_GET_IT_SOURCE

Description:

- Check whether the specified DMA Stream interrupt is enabled or not.

Parameters:

- __HANDLE__: DMA handle
- __INTERRUPT__: specifies the DMA interrupt source to check. This parameter can be one of the following values:
  - DMA_IT_TC: Transfer complete interrupt mask.
  - DMA_IT_HT: Half transfer complete interrupt mask.
  - DMA_IT_TE: Transfer error interrupt mask.
  - DMA_IT_FE: FIFO error interrupt mask.
  - DMA_IT_DME: Direct mode error interrupt.

Return value:

- The: state of DMA_IT.

__HAL_DMA_SET_COUNTER

Description:

- Writes the number of data units to be transferred on the DMA Stream.

Parameters:

- __HANDLE__: DMA handle
- __COUNTER__: Number of data units to be transferred (from 0 to 65535) Number of data items depends only on the Peripheral data format.

Return value:

- The: number of remaining data units in the current DMAy Streamx transfer.

Notes:

- If Peripheral data format is Bytes: number of data units is equal to total number of bytes to be transferred.If Peripheral data format is Half-Word: number of data units is equal to total number of bytes to be transferred / 2.If Peripheral data format is Word: number of data units is equal to total number of bytes to be transferred / 4.

__HAL_DMA_GET_COUNTER

Description:

- Returns the number of remaining data units in the current DMAy Streamx transfer.

Parameters:

- __HANDLE__: DMA handle

Return value:

- The: number of remaining data units in the current DMA Stream transfer.

DMA FIFO direct mode

DMA_FIFOMODE_DISABLE

FIFO mode disable

DMA_FIFOMODE_ENABLE

FIFO mode enable

DMA FIFO threshold level

DMA_FIFO_THRESHOLD_1QUARTERFULL

FIFO threshold 1 quart full configuration

DMA_FIFO_THRESHOLD_HALFFULL

FIFO threshold half full configuration

DMA_FIFO_THRESHOLD_3QUARTERSFULL

FIFO threshold 3 quarts full configuration

DMA_FIFO_THRESHOLD_FULL

FIFO threshold full configuration

24 HAL DMA Extension Driver

24.1 DMAEx Firmware driver registers structures

24.1.1 HAL_DMA_MuxSyncConfigTypeDef

HAL_DMA_MuxSyncConfigTypeDef is defined in the stm32h7xx_hal_dma_ex.h

Data Fields

- ***uint32_t SyncSignalID***
- ***uint32_t SyncPolarity***
- ***FunctionalState SyncEnable***
- ***FunctionalState EventEnable***
- ***uint32_t RequestNumber***

Field Documentation

- ***uint32_t HAL_DMA_MuxSyncConfigTypeDef::SyncSignalID***

  Specifies the synchronization signal gating the DMA request in periodic mode. This parameter can be a value of ***DMAEx_MUX_SyncSignalID_selection***
- ***uint32_t HAL_DMA_MuxSyncConfigTypeDef::SyncPolarity***

  Specifies the polarity of the signal on which the DMA request is synchronized. This parameter can be a value of ***DMAEx_MUX_SyncPolarity_selection***
- ***FunctionalState HAL_DMA_MuxSyncConfigTypeDef::SyncEnable***

  Specifies if the synchronization shall be enabled or disabled This parameter can take the value ENABLE or DISABLE
- ***FunctionalState HAL_DMA_MuxSyncConfigTypeDef::EventEnable***

  Specifies if an event shall be generated once the RequestNumber is reached. This parameter can take the value ENABLE or DISABLE
- ***uint32_t HAL_DMA_MuxSyncConfigTypeDef::RequestNumber***

  Specifies the number of DMA request that will be authorized after a sync event. This parameters can be in the range 1 to 32

24.1.2 HAL_DMA_MuxRequestGeneratorConfigTypeDef

HAL_DMA_MuxRequestGeneratorConfigTypeDef is defined in the stm32h7xx_hal_dma_ex.h

Data Fields

- ***uint32_t SignalID***
- ***uint32_t Polarity***
- ***uint32_t RequestNumber***

Field Documentation

- ***uint32_t HAL_DMA_MuxRequestGeneratorConfigTypeDef::SignalID***

  Specifies the ID of the signal used for DMAMUX request generator This parameter can be a value of ***DMAEx_MUX_SignalGeneratorID_selection***
- ***uint32_t HAL_DMA_MuxRequestGeneratorConfigTypeDef::Polarity***

  Specifies the polarity of the signal on which the request is generated. This parameter can be a value of ***DMAEx_MUX_RequestGeneneratorPolarity_selection***
- ***uint32_t HAL_DMA_MuxRequestGeneratorConfigTypeDef::RequestNumber***

  Specifies the number of DMA request that will be generated after a signal event. This parameters can be in the range 1 to 32

24.2 DMAEx Firmware driver API description

The following section lists the various functions of the DMAEx library.

24.2.1 How to use this driver

The DMA Extension HAL driver can be used as follows:

- Start a multi buffer transfer using the HAL_DMA_MultiBufferStart() function for polling mode or HAL_DMA_MultiBufferStart_IT() for interrupt mode.
- Configure the DMA_MUX Synchronization Block using HAL_DMAEx_ConfigMuxSync function.
- Configure the DMA_MUX Request Generator Block using HAL_DMAEx_ConfigMuxRequestGenerator function. Functions HAL_DMAEx_EnableMuxRequestGenerator and HAL_DMAEx_DisableMuxRequestGenerator can then be used to respectively enable/disable the request generator.
- To handle the DMAMUX Interrupts, the function HAL_DMAEx_MUX_IRQHandler should be called from the DMAMUX IRQ handler i.e DMAMUX1_OVR_IRQHandler or DMAMUX2_OVR_IRQHandler . As only one interrupt line is available for all DMAMUX channels and request generators , HAL_DMA_MUX_IRQHandler should be called with, as parameter, the appropriate DMA handle as many as used DMAs in the user project (exception done if a given DMA is not using the DMAMUX SYNC block neither a request generator)

Note: In Memory-to-Memory transfer mode, Multi (Double) Buffer mode is not allowed.

Note: When Multi (Double) Buffer mode is enabled, the transfer is circular by default.

Note: In Multi (Double) buffer mode, it is possible to update the base address for the AHB memory port on the fly (DMA_SxM0AR or DMA_SxM1AR) when the stream is enabled.

Note: Multi (Double) buffer mode is possible with DMA and BDMA instances.

24.2.2 Extended features functions

This section provides functions allowing to:

- Configure the source, destination address and data length and Start MultiBuffer DMA transfer
- Configure the source, destination address and data length and Start MultiBuffer DMA transfer with interrupt
- Change on the fly the memory0 or memory1 address.
- Configure the DMA_MUX Synchronization Block using HAL_DMAEx_ConfigMuxSync function.
- Configure the DMA_MUX Request Generator Block using HAL_DMAEx_ConfigMuxRequestGenerator function.
- Functions HAL_DMAEx_EnableMuxRequestGenerator and HAL_DMAEx_DisableMuxRequestGenerator can then be used to respectively enable/disable the request generator.
- Handle DMAMUX interrupts using HAL_DMAEx_MUX_IRQHandler : should be called from the DMAMUX IRQ handler i.e DMAMUX1_OVR_IRQHandler or DMAMUX2_OVR_IRQHandler

This section contains the following APIs:

- ***HAL_DMAEx_MultiBufferStart()***
- ***HAL_DMAEx_MultiBufferStart_IT()***
- ***HAL_DMAEx_ChangeMemory()***
- ***HAL_DMAEx_ConfigMuxSync()***
- ***HAL_DMAEx_ConfigMuxRequestGenerator()***
- ***HAL_DMAEx_EnableMuxRequestGenerator()***
- ***HAL_DMAEx_DisableMuxRequestGenerator()***
- ***HAL_DMAEx_MUX_IRQHandler()***

24.2.3 Detailed description of functions

HAL_DMAEx_MultiBufferStart

Function name

HAL_StatusTypeDef HAL_DMAEx_MultiBufferStart (DMA_HandleTypeDef * hdma, uint32_t SrcAddress, uint32_t DstAddress, uint32_t SecondMemAddress, uint32_t DataLength)

Function description

Starts the multi_buffer DMA Transfer.

Parameters

- **hdma:** : pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.
- **SrcAddress:** The source memory Buffer address
- **DstAddress:** The destination memory Buffer address
- **SecondMemAddress:** The second memory Buffer address in case of multi buffer Transfer
- **DataLength:** The length of data to be transferred from source to destination

Return values

- **HAL:** status

HAL_DMAEx_MultiBufferStart_IT

Function name

HAL_StatusTypeDef HAL_DMAEx_MultiBufferStart_IT (DMA_HandleTypeDef * hdma, uint32_t SrcAddress, uint32_t DstAddress, uint32_t SecondMemAddress, uint32_t DataLength)

Function description

Starts the multi_buffer DMA Transfer with interrupt enabled.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.
- **SrcAddress:** The source memory Buffer address
- **DstAddress:** The destination memory Buffer address
- **SecondMemAddress:** The second memory Buffer address in case of multi buffer Transfer
- **DataLength:** The length of data to be transferred from source to destination

Return values

- **HAL:** status

HAL_DMAEx_ChangeMemory

Function name

HAL_StatusTypeDef HAL_DMAEx_ChangeMemory (DMA_HandleTypeDef * hdma, uint32_t Address, HAL_DMA_MemoryTypeDef memory)

Function description

Change the memory0 or memory1 address on the fly.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.
- **Address:** The new address
- **memory:** the memory to be changed, This parameter can be one of the following values: MEMORY0 / MEMORY1

Return values

- **HAL:** status

Notes

- The MEMORY0 address can be changed only when the current transfer use MEMORY1 and the MEMORY1 address can be changed only when the current transfer use MEMORY0.

HAL_DMAEx_ConfigMuxSync

Function name

HAL_StatusTypeDef HAL_DMAEx_ConfigMuxSync (DMA_HandleTypeDef * hdma, HAL_DMA_MuxSyncConfigTypeDef * pSyncConfig)

Function description

Configure the DMAMUX synchronization parameters for a given DMA stream (instance).

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.
- **pSyncConfig:** : pointer to HAL_DMA_MuxSyncConfigTypeDef : contains the DMAMUX synchronization parameters

Return values

- **HAL:** status

HAL_DMAEx_ConfigMuxRequestGenerator

Function name

HAL_StatusTypeDef HAL_DMAEx_ConfigMuxRequestGenerator (DMA_HandleTypeDef * hdma, HAL_DMA_MuxRequestGeneratorConfigTypeDef * pRequestGeneratorConfig)

Function description

Configure the DMAMUX request generator block used by the given DMA stream (instance).

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.
- **pRequestGeneratorConfig:** : pointer to HAL_DMA_MuxRequestGeneratorConfigTypeDef : contains the request generator parameters.

Return values

- **HAL:** status

HAL_DMAEx_EnableMuxRequestGenerator

Function name

HAL_StatusTypeDef HAL_DMAEx_EnableMuxRequestGenerator (DMA_HandleTypeDef * hdma)

Function description

Enable the DMAMUX request generator block used by the given DMA stream (instance).

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.

Return values

- **HAL:** status

HAL_DMAEx_DisableMuxRequestGenerator

Function name

HAL_StatusTypeDef HAL_DMAEx_DisableMuxRequestGenerator (DMA_HandleTypeDef * hdma)

Function description

Disable the DMAMUX request generator block used by the given DMA stream (instance).

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.

Return values

- **HAL:** status

HAL_DMAEx_MUX_IRQHandler

Function name

void HAL_DMAEx_MUX_IRQHandler (DMA_HandleTypeDef * hdma)

Function description

Handles DMAMUX interrupt request.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Stream.

Return values

- **None:**

24.3 DMAEx Firmware driver defines

The following section lists the various define and macros of the module.

24.3.1 DMAEx

DMAEx

DMAEx MUX RequestGeneneratorPolarity selection

HAL_DMAMUX_REQ_GEN_NO_EVENT

block request generator events

HAL_DMAMUX_REQ_GEN_RISING

generate request on rising edge events

HAL_DMAMUX_REQ_GEN_FALLING

generate request on falling edge events

HAL_DMAMUX_REQ_GEN_RISING_FALLING

generate request on rising and falling edge events

DMAEx MUX SignalGeneratorID selection

HAL_DMAMUX2_SYNC_LPUART1_RX_WKUP

DMAMUX2 synchronization Signal is LPUART1 RX Wakeup

HAL_DMAMUX2_SYNC_LPUART1_TX_WKUP

DMAMUX2 synchronization Signal is LPUART1 TX Wakeup

HAL_DMAMUX2_SYNC_LPTIM2_OUT

DMAMUX2 synchronization Signal is LPTIM2 output

HAL_DMAMUX2_SYNC_LPTIM3_OUT

DMAMUX2 synchronization Signal is LPTIM3 output

HAL_DMAMUX2_SYNC_I2C4_WKUP

DMAMUX2 synchronization Signal is I2C4 Wakeup

HAL_DMAMUX2_SYNC_SPI6_WKUP

DMAMUX2 synchronization Signal is SPI6 Wakeup

HAL_DMAMUX2_SYNC_COMP1_OUT

DMAMUX2 synchronization Signal is Comparator 1 output

HAL_DMAMUX2_SYNC_RTC_WKUP

DMAMUX2 synchronization Signal is RTC Wakeup

HAL_DMAMUX2_SYNC_EXTI0

DMAMUX2 synchronization Signal is EXTI0 IT

HAL_DMAMUX2_SYNC_EXTI2

DMAMUX2 synchronization Signal is EXTI2 IT

25 HAL DSI Generic Driver

25.1 DSI Firmware driver registers structures

25.1.1 DSI_InitTypeDef

DSI_InitTypeDef is defined in the stm32h7xx_hal_dsi.h

Data Fields

- ***uint32_t AutomaticClockLaneControl***
- ***uint32_t TXEscapeCkdiv***
- ***uint32_t NumberOfLanes***

Field Documentation

- ***uint32_t DSI_InitTypeDef::AutomaticClockLaneControl***
  Automatic clock lane control This parameter can be any value of ***DSI_Automatic_Clk_Lane_Control***
- ***uint32_t DSI_InitTypeDef::TXEscapeCkdiv***
  TX Escape clock division The values 0 and 1 stop the TX_ESC clock generation
- ***uint32_t DSI_InitTypeDef::NumberOfLanes***
  Number of lanes This parameter can be any value of ***DSI_Number_Of_Lanes***

25.1.2 DSI_PLLInitTypeDef

DSI_PLLInitTypeDef is defined in the stm32h7xx_hal_dsi.h

Data Fields

- ***uint32_t PLLNDIV***
- ***uint32_t PLLIDF***
- ***uint32_t PLLODF***

Field Documentation

- ***uint32_t DSI_PLLInitTypeDef::PLLNDIV***
  PLL Loop Division Factor This parameter must be a value between 10 and 125
- ***uint32_t DSI_PLLInitTypeDef::PLLIDF***
  PLL Input Division Factor This parameter can be any value of ***DSI_PLL_IDF***
- ***uint32_t DSI_PLLInitTypeDef::PLLODF***
  PLL Output Division Factor This parameter can be any value of ***DSI_PLL_ODF***

25.1.3 DSI_VidCfgTypeDef

DSI_VidCfgTypeDef is defined in the stm32h7xx_hal_dsi.h

Data Fields

- ***uint32_t VirtualChannelID***
- ***uint32_t ColorCoding***
- ***uint32_t LooselyPacked***
- ***uint32_t Mode***
- ***uint32_t PacketSize***
- ***uint32_t NumberOfChunks***
- ***uint32_t NullPacketSize***
- ***uint32_t HSPolarity***
- ***uint32_t VSPolarity***
- ***uint32_t DEPolarity***
- ***uint32_t HorizontalSyncActive***

- ***uint32_t HorizontalBackPorch***
- ***uint32_t HorizontalLine***
- ***uint32_t VerticalSyncActive***
- ***uint32_t VerticalBackPorch***
- ***uint32_t VerticalFrontPorch***
- ***uint32_t VerticalActive***
- ***uint32_t LPCommandEnable***
- ***uint32_t LPLargestPacketSize***
- ***uint32_t LPVACTLargestPacketSize***
- ***uint32_t LPHorizontalFrontPorchEnable***
- ***uint32_t LPHorizontalBackPorchEnable***
- ***uint32_t LPVerticalActiveEnable***
- ***uint32_t LPVerticalFrontPorchEnable***
- ***uint32_t LPVerticalBackPorchEnable***
- ***uint32_t LPVerticalSyncActiveEnable***
- ***uint32_t FrameBTAAcknowledgeEnable***

Field Documentation

- ***uint32_t DSI_VidCfgTypeDef::VirtualChannelID***
  Virtual channel ID
- ***uint32_t DSI_VidCfgTypeDef::ColorCoding***
  Color coding for LTDC interface This parameter can be any value of ***DSI_Color_Coding***
- ***uint32_t DSI_VidCfgTypeDef::LooselyPacked***
  Enable or disable loosely packed stream (needed only when using 18-bit configuration). This parameter can be any value of ***DSI_LooselyPacked***
- ***uint32_t DSI_VidCfgTypeDef::Mode***
  Video mode type This parameter can be any value of ***DSI_Video_Mode_Type***
- ***uint32_t DSI_VidCfgTypeDef::PacketSize***
  Video packet size
- ***uint32_t DSI_VidCfgTypeDef::NumberOfChunks***
  Number of chunks
- ***uint32_t DSI_VidCfgTypeDef::NullPacketSize***
  Null packet size
- ***uint32_t DSI_VidCfgTypeDef::HSPolarity***
  HSYNC pin polarity This parameter can be any value of ***DSI_HSYNC_Polarity***
- ***uint32_t DSI_VidCfgTypeDef::VSPolarity***
  VSYNC pin polarity This parameter can be any value of ***DSI_VSYNC_Active_Polarity***
- ***uint32_t DSI_VidCfgTypeDef::DEPolarity***
  Data Enable pin polarity This parameter can be any value of ***DSI_DATA_ENABLE_Polarity***
- ***uint32_t DSI_VidCfgTypeDef::HorizontalSyncActive***
  Horizontal synchronism active duration (in lane byte clock cycles)
- ***uint32_t DSI_VidCfgTypeDef::HorizontalBackPorch***
  Horizontal back-porch duration (in lane byte clock cycles)
- ***uint32_t DSI_VidCfgTypeDef::HorizontalLine***
  Horizontal line duration (in lane byte clock cycles)
- ***uint32_t DSI_VidCfgTypeDef::VerticalSyncActive***
  Vertical synchronism active duration
- ***uint32_t DSI_VidCfgTypeDef::VerticalBackPorch***
  Vertical back-porch duration

- ***uint32_t DSI_VidCfgTypeDef::VerticalFrontPorch***
  Vertical front-porch duration
- ***uint32_t DSI_VidCfgTypeDef::VerticalActive***
  Vertical active duration
- ***uint32_t DSI_VidCfgTypeDef::LPCommandEnable***
  Low-power command enable This parameter can be any value of ***DSI_LP_Command***
- ***uint32_t DSI_VidCfgTypeDef::LPLargestPacketSize***
  The size, in bytes, of the low power largest packet that can fit in a line during VSA, VBP and VFP regions
- ***uint32_t DSI_VidCfgTypeDef::LPVACTLargestPacketSize***
  The size, in bytes, of the low power largest packet that can fit in a line during VACT region
- ***uint32_t DSI_VidCfgTypeDef::LPHorizontalFrontPorchEnable***
  Low-power horizontal front-porch enable This parameter can be any value of ***DSI_LP_HFP***
- ***uint32_t DSI_VidCfgTypeDef::LPHorizontalBackPorchEnable***
  Low-power horizontal back-porch enable This parameter can be any value of ***DSI_LP_HBP***
- ***uint32_t DSI_VidCfgTypeDef::LPVerticalActiveEnable***
  Low-power vertical active enable This parameter can be any value of ***DSI_LP_VACT***
- ***uint32_t DSI_VidCfgTypeDef::LPVerticalFrontPorchEnable***
  Low-power vertical front-porch enable This parameter can be any value of ***DSI_LP_VFP***
- ***uint32_t DSI_VidCfgTypeDef::LPVerticalBackPorchEnable***
  Low-power vertical back-porch enable This parameter can be any value of ***DSI_LP_VBP***
- ***uint32_t DSI_VidCfgTypeDef::LPVerticalSyncActiveEnable***
  Low-power vertical sync active enable This parameter can be any value of ***DSI_LP_VSYNC***
- ***uint32_t DSI_VidCfgTypeDef::FrameBTAAcknowledgeEnable***
  Frame bus-turn-around acknowledge enable This parameter can be any value of ***DSI_FBTA_acknowledge***

25.1.4 DSI_CmdCfgTypeDef

DSI_CmdCfgTypeDef is defined in the stm32h7xx_hal_dsi.h

Data Fields

- ***uint32_t VirtualChannelID***
- ***uint32_t ColorCoding***
- ***uint32_t CommandSize***
- ***uint32_t TearingEffectSource***
- ***uint32_t TearingEffectPolarity***
- ***uint32_t HSPolarity***
- ***uint32_t VSPolarity***
- ***uint32_t DEPolarity***
- ***uint32_t VSyncPol***
- ***uint32_t AutomaticRefresh***
- ***uint32_t TEAcknowledgeRequest***

Field Documentation

- ***uint32_t DSI_CmdCfgTypeDef::VirtualChannelID***
  Virtual channel ID
- ***uint32_t DSI_CmdCfgTypeDef::ColorCoding***
  Color coding for LTDC interface This parameter can be any value of ***DSI_Color_Coding***
- ***uint32_t DSI_CmdCfgTypeDef::CommandSize***
  Maximum allowed size for an LTDC write memory command, measured in pixels. This parameter can be any value between 0x00 and 0xFFFFU
- ***uint32_t DSI_CmdCfgTypeDef::TearingEffectSource***
  Tearing effect source This parameter can be any value of ***DSI_TearingEffectSource***

- ***uint32_t DSI_CmdCfgTypeDef::TearingEffectPolarity***
  Tearing effect pin polarity This parameter can be any value of ***DSI_TearingEffectPolarity***
- ***uint32_t DSI_CmdCfgTypeDef::HSPolarity***
  HSYNC pin polarity This parameter can be any value of ***DSI_HSYNC_Polarity***
- ***uint32_t DSI_CmdCfgTypeDef::VSPolarity***
  VSYNC pin polarity This parameter can be any value of ***DSI_VSYNC_Active_Polarity***
- ***uint32_t DSI_CmdCfgTypeDef::DEPolarity***
  Data Enable pin polarity This parameter can be any value of ***DSI_DATA_ENABLE_Polarity***
- ***uint32_t DSI_CmdCfgTypeDef::VSyncPol***
  VSync edge on which the LTDC is halted This parameter can be any value of ***DSI_Vsync_Polarity***
- ***uint32_t DSI_CmdCfgTypeDef::AutomaticRefresh***
  Automatic refresh mode This parameter can be any value of ***DSI_AutomaticRefresh***
- ***uint32_t DSI_CmdCfgTypeDef::TEAcknowledgeRequest***
  Tearing Effect Acknowledge Request Enable This parameter can be any value of ***DSI_TE_AcknowledgeRequest***

25.1.5 DSI_LPCmdTypeDef

DSI_LPCmdTypeDef is defined in the stm32h7xx_hal_dsi.h

Data Fields

- ***uint32_t LPGenShortWriteNoP***
- ***uint32_t LPGenShortWriteOneP***
- ***uint32_t LPGenShortWriteTwoP***
- ***uint32_t LPGenShortReadNoP***
- ***uint32_t LPGenShortReadOneP***
- ***uint32_t LPGenShortReadTwoP***
- ***uint32_t LPGenLongWrite***
- ***uint32_t LPDcsShortWriteNoP***
- ***uint32_t LPDcsShortWriteOneP***
- ***uint32_t LPDcsShortReadNoP***
- ***uint32_t LPDcsLongWrite***
- ***uint32_t LPMaxReadPacket***
- ***uint32_t AcknowledgeRequest***

Field Documentation

- ***uint32_t DSI_LPCmdTypeDef::LPGenShortWriteNoP***
  Generic Short Write Zero parameters Transmission This parameter can be any value of ***DSI_LP_LPGenShortWriteNoP***
- ***uint32_t DSI_LPCmdTypeDef::LPGenShortWriteOneP***
  Generic Short Write One parameter Transmission This parameter can be any value of ***DSI_LP_LPGenShortWriteOneP***
- ***uint32_t DSI_LPCmdTypeDef::LPGenShortWriteTwoP***
  Generic Short Write Two parameters Transmission This parameter can be any value of ***DSI_LP_LPGenShortWriteTwoP***
- ***uint32_t DSI_LPCmdTypeDef::LPGenShortReadNoP***
  Generic Short Read Zero parameters Transmission This parameter can be any value of ***DSI_LP_LPGenShortReadNoP***
- ***uint32_t DSI_LPCmdTypeDef::LPGenShortReadOneP***
  Generic Short Read One parameter Transmission This parameter can be any value of ***DSI_LP_LPGenShortReadOneP***
- ***uint32_t DSI_LPCmdTypeDef::LPGenShortReadTwoP***
  Generic Short Read Two parameters Transmission This parameter can be any value of ***DSI_LP_LPGenShortReadTwoP***

- ***uint32_t DSI_LPCmdTypeDef::LPGenLongWrite***
  Generic Long Write Transmission This parameter can be any value of ***DSI_LP_LPGenLongWrite***
- ***uint32_t DSI_LPCmdTypeDef::LPDcsShortWriteNoP***
  DCS Short Write Zero parameters Transmission This parameter can be any value of ***DSI_LP_LPDcsShortWriteNoP***
- ***uint32_t DSI_LPCmdTypeDef::LPDcsShortWriteOneP***
  DCS Short Write One parameter Transmission This parameter can be any value of ***DSI_LP_LPDcsShortWriteOneP***
- ***uint32_t DSI_LPCmdTypeDef::LPDcsShortReadNoP***
  DCS Short Read Zero parameters Transmission This parameter can be any value of ***DSI_LP_LPDcsShortReadNoP***
- ***uint32_t DSI_LPCmdTypeDef::LPDcsLongWrite***
  DCS Long Write Transmission This parameter can be any value of ***DSI_LP_LPDcsLongWrite***
- ***uint32_t DSI_LPCmdTypeDef::LPMaxReadPacket***
  Maximum Read Packet Size Transmission This parameter can be any value of ***DSI_LP_LPMaxReadPacket***
- ***uint32_t DSI_LPCmdTypeDef::AcknowledgeRequest***
  Acknowledge Request Enable This parameter can be any value of ***DSI_AcknowledgeRequest***

25.1.6 DSI_PHY_TimerTypeDef

DSI_PHY_TimerTypeDef is defined in the stm32h7xx_hal_dsi.h

Data Fields

- ***uint32_t ClockLaneHS2LPTime***
- ***uint32_t ClockLaneLP2HSTime***
- ***uint32_t DataLaneHS2LPTime***
- ***uint32_t DataLaneLP2HSTime***
- ***uint32_t DataLaneMaxReadTime***
- ***uint32_t StopWaitTime***

Field Documentation

- ***uint32_t DSI_PHY_TimerTypeDef::ClockLaneHS2LPTime***
  The maximum time that the D-PHY clock lane takes to go from high-speed to low-power transmission
- ***uint32_t DSI_PHY_TimerTypeDef::ClockLaneLP2HSTime***
  The maximum time that the D-PHY clock lane takes to go from low-power to high-speed transmission
- ***uint32_t DSI_PHY_TimerTypeDef::DataLaneHS2LPTime***
  The maximum time that the D-PHY data lanes takes to go from high-speed to low-power transmission
- ***uint32_t DSI_PHY_TimerTypeDef::DataLaneLP2HSTime***
  The maximum time that the D-PHY data lanes takes to go from low-power to high-speed transmission
- ***uint32_t DSI_PHY_TimerTypeDef::DataLaneMaxReadTime***
  The maximum time required to perform a read command
- ***uint32_t DSI_PHY_TimerTypeDef::StopWaitTime***
  The minimum wait period to request a High-Speed transmission after the Stop state

25.1.7 DSI_HOST_TimeoutTypeDef

DSI_HOST_TimeoutTypeDef is defined in the stm32h7xx_hal_dsi.h

Data Fields

- ***uint32_t TimeoutCkdiv***
- ***uint32_t HighSpeedTransmissionTimeout***
- ***uint32_t LowPowerReceptionTimeout***
- ***uint32_t HighSpeedReadTimeout***
- ***uint32_t LowPowerReadTimeout***
- ***uint32_t HighSpeedWriteTimeout***

- ***uint32_t HighSpeedWritePrespMode***
- ***uint32_t LowPowerWriteTimeout***
- ***uint32_t BTATimeout***

Field Documentation

- ***uint32_t DSI_HOST_TimeoutTypeDef::TimeoutCkdiv***
  Time-out clock division
- ***uint32_t DSI_HOST_TimeoutTypeDef::HighSpeedTransmissionTimeout***
  High-speed transmission time-out
- ***uint32_t DSI_HOST_TimeoutTypeDef::LowPowerReceptionTimeout***
  Low-power reception time-out
- ***uint32_t DSI_HOST_TimeoutTypeDef::HighSpeedReadTimeout***
  High-speed read time-out
- ***uint32_t DSI_HOST_TimeoutTypeDef::LowPowerReadTimeout***
  Low-power read time-out
- ***uint32_t DSI_HOST_TimeoutTypeDef::HighSpeedWriteTimeout***
  High-speed write time-out
- ***uint32_t DSI_HOST_TimeoutTypeDef::HighSpeedWritePrespMode***
  High-speed write presp mode This parameter can be any value of ***DSI_HS_PrespMode***
- ***uint32_t DSI_HOST_TimeoutTypeDef::LowPowerWriteTimeout***
  Low-speed write time-out
- ***uint32_t DSI_HOST_TimeoutTypeDef::BTATimeout***
  BTA time-out

25.1.8 __DSI_HandleTypeDef

__DSI_HandleTypeDef is defined in the stm32h7xx_hal_dsi.h

Data Fields

- ***DSI_TypeDef * Instance***
- ***DSI_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_DSI_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***uint32_t ErrorMsk***
- ***void(* TearingEffectCallback***
- ***void(* EndOfRefreshCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***DSI_TypeDef* __DSI_HandleTypeDef::Instance***
  Register base address
- ***DSI_InitTypeDef __DSI_HandleTypeDef::Init***
  DSI required parameters
- ***HAL_LockTypeDef __DSI_HandleTypeDef::Lock***
  DSI peripheral status
- ***__IO HAL_DSI_StateTypeDef __DSI_HandleTypeDef::State***
  DSI communication state
- ***__IO uint32_t __DSI_HandleTypeDef::ErrorCode***
  DSI Error code

- ***uint32_t __DSI_HandleTypeDef::ErrorMsk***
  DSI Error monitoring mask
- ***void(* __DSI_HandleTypeDef::TearingEffectCallback)(struct __DSI_HandleTypeDef *hdsi)***
  DSI Tearing Effect Callback
- ***void(* __DSI_HandleTypeDef::EndOfRefreshCallback)(struct __DSI_HandleTypeDef *hdsi)***
  DSI End Of Refresh Callback
- ***void(* __DSI_HandleTypeDef::ErrorCallback)(struct __DSI_HandleTypeDef *hdsi)***
  DSI Error Callback
- ***void(* __DSI_HandleTypeDef::MspInitCallback)(struct __DSI_HandleTypeDef *hdsi)***
  DSI Msp Init callback
- ***void(* __DSI_HandleTypeDef::MspDeInitCallback)(struct __DSI_HandleTypeDef *hdsi)***
  DSI Msp DeInit callback

25.2 DSI Firmware driver API description

The following section lists the various functions of the DSI library.

25.2.1 How to use this driver

The DSI HAL driver can be used as follows:

1. Declare a DSI_HandleTypeDef handle structure, for example: DSI_HandleTypeDef hdsi;
2. Initialize the DSI low level resources by implementing the HAL_DSI_MspInit() API:
   a. Enable the DSI interface clock
   b. NVIC configuration if you need to use interrupt process
      - Configure the DSI interrupt priority
      - Enable the NVIC DSI IRQ Channel
3. Initialize the DSI Host peripheral, the required PLL parameters, number of lances and TX Escape clock divider by calling the HAL_DSI_Init() API which calls HAL_DSI_MspInit().

Configuration

1. Use HAL_DSI_ConfigAdaptedCommandMode() function to configure the DSI host in adapted command mode.
2. When operating in video mode , use HAL_DSI_ConfigVideoMode() to configure the DSI host.
3. Function HAL_DSI_ConfigCommand() is used to configure the DSI commands behavior in low power mode.
4. To configure the DSI PHY timings parameters, use function HAL_DSI_ConfigPhyTimer().
5. The DSI Host can be started/stopped using respectively functions HAL_DSI_Start() and HAL_DSI_Stop(). Functions HAL_DSI_ShortWrite(), HAL_DSI_LongWrite() and HAL_DSI_Read() allows respectively to write DSI short packets, long packets and to read DSI packets.
6. The DSI Host Offers two Low power modes :
   – Low Power Mode on data lanes only: Only DSI data lanes are shut down. It is possible to enter/exit from this mode using respectively functions HAL_DSI_EnterULPMData() and HAL_DSI_ExitULPMData()
   – Low Power Mode on data and clock lanes : All DSI lanes are shut down including data and clock lanes. It is possible to enter/exit from this mode using respectively functions HAL_DSI_EnterULPM() and HAL_DSI_ExitULPM()
7. To control DSI state you can use the following function: HAL_DSI_GetState()

Error management

1. User can select the DSI errors to be reported/monitored using function HAL_DSI_ConfigErrorMonitor() When an error occurs, the callback HAL_DSI_ErrorCallback() is asserted and then user can retrieve the error code by calling function HAL_DSI_GetError()

DSI HAL driver macros list

Below the list of most used macros in DSI HAL driver.

- __HAL_DSI_ENABLE: Enable the DSI Host.
- __HAL_DSI_DISABLE: Disable the DSI Host.
- __HAL_DSI_WRAPPER_ENABLE: Enables the DSI wrapper.
- __HAL_DSI_WRAPPER_DISABLE: Disable the DSI wrapper.
- __HAL_DSI_PLL_ENABLE: Enables the DSI PLL.
- __HAL_DSI_PLL_DISABLE: Disables the DSI PLL.
- __HAL_DSI_REG_ENABLE: Enables the DSI regulator.
- __HAL_DSI_REG_DISABLE: Disables the DSI regulator.
- __HAL_DSI_GET_FLAG: Get the DSI pending flags.
- __HAL_DSI_CLEAR_FLAG: Clears the DSI pending flags.
- __HAL_DSI_ENABLE_IT: Enables the specified DSI interrupts.
- __HAL_DSI_DISABLE_IT: Disables the specified DSI interrupts.
- __HAL_DSI_GET_IT_SOURCE: Checks whether the specified DSI interrupt source is enabled or not.

Note: You can refer to the DSI HAL driver header file for more useful macros

Callback registration

The compilation define USE_HAL_DSI_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Function HAL_DSI_RegisterCallback() to register a callback.

Function HAL_DSI_RegisterCallback() allows to register following callbacks:

- TearingEffectCallback : DSI Tearing Effect Callback.
- EndOfRefreshCallback : DSI End Of Refresh Callback.
- ErrorCallback : DSI Error Callback
- MspInitCallback : DSI MspInit.
- MspDeInitCallback : DSI MspDeInit.

This function takes as parameters the HAL peripheral handle, the callback ID and a pointer to the user callback function.

Use function HAL_DSI_UnRegisterCallback() to reset a callback to the default weak function. HAL_DSI_UnRegisterCallback takes as parameters the HAL peripheral handle, and the callback ID.

This function allows to reset following callbacks:

- TearingEffectCallback : DSI Tearing Effect Callback.
- EndOfRefreshCallback : DSI End Of Refresh Callback.
- ErrorCallback : DSI Error Callback
- MspInitCallback : DSI MspInit.
- MspDeInitCallback : DSI MspDeInit.

By default, after the HAL_DSI_Init and when the state is HAL_DSI_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_DSI_TearingEffectCallback(), HAL_DSI_EndOfRefreshCallback(). Exception done for MspInit and MspDeInit functions that are respectively reset to the legacy weak (surcharged) functions in the HAL_DSI_Init() and HAL_DSI_DeInit() only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_DSI_Init() and HAL_DSI_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in HAL_DSI_STATE_READY state only. Exception done MspInit/ MspDeInit that can be registered/unregistered in HAL_DSI_STATE_READY or HAL_DSI_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_DSI_RegisterCallback() before calling HAL_DSI_DeInit() or HAL_DSI_Init() function.

When The compilation define USE_HAL_DSI_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

25.2.2 Initialization and Configuration functions

This section provides functions allowing to:

- Initialize and configure the DSI
- De-initialize the DSI

This section contains the following APIs:

- ***HAL_DSI_Init()***
- ***HAL_DSI_DeInit()***
- ***HAL_DSI_ConfigErrorMonitor()***
- ***HAL_DSI_MspInit()***
- ***HAL_DSI_MspDeInit()***
- ***HAL_DSI_RegisterCallback()***
- ***HAL_DSI_UnRegisterCallback()***

25.2.3 IO operation functions

This section provides function allowing to:

- Handle DSI interrupt request

This section contains the following APIs:

- ***HAL_DSI_IRQHandler()***
- ***HAL_DSI_TearingEffectCallback()***
- ***HAL_DSI_EndOfRefreshCallback()***
- ***HAL_DSI_ErrorCallback()***

25.2.4 Peripheral Control functions

This section provides functions allowing to:

- Configure the Generic interface read-back Virtual Channel ID
- Select video mode and configure the corresponding parameters
- Configure command transmission mode: High-speed or Low-power
- Configure the flow control
- Configure the DSI PHY timer
- Configure the DSI HOST timeout
- Configure the DSI HOST timeout
- Start/Stop the DSI module
- Refresh the display in command mode
- Controls the display color mode in Video mode
- Control the display shutdown in Video mode
- write short DCS or short Generic command
- write long DCS or long Generic command
- Read command (DCS or generic)
- Enter/Exit the Ultra Low Power Mode on data only (D-PHY PLL running)
- Enter/Exit the Ultra Low Power Mode on data only and clock (D-PHY PLL turned off)
- Start/Stop test pattern generation
- Slew-Rate And Delay Tuning
- Low-Power Reception Filter Tuning
- Activate an additional current path on all lanes to meet the SDDTx parameter
- Custom lane pins configuration
- Set custom timing for the PHY
- Force the Clock/Data Lane in TX Stop Mode
- Force LP Receiver in Low-Power Mode

- Force Data Lanes in RX Mode after a BTA
- Enable a pull-down on the lanes to prevent from floating states when unused
- Switch off the contention detection on data lanes

This section contains the following APIs:

- *HAL_DSI_SetGenericVCID()*
- *HAL_DSI_ConfigVideoMode()*
- *HAL_DSI_ConfigAdaptedCommandMode()*
- *HAL_DSI_ConfigCommand()*
- *HAL_DSI_ConfigFlowControl()*
- *HAL_DSI_ConfigPhyTimer()*
- *HAL_DSI_ConfigHostTimeouts()*
- *HAL_DSI_Start()*
- *HAL_DSI_Stop()*
- *HAL_DSI_Refresh()*
- *HAL_DSI_ColorMode()*
- *HAL_DSI_Shutdown()*

- *HAL_DSI_PatternGeneratorStop()*
- *HAL_DSI_SetSlewRateAndDelayTuning()*
- *HAL_DSI_SetLowPowerRXFilter()*
- *HAL_DSI_SetSDD()*
- *HAL_DSI_SetLanePinsConfiguration()*
- *HAL_DSI_SetPHYTimings()*
- *HAL_DSI_ForceTXStopMode()*
- *HAL_DSI_ForceRXLowPower()*
- *HAL_DSI_ForceDataLanesInRX()*
- *HAL_DSI_SetPullDown()*
- *HAL_DSI_SetContentionDetectionOff()*

25.2.5 Peripheral State and Errors functions

This subsection provides functions allowing to

- Check the DSI state.
- Get error code.

This section contains the following APIs:

- *HAL_DSI_GetState()*
- *HAL_DSI_GetError()*

25.2.6 Detailed description of functions

HAL_DSI_Init

Function name

HAL_StatusTypeDef HAL_DSI_Init (DSI_HandleTypeDef * hdsi, DSI_PLLInitTypeDef * PLLInit)

Function description

Initializes the DSI according to the specified parameters in the DSI_InitTypeDef and create the associated handle.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **PLLInit:** pointer to a DSI_PLLInitTypeDef structure that contains the PLL Clock structure definition for the DSI.

Return values

- **HAL:** status

HAL_DSI_DeInit

Function name

HAL_StatusTypeDef HAL_DSI_DeInit (DSI_HandleTypeDef * hdsi)

Function description

De-initializes the DSI peripheral registers to their default reset values.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_MspInit

Function name

void HAL_DSI_MspInit (DSI_HandleTypeDef * hdsi)

Function description

Initializes the DSI MSP.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **None:**

HAL_DSI_MspDeInit

Function name

void HAL_DSI_MspDeInit (DSI_HandleTypeDef * hdsi)

Function description

De-initializes the DSI MSP.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **None:**

HAL_DSI_ConfigErrorMonitor

Function name

HAL_StatusTypeDef HAL_DSI_ConfigErrorMonitor (DSI_HandleTypeDef * hdsi, uint32_t ActiveErrors)

Function description

Enable the error monitor flags.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **ActiveErrors:** indicates which error interrupts will be enabled. This parameter can be any combination of
  - DSI_Error_Data_Type.

Return values

- **HAL:** status

HAL_DSI_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DSI_RegisterCallback (DSI_HandleTypeDef * hdsi, HAL_DSI_CallbackIDTypeDef CallbackID, pDSI_CallbackTypeDef pCallback)

Function description

Register a User DSI Callback To be used instead of the weak predefined callback.

Parameters

- **hdsi:** dsi handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_DSI_TEARING_EFFECT_CB_ID Tearing Effect Callback ID
  - HAL_DSI_ENDOF_REFRESH_CB_ID End Of Refresh Callback ID
  - HAL_DSI_ERROR_CB_ID Error Callback ID
  - HAL_DSI_MSPINIT_CB_ID MspInit callback ID
  - HAL_DSI_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

HAL_DSI_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DSI_UnRegisterCallback (DSI_HandleTypeDef * hdsi, HAL_DSI_CallbackIDTypeDef CallbackID)

Function description

Unregister a DSI Callback DSI callback is redirected to the weak predefined callback.

Parameters

- **hdsi:** dsi handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_DSI_TEARING_EFFECT_CB_ID Tearing Effect Callback ID
  - HAL_DSI_ENDOF_REFRESH_CB_ID End Of Refresh Callback ID
  - HAL_DSI_ERROR_CB_ID Error Callback ID
  - HAL_DSI_MSPINIT_CB_ID MspInit callback ID
  - HAL_DSI_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **status:**

HAL_DSI_IRQHandler

Function name

void HAL_DSI_IRQHandler (DSI_HandleTypeDef * hdsi)

Function description

Handles DSI interrupt request.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_TearingEffectCallback

Function name

void HAL_DSI_TearingEffectCallback (DSI_HandleTypeDef * hdsi)

Function description

Tearing Effect DSI callback.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **None:**

HAL_DSI_EndOfRefreshCallback

Function name

void HAL_DSI_EndOfRefreshCallback (DSI_HandleTypeDef * hdsi)

Function description

End of Refresh DSI callback.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **None:**

HAL_DSI_ErrorCallback

Function name

void HAL_DSI_ErrorCallback (DSI_HandleTypeDef * hdsi)

Function description

Operation Error DSI callback.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **None:**

HAL_DSI_SetGenericVCID

Function name

HAL_StatusTypeDef HAL_DSI_SetGenericVCID (DSI_HandleTypeDef * hdsi, uint32_t VirtualChannelID)

Function description

Configure the Generic interface read-back Virtual Channel ID.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **VirtualChannelID:** Virtual channel ID

Return values

- **HAL:** status

HAL_DSI_ConfigVideoMode

Function name

HAL_StatusTypeDef HAL_DSI_ConfigVideoMode (DSI_HandleTypeDef * hdsi, DSI_VidCfgTypeDef * VidCfg)

Function description

Select video mode and configure the corresponding parameters.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **VidCfg:** pointer to a DSI_VidCfgTypeDef structure that contains the DSI video mode configuration parameters

Return values

- **HAL:** status

HAL_DSI_ConfigAdaptedCommandMode

Function name

HAL_StatusTypeDef HAL_DSI_ConfigAdaptedCommandMode (DSI_HandleTypeDef * hdsi, DSI_CmdCfgTypeDef * CmdCfg)

Function description

Select adapted command mode and configure the corresponding parameters.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **CmdCfg:** pointer to a DSI_CmdCfgTypeDef structure that contains the DSI command mode configuration parameters

Return values

- **HAL:** status

HAL_DSI_ConfigCommand

Function name

HAL_StatusTypeDef HAL_DSI_ConfigCommand (DSI_HandleTypeDef * hdsi, DSI_LPCmdTypeDef * LPCmd)

Function description

Configure command transmission mode: High-speed or Low-power and enable/disable acknowledge request after packet transmission.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **LPCmd:** pointer to a DSI_LPCmdTypeDef structure that contains the DSI command transmission mode configuration parameters

Return values

- **HAL:** status

HAL_DSI_ConfigFlowControl

Function name

HAL_StatusTypeDef HAL_DSI_ConfigFlowControl (DSI_HandleTypeDef * hdsi, uint32_t FlowControl)

Function description

Configure the flow control parameters.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **FlowControl:** flow control feature(s) to be enabled. This parameter can be any combination of
  - DSI_FlowControl.

Return values

- **HAL:** status

HAL_DSI_ConfigPhyTimer

Function name

HAL_StatusTypeDef HAL_DSI_ConfigPhyTimer (DSI_HandleTypeDef * hdsi, DSI_PHY_TimerTypeDef * PhyTimers)

Function description

Configure the DSI PHY timer parameters.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **PhyTimers:** DSI_PHY_TimerTypeDef structure that contains the DSI PHY timing parameters

Return values

- **HAL:** status

HAL_DSI_ConfigHostTimeouts

Function name

HAL_StatusTypeDef HAL_DSI_ConfigHostTimeouts (DSI_HandleTypeDef * hdsi, DSI_HOST_TimeoutTypeDef * HostTimeouts)

Function description

Configure the DSI HOST timeout parameters.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **HostTimeouts:** DSI_HOST_TimeoutTypeDef structure that contains the DSI host timeout parameters

Return values

- **HAL:** status

HAL_DSI_Start

Function name

HAL_StatusTypeDef HAL_DSI_Start (DSI_HandleTypeDef * hdsi)

Function description

Start the DSI module.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_Stop

Function name

HAL_StatusTypeDef HAL_DSI_Stop (DSI_HandleTypeDef * hdsi)

Function description

Stop the DSI module.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_Refresh

Function name

HAL_StatusTypeDef HAL_DSI_Refresh (DSI_HandleTypeDef * hdsi)

Function description

Refresh the display in command mode.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_ColorMode

Function name

HAL_StatusTypeDef HAL_DSI_ColorMode (DSI_HandleTypeDef * hdsi, uint32_t ColorMode)

Function description

Controls the display color mode in Video mode.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **ColorMode:** Color mode (full or 8-colors). This parameter can be any value of
  - DSI_Color_Mode

Return values

- **HAL:** status

HAL_DSI_Shutdown

Function name

HAL_StatusTypeDef HAL_DSI_Shutdown (DSI_HandleTypeDef * hdsi, uint32_t Shutdown)

Function description

Control the display shutdown in Video mode.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **Shutdown:** Shut-down (Display-ON or Display-OFF). This parameter can be any value of
  - DSI_ShutDown

Return values

- **HAL:** status

HAL_DSI_ShortWrite

Function name

HAL_StatusTypeDef HAL_DSI_ShortWrite (DSI_HandleTypeDef * hdsi, uint32_t ChannelID, uint32_t Mode, uint32_t Param1, uint32_t Param2)

Function description

write short DCS or short Generic command

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **ChannelID:** Virtual channel ID.
- **Mode:** DSI short packet data type. This parameter can be any value of
  - DSI_SHORT_WRITE_PKT_Data_Type.
- **Param1:** DSC command or first generic parameter. This parameter can be any value of
  - DSI_DCS_Command or a generic command code.
- **Param2:** DSC parameter or second generic parameter.

Return values

- **HAL:** status

HAL_DSI_LongWrite

Function name

HAL_StatusTypeDef HAL_DSI_LongWrite (DSI_HandleTypeDef * hdsi, uint32_t ChannelID, uint32_t Mode, uint32_t NbParams, uint32_t Param1, uint8_t * ParametersTable)

Function description

write long DCS or long Generic command

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **ChannelID:** Virtual channel ID.
- **Mode:** DSI long packet data type. This parameter can be any value of
  - DSI_LONG_WRITE_PKT_Data_Type.
- **NbParams:** Number of parameters.
- **Param1:** DSC command or first generic parameter. This parameter can be any value of
  - DSI_DCS_Command or a generic command code
- **ParametersTable:** Pointer to parameter values table.

Return values

- **HAL:** status

HAL_DSI_Read

Function name

HAL_StatusTypeDef HAL_DSI_Read (DSI_HandleTypeDef * hdsi, uint32_t ChannelNbr, uint8_t * Array, uint32_t Size, uint32_t Mode, uint32_t DCSCmd, uint8_t * ParametersTable)

Function description

Read command (DCS or generic)

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **ChannelNbr:** Virtual channel ID
- **Array:** pointer to a buffer to store the payload of a read back operation.
- **Size:** Data size to be read (in byte).
- **Mode:** DSI read packet data type. This parameter can be any value of
  - DSI_SHORT_READ_PKT_Data_Type.
- **DCSCmd:** DCS get/read command.
- **ParametersTable:** Pointer to parameter values table.

Return values

- **HAL:** status

HAL_DSI_EnterULPMData

Function name

HAL_StatusTypeDef HAL_DSI_EnterULPMData (DSI_HandleTypeDef * hdsi)

Function description

Enter the ULPM (Ultra Low Power Mode) with the D-PHY PLL running (only data lanes are in ULPM)

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_ExitULPMData

Function name

HAL_StatusTypeDef HAL_DSI_ExitULPMData (DSI_HandleTypeDef * hdsi)

Function description

Exit the ULPM (Ultra Low Power Mode) with the D-PHY PLL running (only data lanes are in ULPM)

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_EnterULPM

Function name

HAL_StatusTypeDef HAL_DSI_EnterULPM (DSI_HandleTypeDef * hdsi)

Function description

Enter the ULPM (Ultra Low Power Mode) with the D-PHY PLL turned off (both data and clock lanes are in ULPM)

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_ExitULPM

Function name

HAL_StatusTypeDef HAL_DSI_ExitULPM (DSI_HandleTypeDef * hdsi)

Function description

Exit the ULPM (Ultra Low Power Mode) with the D-PHY PLL turned off (both data and clock lanes are in ULPM)

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_PatternGeneratorStart

Function name

HAL_StatusTypeDef HAL_DSI_PatternGeneratorStart (DSI_HandleTypeDef * hdsi, uint32_t Mode, uint32_t Orientation)

Function description

Start test pattern generation.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **Mode:** Pattern generator mode This parameter can be one of the following values: 0 : Color bars (horizontal or vertical) 1 : BER pattern (vertical only)
- **Orientation:** Pattern generator orientation This parameter can be one of the following values: 0 : Vertical color bars 1 : Horizontal color bars

Return values

- **HAL:** status

HAL_DSI_PatternGeneratorStop

Function name

HAL_StatusTypeDef HAL_DSI_PatternGeneratorStop (DSI_HandleTypeDef * hdsi)

Function description

Stop test pattern generation.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_SetSlewRateAndDelayTuning

Function name

HAL_StatusTypeDef HAL_DSI_SetSlewRateAndDelayTuning (DSI_HandleTypeDef * hdsi, uint32_t CommDelay, uint32_t Lane, uint32_t Value)

Function description

Set Slew-Rate And Delay Tuning.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **CommDelay:** Communication delay to be adjusted. This parameter can be any value of
  - DSI_Communication_Delay
- **Lane:** select between clock or data lanes. This parameter can be any value of
  - DSI_Lane_Group
- **Value:** Custom value of the slew-rate or delay

Return values

- **HAL:** status

HAL_DSI_SetLowPowerRXFilter

Function name

HAL_StatusTypeDef HAL_DSI_SetLowPowerRXFilter (DSI_HandleTypeDef * hdsi, uint32_t Frequency)

Function description

Low-Power Reception Filter Tuning.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **Frequency:** cutoff frequency of low-pass filter at the input of LPRX

Return values

- **HAL:** status

HAL_DSI_SetSDD

Function name

HAL_StatusTypeDef HAL_DSI_SetSDD (DSI_HandleTypeDef * hdsi, FunctionalState State)

Function description

Activate an additional current path on all lanes to meet the SDDTx parameter defined in the MIPI D-PHY specification.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **State:** ENABLE or DISABLE

Return values

- **HAL:** status

HAL_DSI_SetLanePinsConfiguration

Function name

HAL_StatusTypeDef HAL_DSI_SetLanePinsConfiguration (DSI_HandleTypeDef * hdsi, uint32_t CustomLane, uint32_t Lane, FunctionalState State)

Function description

Custom lane pins configuration.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **CustomLane:** Function to be applied on selected lane. This parameter can be any value of
  - DSI_CustomLane
- **Lane:** select between clock or data lane 0 or data lane 1. This parameter can be any value of
  - DSI_Lane_Select
- **State:** ENABLE or DISABLE

Return values

- **HAL:** status

HAL_DSI_SetPHYTimings

Function name

HAL_StatusTypeDef HAL_DSI_SetPHYTimings (DSI_HandleTypeDef * hdsi, uint32_t Timing, FunctionalState State, uint32_t Value)

Function description

Set custom timing for the PHY.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **Timing:** PHY timing to be adjusted. This parameter can be any value of
  - DSI_PHY_Timing
- **State:** ENABLE or DISABLE
- **Value:** Custom value of the timing

Return values

- **HAL:** status

HAL_DSI_ForceTXStopMode

Function name

HAL_StatusTypeDef HAL_DSI_ForceTXStopMode (DSI_HandleTypeDef * hdsi, uint32_t Lane, FunctionalState State)

Function description

Force the Clock/Data Lane in TX Stop Mode.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **Lane:** select between clock or data lanes. This parameter can be any value of
  – DSI_Lane_Group
- **State:** ENABLE or DISABLE

Return values

- **HAL:** status

HAL_DSI_ForceRXLowPower

Function name

HAL_StatusTypeDef HAL_DSI_ForceRXLowPower (DSI_HandleTypeDef * hdsi, FunctionalState State)

Function description

Force LP Receiver in Low-Power Mode.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **State:** ENABLE or DISABLE

Return values

- **HAL:** status

HAL_DSI_ForceDataLanesInRX

Function name

HAL_StatusTypeDef HAL_DSI_ForceDataLanesInRX (DSI_HandleTypeDef * hdsi, FunctionalState State)

Function description

Force Data Lanes in RX Mode after a BTA.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **State:** ENABLE or DISABLE

Return values

- **HAL:** status

HAL_DSI_SetPullDown

Function name

HAL_StatusTypeDef HAL_DSI_SetPullDown (DSI_HandleTypeDef * hdsi, FunctionalState State)

Function description

Enable a pull-down on the lanes to prevent from floating states when unused.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **State:** ENABLE or DISABLE

Return values

- **HAL:** status

HAL_DSI_SetContentionDetectionOff

Function name

HAL_StatusTypeDef HAL_DSI_SetContentionDetectionOff (DSI_HandleTypeDef * hdsi, FunctionalState State)

Function description

Switch off the contention detection on data lanes.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **State:** ENABLE or DISABLE

Return values

- **HAL:** status

HAL_DSI_GetError

Function name

uint32_t HAL_DSI_GetError (DSI_HandleTypeDef * hdsi)

Function description

Return the DSI error code.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **DSI:** Error Code

HAL_DSI_GetState

Function name

HAL_DSI_StateTypeDef HAL_DSI_GetState (DSI_HandleTypeDef * hdsi)

Function description

Return the DSI state.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** state

25.3 DSI Firmware driver defines

The following section lists the various define and macros of the module.

25.3.1 DSI

DSI

DSI Acknowledge Request

DSI_ACKNOWLEDGE_DISABLE

DSI_ACKNOWLEDGE_ENABLE

DSI Automatic Refresh

DSI_AR_DISABLE

DSI_AR_ENABLE

DSI Automatic Clk Lane Control

DSI_AUTO_CLK_LANE_CTRL_DISABLE

Generic FIFO related errors

HAL_DSI_ERROR_INVALID_CALLBACK

DSI Invalid Callback error

DSI Exported Macros

__HAL_DSI_RESET_HANDLE_STATE

Description:

- Reset DSI handle state.

Parameters:

- __HANDLE__: DSI handle

Return value:

- None

__HAL_DSI_ENABLE

Description:

- Enables the DSI host.

Parameters:

- __HANDLE__: DSI handle

Return value:

- None.

__HAL_DSI_DISABLE

Description:

- Disables the DSI host.

Parameters:

- __HANDLE__: DSI handle

Return value:

- None.

__HAL_DSI_WRAPPER_ENABLE

Description:

- Enables the DSI wrapper.

Parameters:

- __HANDLE__: DSI handle

Return value:

- None.

__HAL_DSI_WRAPPER_DISABLE

Description:

- Disable the DSI wrapper.

Parameters:

- __HANDLE__: DSI handle

Return value:

- None.

__HAL_DSI_PLL_ENABLE

Description:

- Enables the DSI PLL.

Parameters:

- __HANDLE__: DSI handle

Return value:

- None.

__HAL_DSI_PLL_DISABLE

Description:

- Disables the DSI PLL.

Parameters:

- __HANDLE__: DSI handle

Return value:

- None.

__HAL_DSI_REG_ENABLE

Description:

- Enables the DSI regulator.

Parameters:

- __HANDLE__: DSI handle

Return value:

- None.

__HAL_DSI_REG_DISABLE

Description:

- Disables the DSI regulator.

Parameters:

- __HANDLE__: DSI handle

Return value:

- None.

__HAL_DSI_GET_FLAG

Description:

- Get the DSI pending flags.

Parameters:

- __HANDLE__: DSI handle.
- __FLAG__: Get the specified flag. This parameter can be any combination of the following values:
  - DSI_FLAG_TE : Tearing Effect Interrupt Flag
  - DSI_FLAG_ER : End of Refresh Interrupt Flag
  - DSI_FLAG_BUSY : Busy Flag
  - DSI_FLAG_PLLLS: PLL Lock Status
  - DSI_FLAG_PLLL : PLL Lock Interrupt Flag
  - DSI_FLAG_PLLU : PLL Unlock Interrupt Flag
  - DSI_FLAG_RRS : Regulator Ready Flag
  - DSI_FLAG_RR : Regulator Ready Interrupt Flag

Return value:

- The: state of FLAG (SET or RESET).

__HAL_DSI_CLEAR_FLAG

Description:

- Clears the DSI pending flags.

Parameters:

- __HANDLE__: DSI handle.
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - DSI_FLAG_TE : Tearing Effect Interrupt Flag
  - DSI_FLAG_ER : End of Refresh Interrupt Flag
  - DSI_FLAG_PLLL : PLL Lock Interrupt Flag
  - DSI_FLAG_PLLU : PLL Unlock Interrupt Flag
  - DSI_FLAG_RR : Regulator Ready Interrupt Flag

Return value:

- None

__HAL_DSI_ENABLE_IT

Description:

- Enables the specified DSI interrupts.

Parameters:

- __HANDLE__: DSI handle.
- __INTERRUPT__: specifies the DSI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DSI_IT_TE : Tearing Effect Interrupt
  - DSI_IT_ER : End of Refresh Interrupt
  - DSI_IT_PLLL: PLL Lock Interrupt
  - DSI_IT_PLLU: PLL Unlock Interrupt
  - DSI_IT_RR : Regulator Ready Interrupt

Return value:

- None

__HAL_DSI_DISABLE_IT

Description:

- Disables the specified DSI interrupts.

Parameters:

- __HANDLE__: DSI handle
- __INTERRUPT__: specifies the DSI interrupt sources to be disabled. This parameter can be any combination of the following values:
  - DSI_IT_TE : Tearing Effect Interrupt
  - DSI_IT_ER : End of Refresh Interrupt
  - DSI_IT_PLLL: PLL Lock Interrupt
  - DSI_IT_PLLU: PLL Unlock Interrupt
  - DSI_IT_RR : Regulator Ready Interrupt

Return value:

- None

__HAL_DSI_GET_IT_SOURCE

Description:

- Checks whether the specified DSI interrupt source is enabled or not.

Parameters:

- __HANDLE__: DSI handle
- __INTERRUPT__: specifies the DSI interrupt source to check. This parameter can be one of the following values:
  - DSI_IT_TE : Tearing Effect Interrupt
  - DSI_IT_ER : End of Refresh Interrupt
  - DSI_IT_PLLL: PLL Lock Interrupt
  - DSI_IT_PLLU: PLL Unlock Interrupt
  - DSI_IT_RR : Regulator Ready Interrupt

Return value:

- The: state of INTERRUPT (SET or RESET).

26 HAL DTS Generic Driver

26.1 DTS Firmware driver registers structures

26.1.1 DTS_InitTypeDef

DTS_InitTypeDef is defined in the stm32h7xx_hal_dts.h

Data Fields

- ***uint32_t QuickMeasure***
- ***uint32_t RefClock***
- ***uint32_t TriggerInput***
- ***uint32_t SamplingTime***
- ***uint32_t Divider***
- ***uint32_t HighThreshold***
- ***uint32_t LowThreshold***

Field Documentation

- ***uint32_t DTS_InitTypeDef::QuickMeasure***
  Specifies the quick measure option selection of the DTS sensor. This parameter can be a value of ***DTS_Quick_Measurement***
- ***uint32_t DTS_InitTypeDef::RefClock***
  Specifies the reference clock selection of the DTS sensor. This parameter can be a value of ***DTS_Reference_Clock_Selection***
- ***uint32_t DTS_InitTypeDef::TriggerInput***
  Specifies the trigger input of the DTS sensor. This parameter can be a value of ***DTS_TriggerConfig***
- ***uint32_t DTS_InitTypeDef::SamplingTime***
  Specifies the sampling time configuration. This parameter can be a value of ***DTS_Sampling_Time***
- ***uint32_t DTS_InitTypeDef::Divider***
  Specifies the high speed clock divider ratio. This parameter can be a value from 0 to 127
- ***uint32_t DTS_InitTypeDef::HighThreshold***
  Specifies the high threshold of the DTS sensor
- ***uint32_t DTS_InitTypeDef::LowThreshold***
  Specifies the low threshold of the DTS sensor

26.1.2 __DTS_HandleTypeDef

__DTS_HandleTypeDef is defined in the stm32h7xx_hal_dts.h

Data Fields

26.2 DTS Firmware driver API description

The following section lists the various functions of the DTS library.

26.2.1 DTS Peripheral features

The STM32h7xx device family integrate one DTS sensor interface :

26.2.2 How to use this driver

26.2.3 Initialization and de-initialization functions

This section provides functions to initialize and de-initialize comparators
This section contains the following APIs:

- ***HAL_DTS_Init()***
- ***HAL_DTS_DeInit()***
- ***HAL_DTS_MspInit()***
- ***HAL_DTS_MspDeInit()***
- ***HAL_DTS_RegisterCallback()***
- ***HAL_DTS_UnRegisterCallback()***

26.2.4 DTS Start Stop operation functions

This section provides functions allowing to:

- Start a DTS Sensor without interrupt.
- Stop a DTS Sensor without interrupt.

- Start a DTS Sensor with interrupt generation.
- Stop a DTS Sensor with interrupt generation.

This section contains the following APIs:

- *HAL_DTS_Start()*
- *HAL_DTS_Stop()*
- *HAL_DTS_Start_IT()*
- *HAL_DTS_Stop_IT()*
- *HAL_DTS_GetTemperature()*
- *HAL_DTS_IRQHandler()*
- *HAL_DTS_EndCallback()*
- *HAL_DTS_LowCallback()*
- *HAL_DTS_HighCallback()*
- *HAL_DTS_AsyncEndCallback()*
- *HAL_DTS_AsyncLowCallback()*
- *HAL_DTS_AsyncHighCallback()*
- *HAL_DTS_GetState()*

26.2.5 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- *HAL_DTS_GetState()*

26.2.6 Detailed description of functions

HAL_DTS_Init

Function name

HAL_StatusTypeDef HAL_DTS_Init (DTS_HandleTypeDef * hdts)

Function description

Initialize the DTS according to the specified parameters in the DTS_InitTypeDef and initialize the associated handle.

Parameters

- **hdts:** DTS handle

Return values

- **HAL:** status

HAL_DTS_DeInit

Function name

HAL_StatusTypeDef HAL_DTS_DeInit (DTS_HandleTypeDef * hdts)

Function description

DeInitialize the DTS peripheral.

Parameters

- **hdts:** DTS handle

Return values

- **HAL:** status

Notes

- Deinitialization cannot be performed if the DTS configuration is locked. To unlock the configuration, perform a system reset.

HAL_DTS_MspInit

Function name

void HAL_DTS_MspInit (DTS_HandleTypeDef * hdts)

Function description

Initialize the DTS MSP.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

HAL_DTS_MspDeInit

Function name

void HAL_DTS_MspDeInit (DTS_HandleTypeDef * hdts)

Function description

DeInitialize the DTS MSP.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

HAL_DTS_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DTS_RegisterCallback (DTS_HandleTypeDef * hdts, HAL_DTS_CallbackIDTypeDef CallbackID, pDTS_CallbackTypeDef pCallback)

Function description

Register a user DTS callback to be used instead of the weak predefined callback.

Parameters

- **hdts:** DTS handle.
- **CallbackID:** ID of the callback to be registered. This parameter can be one of the following values:
  - HAL_DTS_MEAS_COMPLETE_CB_ID measure complete callback ID.
  - HAL_DTS_ASYNC_MEAS_COMPLETE_CB_ID asynchronous measure complete callback ID.
  - HAL_DTS_LOW_THRESHOLD_CB_ID low threshold detection callback ID.
  - HAL_DTS_ASYNC_LOW_THRESHOLD_CB_ID asynchronous low threshold detection callback ID.
  - HAL_DTS_HIGH_THRESHOLD_CB_ID high threshold detection callback ID.
  - HAL_DTS_ASYNC_HIGH_THRESHOLD_CB_ID asynchronous high threshold detection callback ID.
  - HAL_DTS_MSPINIT_CB_ID MSP init callback ID.
  - HAL_DTS_MSPDEINIT_CB_ID MSP de-init callback ID.
- **pCallback:** pointer to the callback function.

Return values

- **HAL:** status.

HAL_DTS_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DTS_UnRegisterCallback (DTS_HandleTypeDef * hdts, HAL_DTS_CallbackIDTypeDef CallbackID)

Function description

Unregister a user DTS callback.

Parameters

- **hdts:** DTS handle.
- **CallbackID:** ID of the callback to be unregistered. This parameter can be one of the following values:
  - HAL_DTS_MEAS_COMPLETE_CB_ID measure complete callback ID.
  - HAL_DTS_ASYNC_MEAS_COMPLETE_CB_ID asynchronous measure complete callback ID.
  - HAL_DTS_LOW_THRESHOLD_CB_ID low threshold detection callback ID.
  - HAL_DTS_ASYNC_LOW_THRESHOLD_CB_ID asynchronous low threshold detection callback ID.
  - HAL_DTS_HIGH_THRESHOLD_CB_ID high threshold detection callback ID.
  - HAL_DTS_ASYNC_HIGH_THRESHOLD_CB_ID asynchronous high threshold detection callback ID.
  - HAL_DTS_MSPINIT_CB_ID MSP init callback ID.
  - HAL_DTS_MSPDEINIT_CB_ID MSP de-init callback ID.

Return values

- **HAL:** status.

HAL_DTS_Start

Function name

HAL_StatusTypeDef HAL_DTS_Start (DTS_HandleTypeDef * hdts)

Function description

Start the DTS sensor.

Parameters

- **hdts:** DTS handle

Return values

- **HAL:** status

HAL_DTS_Stop

Function name

HAL_StatusTypeDef HAL_DTS_Stop (DTS_HandleTypeDef * hdts)

Function description

Stop the DTS Sensor.

Parameters

- **hdts:** DTS handle

Return values

- **HAL:** status

HAL_DTS_GetTemperature

Function name

HAL_StatusTypeDef HAL_DTS_GetTemperature (DTS_HandleTypeDef * hdts, int32_t * Temperature)

Function description

Get temperature from DTS.

Parameters

- **hdts:** DTS handle
- **Temperature:** Temperature in deg C

Return values

- **HAL:** status

Notes

- This function retrieves latest available measure

HAL_DTS_Start_IT

Function name

HAL_StatusTypeDef HAL_DTS_Start_IT (DTS_HandleTypeDef * hdts)

Function description

Enable the interrupt(s) and start the DTS sensor.

Parameters

- **hdts:** DTS handle

Return values

- **HAL:** status

HAL_DTS_Stop_IT

Function name

HAL_StatusTypeDef HAL_DTS_Stop_IT (DTS_HandleTypeDef * hdts)

Function description

Disable the interrupt(s) and stop the DTS sensor.

Parameters

- **hdts:** DTS handle

Return values

- **HAL:** status

HAL_DTS_IRQHandler

Function name

void HAL_DTS_IRQHandler (DTS_HandleTypeDef * hdts)

Function description

DTS sensor IRQ Handler.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

HAL_DTS_GetState

Function name

HAL_DTS_StateTypeDef HAL_DTS_GetState (DTS_HandleTypeDef * hdts)

Function description

Return the DTS handle state.

Parameters

- **hdts:** DTS handle

Return values

- **HAL:** state

HAL_DTS_EndCallback

Function name

void HAL_DTS_EndCallback (DTS_HandleTypeDef * hdts)

Function description

DTS Sensor End measure callback.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

HAL_DTS_LowCallback

Function name

void HAL_DTS_LowCallback (DTS_HandleTypeDef * hdts)

Function description

DTS Sensor low threshold measure callback.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

HAL_DTS_HighCallback

Function name

void HAL_DTS_HighCallback (DTS_HandleTypeDef * hdts)

Function description

DTS Sensor high threshold measure callback.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

HAL_DTS_AsyncEndCallback

Function name

void HAL_DTS_AsyncEndCallback (DTS_HandleTypeDef * hdts)

Function description

DTS Sensor asynchronous end measure callback.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

HAL_DTS_AsyncLowCallback

Function name

void HAL_DTS_AsyncLowCallback (DTS_HandleTypeDef * hdts)

Function description

DTS Sensor asynchronous low threshold measure callback.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

HAL_DTS_AsyncHighCallback

Function name

void HAL_DTS_AsyncHighCallback (DTS_HandleTypeDef * hdts)

Function description

DTS Sensor asynchronous high threshold measure callback.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

26.3 DTS Firmware driver defines

The following section lists the various define and macros of the module.

26.3.1 DTS

DTS

DTS Exported Macros

__HAL_DTS_RESET_HANDLE_STATE

Description:

- Reset DTS handle state.

Parameters:

- __HANDLE__: DTS handle.

Return value:

- None

__HAL_DTS_ENABLE

Description:

- Enable the specified DTS sensor.

Parameters:

- __HANDLE__: DTS handle.

Return value:

- None

__HAL_DTS_DISABLE

Description:

- Disable the specified DTS sensor.

Parameters:

- __HANDLE__: DTS handle.

Return value:

- None

__HAL_DTS_EXTI_WAKEUP_ENABLE_IT

Description:

- Enable the DTS EXTI line in interrupt mode.

Return value:

- None

__HAL_DTS_EXTI_WAKEUP_DISABLE_IT

Description:

- Disable the DTS EXTI line in interrupt mode.

Return value:

- None

__HAL_DTS_EXTI_WAKEUP_ENABLE_EVENT

Description:

- Enable the DTS EXTI Line in event mode.

Return value:

- None

__HAL_DTS_EXTI_WAKEUP_DISABLE_EVENT

Description:

- Disable the DTS EXTI Line in event mode.

Return value:

- None

__HAL_DTS_GET_FLAG

Description:

- Checks whether the specified DTS flag is set or not.

Parameters:

- __HANDLE__: specifies the DTS Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - DTS_FLAG_TS1_ITE : interrupt flag for end of measure for DTS1
  - DTS_FLAG_TS1_ITL : interrupt flag for low threshold for DTS1
  - DTS_FLAG_TS1_ITH : interrupt flag for high threshold for DTS1
  - DTS_FLAG_TS1_AITE: asynchronous interrupt flag for end of measure for DTS1
  - DTS_FLAG_TS1_AITL: asynchronous interrupt flag for low threshold for DTS1
  - DTS_FLAG_TS1_AITH: asynchronous interrupt flag for high threshold for DTS1
  - DTS_FLAG_TS1_RDY : Ready flag for DTS1

Return value:

- The: new state of __FLAG__ (SET or RESET).

__HAL_DTS_CLEAR_FLAG

Description:

- Clears the specified DTS pending flag.

Parameters:

- __HANDLE__: specifies the DTS Handle.
- __FLAG__: specifies the flag to check. This parameter can be any combination of the following values:
  - DTS_FLAG_TS1_ITE : interrupt flag for end of measure for DTS1
  - DTS_FLAG_TS1_ITL : interrupt flag for low threshold for DTS1
  - DTS_FLAG_TS1_ITH : interrupt flag for high threshold for DTS1
  - DTS_FLAG_TS1_AITE: asynchronous interrupt flag for end of measure for DTS1
  - DTS_FLAG_TS1_AITL: asynchronous interrupt flag for low threshold for DTS1
  - DTS_FLAG_TS1_AITH: asynchronous interrupt flag for high threshold for DTS1

Return value:

- None

__HAL_DTS_ENABLE_IT

Description:

- Enable the specified DTS interrupt.

Parameters:

- __HANDLE__: specifies the DTS Handle.
- __INTERRUPT__: specifies the DTS interrupt source to enable. This parameter can be one of the following values:
  - DTS_IT_TS1_ITE : interrupt flag for end of measure for DTS1
  - DTS_IT_TS1_ITL : interrupt flag for low of measure for DTS1
  - DTS_IT_TS1_ITH : interrupt flag for high of measure for DTS1
  - DTS_IT_TS1_AITE : asynchronous interrupt flag for end of measure for DTS1
  - DTS_IT_TS1_AITL : asynchronous interrupt flag for low of measure for DTS1
  - DTS_IT_TS1_AITH : asynchronous interrupt flag for high of measure for DTS1

Return value:

- None

__HAL_DTS_DISABLE_IT

Description:

- Disable the specified DTS interrupt.

Parameters:

- __HANDLE__: specifies the DTS Handle.
- __INTERRUPT__: specifies the DTS interrupt source to enable. This parameter can be one of the following values:
  - DTS_IT_TS1_ITE : interrupt flag for end of measure for DTS1
  - DTS_IT_TS1_ITL : interrupt flag for low of measure for DTS1
  - DTS_IT_TS1_ITH : interrupt flag for high of measure for DTS1
  - DTS_IT_TS1_AITE : asynchronous interrupt flag for end of measure for DTS1
  - DTS_IT_TS1_AITL : asynchronous interrupt flag for low of measure for DTS1
  - DTS_IT_TS1_AITH : asynchronous interrupt flag for high of measure for DTS1

Return value:

- None

__HAL_DTS_GET_IT_SOURCE

Description:

- Check whether the specified DTS interrupt source is enabled or not.

Parameters:

- __HANDLE__: DTS handle.
- __INTERRUPT__: DTS interrupt source to check This parameter can be one of the following values:
  - DTS_IT_TS1_ITE : interrupt flag for end of measure for DTS1
  - DTS_IT_TS1_ITL : interrupt flag for low of measure for DTS1
  - DTS_IT_TS1_ITH : interrupt flag for high of measure for DTS1
  - DTS_IT_TS1_AITE : asynchronous interrupt flag for end of measure for DTS1
  - DTS_IT_TS1_AITL : asynchronous interrupt flag for low of measure for DTS1
  - DTS_IT_TS1_AITH : asynchronous interrupt flag for high of measure for DTS1

Return value:

- State: of interruption (SET or RESET)

__HAL_DTS_GET_REFCLK

Description:

- Check whether the specified DTS REFCLK is selected.

Parameters:

- __HANDLE__: DTS handle.
- __REFCLK__: DTS reference clock to check This parameter can be one of the following values:
  - DTS_REFCLKSEL_LSE: Low speed REF clock
  - DTS_REFCLKSEL_PCLK: High speed REF clock

Return value:

- State: of the REF clock tested (SET or RESET)

__HAL_DTS_GET_TRIGGER

Description:

- Get Trigger.

Parameters:

- __HANDLE__: DTS handle.

Return value:

- One: of the following trigger DTS_TRIGGER_HW_NONE : No HW trigger (SW trigger) DTS_TRIGGER_LPTIMER1: LPTIMER1 trigger DTS_TRIGGER_LPTIMER2: LPTIMER2 trigger DTS_TRIGGER_LPTIMER3: LPTIMER3 trigger DTS_TRIGGER_EXTI13 : EXTI13 trigger

DTS EXTI Lines

DTS_EXTI_LINE_DTS1

EXTI line 88 connected to DTS1 output

DTS Flag Definitions

DTS_FLAG_TS1_ITE

Interrupt flag for end of measure for DTS1

DTS_FLAG_TS1_ITL

Interrupt flag for low threshold for DTS1

DTS_FLAG_TS1_ITH

Interrupt flag for high threshold for DTS1

DTS_FLAG_TS1_AITE

Asynchronous Interrupt flag for end of measure for DTS1

DTS_FLAG_TS1_AITL

Asynchronous Interrupt flag for low threshold for DTS1

DTS_FLAG_TS1_AITH

Asynchronous Interrupt flag for high threshold for DTS1

DTS_FLAG_TS1_RDY

Ready flag for DTS1

DTS Interrupts Definitions

DTS_IT_TS1_ITE

Enable interrupt flag for end of measure for DTS1

DTS_IT_TS1_ITL

Enable interrupt flag for low threshold for DTS1

DTS_IT_TS1_ITH

Enable interrupt flag for high threshold for DTS1

DTS_IT_TS1_AITE

Enable asynchronous interrupt flag for end of measure for DTS1

DTS_IT_TS1_AITL

Enable asynchronous interrupt flag for low threshold for DTS1

DTS_IT_TS1_AITH

Enable asynchronous interrupt flag for high threshold for DTS1

DTS Private macros to check input parameters

IS_DTS_QUICKMEAS

IS_DTS_REFCLK

IS_DTS_TRIGGERINPUT

IS_DTS_THRESHOLD

IS_DTS_DIVIDER_RATIO_NUMBER

IS_DTS_SAMPLINGTIME

DTS Quick Measurement

DTS_QUICKMEAS_ENABLE

Enable the Quick Measure (Measure without calibration)

DTS_QUICKMEAS_DISABLE

Disable the Quick Measure (Measure with calibration)

DTS Reference Clock Selection

DTS_REFCLKSEL_LSE

Low speed REF clock (LSE)

DTS_REFCLKSEL_PCLK

High speed REF clock (PCLK)

DTS Sampling Time

DTS_SMP_TIME_1_CYCLE

1 clock cycle for the sampling time

DTS_SMP_TIME_2_CYCLE

2 clock cycle for the sampling time

DTS_SMP_TIME_3_CYCLE

3 clock cycle for the sampling time

DTS_SMP_TIME_4_CYCLE

4 clock cycle for the sampling time

DTS_SMP_TIME_5_CYCLE

5 clock cycle for the sampling time

DTS_SMP_TIME_6_CYCLE

6 clock cycle for the sampling time

DTS_SMP_TIME_7_CYCLE

7 clock cycle for the sampling time

DTS_SMP_TIME_8_CYCLE

8 clock cycle for the sampling time

DTS_SMP_TIME_9_CYCLE

9 clock cycle for the sampling time

DTS_SMP_TIME_10_CYCLE

10 clock cycle for the sampling time

DTS_SMP_TIME_11_CYCLE

11 clock cycle for the sampling time

DTS_SMP_TIME_12_CYCLE

12 clock cycle for the sampling time

DTS_SMP_TIME_13_CYCLE

13 clock cycle for the sampling time

DTS_SMP_TIME_14_CYCLE

14 clock cycle for the sampling time

DTS_SMP_TIME_15_CYCLE

15 clock cycle for the sampling time

DTS Trigger Configuration

DTS_TRIGGER_LPTIMER1

DTS_TRIGGER_LPTIMER2

DTS_TRIGGER_LPTIMER3

DTS_TRIGGER_EXTI13

27 HAL ETH Generic Driver

27.1 ETH Firmware driver registers structures

27.1.1 ETH_DMADescTypeDef

ETH_DMADescTypeDef is defined in the stm32h7xx_hal_eth.h

Data Fields

- ***__IO uint32_t DESC0***
- ***__IO uint32_t DESC1***
- ***__IO uint32_t DESC2***
- ***__IO uint32_t DESC3***
- ***uint32_t BackupAddr0***
- ***uint32_t BackupAddr1***

Field Documentation

- ***__IO uint32_t ETH_DMADescTypeDef::DESC0***
- ***__IO uint32_t ETH_DMADescTypeDef::DESC1***
- ***__IO uint32_t ETH_DMADescTypeDef::DESC2***
- ***__IO uint32_t ETH_DMADescTypeDef::DESC3***
- ***uint32_t ETH_DMADescTypeDef::BackupAddr0***
- ***uint32_t ETH_DMADescTypeDef::BackupAddr1***

27.1.2 __ETH_BufferTypeDef

__ETH_BufferTypeDef is defined in the stm32h7xx_hal_eth.h

Data Fields

- ***uint8_t * buffer***
- ***uint32_t len***
- ***struct __ETH_BufferTypeDef * next***

Field Documentation

- ***uint8_t* __ETH_BufferTypeDef::buffer***
- ***uint32_t __ETH_BufferTypeDef::len***
- ***struct __ETH_BufferTypeDef* __ETH_BufferTypeDef::next***

27.1.3 ETH_TxDescListTypeDef

ETH_TxDescListTypeDef is defined in the stm32h7xx_hal_eth.h

Data Fields

- ***uint32_t TxDesc***
- ***uint32_t CurTxDesc***
- ***uint32_t * PacketAddress***
- ***uint32_t * CurrentPacketAddress***
- ***uint32_t BuffersInUse***
- ***uint32_t releaseIndex***

Field Documentation

- ***uint32_t ETH_TxDescListTypeDef::TxDesc[ETH_TX_DESC_CNT]***

- ***uint32_t ETH_TxDescListTypeDef::CurTxDesc***
- ***uint32_t* ETH_TxDescListTypeDef::PacketAddress[ETH_TX_DESC_CNT]***
- ***uint32_t* ETH_TxDescListTypeDef::CurrentPacketAddress***
- ***uint32_t ETH_TxDescListTypeDef::BuffersInUse***
- ***uint32_t ETH_TxDescListTypeDef::releaseIndex***

27.1.4 ETH_TxPacketConfig

ETH_TxPacketConfig is defined in the stm32h7xx_hal_eth.h

Data Fields

- ***uint32_t Attributes***
- ***uint32_t Length***
- ***ETH_BufferTypeDef * TxBuffer***
- ***uint32_t SrcAddrCtrl***
- ***uint32_t CRCPadCtrl***
- ***uint32_t ChecksumCtrl***
- ***uint32_t MaxSegmentSize***
- ***uint32_t PayloadLen***
- ***uint32_t TCPHeaderLen***
- ***uint32_t VlanTag***
- ***uint32_t VlanCtrl***
- ***uint32_t InnerVlanTag***
- ***uint32_t InnerVlanCtrl***
- ***void * pData***

Field Documentation

- ***uint32_t ETH_TxPacketConfig::Attributes***
  Tx packet HW features capabilities. This parameter can be a combination of ***ETH_Tx_Packet_Attributes***
- ***uint32_t ETH_TxPacketConfig::Length***
  Total packet length
- ***ETH_BufferTypeDef* ETH_TxPacketConfig::TxBuffer***
  Tx buffers pointers
- ***uint32_t ETH_TxPacketConfig::SrcAddrCtrl***
  Specifies the source address insertion control. This parameter can be a value of ***ETH_Tx_Packet_Source_Addr_Control***
- ***uint32_t ETH_TxPacketConfig::CRCPadCtrl***
  Specifies the CRC and Pad insertion and replacement control. This parameter can be a value of ***ETH_Tx_Packet_CRC_Pad_Control***
- ***uint32_t ETH_TxPacketConfig::ChecksumCtrl***
  Specifies the checksum insertion control. This parameter can be a value of ***ETH_Tx_Packet_Checksum_Control***
- ***uint32_t ETH_TxPacketConfig::MaxSegmentSize***
  Sets TCP maximum segment size only when TCP segmentation is enabled. This parameter can be a value from 0x0 to 0x3FFF
- ***uint32_t ETH_TxPacketConfig::PayloadLen***
  Sets Total payload length only when TCP segmentation is enabled. This parameter can be a value from 0x0 to 0x3FFFF
- ***uint32_t ETH_TxPacketConfig::TCPHeaderLen***
  Sets TCP header length only when TCP segmentation is enabled. This parameter can be a value from 0x5 to 0xF

- ***uint32_t ETH_TxPacketConfig::VlanTag***

  Sets VLAN Tag only when VLAN is enabled. This parameter can be a value from 0x0 to 0xFFFF
- ***uint32_t ETH_TxPacketConfig::VlanCtrl***

  Specifies VLAN Tag insertion control only when VLAN is enabled. This parameter can be a value of ***ETH_Tx_Packet_VLAN_Control***
- ***uint32_t ETH_TxPacketConfig::InnerVlanTag***

  Sets Inner VLAN Tag only when Inner VLAN is enabled. This parameter can be a value from 0x0 to 0x3FFFF
- ***uint32_t ETH_TxPacketConfig::InnerVlanCtrl***

  Specifies Inner VLAN Tag insertion control only when Inner VLAN is enabled. This parameter can be a value of ***ETH_Tx_Packet_Inner_VLAN_Control***
- ***void* ETH_TxPacketConfig::pData***

  Specifies Application packet pointer to save

27.1.5 ETH_TimeStampTypeDef

ETH_TimeStampTypeDef is defined in the stm32h7xx_hal_eth.h

Data Fields

- ***uint32_t TimeStampLow***
- ***uint32_t TimeStampHigh***

Field Documentation

- ***uint32_t ETH_TimeStampTypeDef::TimeStampLow***
- ***uint32_t ETH_TimeStampTypeDef::TimeStampHigh***

27.1.6 ETH_TimeTypeDef

ETH_TimeTypeDef is defined in the stm32h7xx_hal_eth.h

Data Fields

- ***uint32_t Seconds***
- ***uint32_t NanoSeconds***

Field Documentation

- ***uint32_t ETH_TimeTypeDef::Seconds***
- ***uint32_t ETH_TimeTypeDef::NanoSeconds***

27.1.7 ETH_RxDescListTypeDef

ETH_RxDescListTypeDef is defined in the stm32h7xx_hal_eth.h

Data Fields

- ***uint32_t RxDesc***
- ***uint32_t ItMode***
- ***uint32_t RxDescIdx***
- ***uint32_t RxDescCnt***
- ***uint32_t RxDataLength***
- ***uint32_t RxBuildDescIdx***
- ***uint32_t RxBuildDescCnt***
- ***uint32_t pRxLastRxDesc***
- ***ETH_TimeStampTypeDef TimeStamp***
- ***void * pRxStart***
- ***void * pRxEnd***

Field Documentation

- ***uint32_t ETH_RxDescListTypeDef::RxDesc[ETH_RX_DESC_CNT]***

- *uint32_t ETH_RxDescListTypeDef::ItMode*
- *uint32_t ETH_RxDescListTypeDef::RxDescIdx*
- *uint32_t ETH_RxDescListTypeDef::RxDescCnt*
- *uint32_t ETH_RxDescListTypeDef::RxDataLength*
- *uint32_t ETH_RxDescListTypeDef::RxBuildDescIdx*
- *uint32_t ETH_RxDescListTypeDef::RxBuildDescCnt*
- *uint32_t ETH_RxDescListTypeDef::pRxLastRxDesc*
- *ETH_TimeStampTypeDef ETH_RxDescListTypeDef::TimeStamp*
- *void* ETH_RxDescListTypeDef::pRxStart*
- *void* ETH_RxDescListTypeDef::pRxEnd*

27.1.8 ETH_MACConfigTypeDef

ETH_MACConfigTypeDef is defined in the stm32h7xx_hal_eth.h

Data Fields

- *uint32_t SourceAddrControl*
- *FunctionalState ChecksumOffload*
- *uint32_t InterPacketGapVal*
- *FunctionalState GiantPacketSizeLimitControl*
- *FunctionalState Support2KPacket*
- *FunctionalState CRCStripTypePacket*
- *FunctionalState AutomaticPadCRCStrip*
- *FunctionalState Watchdog*
- *FunctionalState Jabber*
- *FunctionalState JumboPacket*
- *uint32_t Speed*
- *uint32_t DuplexMode*
- *FunctionalState LoopbackMode*
- *FunctionalState CarrierSenseBeforeTransmit*
- *FunctionalState ReceiveOwn*
- *FunctionalState CarrierSenseDuringTransmit*
- *FunctionalState RetryTransmission*
- *uint32_t BackOffLimit*
- *FunctionalState DeferralCheck*
- *uint32_t PreambleLength*
- *FunctionalState UnicastSlowProtocolPacketDetect*
- *FunctionalState SlowProtocolDetect*
- *FunctionalState CRCCheckingRxPackets*
- *uint32_t GiantPacketSizeLimit*
- *FunctionalState ExtendedInterPacketGap*
- *uint32_t ExtendedInterPacketGapVal*
- *FunctionalState ProgrammableWatchdog*
- *uint32_t WatchdogTimeout*
- *uint32_t PauseTime*
- *FunctionalState ZeroQuantaPause*
- *uint32_t PauseLowThreshold*
- *FunctionalState TransmitFlowControl*
- *FunctionalState UnicastPausePacketDetect*
- *FunctionalState ReceiveFlowControl*

- ***uint32_t TransmitQueueMode***
- ***uint32_t ReceiveQueueMode***
- ***FunctionalState DropTCPIPChecksumErrorPacket***
- ***FunctionalState ForwardRxErrorPacket***
- ***FunctionalState ForwardRxUndersizedGoodPacket***

Field Documentation

- ***uint32_t ETH_MACConfigTypeDef::SourceAddrControl***
  Selects the Source Address Insertion or Replacement Control. This parameter can be a value of ***ETH_Source_Addr_Control***
- ***FunctionalState ETH_MACConfigTypeDef::ChecksumOffload***
  Enables or Disable the checksum checking for received packet payloads TCP, UDP or ICMP headers
- ***uint32_t ETH_MACConfigTypeDef::InterPacketGapVal***
  Sets the minimum IPG between Packet during transmission. This parameter can be a value of ***ETH_Inter_Packet_Gap***
- ***FunctionalState ETH_MACConfigTypeDef::GiantPacketSizeLimitControl***
  Enables or disables the Giant Packet Size Limit Control.
- ***FunctionalState ETH_MACConfigTypeDef::Support2KPacket***
  Enables or disables the IEEE 802.3as Support for 2K length Packets
- ***FunctionalState ETH_MACConfigTypeDef::CRCStripTypePacket***
  Enables or disables the CRC stripping for Type packets.
- ***FunctionalState ETH_MACConfigTypeDef::AutomaticPadCRCStrip***
  Enables or disables the Automatic MAC Pad/CRC Stripping.
- ***FunctionalState ETH_MACConfigTypeDef::Watchdog***
  Enables or disables the Watchdog timer on Rx path.
- ***FunctionalState ETH_MACConfigTypeDef::Jabber***
  Enables or disables Jabber timer on Tx path.
- ***FunctionalState ETH_MACConfigTypeDef::JumboPacket***
  Enables or disables receiving Jumbo Packet When enabled, the MAC allows jumbo packets of 9,018 bytes without reporting a giant packet error
- ***uint32_t ETH_MACConfigTypeDef::Speed***
  Sets the Ethernet speed: 10/100 Mbps. This parameter can be a value of ***ETH_Speed***
- ***uint32_t ETH_MACConfigTypeDef::DuplexMode***
  Selects the MAC duplex mode: Half-Duplex or Full-Duplex mode This parameter can be a value of ***ETH_Duplex_Mode***
- ***FunctionalState ETH_MACConfigTypeDef::LoopbackMode***
  Enables or disables the loopback mode
- ***FunctionalState ETH_MACConfigTypeDef::CarrierSenseBeforeTransmit***
  Enables or disables the Carrier Sense Before Transmission in Full Duplex Mode.
- ***FunctionalState ETH_MACConfigTypeDef::ReceiveOwn***
  Enables or disables the Receive Own in Half Duplex mode.
- ***FunctionalState ETH_MACConfigTypeDef::CarrierSenseDuringTransmit***
  Enables or disables the Carrier Sense During Transmission in the Half Duplex mode
- ***FunctionalState ETH_MACConfigTypeDef::RetryTransmission***
  Enables or disables the MAC retry transmission, when a collision occurs in Half Duplex mode.
- ***uint32_t ETH_MACConfigTypeDef::BackOffLimit***
  Selects the BackOff limit value. This parameter can be a value of ***ETH_Back_Off_Limit***
- ***FunctionalState ETH_MACConfigTypeDef::DeferralCheck***
  Enables or disables the deferral check function in Half Duplex mode.

- ***uint32_t ETH_MACConfigTypeDef::PreambleLength***
  Selects or not the Preamble Length for Transmit packets (Full Duplex mode). This parameter can be a value of ***ETH_Preamble_Length***
- ***FunctionalState ETH_MACConfigTypeDef::UnicastSlowProtocolPacketDetect***
  Enable or disables the Detection of Slow Protocol Packets with unicast address.
- ***FunctionalState ETH_MACConfigTypeDef::SlowProtocolDetect***
  Enable or disables the Slow Protocol Detection.
- ***FunctionalState ETH_MACConfigTypeDef::CRCCheckingRxPackets***
  Enable or disables the CRC Checking for Received Packets.
- ***uint32_t ETH_MACConfigTypeDef::GiantPacketSizeLimit***
  Specifies the packet size that the MAC will declare it as Giant, If it's size is greater than the value programmed in this field in units of bytes This parameter must be a number between Min_Data = 0x618 (1518 byte) and Max_Data = 0x3FFF (32 Kbyte).
- ***FunctionalState ETH_MACConfigTypeDef::ExtendedInterPacketGap***
  Enable or disables the extended inter packet gap.
- ***uint32_t ETH_MACConfigTypeDef::ExtendedInterPacketGapVal***
  Sets the Extended IPG between Packet during transmission. This parameter can be a value from 0x0 to 0xFF
- ***FunctionalState ETH_MACConfigTypeDef::ProgrammableWatchdog***
  Enable or disables the Programmable Watchdog.
- ***uint32_t ETH_MACConfigTypeDef::WatchdogTimeout***
  This field is used as watchdog timeout for a received packet This parameter can be a value of ***ETH_Watchdog_Timeout***
- ***uint32_t ETH_MACConfigTypeDef::PauseTime***
  This field holds the value to be used in the Pause Time field in the transmit control packet. This parameter must be a number between Min_Data = 0x0 and Max_Data = 0xFFFF.
- ***FunctionalState ETH_MACConfigTypeDef::ZeroQuantaPause***
  Enable or disables the automatic generation of Zero Quanta Pause Control packets.
- ***uint32_t ETH_MACConfigTypeDef::PauseLowThreshold***
  This field configures the threshold of the PAUSE to be checked for automatic retransmission of PAUSE Packet. This parameter can be a value of ***ETH_Pause_Low_Threshold***
- ***FunctionalState ETH_MACConfigTypeDef::TransmitFlowControl***
  Enables or disables the MAC to transmit Pause packets in Full Duplex mode or the MAC back pressure operation in Half Duplex mode
- ***FunctionalState ETH_MACConfigTypeDef::UnicastPausePacketDetect***
  Enables or disables the MAC to detect Pause packets with unicast address of the station
- ***FunctionalState ETH_MACConfigTypeDef::ReceiveFlowControl***
  Enables or disables the MAC to decodes the received Pause packet and disables its transmitter for a specified (Pause) time
- ***uint32_t ETH_MACConfigTypeDef::TransmitQueueMode***
  Specifies the Transmit Queue operating mode. This parameter can be a value of ***ETH_Transmit_Mode***
- ***uint32_t ETH_MACConfigTypeDef::ReceiveQueueMode***
  Specifies the Receive Queue operating mode. This parameter can be a value of ***ETH_Receive_Mode***
- ***FunctionalState ETH_MACConfigTypeDef::DropTCPIPChecksumErrorPacket***
  Enables or disables Dropping of TCPIP Checksum Error Packets.
- ***FunctionalState ETH_MACConfigTypeDef::ForwardRxErrorPacket***
  Enables or disables forwarding Error Packets.
- ***FunctionalState ETH_MACConfigTypeDef::ForwardRxUndersizedGoodPacket***
  Enables or disables forwarding Undersized Good Packets.

27.1.9 ETH_DMAConfigTypeDef

ETH_DMAConfigTypeDef is defined in the stm32h7xx_hal_eth.h

Data Fields

- ***uint32_t DMAArbitration***
- ***FunctionalState AddressAlignedBeats***
- ***uint32_t BurstMode***
- ***FunctionalState RebuildINCRxBurst***
- ***FunctionalState PBLx8Mode***
- ***uint32_t TxDMABurstLength***
- ***FunctionalState SecondPacketOperate***
- ***uint32_t RxDMABurstLength***
- ***FunctionalState FlushRxPacket***
- ***FunctionalState TCPSegmentation***
- ***uint32_t MaximumSegmentSize***

Field Documentation

- ***uint32_t ETH_DMAConfigTypeDef::DMAArbitration***

  Sets the arbitration scheme between DMA Tx and Rx This parameter can be a value of ***ETH_DMA_Arbitration***
- ***FunctionalState ETH_DMAConfigTypeDef::AddressAlignedBeats***

  Enables or disables the AHB Master interface address aligned burst transfers on Read and Write channels
- ***uint32_t ETH_DMAConfigTypeDef::BurstMode***

  Sets the AHB Master interface burst transfers. This parameter can be a value of ***ETH_Burst_Mode***
- ***FunctionalState ETH_DMAConfigTypeDef::RebuildINCRxBurst***

  Enables or disables the AHB Master to rebuild the pending beats of any initiated burst transfer with INCRx and SINGLE transfers.
- ***FunctionalState ETH_DMAConfigTypeDef::PBLx8Mode***

  Enables or disables the PBL multiplication by eight.
- ***uint32_t ETH_DMAConfigTypeDef::TxDMABurstLength***

  Indicates the maximum number of beats to be transferred in one Tx DMA transaction. This parameter can be a value of ***ETH_Tx_DMA_Burst_Length***
- ***FunctionalState ETH_DMAConfigTypeDef::SecondPacketOperate***

  Enables or disables the Operate on second Packet mode, which allows the DMA to process a second Packet of Transmit data even before obtaining the status for the first one.
- ***uint32_t ETH_DMAConfigTypeDef::RxDMABurstLength***

  Indicates the maximum number of beats to be transferred in one Rx DMA transaction. This parameter can be a value of ***ETH_Rx_DMA_Burst_Length***
- ***FunctionalState ETH_DMAConfigTypeDef::FlushRxPacket***

  Enables or disables the Rx Packet Flush
- ***FunctionalState ETH_DMAConfigTypeDef::TCPSegmentation***

  Enables or disables the TCP Segmentation
- ***uint32_t ETH_DMAConfigTypeDef::MaximumSegmentSize***

  Sets the maximum segment size that should be used while segmenting the packet This parameter can be a value from 0x40 to 0x3FFF

27.1.10 ETH_InitTypeDef

ETH_InitTypeDef is defined in the stm32h7xx_hal_eth.h

Data Fields

- ***uint8_t * MACAddr***
- ***ETH_MediaInterfaceTypeDef MediaInterface***
- ***ETH_DMADescTypeDef * TxDesc***

- ***ETH_DMADescTypeDef * RxDesc***
- ***uint32_t RxBuffLen***

Field Documentation

- ***uint8_t* ETH_InitTypeDef::MACAddr***
  MAC Address of used Hardware: must be pointer on an array of 6 bytes
- ***ETH_MediaInterfaceTypeDef ETH_InitTypeDef::MediaInterface***
  Selects the MII interface or the RMII interface.
- ***ETH_DMADescTypeDef* ETH_InitTypeDef::TxDesc***
  Provides the address of the first DMA Tx descriptor in the list
- ***ETH_DMADescTypeDef* ETH_InitTypeDef::RxDesc***
  Provides the address of the first DMA Rx descriptor in the list
- ***uint32_t ETH_InitTypeDef::RxBuffLen***
  Provides the length of Rx buffers size

27.1.11 ETH_PTP_ConfigTypeDef

ETH_PTP_ConfigTypeDef is defined in the stm32h7xx_hal_eth.h

Data Fields

- ***uint32_t Timestamp***
- ***uint32_t TimestampUpdateMode***
- ***uint32_t TimestampInitialize***
- ***uint32_t TimestampUpdate***
- ***uint32_t TimestampAddendUpdate***
- ***uint32_t TimestampAll***
- ***uint32_t TimestampRolloverMode***
- ***uint32_t TimestampV2***
- ***uint32_t TimestampEthernet***
- ***uint32_t TimestampIPv6***
- ***uint32_t TimestampIPv4***
- ***uint32_t TimestampEvent***
- ***uint32_t TimestampMaster***
- ***uint32_t TimestampSnapshots***
- ***uint32_t TimestampFilter***
- ***uint32_t TimestampChecksumCorrection***
- ***uint32_t TimestampStatusMode***
- ***uint32_t TimestampAddend***
- ***uint32_t TimestampSubsecondInc***

Field Documentation

- ***uint32_t ETH_PTP_ConfigTypeDef::Timestamp***
  Enable Timestamp
- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampUpdateMode***
  Fine or Coarse Timestamp Update
- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampInitialize***
  Initialize Timestamp
- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampUpdate***
  Timestamp Update
- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampAddendUpdate***
  Timestamp Addend Update
- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampAll***
  Enable Timestamp for All Packets

- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampRolloverMode***
  Timestamp Digital or Binary Rollover Control
- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampV2***
  Enable PTP Packet Processing for Version 2 Format
- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampEthernet***
  Enable Processing of PTP over Ethernet Packets
- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampIPv6***
  Enable Processing of PTP Packets Sent over IPv6-UDP
- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampIPv4***
  Enable Processing of PTP Packets Sent over IPv4-UDP
- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampEvent***
  Enable Timestamp Snapshot for Event Messages
- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampMaster***
  Enable Timestamp Snapshot for Event Messages
- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampSnapshots***
  Select PTP packets for Taking Snapshots
- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampFilter***
  Enable MAC Address for PTP Packet Filtering
- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampChecksumCorrection***
  Enable checksum correction during OST for PTP over UDP/IPv4 packets
- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampStatusMode***
  Transmit Timestamp Status Mode
- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampAddend***
  Timestamp addend value
- ***uint32_t ETH_PTP_ConfigTypeDef::TimestampSubsecondInc***
  Subsecond Increment

27.1.12 __ETH_HandleTypeDef

__ETH_HandleTypeDef is defined in the stm32h7xx_hal_eth.h

Data Fields

- ***ETH_TypeDef * Instance***
- ***ETH_InitTypeDef Init***
- ***ETH_TxDescListTypeDef TxDescList***
- ***ETH_RxDescListTypeDef RxDescList***
- ***__IO HAL_ETH_StateTypeDef gState***
- ***__IO uint32_t ErrorCode***
- ***__IO uint32_t DMAErrorCode***
- ***__IO uint32_t MACErrorCode***
- ***__IO uint32_t MACWakeUpEvent***
- ***__IO uint32_t MACLPIEvent***
- ***__IO uint32_t IsPtpConfigured***
- ***void(* TxCpltCallback***
- ***void(* RxCpltCallback***
- ***void(* ErrorCallback***
- ***void(* PMTCallback***
- ***void(* EEECallback***
- ***void(* WakeUpCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

- ***pETH_rxAllocateCallbackTypeDef rxAllocateCallback***
- ***pETH_rxLinkCallbackTypeDef rxLinkCallback***
- ***pETH_txFreeCallbackTypeDef txFreeCallback***
- ***pETH_txPtpCallbackTypeDef txPtpCallback***

Field Documentation

- ***ETH_TypeDef* __ETH_HandleTypeDef::Instance***
  Register base address
- ***ETH_InitTypeDef __ETH_HandleTypeDef::Init***
  Ethernet Init Configuration
- ***ETH_TxDescListTypeDef __ETH_HandleTypeDef::TxDescList***
  Tx descriptor wrapper: holds all Tx descriptors list addresses and current descriptor index
- ***ETH_RxDescListTypeDef __ETH_HandleTypeDef::RxDescList***
  Rx descriptor wrapper: holds all Rx descriptors list addresses and current descriptor index
- ***__IO HAL_ETH_StateTypeDef __ETH_HandleTypeDef::gState***
  ETH state information related to global Handle management and also related to Tx operations. This parameter can be a value of ***HAL_ETH_StateTypeDef***
- ***__IO uint32_t __ETH_HandleTypeDef::ErrorCode***
  Holds the global Error code of the ETH HAL status machine This parameter can be a value of ***ETH_Error_Code***.
- ***__IO uint32_t __ETH_HandleTypeDef::DMAErrorCode***
  Holds the DMA Rx Tx Error code when a DMA AIS interrupt occurs This parameter can be a combination of ***ETH_DMA_Status_Flags***
- ***__IO uint32_t __ETH_HandleTypeDef::MACErrorCode***
  Holds the MAC Rx Tx Error code when a MAC Rx or Tx status interrupt occurs This parameter can be a combination of ***ETH_MAC_Rx_Tx_Status***
- ***__IO uint32_t __ETH_HandleTypeDef::MACWakeUpEvent***
  Holds the Wake Up event when the MAC exit the power down mode This parameter can be a value of ***ETH_MAC_Wake_Up_Event***
- ***__IO uint32_t __ETH_HandleTypeDef::MACLPIEvent***
  Holds the LPI event when the an LPI status interrupt occurs. This parameter can be a value of ***ETHEx_LPI_Event***
- ***__IO uint32_t __ETH_HandleTypeDef::IsPtpConfigured***
  Holds the PTP configuration status. This parameter can be a value of ***ETH_PTP_Config_Status***
- ***void(* __ETH_HandleTypeDef::TxCpltCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Tx Complete Callback
- ***void(* __ETH_HandleTypeDef::RxCpltCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Rx Complete Callback
- ***void(* __ETH_HandleTypeDef::ErrorCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Error Callback
- ***void(* __ETH_HandleTypeDef::PMTCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Power Management Callback
- ***void(* __ETH_HandleTypeDef::EEECallback)(struct __ETH_HandleTypeDef *heth)***
  ETH EEE Callback
- ***void(* __ETH_HandleTypeDef::WakeUpCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Wake UP Callback
- ***void(* __ETH_HandleTypeDef::MspInitCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Msp Init callback
- ***void(* __ETH_HandleTypeDef::MspDeInitCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Msp DeInit callback

- ***pETH_rxAllocateCallbackTypeDef __ETH_HandleTypeDef::rxAllocateCallback***
  ETH Rx Get Buffer Function
- ***pETH_rxLinkCallbackTypeDef __ETH_HandleTypeDef::rxLinkCallback***
  ETH Rx Set App Data Function
- ***pETH_txFreeCallbackTypeDef __ETH_HandleTypeDef::txFreeCallback***
  ETH Tx Free Function
- ***pETH_txPtpCallbackTypeDef __ETH_HandleTypeDef::txPtpCallback***
  ETH Tx Handle Ptp Function

27.1.13 ETH_MACFilterConfigTypeDef

ETH_MACFilterConfigTypeDef is defined in the stm32h7xx_hal_eth.h

Data Fields

- ***FunctionalState PromiscuousMode***
- ***FunctionalState ReceiveAllMode***
- ***FunctionalState HachOrPerfectFilter***
- ***FunctionalState HashUnicast***
- ***FunctionalState HashMulticast***
- ***FunctionalState PassAllMulticast***
- ***FunctionalState SrcAddrFiltering***
- ***FunctionalState SrcAddrInverseFiltering***
- ***FunctionalState DestAddrInverseFiltering***
- ***FunctionalState BroadcastFilter***
- ***uint32_t ControlPacketsFilter***

Field Documentation

- ***FunctionalState ETH_MACFilterConfigTypeDef::PromiscuousMode***
  Enable or Disable Promiscuous Mode
- ***FunctionalState ETH_MACFilterConfigTypeDef::ReceiveAllMode***
  Enable or Disable Receive All Mode
- ***FunctionalState ETH_MACFilterConfigTypeDef::HachOrPerfectFilter***
  Enable or Disable Perfect filtering in addition to Hash filtering
- ***FunctionalState ETH_MACFilterConfigTypeDef::HashUnicast***
  Enable or Disable Hash filtering on unicast packets
- ***FunctionalState ETH_MACFilterConfigTypeDef::HashMulticast***
  Enable or Disable Hash filtering on multicast packets
- ***FunctionalState ETH_MACFilterConfigTypeDef::PassAllMulticast***
  Enable or Disable passing all multicast packets
- ***FunctionalState ETH_MACFilterConfigTypeDef::SrcAddrFiltering***
  Enable or Disable source address filtering module
- ***FunctionalState ETH_MACFilterConfigTypeDef::SrcAddrInverseFiltering***
  Enable or Disable source address inverse filtering
- ***FunctionalState ETH_MACFilterConfigTypeDef::DestAddrInverseFiltering***
  Enable or Disable destination address inverse filtering
- ***FunctionalState ETH_MACFilterConfigTypeDef::BroadcastFilter***
  Enable or Disable broadcast filter
- ***uint32_t ETH_MACFilterConfigTypeDef::ControlPacketsFilter***
  Set the control packets filter This parameter can be a value of ***ETH_Control_Packets_Filter***

27.1.14 ETH_PowerDownConfigTypeDef

ETH_PowerDownConfigTypeDef is defined in the stm32h7xx_hal_eth.h

Data Fields

- ***FunctionalState WakeUpPacket***
- ***FunctionalState MagicPacket***
- ***FunctionalState GlobalUnicast***
- ***FunctionalState WakeUpForward***

Field Documentation

- ***FunctionalState ETH_PowerDownConfigTypeDef::WakeUpPacket***
  Enable or Disable Wake up packet detection in power down mode
- ***FunctionalState ETH_PowerDownConfigTypeDef::MagicPacket***
  Enable or Disable Magic packet detection in power down mode
- ***FunctionalState ETH_PowerDownConfigTypeDef::GlobalUnicast***
  Enable or Disable Global unicast packet detection in power down mode
- ***FunctionalState ETH_PowerDownConfigTypeDef::WakeUpForward***
  Enable or Disable Forwarding Wake up packets

27.2 ETH Firmware driver API description

The following section lists the various functions of the ETH library.

27.2.1 How to use this driver

The ETH HAL driver can be used as follows:

1. Declare a ETH_HandleTypeDef handle structure, for example: ETH_HandleTypeDef heth;
2. Fill parameters of Init structure in heth handle
3. Call HAL_ETH_Init() API to initialize the Ethernet peripheral (MAC, DMA, ...)
4. Initialize the ETH low level resources through the HAL_ETH_MspInit() API:
   a. Enable the Ethernet interface clock using
      - __HAL_RCC_ETH1MAC_CLK_ENABLE()
      - __HAL_RCC_ETH1TX_CLK_ENABLE()
      - __HAL_RCC_ETH1RX_CLK_ENABLE()
   b. Initialize the related GPIO clocks
   c. Configure Ethernet pinout
   d. Configure Ethernet NVIC interrupt (in Interrupt mode)
5. Ethernet data reception is asynchronous, so call the following API to start the listening mode:
   a. HAL_ETH_Start(): This API starts the MAC and DMA transmission and reception process, without enabling end of transfer interrupts, in this mode user has to poll for data reception by calling HAL_ETH_ReadData()
   b. HAL_ETH_Start_IT(): This API starts the MAC and DMA transmission and reception process, end of transfer interrupts are enabled in this mode, HAL_ETH_RxCpltCallback() will be executed when an Ethernet packet is received
6. When data is received user can call the following API to get received data:
   a. HAL_ETH_ReadData(): Read a received packet
7. For transmission path, two APIs are available:
   a. HAL_ETH_Transmit(): Transmit an ETH frame in blocking mode
   b. HAL_ETH_Transmit_IT(): Transmit an ETH frame in interrupt mode, HAL_ETH_TxCpltCallback() will be executed when end of transfer occur
8. Communication with an external PHY device:
   a. HAL_ETH_ReadPHYRegister(): Read a register from an external PHY
   b. HAL_ETH_WritePHYRegister(): Write data to an external RHY register

9. Configure the Ethernet MAC after ETH peripheral initialization
   a. HAL_ETH_GetMACConfig(): Get MAC actual configuration into ETH_MACConfigTypeDef
   b. HAL_ETH_SetMACConfig(): Set MAC configuration based on ETH_MACConfigTypeDef
10. Configure the Ethernet DMA after ETH peripheral initialization
   a. HAL_ETH_GetDMAConfig(): Get DMA actual configuration into ETH_DMAConfigTypeDef
   b. HAL_ETH_SetDMAConfig(): Set DMA configuration based on ETH_DMAConfigTypeDef
11. Configure the Ethernet PTP after ETH peripheral initialization
   a. Define HAL_ETH_USE_PTP to use PTP APIs.
   b. HAL_ETH_PTP_GetConfig(): Get PTP actual configuration into ETH_PTP_ConfigTypeDef
   c. HAL_ETH_PTP_SetConfig(): Set PTP configuration based on ETH_PTP_ConfigTypeDef
   d. HAL_ETH_PTP_GetTime(): Get Seconds and Nanoseconds for the Ethernet PTP registers
   e. HAL_ETH_PTP_SetTime(): Set Seconds and Nanoseconds for the Ethernet PTP registers
   f. HAL_ETH_PTP_AddTimeOffset(): Add Seconds and Nanoseconds offset for the Ethernet PTP registers
   g. HAL_ETH_PTP_InsertTxTimestamp(): Insert Timestamp in transmission
   h. HAL_ETH_PTP_GetTxTimestamp(): Get transmission timestamp
   i. HAL_ETH_PTP_GetRxTimestamp(): Get reception timestamp -@- The ARP offload feature is not supported in this driver. -@- The PTP offload feature is not supported in this driver.

Callback registration

27.2.2 Initialization and Configuration functions

This subsection provides a set of functions allowing to initialize and deinitialize the ETH peripheral:

- User must Implement HAL_ETH_MspInit() function in which he configures all related peripherals resources (CLOCK, GPIO and NVIC).
- Call the function HAL_ETH_Init() to configure the selected device with the selected configuration:
  - MAC address
  - Media interface (MII or RMII)
  - Rx DMA Descriptors Tab
  - Tx DMA Descriptors Tab
  - Length of Rx Buffers
- Call the function HAL_ETH_DeInit() to restore the default configuration of the selected ETH peripheral.

This section contains the following APIs:

- ***HAL_ETH_Init()***
- ***HAL_ETH_DeInit()***
- ***HAL_ETH_MspInit()***
- ***HAL_ETH_MspDeInit()***
- ***HAL_ETH_RegisterCallback()***
- ***HAL_ETH_UnRegisterCallback()***

27.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the ETH data transfer.

This section contains the following APIs:

- ***HAL_ETH_Start()***
- ***HAL_ETH_Start_IT()***
- ***HAL_ETH_Stop()***
- ***HAL_ETH_Stop_IT()***
- ***HAL_ETH_Transmit()***
- ***HAL_ETH_Transmit_IT()***
- ***HAL_ETH_ReadData()***

- *HAL_ETH_RegisterRxAllocateCallback()*
- *HAL_ETH_UnRegisterRxAllocateCallback()*
- *HAL_ETH_RxAllocateCallback()*

27.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the ETH peripheral.

This section contains the following APIs:

- *HAL_ETH_GetMACConfig()*
- *HAL_ETH_GetDMAConfig()*
- *HAL_ETH_SetMACConfig()*
- *HAL_ETH_SetDMAConfig()*
- *HAL_ETH_SetMDIOClockRange()*
- *HAL_ETH_SetMACFilterConfig()*
- *HAL_ETH_GetMACFilterConfig()*
- *HAL_ETH_SetSourceMACAddrMatch()*
- *HAL_ETH_SetHashTable()*
- *HAL_ETH_SetRxVLANIdentifier()*
- *HAL_ETH_EnterPowerDownMode()*
- *HAL_ETH_ExitPowerDownMode()*
- *HAL_ETH_SetWakeUpFilter()*

27.2.5 Peripheral State and Errors functions

This subsection provides a set of functions allowing to return the State of ETH communication process, return Peripheral Errors occurred during communication process

This section contains the following APIs:

- *HAL_ETH_GetState()*
- *HAL_ETH_GetError()*
- *HAL_ETH_GetDMAError()*
- *HAL_ETH_GetMACError()*
- *HAL_ETH_GetMACWakeUpSource()*

27.2.6 Detailed description of functions

HAL_ETH_Init

Function name

HAL_StatusTypeDef HAL_ETH_Init (ETH_HandleTypeDef * heth)

Function description

Initialize the Ethernet peripheral registers.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_DeInit

Function name

HAL_StatusTypeDef HAL_ETH_DeInit (ETH_HandleTypeDef * heth)

Function description

DeInitializes the ETH peripheral.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_MspInit

Function name

void HAL_ETH_MspInit (ETH_HandleTypeDef * heth)

Function description

Initializes the ETH MSP.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_MspDeInit

Function name

void HAL_ETH_MspDeInit (ETH_HandleTypeDef * heth)

Function description

DeInitializes ETH MSP.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_RegisterCallback

Function name

HAL_StatusTypeDef HAL_ETH_RegisterCallback (ETH_HandleTypeDef * heth, HAL_ETH_CallbackIDTypeDef CallbackID, pETH_CallbackTypeDef pCallback)

Function description

Register a User ETH Callback To be used instead of the weak predefined callback.

Parameters

- **heth:** eth handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_ETH_TX_COMPLETE_CB_ID Tx Complete Callback ID
  - HAL_ETH_RX_COMPLETE_CB_ID Rx Complete Callback ID
  - HAL_ETH_ERROR_CB_ID Error Callback ID
  - HAL_ETH_PMT_CB_ID Power Management Callback ID
  - HAL_ETH_EEE_CB_ID EEE Callback ID
  - HAL_ETH_WAKEUP_CB_ID Wake UP Callback ID
  - HAL_ETH_MSPINIT_CB_ID MspInit callback ID
  - HAL_ETH_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

HAL_ETH_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_ETH_UnRegisterCallback (ETH_HandleTypeDef * heth, HAL_ETH_CallbackIDTypeDef CallbackID)

Function description

Unregister an ETH Callback ETH callabck is redirected to the weak predefined callback.

Parameters

- **heth:** eth handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_ETH_TX_COMPLETE_CB_ID Tx Complete Callback ID
  - HAL_ETH_RX_COMPLETE_CB_ID Rx Complete Callback ID
  - HAL_ETH_ERROR_CB_ID Error Callback ID
  - HAL_ETH_PMT_CB_ID Power Management Callback ID
  - HAL_ETH_EEE_CB_ID EEE Callback ID
  - HAL_ETH_WAKEUP_CB_ID Wake UP Callback ID
  - HAL_ETH_MSPINIT_CB_ID MspInit callback ID
  - HAL_ETH_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **status:**

HAL_ETH_Start

Function name

HAL_StatusTypeDef HAL_ETH_Start (ETH_HandleTypeDef * heth)

Function description

Enables Ethernet MAC and DMA reception and transmission.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_Start_IT

Function name

HAL_StatusTypeDef HAL_ETH_Start_IT (ETH_HandleTypeDef * heth)

Function description

Enables Ethernet MAC and DMA reception/transmission in Interrupt mode.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_Stop

Function name

HAL_StatusTypeDef HAL_ETH_Stop (ETH_HandleTypeDef * heth)

Function description

Stop Ethernet MAC and DMA reception/transmission.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_Stop_IT

Function name

HAL_StatusTypeDef HAL_ETH_Stop_IT (ETH_HandleTypeDef * heth)

Function description

Stop Ethernet MAC and DMA reception/transmission in Interrupt mode.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_ReadData

Function name

HAL_StatusTypeDef HAL_ETH_ReadData (ETH_HandleTypeDef * heth, void ** pAppBuff)

Function description

Read a received packet.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pAppBuff:** Pointer to an application buffer to receive the packet.

Return values

- **HAL:** status

HAL_ETH_RegisterRxAllocateCallback

Function name

HAL_StatusTypeDef HAL_ETH_RegisterRxAllocateCallback (ETH_HandleTypeDef * heth, pETH_rxAllocateCallbackTypeDef rxAllocateCallback)

Function description

Register the Rx alloc callback.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **rxAllocateCallback:** pointer to function to alloc buffer

Return values

- **HAL:** status

HAL_ETH_UnRegisterRxAllocateCallback

Function name

HAL_StatusTypeDef HAL_ETH_UnRegisterRxAllocateCallback (ETH_HandleTypeDef * heth)

Function description

Unregister the Rx alloc callback.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_RegisterRxLinkCallback

Function name

HAL_StatusTypeDef HAL_ETH_RegisterRxLinkCallback (ETH_HandleTypeDef * heth, pETH_rxLinkCallbackTypeDef rxLinkCallback)

Function description

Set the Rx link data function.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **rxLinkCallback:** pointer to function to link data

Return values

- **HAL:** status

HAL_ETH_UnRegisterRxLinkCallback

Function name

HAL_StatusTypeDef HAL_ETH_UnRegisterRxLinkCallback (ETH_HandleTypeDef * heth)

Function description

Unregister the Rx link callback.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_GetRxDataErrorCode

Function name

HAL_StatusTypeDef HAL_ETH_GetRxDataErrorCode (ETH_HandleTypeDef * heth, uint32_t * pErrorCode)

Function description

Get the error state of the last received packet.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pErrorCode:** pointer to uint32_t to hold the error code

Return values

- **HAL:** status

HAL_ETH_RegisterTxFreeCallback

Function name

HAL_StatusTypeDef HAL_ETH_RegisterTxFreeCallback (ETH_HandleTypeDef * heth, pETH_txFreeCallbackTypeDef txFreeCallback)

Function description

Set the Tx free function.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **txFreeCallback:** pointer to function to release the packet

Return values

- **HAL:** status

HAL_ETH_UnRegisterTxFreeCallback

Function name

HAL_StatusTypeDef HAL_ETH_UnRegisterTxFreeCallback (ETH_HandleTypeDef * heth)

Function description

Unregister the Tx free callback.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_ReleaseTxPacket

Function name

HAL_StatusTypeDef HAL_ETH_ReleaseTxPacket (ETH_HandleTypeDef * heth)

Function description

Release transmitted Tx packets.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_Transmit

Function name

HAL_StatusTypeDef HAL_ETH_Transmit (ETH_HandleTypeDef * heth, ETH_TxPacketConfig * pTxConfig, uint32_t Timeout)

Function description

Sends an Ethernet Packet in polling mode.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pTxConfig:** Hold the configuration of packet to be transmitted
- **Timeout:** timeout value

Return values

- **HAL:** status

HAL_ETH_Transmit_IT

Function name

HAL_StatusTypeDef HAL_ETH_Transmit_IT (ETH_HandleTypeDef * heth, ETH_TxPacketConfig * pTxConfig)

Function description

Sends an Ethernet Packet in interrupt mode.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pTxConfig:** Hold the configuration of packet to be transmitted

Return values

- **HAL:** status

HAL_ETH_WritePHYRegister

Function name

HAL_StatusTypeDef HAL_ETH_WritePHYRegister (ETH_HandleTypeDef * heth, uint32_t PHYAddr, uint32_t PHYReg, uint32_t RegValue)

Function description

Writes to a PHY register.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **PHYAddr:** PHY port address, must be a value from 0 to 31
- **PHYReg:** PHY register address, must be a value from 0 to 31
- **RegValue:** the value to write

Return values

- **HAL:** status

HAL_ETH_ReadPHYRegister

Function name

HAL_StatusTypeDef HAL_ETH_ReadPHYRegister (ETH_HandleTypeDef * heth, uint32_t PHYAddr, uint32_t PHYReg, uint32_t * pRegValue)

Function description

Read a PHY register.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **PHYAddr:** PHY port address, must be a value from 0 to 31
- **PHYReg:** PHY register address, must be a value from 0 to 31
- **pRegValue:** parameter to hold read value

Return values

- **HAL:** status

HAL_ETH_IRQHandler

Function name

void HAL_ETH_IRQHandler (ETH_HandleTypeDef * heth)

Function description

This function handles ETH interrupt request.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_TxCpltCallback

Function name

void HAL_ETH_TxCpltCallback (ETH_HandleTypeDef * heth)

Function description

Tx Transfer completed callbacks.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_RxCpltCallback

Function name

void HAL_ETH_RxCpltCallback (ETH_HandleTypeDef * heth)

Function description

Rx Transfer completed callbacks.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_ErrorCallback

Function name

void HAL_ETH_ErrorCallback (ETH_HandleTypeDef * heth)

Function description

Ethernet transfer error callbacks.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_PMTCallback

Function name

void HAL_ETH_PMTCallback (ETH_HandleTypeDef * heth)

Function description

Ethernet Power Management module IT callback.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_EEECallback

Function name

void HAL_ETH_EEECallback (ETH_HandleTypeDef * heth)

Function description

Energy Efficient Etherent IT callback.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_WakeUpCallback

Function name

void HAL_ETH_WakeUpCallback (ETH_HandleTypeDef * heth)

Function description

ETH WAKEUP interrupt callback.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_RxAllocateCallback

Function name

void HAL_ETH_RxAllocateCallback (uint8_t ** buff)

Function description

Rx Allocate callback.

Parameters

- **buff:** pointer to allocated buffer

Return values

- **None:**

HAL_ETH_RxLinkCallback

Function name

void HAL_ETH_RxLinkCallback (void ** pStart, void ** pEnd, uint8_t * buff, uint16_t Length)

Function description

Rx Link callback.

Parameters

- **pStart:** pointer to packet start
- **pStart:** pointer to packet end
- **buff:** pointer to received data
- **Length:** received data length

Return values

- **None:**

HAL_ETH_TxFreeCallback

Function name

void HAL_ETH_TxFreeCallback (uint32_t * buff)

Function description

Tx Free callback.

Parameters

- **buff:** pointer to buffer to free

Return values

- **None:**

HAL_ETH_TxPtpCallback

Function name

void HAL_ETH_TxPtpCallback (uint32_t * buff, ETH_TimeStampTypeDef * timestamp)

Function description

HAL_ETH_GetMACConfig

Function name

HAL_StatusTypeDef HAL_ETH_GetMACConfig (ETH_HandleTypeDef * heth, ETH_MACConfigTypeDef * macconf)

Function description

Get the configuration of the MAC and MTL subsystems.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **macconf:** pointer to a ETH_MACConfigTypeDef structure that will hold the configuration of the MAC.

Return values

- **HAL:** Status

HAL_ETH_GetDMAConfig

Function name

HAL_StatusTypeDef HAL_ETH_GetDMAConfig (ETH_HandleTypeDef * heth, ETH_DMAConfigTypeDef * dmaconf)

Function description

Get the configuration of the DMA.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **dmaconf:** pointer to a ETH_DMAConfigTypeDef structure that will hold the configuration of the ETH DMA.

Return values

- **HAL:** Status

HAL_ETH_SetMACConfig

Function name

HAL_StatusTypeDef HAL_ETH_SetMACConfig (ETH_HandleTypeDef * heth, ETH_MACConfigTypeDef * macconf)

Function description

Set the MAC configuration.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **macconf:** pointer to a ETH_MACConfigTypeDef structure that contains the configuration of the MAC.

Return values

- **HAL:** status

HAL_ETH_SetDMAConfig

Function name

HAL_StatusTypeDef HAL_ETH_SetDMAConfig (ETH_HandleTypeDef * heth, ETH_DMAConfigTypeDef * dmaconf)

Function description

Set the ETH DMA configuration.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **dmaconf:** pointer to a ETH_DMAConfigTypeDef structure that will hold the configuration of the ETH DMA.

Return values

- **HAL:** status

HAL_ETH_SetMDIOClockRange

Function name

void HAL_ETH_SetMDIOClockRange (ETH_HandleTypeDef * heth)

Function description

Configures the Clock range of ETH MDIO interface.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_SetRxVLANIdentifier

Function name

void HAL_ETH_SetRxVLANIdentifier (ETH_HandleTypeDef * heth, uint32_t ComparisonBits, uint32_t VLANIdentifier)

Function description

Set the VLAN Identifier for Rx packets.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **ComparisonBits:** 12 or 16 bit comparison mode must be a value of ETH VLAN Tag Comparison
- **VLANIdentifier:** VLAN Identifier value

Return values

- **None:**

HAL_ETH_GetMACFilterConfig

Function name

HAL_StatusTypeDef HAL_ETH_GetMACFilterConfig (ETH_HandleTypeDef * heth, ETH_MACFilterConfigTypeDef * pFilterConfig)

Function description

Get the ETH MAC (L2) Filters configuration.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pFilterConfig:** pointer to a ETH_MACFilterConfigTypeDef structure that will hold the configuration of the ETH MAC filters.

Return values

- **HAL:** status

HAL_ETH_SetMACFilterConfig

Function name

HAL_StatusTypeDef HAL_ETH_SetMACFilterConfig (ETH_HandleTypeDef * heth, ETH_MACFilterConfigTypeDef * pFilterConfig)

Function description

Set the ETH MAC (L2) Filters configuration.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pFilterConfig:** pointer to a ETH_MACFilterConfigTypeDef structure that contains the configuration of the ETH MAC filters.

Return values

- **HAL:** status

HAL_ETH_SetHashTable

Function name

HAL_StatusTypeDef HAL_ETH_SetHashTable (ETH_HandleTypeDef * heth, uint32_t * pHashTable)

Function description

Set the ETH Hash Table Value.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pHashTable:** pointer to a table of two 32 bit values, that contains the 64 bits of the hash table.

Return values

- **HAL:** status

HAL_ETH_SetSourceMACAddrMatch

Function name

HAL_StatusTypeDef HAL_ETH_SetSourceMACAddrMatch (ETH_HandleTypeDef * heth, uint32_t AddrNbr, uint8_t * pMACAddr)

Function description

Set the source MAC Address to be matched.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **AddrNbr:** The MAC address to configure This parameter must be a value of the following: ETH_MAC_ADDRESS1 ETH_MAC_ADDRESS2 ETH_MAC_ADDRESS3
- **pMACAddr:** Pointer to MAC address buffer data (6 bytes)

Return values

- **HAL:** status

HAL_ETH_EnterPowerDownMode

Function name

void HAL_ETH_EnterPowerDownMode (ETH_HandleTypeDef * heth, ETH_PowerDownConfigTypeDef * pPowerDownConfig)

Function description

Enters the Power down mode.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pPowerDownConfig:** a pointer to ETH_PowerDownConfigTypeDef structure that contains the Power Down configuration

Return values

- **None.:**

HAL_ETH_ExitPowerDownMode

Function name

void HAL_ETH_ExitPowerDownMode (ETH_HandleTypeDef * heth)

Function description

Exits from the Power down mode.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None.:**

HAL_ETH_SetWakeUpFilter

Function name

HAL_StatusTypeDef HAL_ETH_SetWakeUpFilter (ETH_HandleTypeDef * heth, uint32_t * pFilter, uint32_t Count)

Function description

Set the WakeUp filter.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pFilter:** pointer to filter registers values
- **Count:** number of filter registers, must be from 1 to 8.

Return values

- **None.:**

HAL_ETH_GetState

Function name

HAL_ETH_StateTypeDef HAL_ETH_GetState (ETH_HandleTypeDef * heth)

Function description

Returns the ETH state.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** state

HAL_ETH_GetError

Function name

uint32_t HAL_ETH_GetError (ETH_HandleTypeDef * heth)

Function description

Returns the ETH error code.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **ETH:** Error Code

HAL_ETH_GetDMAError

Function name

uint32_t HAL_ETH_GetDMAError (ETH_HandleTypeDef * heth)

Function description

Returns the ETH DMA error code.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **ETH:** DMA Error Code

HAL_ETH_GetMACError

Function name

uint32_t HAL_ETH_GetMACError (ETH_HandleTypeDef * heth)

Function description

Returns the ETH MAC error code.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **ETH:** MAC Error Code

HAL_ETH_GetMACWakeUpSource

Function name

uint32_t HAL_ETH_GetMACWakeUpSource (ETH_HandleTypeDef * heth)

Function description

Returns the ETH MAC WakeUp event source.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **ETH:** MAC WakeUp event source

27.3 ETH Firmware driver defines

The following section lists the various define and macros of the module.

27.3.1 ETH

ETH

ETH Back Off Limit

ETH_BACKOFFLIMIT_10

ETH_BACKOFFLIMIT_8

ETH_BACKOFFLIMIT_4

ETH_BACKOFFLIMIT_1

ETH Burst Mode

ETH Exported Macros

__HAL_ETH_RESET_HANDLE_STATE

Description:

- Reset ETH handle state.

Parameters:

- __HANDLE__: specifies the ETH handle.

Return value:

- None

__HAL_ETH_DMA_ENABLE_IT

Description:

- Enables the specified ETHERNET DMA interrupts.

Parameters:

- __HANDLE__: : ETH Handle
- __INTERRUPT__: specifies the ETHERNET DMA interrupt sources to be enabled

Return value:

- None

__HAL_ETH_DMA_DISABLE_IT

Description:

- Disables the specified ETHERNET DMA interrupts.

Parameters:

- __HANDLE__: : ETH Handle
- __INTERRUPT__: specifies the ETHERNET DMA interrupt sources to be disabled.

Return value:

- None

__HAL_ETH_DMA_GET_IT_SOURCE

Description:

- Gets the ETHERNET DMA IT source enabled or disabled.

Parameters:

- __HANDLE__: : ETH Handle
- __INTERRUPT__: specifies the interrupt source to get .

Return value:

- The: ETH DMA IT Source enabled or disabled

__HAL_ETH_DMA_GET_IT

Description:

- Gets the ETHERNET DMA IT pending bit.

Parameters:

- __HANDLE__: : ETH Handle
- __INTERRUPT__: specifies the interrupt source to get .

Return value:

- The: state of ETH DMA IT (SET or RESET)

__HAL_ETH_DMA_CLEAR_IT

Description:

- Clears the ETHERNET DMA IT pending bit.

Parameters:

- __HANDLE__: : ETH Handle
- __INTERRUPT__: specifies the interrupt pending bit to clear.

Return value:

- None

__HAL_ETH_DMA_GET_FLAG

Description:

- Checks whether the specified ETHERNET DMA flag is set or not.

Parameters:

- __HANDLE__: ETH Handle
- __FLAG__: specifies the flag to check.

Return value:

- The: state of ETH DMA FLAG (SET or RESET).

__HAL_ETH_DMA_CLEAR_FLAG

Description:

- Clears the specified ETHERNET DMA flag.

Parameters:

- __HANDLE__: ETH Handle
- __FLAG__: specifies the flag to check.

Return value:

- The: state of ETH DMA FLAG (SET or RESET).

__HAL_ETH_MAC_ENABLE_IT

Description:

- Enables the specified ETHERNET MAC interrupts.

Parameters:

- __HANDLE__: : ETH Handle
- __INTERRUPT__: specifies the ETHERNET MAC interrupt sources to be enabled

Return value:

- None

__HAL_ETH_MAC_DISABLE_IT

Description:

- Disables the specified ETHERNET MAC interrupts.

Parameters:

- __HANDLE__: : ETH Handle
- __INTERRUPT__: specifies the ETHERNET MAC interrupt sources to be enabled

Return value:

- None

__HAL_ETH_MAC_GET_IT

Description:

- Checks whether the specified ETHERNET MAC flag is set or not.

Parameters:

- __HANDLE__: ETH Handle
- __INTERRUPT__: specifies the flag to check.

Return value:

- The: state of ETH MAC IT (SET or RESET). External interrupt line 86 Connected to the ETH wakeup EXTI Line

ETH_WAKEUP_EXTI_LINE

__HAL_ETH_WAKEUP_EXTI_ENABLE_IT

Description:

- Enable the ETH WAKEUP Exti Line.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP Exti sources to be enabled.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None.

__HAL_ETH_WAKEUP_EXTI_GET_FLAG

Description:

- checks whether the specified ETH WAKEUP Exti interrupt flag is set or not.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP Exti sources to be cleared.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- EXTI: ETH WAKEUP Line Status.

__HAL_ETH_WAKEUP_EXTI_CLEAR_FLAG

Description:

- Clear the ETH WAKEUP Exti flag.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP Exti sources to be cleared.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None.

__HAL_ETH_WAKEUP_EXTID2_ENABLE_IT

Description:

- Enable the ETH WAKEUP Exti Line by Core2.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP Exti sources to be enabled.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None.

__HAL_ETH_WAKEUP_EXTID2_GET_FLAG

Description:

- checks whether the specified ETH WAKEUP Exti interrupt flag is set or not.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP Exti sources to be cleared.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- EXTI: ETH WAKEUP Line Status.

__HAL_ETH_WAKEUP_EXTID2_CLEAR_FLAG

Description:

- Clear the ETH WAKEUP Exti flag.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP Exti sources to be cleared.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None.

__HAL_ETH_WAKEUP_EXTI_ENABLE_RISING_EDGE

Description:

- enable rising edge interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP EXTI sources to be disabled.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None

__HAL_ETH_WAKEUP_EXTI_ENABLE_FALLING_EDGE

Description:

- enable falling edge interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP EXTI sources to be disabled.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None

__HAL_ETH_WAKEUP_EXTI_ENABLE_RISING_FALLING_EDGE

Description:

- enable falling edge interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP EXTI sources to be disabled.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None

__HAL_ETH_WAKEUP_EXTI_GENERATE_SWIT

Description:

- Generates a Software interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP EXTI sources to be disabled.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None

28 HAL ETH Extension Driver

28.1 ETHEx Firmware driver registers structures

28.1.1 ETH_RxVLANConfigTypeDef

ETH_RxVLANConfigTypeDef is defined in the stm32h7xx_hal_eth_ex.h

Data Fields

- ***FunctionalState InnerVLANTagInStatus***
- ***uint32_t StripInnerVLANTag***
- ***FunctionalState InnerVLANTag***
- ***FunctionalState DoubleVLANProcessing***
- ***FunctionalState VLANTagHashTableMatch***
- ***FunctionalState VLANTagInStatus***
- ***uint32_t StripVLANTag***
- ***uint32_t VLANTypeCheck***
- ***FunctionalState VLANTagInverceMatch***

Field Documentation

- ***FunctionalState ETH_RxVLANConfigTypeDef::InnerVLANTagInStatus***
  Enables or disables Inner VLAN Tag in Rx Status
- ***uint32_t ETH_RxVLANConfigTypeDef::StripInnerVLANTag***
  Sets the Inner VLAN Tag Stripping on Receive This parameter can be a value of ***ETHEx_Rx_Inner_VLAN_Tag_Stripping***
- ***FunctionalState ETH_RxVLANConfigTypeDef::InnerVLANTag***
  Enables or disables Inner VLAN Tag
- ***FunctionalState ETH_RxVLANConfigTypeDef::DoubleVLANProcessing***
  Enable or Disable double VLAN processing
- ***FunctionalState ETH_RxVLANConfigTypeDef::VLANTagHashTableMatch***
  Enable or Disable VLAN Tag Hash Table Match
- ***FunctionalState ETH_RxVLANConfigTypeDef::VLANTagInStatus***
  Enable or Disable VLAN Tag in Rx status
- ***uint32_t ETH_RxVLANConfigTypeDef::StripVLANTag***
  Set the VLAN Tag Stripping on Receive This parameter can be a value of ***ETHEx_Rx_VLAN_Tag_Stripping***
- ***uint32_t ETH_RxVLANConfigTypeDef::VLANTypeCheck***
  Enable or Disable VLAN Type Check This parameter can be a value of ***ETHEx_VLAN_Type_Check***
- ***FunctionalState ETH_RxVLANConfigTypeDef::VLANTagInverceMatch***
  Enable or disable VLAN Tag Inverse Match

28.1.2 ETH_TxVLANConfigTypeDef

ETH_TxVLANConfigTypeDef is defined in the stm32h7xx_hal_eth_ex.h

Data Fields

- ***FunctionalState SourceTxDesc***
- ***FunctionalState SVLANType***
- ***uint32_t VLANTagControl***

Field Documentation

- ***FunctionalState ETH_TxVLANConfigTypeDef::SourceTxDesc***
  Enable or Disable VLAN tag source from DMA tx descriptors
- ***FunctionalState ETH_TxVLANConfigTypeDef::SVLANType***
  Enable or Disable insertion of SVLAN type
- ***uint32_t ETH_TxVLANConfigTypeDef::VLANTagControl***
  Sets the VLAN tag control in tx packets This parameter can be a value of ***ETHEx_VLAN_Tag_Control***

28.1.3 ETH_L3FilterConfigTypeDef

ETH_L3FilterConfigTypeDef is defined in the stm32h7xx_hal_eth_ex.h

Data Fields

- ***uint32_t Protocol***
- ***uint32_t SrcAddrFilterMatch***
- ***uint32_t DestAddrFilterMatch***
- ***uint32_t SrcAddrHigherBitsMatch***
- ***uint32_t DestAddrHigherBitsMatch***
- ***uint32_t Ip4SrcAddr***
- ***uint32_t Ip4DestAddr***
- ***uint32_t Ip6Addr***

Field Documentation

- ***uint32_t ETH_L3FilterConfigTypeDef::Protocol***
  Sets the L3 filter protocol to IPv4 or IPv6 This parameter can be a value of ***ETHEx_L3_Protocol***
- ***uint32_t ETH_L3FilterConfigTypeDef::SrcAddrFilterMatch***
  Sets the L3 filter source address match This parameter can be a value of ***ETHEx_L3_Source_Match***
- ***uint32_t ETH_L3FilterConfigTypeDef::DestAddrFilterMatch***
  Sets the L3 filter destination address match This parameter can be a value of ***ETHEx_L3_Destination_Match***
- ***uint32_t ETH_L3FilterConfigTypeDef::SrcAddrHigherBitsMatch***
  Sets the L3 filter source address higher bits match This parameter can be a value from 0 to 31
- ***uint32_t ETH_L3FilterConfigTypeDef::DestAddrHigherBitsMatch***
  Sets the L3 filter destination address higher bits match This parameter can be a value from 0 to 31
- ***uint32_t ETH_L3FilterConfigTypeDef::Ip4SrcAddr***
  Sets the L3 filter IPv4 source address if IPv4 protocol is used This parameter can be a value from 0x0 to 0xFFFFFFFF
- ***uint32_t ETH_L3FilterConfigTypeDef::Ip4DestAddr***
  Sets the L3 filter IPv4 destination address if IPv4 protocol is used This parameter can be a value from 0 to 0xFFFFFFFF
- ***uint32_t ETH_L3FilterConfigTypeDef::Ip6Addr[4]***
  Sets the L3 filter IPv6 address if IPv6 protocol is used This parameter must be a table of 4 words (4* 32 bits)

28.1.4 ETH_L4FilterConfigTypeDef

ETH_L4FilterConfigTypeDef is defined in the stm32h7xx_hal_eth_ex.h

Data Fields

- ***uint32_t Protocol***
- ***uint32_t SrcPortFilterMatch***
- ***uint32_t DestPortFilterMatch***
- ***uint32_t SourcePort***
- ***uint32_t DestinationPort***

Field Documentation

- ***uint32_t ETH_L4FilterConfigTypeDef::Protocol***
  Sets the L4 filter protocol to TCP or UDP This parameter can be a value of ***ETHEx_L4_Protocol***

- ***uint32_t ETH_L4FilterConfigTypeDef::SrcPortFilterMatch***
  Sets the L4 filter source port match This parameter can be a value of ***ETHEx_L4_Source_Match***
- ***uint32_t ETH_L4FilterConfigTypeDef::DestPortFilterMatch***
  Sets the L4 filter destination port match This parameter can be a value of ***ETHEx_L4_Destination_Match***
- ***uint32_t ETH_L4FilterConfigTypeDef::SourcePort***
  Sets the L4 filter source port This parameter must be a value from 0x0 to 0xFFFF
- ***uint32_t ETH_L4FilterConfigTypeDef::DestinationPort***
  Sets the L4 filter destination port This parameter must be a value from 0x0 to 0xFFFF

28.2 ETHEx Firmware driver API description

The following section lists the various functions of the ETHEx library.

28.2.1 Extended features functions

This section provides functions allowing to:

- Configure ARP offload module
- Configure L3 and L4 filters
- Configure Extended VLAN features
- Configure Energy Efficient Ethernet module

This section contains the following APIs:

- ***HAL_ETHEx_EnableARPOffload()***
- ***HAL_ETHEx_DisableARPOffload()***
- ***HAL_ETHEx_SetARPAddressMatch()***
- ***HAL_ETHEx_SetL4FilterConfig()***
- ***HAL_ETHEx_GetL4FilterConfig()***
- ***HAL_ETHEx_SetL3FilterConfig()***
- ***HAL_ETHEx_GetL3FilterConfig()***
- ***HAL_ETHEx_EnableL3L4Filtering()***
- ***HAL_ETHEx_DisableL3L4Filtering()***
- ***HAL_ETHEx_GetRxVLANConfig()***
- ***HAL_ETHEx_SetRxVLANConfig()***
- ***HAL_ETHEx_SetVLANHashTable()***
- ***HAL_ETHEx_GetTxVLANConfig()***
- ***HAL_ETHEx_SetTxVLANConfig()***
- ***HAL_ETHEx_SetTxVLANIdentifier()***
- ***HAL_ETHEx_EnableVLANProcessing()***
- ***HAL_ETHEx_DisableVLANProcessing()***
- ***HAL_ETHEx_EnterLPIMode()***
- ***HAL_ETHEx_ExitLPIMode()***
- ***HAL_ETHEx_GetMACLPIEvent()***

28.2.2 Detailed description of functions

HAL_ETHEx_EnableARPOffload

Function name

void HAL_ETHEx_EnableARPOffload (ETH_HandleTypeDef * heth)

Function description

Enables ARP Offload.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETHEx_DisableARPOffload

Function name

void HAL_ETHEx_DisableARPOffload (ETH_HandleTypeDef * heth)

Function description

Disables ARP Offload.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETHEx_SetARPAddressMatch

Function name

void HAL_ETHEx_SetARPAddressMatch (ETH_HandleTypeDef * heth, uint32_t IpAddress)

Function description

Set the ARP Match IP address.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **IpAddress:** IP Address to be matched for incoming ARP requests

Return values

- **None:**

HAL_ETHEx_EnableL3L4Filtering

Function name

void HAL_ETHEx_EnableL3L4Filtering (ETH_HandleTypeDef * heth)

Function description

Enables L3 and L4 filtering process.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None.:**

HAL_ETHEx_DisableL3L4Filtering

Function name

void HAL_ETHEx_DisableL3L4Filtering (ETH_HandleTypeDef * heth)

Function description

Disables L3 and L4 filtering process.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None.:**

HAL_ETHEx_GetL3FilterConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_GetL3FilterConfig (ETH_HandleTypeDef * heth, uint32_t Filter, ETH_L3FilterConfigTypeDef * pL3FilterConfig)

Function description

Configures the L3 Filter, this function allow to: set the layer 3 protocol to be matched (IPv4 or IPv6) enable/ disable L3 source/destination port perfect/inverse match.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **Filter:** L3 filter to configured, this parameter must be one of the following ETH_L3_FILTER_0 ETH_L3_FILTER_1
- **pL3FilterConfig:** pointer to a ETH_L3FilterConfigTypeDef structure that will contain the L3 filter configuration.

Return values

- **HAL:** status

HAL_ETHEx_GetL4FilterConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_GetL4FilterConfig (ETH_HandleTypeDef * heth, uint32_t Filter, ETH_L4FilterConfigTypeDef * pL4FilterConfig)

Function description

Configures the L4 Filter, this function allow to: set the layer 4 protocol to be matched (TCP or UDP) enable/ disable L4 source/destination port perfect/inverse match.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **Filter:** L4 filter to configured, this parameter must be one of the following ETH_L4_FILTER_0 ETH_L4_FILTER_1
- **pL4FilterConfig:** pointer to a ETH_L4FilterConfigTypeDef structure that contains L4 filter configuration.

Return values

- **HAL:** status

HAL_ETHEx_SetL3FilterConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_SetL3FilterConfig (ETH_HandleTypeDef * heth, uint32_t Filter, ETH_L3FilterConfigTypeDef * pL3FilterConfig)

Function description

Configures the L3 Filter, this function allow to: set the layer 3 protocol to be matched (IPv4 or IPv6) enable/ disable L3 source/destination port perfect/inverse match.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **Filter:** L3 filter to configured, this parameter must be one of the following ETH_L3_FILTER_0 ETH_L3_FILTER_1
- **pL3FilterConfig:** pointer to a ETH_L3FilterConfigTypeDef structure that contains L3 filter configuration.

Return values

- **HAL:** status

HAL_ETHEx_SetL4FilterConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_SetL4FilterConfig (ETH_HandleTypeDef * heth, uint32_t Filter, ETH_L4FilterConfigTypeDef * pL4FilterConfig)

Function description

Configures the L4 Filter, this function allow to: set the layer 4 protocol to be matched (TCP or UDP) enable/ disable L4 source/destination port perfect/inverse match.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **Filter:** L4 filter to configured, this parameter must be one of the following ETH_L4_FILTER_0 ETH_L4_FILTER_1
- **pL4FilterConfig:** pointer to a ETH_L4FilterConfigTypeDef structure that contains L4 filter configuration.

Return values

- **HAL:** status

HAL_ETHEx_EnableVLANProcessing

Function name

void HAL_ETHEx_EnableVLANProcessing (ETH_HandleTypeDef * heth)

Function description

Enables the VLAN Tag Filtering process.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None.:**

HAL_ETHEx_DisableVLANProcessing

Function name

void HAL_ETHEx_DisableVLANProcessing (ETH_HandleTypeDef * heth)

Function description

Disables the VLAN Tag Filtering process.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None.:**

HAL_ETHEx_GetRxVLANConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_GetRxVLANConfig (ETH_HandleTypeDef * heth, ETH_RxVLANConfigTypeDef * pVlanConfig)

Function description

Get the VLAN Configuration for Receive Packets.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pVlanConfig:** pointer to a ETH_RxVLANConfigTypeDef structure that will contain the VLAN filter configuration.

Return values

- **HAL:** status

HAL_ETHEx_SetRxVLANConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_SetRxVLANConfig (ETH_HandleTypeDef * heth, ETH_RxVLANConfigTypeDef * pVlanConfig)

Function description

Set the VLAN Configuration for Receive Packets.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pVlanConfig:** pointer to a ETH_RxVLANConfigTypeDef structure that contains VLAN filter configuration.

Return values

- **HAL:** status

HAL_ETHEx_SetVLANHashTable

Function name

void HAL_ETHEx_SetVLANHashTable (ETH_HandleTypeDef * heth, uint32_t VLANHashTable)

Function description

Set the VLAN Hash Table.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **VLANHashTable:** VLAN hash table 16 bit value

Return values

- **None:**

HAL_ETHEx_GetTxVLANConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_GetTxVLANConfig (ETH_HandleTypeDef * heth, uint32_t VLANTag, ETH_TxVLANConfigTypeDef * pVlanConfig)

Function description

Get the VLAN Configuration for Transmit Packets.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **VLANTag:** Selects the vlan tag, this parameter must be one of the following ETH_OUTER_TX_VLANTAG ETH_INNER_TX_VLANTAG
- **pVlanConfig:** pointer to a ETH_TxVLANConfigTypeDef structure that will contain the Tx VLAN filter configuration.

Return values

- **HAL:** Status.

HAL_ETHEx_SetTxVLANConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_SetTxVLANConfig (ETH_HandleTypeDef * heth, uint32_t VLANTag, ETH_TxVLANConfigTypeDef * pVlanConfig)

Function description

Set the VLAN Configuration for Transmit Packets.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **VLANTag:** Selects the vlan tag, this parameter must be one of the following ETH_OUTER_TX_VLANTAG ETH_INNER_TX_VLANTAG
- **pVlanConfig:** pointer to a ETH_TxVLANConfigTypeDef structure that contains Tx VLAN filter configuration.

Return values

- **HAL:** Status

HAL_ETHEx_SetTxVLANIdentifier

Function name

void HAL_ETHEx_SetTxVLANIdentifier (ETH_HandleTypeDef * heth, uint32_t VLANTag, uint32_t VLANIdentifier)

Function description

Set the VLAN Tag Identifier for Transmit Packets.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **VLANTag:** Selects the vlan tag, this parameter must be one of the following ETH_OUTER_TX_VLANTAG ETH_INNER_TX_VLANTAG
- **VLANIdentifier:** VLAN Identifier 16 bit value

Return values

- **None:**

HAL_ETHEx_EnterLPIMode

Function name

void HAL_ETHEx_EnterLPIMode (ETH_HandleTypeDef * heth, FunctionalState TxAutomate, FunctionalState TxClockStop)

Function description

Enters the Low Power Idle (LPI) mode.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **TxAutomate:** Enable/Disable automate enter/exit LPI mode.
- **TxClockStop:** Enable/Disable Tx clock stop in LPI mode.

Return values

- **None:**

HAL_ETHEx_ExitLPIMode

Function name

void HAL_ETHEx_ExitLPIMode (ETH_HandleTypeDef * heth)

Function description

Exits the Low Power Idle (LPI) mode.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETHEx_GetMACLPIEvent

Function name

uint32_t HAL_ETHEx_GetMACLPIEvent (ETH_HandleTypeDef * heth)

Function description

Returns the ETH MAC LPI event.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **ETH:** MAC WakeUp event

28.3 ETHEx Firmware driver defines

29 HAL EXTI Generic Driver

29.1 EXTI Firmware driver registers structures

29.1.1 EXTI_HandleTypeDef

EXTI_HandleTypeDef is defined in the stm32h7xx_hal_exti.h

Data Fields

- ***uint32_t Line***
- ***void(* PendingCallback***

Field Documentation

- ***uint32_t EXTI_HandleTypeDef::Line***
  Exti line number
- ***void(* EXTI_HandleTypeDef::PendingCallback)(void)***
  Exti pending callback

29.1.2 EXTI_ConfigTypeDef

EXTI_ConfigTypeDef is defined in the stm32h7xx_hal_exti.h

Data Fields

- ***uint32_t Line***
- ***uint32_t Mode***
- ***uint32_t Trigger***
- ***uint32_t GPIOSel***
- ***uint32_t PendClearSource***

Field Documentation

- ***uint32_t EXTI_ConfigTypeDef::Line***
  The Exti line to be configured. This parameter can be a value of ***EXTI_Line***
- ***uint32_t EXTI_ConfigTypeDef::Mode***
  The Exit Mode to be configured for a core. This parameter can be a combination of ***EXTI_Mode***
- ***uint32_t EXTI_ConfigTypeDef::Trigger***
  The Exti Trigger to be configured. This parameter can be a value of ***EXTI_Trigger***
- ***uint32_t EXTI_ConfigTypeDef::GPIOSel***
  The Exti GPIO multiplexer selection to be configured. This parameter is only possible for line 0 to 15. It can be a value of ***EXTI_GPIOSel***
- ***uint32_t EXTI_ConfigTypeDef::PendClearSource***
  Specifies the event pending clear source for D3/SRD domain. This parameter can be a value of ***EXTI_PendClear_Source***

29.2 EXTI Firmware driver API description

The following section lists the various functions of the EXTI library.

29.2.1 EXTI Peripheral features

- Each Exti line can be configured within this driver.

- Exti line can be configured in 3 different modes
  - Interrupt (CORE1 or CORE2 in case of dual core line)
  - Event (CORE1 or CORE2 in case of dual core line)
  - a combination of the previous
- Configurable Exti lines can be configured with 3 different triggers
  - Rising
  - Falling
  - Both of them
- When set in interrupt mode, configurable Exti lines have two diffenrents interrupt pending registers which allow to distinguish which transition occurs:
  - Rising edge pending interrupt
  - Falling
- Exti lines 0 to 15 are linked to gpio pin number 0 to 15. Gpio port can be selected through multiplexer.
- PendClearSource used to set the D3 Smart Run Domain autoamtic pend clear source. It is applicable for line with wkaeup target is Any (CPU1 , CPU2 and D3 smart run domain). Value can be one of the following:
  - EXTI_D3_PENDCLR_SRC_NONE : no pend clear source is selected : In this case corresponding bit of D2PMRx register is set to 0
    - On a configurable Line : the D3 domain wakeup signal is automatically cleared after after the Delay + Rising Edge detect
    - On a direct Line : the D3 domain wakeup signal is cleared after the direct event input signal is cleared
  - EXTI_D3_PENDCLR_SRC_DMACH6 : no pend clear source is selected : In this case corresponding bit of D2PMRx register is set to 1 and corresponding bits(2) of D3PCRxL/H is set to b00 : DMA ch6 event selected as D3 domain pendclear source
  - EXTI_D3_PENDCLR_SRC_DMACH7 : no pend clear source is selected : In this case corresponding bit of D2PMRx register is set to 1 and corresponding bits(2) of D3PCRxL/H is set to b01 : DMA ch7 event selected as D3 domain pendclear source
  - EXTI_D3_PENDCLR_SRC_LPTIM4 : no pend clear source is selected : In this case corresponding bit of D2PMRx register is set to 1 and corresponding bits(2) of D3PCRxL/H is set to b10 : LPTIM4 out selected as D3 domain pendclear source
  - EXTI_D3_PENDCLR_SRC_LPTIM5 : no pend clear source is selected : In this case corresponding bit of D2PMRx register is set to 1 and corresponding bits(2) of D3PCRxL/H is set to b11 : LPTIM5 out selected as D3 domain pendclear source

29.2.2 How to use this driver

1. Configure the EXTI line using HAL_EXTI_SetConfigLine().
   - Choose the interrupt line number by setting "Line" member from EXTI_ConfigTypeDef structure.
   - Configure the interrupt and/or event mode using "Mode" member from EXTI_ConfigTypeDef structure.
   - For configurable lines, configure rising and/or falling trigger "Trigger" member from EXTI_ConfigTypeDef structure.
   - For Exti lines linked to gpio, choose gpio port using "GPIOSel" member from GPIO_InitTypeDef structure.
   - For Exti lines with wkaeup target is Any (CPU1 , CPU2 and D3 smart run domain), choose gpio D3 PendClearSource using PendClearSource member from EXTI_PendClear_Source structure.
2. Get current Exti configuration of a dedicated line using HAL_EXTI_GetConfigLine().
   - Provide exiting handle as parameter.
   - Provide pointer on EXTI_ConfigTypeDef structure as second parameter.
3. Clear Exti configuration of a dedicated line using HAL_EXTI_GetConfigLine().
   - Provide exiting handle as parameter.

4. Register callback to treat Exti interrupts using HAL_EXTI_RegisterCallback().
   – Provide exiting handle as first parameter.
   – Provide which callback will be registered using one value from EXTI_CallbackIDTypeDef.
   – Provide callback function pointer.
5. Get interrupt pending bit using HAL_EXTI_GetPending().
6. Clear interrupt pending bit using HAL_EXTI_GetPending().
7. Generate software interrupt using HAL_EXTI_GenerateSWI().

29.2.3 Configuration functions

This section contains the following APIs:

- *HAL_EXTI_SetConfigLine()*
- *HAL_EXTI_GetConfigLine()*
- *HAL_EXTI_ClearConfigLine()*
- *HAL_EXTI_RegisterCallback()*
- *HAL_EXTI_GetHandle()*

29.2.4 Detailed description of functions

HAL_EXTI_SetConfigLine

Function name

HAL_StatusTypeDef HAL_EXTI_SetConfigLine (EXTI_HandleTypeDef * hexti, EXTI_ConfigTypeDef * pExtiConfig)

Function description

Set configuration of a dedicated Exti line.

Parameters

- **hexti:** Exti handle.
- **pExtiConfig:** Pointer on EXTI configuration to be set.

Return values

- **HAL:** Status.

HAL_EXTI_GetConfigLine

Function name

HAL_StatusTypeDef HAL_EXTI_GetConfigLine (EXTI_HandleTypeDef * hexti, EXTI_ConfigTypeDef * pExtiConfig)

Function description

Get configuration of a dedicated Exti line.

Parameters

- **hexti:** Exti handle.
- **pExtiConfig:** Pointer on structure to store Exti configuration.

Return values

- **HAL:** Status.

HAL_EXTI_ClearConfigLine

Function name

HAL_StatusTypeDef HAL_EXTI_ClearConfigLine (EXTI_HandleTypeDef * hexti)

Function description

Clear whole configuration of a dedicated Exti line.

Parameters

- **hexti:** Exti handle.

Return values

- **HAL:** Status.

HAL_EXTI_RegisterCallback

Function name

HAL_StatusTypeDef HAL_EXTI_RegisterCallback (EXTI_HandleTypeDef * hexti, EXTI_CallbackIDTypeDef CallbackID, void(*)(void) pPendingCbfn)

Function description

Register callback for a dedicated Exti line.

Parameters

- **hexti:** Exti handle.
- **CallbackID:** User callback identifier. This parameter can be one of
  - EXTI_CallbackIDTypeDef values.
- **pPendingCbfn:** function pointer to be stored as callback.

Return values

- **HAL:** Status.

HAL_EXTI_GetHandle

Function name

HAL_StatusTypeDef HAL_EXTI_GetHandle (EXTI_HandleTypeDef * hexti, uint32_t ExtiLine)

Function description

Store line number as handle private field.

Parameters

- **hexti:** Exti handle.
- **ExtiLine:** Exti line number. This parameter can be from 0 to EXTI_LINE_NB.

Return values

- **HAL:** Status.

HAL_EXTI_IRQHandler

Function name

void HAL_EXTI_IRQHandler (EXTI_HandleTypeDef * hexti)

Function description

Handle EXTI interrupt request.

Parameters

- **hexti:** Exti handle.

Return values

- **none.:**

HAL_EXTI_GetPending

Function name

uint32_t HAL_EXTI_GetPending (EXTI_HandleTypeDef * hexti, uint32_t Edge)

Function description

Get interrupt pending bit of a dedicated line.

Parameters

- **hexti:** Exti handle.
- **Edge:** Specify which pending edge as to be checked. This parameter can be one of the following values:
  – EXTI_TRIGGER_RISING_FALLING This parameter is kept for compatibility with other series.

Return values

- **1:** if interrupt is pending else 0.

HAL_EXTI_ClearPending

Function name

void HAL_EXTI_ClearPending (EXTI_HandleTypeDef * hexti, uint32_t Edge)

Function description

Clear interrupt pending bit of a dedicated line.

Parameters

- **hexti:** Exti handle.
- **Edge:** Specify which pending edge as to be clear. This parameter can be one of the following values:
  – EXTI_TRIGGER_RISING_FALLING This parameter is kept for compatibility with other series.

Return values

- **None.:**

HAL_EXTI_GenerateSWI

Function name

void HAL_EXTI_GenerateSWI (EXTI_HandleTypeDef * hexti)

Function description

Generate a software interrupt for a dedicated line.

Parameters

- **hexti:** Exti handle.

Return values

- **None.:**

- ***uint32_t TxElmtSize***

Field Documentation

- ***uint32_t FDCAN_InitTypeDef::FrameFormat***
  Specifies the FDCAN frame format. This parameter can be a value of ***FDCAN_frame_format***
- ***uint32_t FDCAN_InitTypeDef::Mode***
  Specifies the FDCAN mode. This parameter can be a value of ***FDCAN_operating_mode***
- ***FunctionalState FDCAN_InitTypeDef::AutoRetransmission***
  Enable or disable the automatic retransmission mode. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState FDCAN_InitTypeDef::TransmitPause***
  Enable or disable the Transmit Pause feature. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState FDCAN_InitTypeDef::ProtocolException***
  Enable or disable the Protocol Exception Handling. This parameter can be set to ENABLE or DISABLE

- ***uint32_t FDCAN_InitTypeDef::NominalPrescaler***
  Specifies the value by which the oscillator frequency is divided for generating the nominal bit time quanta. This parameter must be a number between 1 and 512
- ***uint32_t FDCAN_InitTypeDef::NominalSyncJumpWidth***
  Specifies the maximum number of time quanta the FDCAN hardware is allowed to lengthen or shorten a bit to perform resynchronization. This parameter must be a number between 1 and 128
- ***uint32_t FDCAN_InitTypeDef::NominalTimeSeg1***
  Specifies the number of time quanta in Bit Segment 1. This parameter must be a number between 2 and 256
- ***uint32_t FDCAN_InitTypeDef::NominalTimeSeg2***
  Specifies the number of time quanta in Bit Segment 2. This parameter must be a number between 2 and 128
- ***uint32_t FDCAN_InitTypeDef::DataPrescaler***
  Specifies the value by which the oscillator frequency is divided for generating the data bit time quanta. This parameter must be a number between 1 and 32
- ***uint32_t FDCAN_InitTypeDef::DataSyncJumpWidth***
  Specifies the maximum number of time quanta the FDCAN hardware is allowed to lengthen or shorten a data bit to perform resynchronization. This parameter must be a number between 1 and 16
- ***uint32_t FDCAN_InitTypeDef::DataTimeSeg1***
  Specifies the number of time quanta in Data Bit Segment 1. This parameter must be a number between 1 and 32
- ***uint32_t FDCAN_InitTypeDef::DataTimeSeg2***
  Specifies the number of time quanta in Data Bit Segment 2. This parameter must be a number between 1 and 16
- ***uint32_t FDCAN_InitTypeDef::MessageRAMOffset***
  Specifies the message RAM start address. This parameter must be a number between 0 and 2560
- ***uint32_t FDCAN_InitTypeDef::StdFiltersNbr***
  Specifies the number of standard Message ID filters. This parameter must be a number between 0 and 128
- ***uint32_t FDCAN_InitTypeDef::ExtFiltersNbr***
  Specifies the number of extended Message ID filters. This parameter must be a number between 0 and 64
- ***uint32_t FDCAN_InitTypeDef::RxFifo0ElmtsNbr***
  Specifies the number of Rx FIFO0 Elements. This parameter must be a number between 0 and 64
- ***uint32_t FDCAN_InitTypeDef::RxFifo0ElmtSize***
  Specifies the Data Field Size in an Rx FIFO 0 element. This parameter can be a value of ***FDCAN_data_field_size***
- ***uint32_t FDCAN_InitTypeDef::RxFifo1ElmtsNbr***
  Specifies the number of Rx FIFO 1 Elements. This parameter must be a number between 0 and 64
- ***uint32_t FDCAN_InitTypeDef::RxFifo1ElmtSize***
  Specifies the Data Field Size in an Rx FIFO 1 element. This parameter can be a value of ***FDCAN_data_field_size***
- ***uint32_t FDCAN_InitTypeDef::RxBuffersNbr***
  Specifies the number of Dedicated Rx Buffer elements. This parameter must be a number between 0 and 64
- ***uint32_t FDCAN_InitTypeDef::RxBufferSize***
  Specifies the Data Field Size in an Rx Buffer element. This parameter can be a value of ***FDCAN_data_field_size***
- ***uint32_t FDCAN_InitTypeDef::TxEventsNbr***
  Specifies the number of Tx Event FIFO elements. This parameter must be a number between 0 and 32
- ***uint32_t FDCAN_InitTypeDef::TxBuffersNbr***
  Specifies the number of Dedicated Tx Buffers. This parameter must be a number between 0 and 32
- ***uint32_t FDCAN_InitTypeDef::TxFifoQueueElmtsNbr***
  Specifies the number of Tx Buffers used for Tx FIFO/Queue. This parameter must be a number between 0 and 32
- ***uint32_t FDCAN_InitTypeDef::TxFifoQueueMode***
  Tx FIFO/Queue Mode selection. This parameter can be a value of ***FDCAN_txFifoQueue_Mode***

- ***uint32_t FDCAN_InitTypeDef::TxElmtSize***
  Specifies the Data Field Size in a Tx Element. This parameter can be a value of ***FDCAN_data_field_size***

30.1.2 FDCAN_ClkCalUnitTypeDef

FDCAN_ClkCalUnitTypeDef is defined in the stm32h7xx_hal_fdcan.h

Data Fields

- ***uint32_t ClockCalibration***
- ***uint32_t ClockDivider***
- ***uint32_t MinOscClkPeriods***
- ***uint32_t CalFieldLength***
- ***uint32_t TimeQuantaPerBitTime***
- ***uint32_t WatchdogStartValue***

Field Documentation

- ***uint32_t FDCAN_ClkCalUnitTypeDef::ClockCalibration***
  Enable or disable the clock calibration. This parameter can be a value of ***FDCAN_clock_calibration***.
- ***uint32_t FDCAN_ClkCalUnitTypeDef::ClockDivider***
  Specifies the FDCAN kernel clock divider when the clock calibration is bypassed. This parameter can be a value of ***FDCAN_clock_divider***
- ***uint32_t FDCAN_ClkCalUnitTypeDef::MinOscClkPeriods***
  Configures the minimum number of periods in two CAN bit times. The actual configured number of periods is MinOscClkPeriods x 32. This parameter must be a number between 0x00 and 0xFF
- ***uint32_t FDCAN_ClkCalUnitTypeDef::CalFieldLength***
  Specifies the calibration field length. This parameter can be a value of ***FDCAN_calibration_field_length***
- ***uint32_t FDCAN_ClkCalUnitTypeDef::TimeQuantaPerBitTime***
  Configures the number of time quanta per bit time. This parameter must be a number between 4 and 25
- ***uint32_t FDCAN_ClkCalUnitTypeDef::WatchdogStartValue***
  Start value of the Calibration Watchdog Counter. If set to zero the counter is disabled. This parameter must be a number between 0x0000 and 0xFFFF

30.1.3 FDCAN_FilterTypeDef

FDCAN_FilterTypeDef is defined in the stm32h7xx_hal_fdcan.h

Data Fields

- ***uint32_t IdType***
- ***uint32_t FilterIndex***
- ***uint32_t FilterType***
- ***uint32_t FilterConfig***
- ***uint32_t FilterID1***
- ***uint32_t FilterID2***
- ***uint32_t RxBufferIndex***
- ***uint32_t IsCalibrationMsg***

Field Documentation

- ***uint32_t FDCAN_FilterTypeDef::IdType***
  Specifies the identifier type. This parameter can be a value of ***FDCAN_id_type***
- ***uint32_t FDCAN_FilterTypeDef::FilterIndex***
  Specifies the filter which will be initialized. This parameter must be a number between:
  – 0 and 127, if IdType is FDCAN_STANDARD_ID
  – 0 and 63, if IdType is FDCAN_EXTENDED_ID

- ***uint32_t FDCAN_FilterTypeDef::FilterType***

  Specifies the filter type. This parameter can be a value of ***FDCAN_filter_type***. The value FDCAN_EXT_FILTER_RANGE_NO_EIDM is permitted only when IdType is FDCAN_EXTENDED_ID. This parameter is ignored if FilterConfig is set to FDCAN_FILTER_TO_RXBUFFER
- ***uint32_t FDCAN_FilterTypeDef::FilterConfig***

  Specifies the filter configuration. This parameter can be a value of ***FDCAN_filter_config***
- ***uint32_t FDCAN_FilterTypeDef::FilterID1***

  Specifies the filter identification 1. This parameter must be a number between:
  - 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  - 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_FilterTypeDef::FilterID2***

  Specifies the filter identification 2. This parameter is ignored if FilterConfig is set to FDCAN_FILTER_TO_RXBUFFER. This parameter must be a number between:
  - 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  - 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_FilterTypeDef::RxBufferIndex***

  Contains the index of the Rx buffer in which the matching message will be stored. This parameter must be a number between 0 and 63. This parameter is ignored if FilterConfig is different from FDCAN_FILTER_TO_RXBUFFER
- ***uint32_t FDCAN_FilterTypeDef::IsCalibrationMsg***

  Specifies whether the filter is configured for calibration messages. This parameter is ignored if FilterConfig is different from FDCAN_FILTER_TO_RXBUFFER. This parameter can be:
  - 0 : ordinary message
  - 1 : calibration message

30.1.4 FDCAN_TxHeaderTypeDef

FDCAN_TxHeaderTypeDef is defined in the stm32h7xx_hal_fdcan.h

Data Fields

- ***uint32_t Identifier***
- ***uint32_t IdType***
- ***uint32_t TxFrameType***
- ***uint32_t DataLength***
- ***uint32_t ErrorStateIndicator***
- ***uint32_t BitRateSwitch***
- ***uint32_t FDFormat***
- ***uint32_t TxEventFifoControl***
- ***uint32_t MessageMarker***

Field Documentation

- ***uint32_t FDCAN_TxHeaderTypeDef::Identifier***

  Specifies the identifier. This parameter must be a number between:
  - 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  - 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_TxHeaderTypeDef::IdType***

  Specifies the identifier type for the message that will be transmitted. This parameter can be a value of ***FDCAN_id_type***
- ***uint32_t FDCAN_TxHeaderTypeDef::TxFrameType***

  Specifies the frame type of the message that will be transmitted. This parameter can be a value of ***FDCAN_frame_type***
- ***uint32_t FDCAN_TxHeaderTypeDef::DataLength***

  Specifies the length of the frame that will be transmitted. This parameter can be a value of ***FDCAN_data_length_code***

- ***uint32_t FDCAN_TxHeaderTypeDef::ErrorStateIndicator***
  Specifies the error state indicator. This parameter can be a value of ***FDCAN_error_state_indicator***
- ***uint32_t FDCAN_TxHeaderTypeDef::BitRateSwitch***
  Specifies whether the Tx frame will be transmitted with or without bit rate switching. This parameter can be a value of ***FDCAN_bit_rate_switching***
- ***uint32_t FDCAN_TxHeaderTypeDef::FDFormat***
  Specifies whether the Tx frame will be transmitted in classic or FD format. This parameter can be a value of ***FDCAN_format***
- ***uint32_t FDCAN_TxHeaderTypeDef::TxEventFifoControl***
  Specifies the event FIFO control. This parameter can be a value of ***Section 30.3.1 FDCAN_EFC***
- ***uint32_t FDCAN_TxHeaderTypeDef::MessageMarker***
  Specifies the message marker to be copied into Tx Event FIFO element for identification of Tx message status. This parameter must be a number between 0 and 0xFF

30.1.5 FDCAN_RxHeaderTypeDef

FDCAN_RxHeaderTypeDef is defined in the stm32h7xx_hal_fdcan.h

Data Fields

- ***uint32_t Identifier***
- ***uint32_t IdType***
- ***uint32_t RxFrameType***
- ***uint32_t DataLength***
- ***uint32_t ErrorStateIndicator***
- ***uint32_t BitRateSwitch***
- ***uint32_t FDFormat***
- ***uint32_t RxTimestamp***
- ***uint32_t FilterIndex***
- ***uint32_t IsFilterMatchingFrame***

Field Documentation

- ***uint32_t FDCAN_RxHeaderTypeDef::Identifier***
  Specifies the identifier. This parameter must be a number between:
  – 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  – 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_RxHeaderTypeDef::IdType***
  Specifies the identifier type of the received message. This parameter can be a value of ***FDCAN_id_type***
- ***uint32_t FDCAN_RxHeaderTypeDef::RxFrameType***
  Specifies the the received message frame type. This parameter can be a value of ***FDCAN_frame_type***
- ***uint32_t FDCAN_RxHeaderTypeDef::DataLength***
  Specifies the received frame length. This parameter can be a value of ***FDCAN_data_length_code***
- ***uint32_t FDCAN_RxHeaderTypeDef::ErrorStateIndicator***
  Specifies the error state indicator. This parameter can be a value of ***FDCAN_error_state_indicator***
- ***uint32_t FDCAN_RxHeaderTypeDef::BitRateSwitch***
  Specifies whether the Rx frame is received with or without bit rate switching. This parameter can be a value of ***FDCAN_bit_rate_switching***
- ***uint32_t FDCAN_RxHeaderTypeDef::FDFormat***
  Specifies whether the Rx frame is received in classic or FD format. This parameter can be a value of ***FDCAN_format***
- ***uint32_t FDCAN_RxHeaderTypeDef::RxTimestamp***
  Specifies the timestamp counter value captured on start of frame reception. This parameter must be a number between 0 and 0xFFFF

- ***uint32_t FDCAN_RxHeaderTypeDef::FilterIndex***

  Specifies the index of matching Rx acceptance filter element. This parameter must be a number between:
  - 0 and 127, if IdType is FDCAN_STANDARD_ID
  - 0 and 63, if IdType is FDCAN_EXTENDED_ID When the frame is a Non-Filter matching frame, this parameter is unused.
- ***uint32_t FDCAN_RxHeaderTypeDef::IsFilterMatchingFrame***

  Specifies whether the accepted frame did not match any Rx filter. Acceptance of non-matching frames may be enabled via **HAL_FDCAN_ConfigGlobalFilter()**. This parameter takes 0 if the frame matched an Rx filter or 1 if it did not match any Rx filter

30.1.6 FDCAN_TxEventFifoTypeDef

FDCAN_TxEventFifoTypeDef is defined in the stm32h7xx_hal_fdcan.h

Data Fields

- ***uint32_t Identifier***
- ***uint32_t IdType***
- ***uint32_t TxFrameType***
- ***uint32_t DataLength***
- ***uint32_t ErrorStateIndicator***
- ***uint32_t BitRateSwitch***
- ***uint32_t FDFormat***
- ***uint32_t TxTimestamp***
- ***uint32_t MessageMarker***
- ***uint32_t EventType***

Field Documentation

- ***uint32_t FDCAN_TxEventFifoTypeDef::Identifier***

  Specifies the identifier. This parameter must be a number between:
  - 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  - 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_TxEventFifoTypeDef::IdType***

  Specifies the identifier type for the transmitted message. This parameter can be a value of ***FDCAN_id_type***
- ***uint32_t FDCAN_TxEventFifoTypeDef::TxFrameType***

  Specifies the frame type of the transmitted message. This parameter can be a value of ***FDCAN_frame_type***
- ***uint32_t FDCAN_TxEventFifoTypeDef::DataLength***

  Specifies the length of the transmitted frame. This parameter can be a value of ***FDCAN_data_length_code***
- ***uint32_t FDCAN_TxEventFifoTypeDef::ErrorStateIndicator***

  Specifies the error state indicator. This parameter can be a value of ***FDCAN_error_state_indicator***
- ***uint32_t FDCAN_TxEventFifoTypeDef::BitRateSwitch***

  Specifies whether the Tx frame is transmitted with or without bit rate switching. This parameter can be a value of ***FDCAN_bit_rate_switching***
- ***uint32_t FDCAN_TxEventFifoTypeDef::FDFormat***

  Specifies whether the Tx frame is transmitted in classic or FD format. This parameter can be a value of ***FDCAN_format***
- ***uint32_t FDCAN_TxEventFifoTypeDef::TxTimestamp***

  Specifies the timestamp counter value captured on start of frame transmission. This parameter must be a number between 0 and 0xFFFF
- ***uint32_t FDCAN_TxEventFifoTypeDef::MessageMarker***

  Specifies the message marker copied into Tx Event FIFO element for identification of Tx message status. This parameter must be a number between 0 and 0xFF
- ***uint32_t FDCAN_TxEventFifoTypeDef::EventType***

  Specifies the event type. This parameter can be a value of ***FDCAN_event_type***

30.1.7 FDCAN_HpMsgStatusTypeDef

FDCAN_HpMsgStatusTypeDef is defined in the stm32h7xx_hal_fdcan.h

Data Fields

- ***uint32_t FilterList***
- ***uint32_t FilterIndex***
- ***uint32_t MessageStorage***
- ***uint32_t MessageIndex***

Field Documentation

- ***uint32_t FDCAN_HpMsgStatusTypeDef::FilterList***
  Specifies the filter list of the matching filter element. This parameter can be:
  – 0 : Standard Filter List
  – 1 : Extended Filter List
- ***uint32_t FDCAN_HpMsgStatusTypeDef::FilterIndex***
  Specifies the index of matching filter element. This parameter can be a number between:
  – 0 and 127, if FilterList is 0 (Standard)
  – 0 and 63, if FilterList is 1 (Extended)
- ***uint32_t FDCAN_HpMsgStatusTypeDef::MessageStorage***
  Specifies the HP Message Storage. This parameter can be a value of ***FDCAN_hp_msg_storage***
- ***uint32_t FDCAN_HpMsgStatusTypeDef::MessageIndex***
  Specifies the Index of Rx FIFO element to which the message was stored. This parameter is valid only when MessageStorage is: FDCAN_HP_STORAGE_RXFIFO0 or FDCAN_HP_STORAGE_RXFIFO1

30.1.8 FDCAN_ProtocolStatusTypeDef

FDCAN_ProtocolStatusTypeDef is defined in the stm32h7xx_hal_fdcan.h

Data Fields

- ***uint32_t LastErrorCode***
- ***uint32_t DataLastErrorCode***
- ***uint32_t Activity***
- ***uint32_t ErrorPassive***
- ***uint32_t Warning***
- ***uint32_t BusOff***
- ***uint32_t RxESIflag***
- ***uint32_t RxBRSflag***
- ***uint32_t RxFDFflag***
- ***uint32_t ProtocolException***
- ***uint32_t TDCvalue***

Field Documentation

- ***uint32_t FDCAN_ProtocolStatusTypeDef::LastErrorCode***
  Specifies the type of the last error that occurred on the FDCAN bus. This parameter can be a value of ***FDCAN_protocol_error_code***
- ***uint32_t FDCAN_ProtocolStatusTypeDef::DataLastErrorCode***
  Specifies the type of the last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. This parameter can be a value of ***FDCAN_protocol_error_code***
- ***uint32_t FDCAN_ProtocolStatusTypeDef::Activity***
  Specifies the FDCAN module communication state. This parameter can be a value of ***FDCAN_communication_state***
- ***uint32_t FDCAN_ProtocolStatusTypeDef::ErrorPassive***
  Specifies the FDCAN module error status. This parameter can be:
  – 0 : The FDCAN is in Error_Active state
  – 1 : The FDCAN is in Error_Passive state

- ***uint32_t FDCAN_ProtocolStatusTypeDef::Warning***
  Specifies the FDCAN module warning status. This parameter can be:
  – 0 : error counters (RxErrorCnt and TxErrorCnt) are below the Error_Warning limit of 96
  – 1 : at least one of error counters has reached the Error_Warning limit of 96
- ***uint32_t FDCAN_ProtocolStatusTypeDef::BusOff***
  Specifies the FDCAN module Bus_Off status. This parameter can be:
  – 0 : The FDCAN is not in Bus_Off state
  – 1 : The FDCAN is in Bus_Off state
- ***uint32_t FDCAN_ProtocolStatusTypeDef::RxESIflag***
  Specifies ESI flag of last received CAN FD message. This parameter can be:
  – 0 : Last received CAN FD message did not have its ESI flag set
  – 1 : Last received CAN FD message had its ESI flag set
- ***uint32_t FDCAN_ProtocolStatusTypeDef::RxBRSflag***
  Specifies BRS flag of last received CAN FD message. This parameter can be:
  – 0 : Last received CAN FD message did not have its BRS flag set
  – 1 : Last received CAN FD message had its BRS flag set
- ***uint32_t FDCAN_ProtocolStatusTypeDef::RxFDFflag***
  Specifies if CAN FD message (FDF flag set) has been received since last protocol status. This parameter can be:
  – 0 : no CAN FD message received
  – 1 : CAN FD message received
- ***uint32_t FDCAN_ProtocolStatusTypeDef::ProtocolException***
  Specifies the FDCAN module Protocol Exception status. This parameter can be:
  – 0 : No protocol exception event occurred since last read access
  – 1 : Protocol exception event occurred
- ***uint32_t FDCAN_ProtocolStatusTypeDef::TDCvalue***
  Specifies the Transmitter Delay Compensation Value. This parameter can be a number between 0 and 127

30.1.9 FDCAN_ErrorCountersTypeDef

FDCAN_ErrorCountersTypeDef is defined in the stm32h7xx_hal_fdcan.h

Data Fields

- ***uint32_t TxErrorCnt***
- ***uint32_t RxErrorCnt***
- ***uint32_t RxErrorPassive***
- ***uint32_t ErrorLogging***

Field Documentation

- ***uint32_t FDCAN_ErrorCountersTypeDef::TxErrorCnt***
  Specifies the Transmit Error Counter Value. This parameter can be a number between 0 and 255
- ***uint32_t FDCAN_ErrorCountersTypeDef::RxErrorCnt***
  Specifies the Receive Error Counter Value. This parameter can be a number between 0 and 127
- ***uint32_t FDCAN_ErrorCountersTypeDef::RxErrorPassive***
  Specifies the Receive Error Passive status. This parameter can be:
  – 0 : The Receive Error Counter (RxErrorCnt) is below the error passive level of 128
  – 1 : The Receive Error Counter (RxErrorCnt) has reached the error passive level of 128
- ***uint32_t FDCAN_ErrorCountersTypeDef::ErrorLogging***
  Specifies the Transmit/Receive error logging counter value. This parameter can be a number between 0 and 255. This counter is incremented each time when a FDCAN protocol error causes the TxErrorCnt or the RxErrorCnt to be incremented. The counter stops at 255; the next increment of TxErrorCnt or RxErrorCnt sets interrupt flag FDCAN_FLAG_ERROR_LOGGING_OVERFLOW

30.1.10 FDCAN_TT_ConfigTypeDef

FDCAN_TT_ConfigTypeDef is defined in the stm32h7xx_hal_fdcan.h

Data Fields

- ***uint32_t OperationMode***
- ***uint32_t GapEnable***
- ***uint32_t TimeMaster***
- ***uint32_t SyncDevLimit***
- ***uint32_t InitRefTrigOffset***
- ***uint32_t ExternalClkSync***
- ***uint32_t AppWdgLimit***
- ***uint32_t GlobalTimeFilter***
- ***uint32_t ClockCalibration***
- ***uint32_t EvtTrigPolarity***
- ***uint32_t BasicCyclesNbr***
- ***uint32_t CycleStartSync***
- ***uint32_t TxEnableWindow***
- ***uint32_t ExpTxTrigNbr***
- ***uint32_t TURNumerator***
- ***uint32_t TURDenominator***
- ***uint32_t TriggerMemoryNbr***
- ***uint32_t StopWatchTrigSel***
- ***uint32_t EventTrigSel***

Field Documentation

- ***uint32_t FDCAN_TT_ConfigTypeDef::OperationMode***

  Specifies the FDCAN Operation Mode. This parameter can be a value of ***FDCAN_operation_mode***
- ***uint32_t FDCAN_TT_ConfigTypeDef::GapEnable***

  Specifies the FDCAN TT Operation. This parameter can be a value of ***FDCAN_TT_operation***. This parameter is ignored if OperationMode is set to FDCAN_TT_COMMUNICATION_LEVEL0
- ***uint32_t FDCAN_TT_ConfigTypeDef::TimeMaster***

  Specifies whether the instance is a slave or a potential master. This parameter can be a value of ***FDCAN_TT_time_master***
- ***uint32_t FDCAN_TT_ConfigTypeDef::SyncDevLimit***

  Specifies the Synchronization Deviation Limit SDL of the TUR numerator : TUR = (Numerator +/- SDL) / Denominator. With : SDL = 2^(SyncDevLimit+5). This parameter must be a number between 0 and 7
- ***uint32_t FDCAN_TT_ConfigTypeDef::InitRefTrigOffset***

  Specifies the Initial Reference Trigger Offset. This parameter must be a number between 0 and 127
- ***uint32_t FDCAN_TT_ConfigTypeDef::ExternalClkSync***

  Enable or disable External Clock Synchronization. This parameter can be a value of ***FDCAN_TT_external_clk_sync***. This parameter is ignored if OperationMode is set to FDCAN_TT_COMMUNICATION_LEVEL1
- ***uint32_t FDCAN_TT_ConfigTypeDef::AppWdgLimit***

  Specifies the Application Watchdog Limit : maximum time after which the application has to serve the application watchdog. The application watchdog is incremented once each 256 NTUs. The application watchdog can be disabled by setting AppWdgLimit to 0. This parameter must be a number between 0 and 255. This parameter is ignored if OperationMode is set to FDCAN_TT_COMMUNICATION_LEVEL0
- ***uint32_t FDCAN_TT_ConfigTypeDef::GlobalTimeFilter***

  Enable or disable Global Time Filtering. This parameter can be a value of ***FDCAN_TT_global_time_filtering***. This parameter is ignored if OperationMode is set to FDCAN_TT_COMMUNICATION_LEVEL1

- ***uint32_t FDCAN_TT_ConfigTypeDef::ClockCalibration***

  Enable or disable Automatic Clock Calibration. This parameter can be a value of ***FDCAN_TT_auto_clk_calibration***. This parameter is ignored if OperationMode is set to FDCAN_TT_COMMUNICATION_LEVEL1
- ***uint32_t FDCAN_TT_ConfigTypeDef::EvtTrigPolarity***

  Specifies the Event Trigger Polarity. This parameter can be a value of ***FDCAN_TT_event_trig_polarity***. This parameter is ignored if OperationMode is set to FDCAN_TT_COMMUNICATION_LEVEL0
- ***uint32_t FDCAN_TT_ConfigTypeDef::BasicCyclesNbr***

  Specifies the number of basic cycles in the system matrix. This parameter can be a value of ***FDCAN_TT_basic_cycle_number***
- ***uint32_t FDCAN_TT_ConfigTypeDef::CycleStartSync***

  Enable or disable synchronization pulse output at pin fdcan1_soc. This parameter can be a value of ***FDCAN_TT_cycle_start_sync***
- ***uint32_t FDCAN_TT_ConfigTypeDef::TxEnableWindow***

  Specifies the length of Tx enable window in NTUs. This parameter must be a number between 1 and 16
- ***uint32_t FDCAN_TT_ConfigTypeDef::ExpTxTrigNbr***

  Specifies the number of expected Tx_Triggers in the system matrix. This is the sum of Tx_Triggers for exclusive, single arbitrating and merged arbitrating windows. This parameter must be a number between 0 and 4095
- ***uint32_t FDCAN_TT_ConfigTypeDef::TURNumerator***

  Specifies the TUR (Time Unit Ratio) numerator. It is advised to set this parameter to the largest applicable value. This parameter must be a number between 0x10000 and 0x1FFFF
- ***uint32_t FDCAN_TT_ConfigTypeDef::TURDenominator***

  Specifies the TUR (Time Unit Ratio) denominator. This parameter must be a number between 0x0001 and 0x3FFF
- ***uint32_t FDCAN_TT_ConfigTypeDef::TriggerMemoryNbr***

  Specifies the number of trigger memory elements. This parameter must be a number between 0 and 64
- ***uint32_t FDCAN_TT_ConfigTypeDef::StopWatchTrigSel***

  Specifies the input to be used as stop watch trigger. This parameter can be a value of ***FDCAN_TT_stop_watch_trig_selection***
- ***uint32_t FDCAN_TT_ConfigTypeDef::EventTrigSel***

  Specifies the input to be used as event trigger. This parameter can be a value of ***FDCAN_TT_event_trig_selection***

30.1.11 FDCAN_TriggerTypeDef

FDCAN_TriggerTypeDef is defined in the stm32h7xx_hal_fdcan.h

Data Fields

- ***uint32_t TriggerIndex***
- ***uint32_t TimeMark***
- ***uint32_t RepeatFactor***
- ***uint32_t StartCycle***
- ***uint32_t TmEventInt***
- ***uint32_t TmEventExt***
- ***uint32_t TriggerType***
- ***uint32_t FilterType***
- ***uint32_t TxBufferIndex***
- ***uint32_t FilterIndex***

Field Documentation

- ***uint32_t FDCAN_TriggerTypeDef::TriggerIndex***

  Specifies the trigger which will be configured. This parameter must be a number between 0 and 63

- ***uint32_t FDCAN_TriggerTypeDef::TimeMark***

  Specifies the cycle time for which the trigger becomes active. This parameter must be a number between 0 and 0xFFFF
- ***uint32_t FDCAN_TriggerTypeDef::RepeatFactor***

  Specifies the trigger repeat factor. This parameter can be a value of ***FDCAN_TT_Repeat_Factor***
- ***uint32_t FDCAN_TriggerTypeDef::StartCycle***

  Specifies the index of the first cycle in which the trigger becomes active. This parameter is ignored if RepeatFactor is set to FDCAN_TT_REPEAT_EVERY_CYCLE. This parameter must be a number between 0 and RepeatFactor
- ***uint32_t FDCAN_TriggerTypeDef::TmEventInt***

  Enable or disable the internal time mark event. If enabled, FDCAN_TT_FLAG_TRIG_TIME_MARK flag is set when trigger memory element becomes active. This parameter can be a value of ***FDCAN_TT_Time_Mark_Event_Internal***
- ***uint32_t FDCAN_TriggerTypeDef::TmEventExt***

  Enable or disable the external time mark event. If enabled, and if TTOCN.TTIE is set, a pulse is generated at fdcan1_tmp when trigger memory element becomes active. This parameter can be a value of ***FDCAN_TT_Time_Mark_Event_External***
- ***uint32_t FDCAN_TriggerTypeDef::TriggerType***

  Specifies the trigger type. This parameter can be a value of ***FDCAN_TT_Trigger_Type***
- ***uint32_t FDCAN_TriggerTypeDef::FilterType***

  Specifies the filter identifier type. This parameter can be a value of ***FDCAN_id_type***
- ***uint32_t FDCAN_TriggerTypeDef::TxBufferIndex***

  Specifies the index of the Tx buffer for which the trigger is valid. This parameter can be a value of ***FDCAN_Tx_location***. This parameter is taken in consideration only if the trigger is configured for transmission.
- ***uint32_t FDCAN_TriggerTypeDef::FilterIndex***

  Specifies the filter for which the trigger is valid. This parameter is taken in consideration only if the trigger is configured for reception. This parameter must be a number between:
  - 0 and 127, if FilterType is FDCAN_STANDARD_ID
  - 0 and 63, if FilterType is FDCAN_EXTENDED_ID

30.1.12 FDCAN_TTOperationStatusTypeDef

FDCAN_TTOperationStatusTypeDef is defined in the stm32h7xx_hal_fdcan.h

Data Fields

- ***uint32_t ErrorLevel***
- ***uint32_t MasterState***
- ***uint32_t SyncState***
- ***uint32_t GTimeQuality***
- ***uint32_t ClockQuality***
- ***uint32_t RefTrigOffset***
- ***uint32_t GTimeDiscPending***
- ***uint32_t GapFinished***
- ***uint32_t MasterPriority***
- ***uint32_t GapStarted***
- ***uint32_t WaitForEvt***
- ***uint32_t AppWdgEvt***
- ***uint32_t ECSPending***
- ***uint32_t PhaseLock***

Field Documentation

- ***uint32_t FDCAN_TTOperationStatusTypeDef::ErrorLevel***

  Specifies the type of the TT operation error level. This parameter can be a value of ***FDCAN_TT_error_level***

- ***uint32_t FDCAN_TTOperationStatusTypeDef::MasterState***
  Specifies the type of the TT master state. This parameter can be a value of ***FDCAN_TT_master_state***
- ***uint32_t FDCAN_TTOperationStatusTypeDef::SyncState***
  Specifies the type of the TT synchronization state. This parameter can be a value of ***FDCAN_TT_sync_state***
- ***uint32_t FDCAN_TTOperationStatusTypeDef::GTimeQuality***
  Specifies the Quality of Global Time Phase. This parameter is only relevant in Level 0 and Level 2, otherwise fixed to 0. This parameter can be:
  – 0 : Global time not valid
  – 1 : Global time in phase with Time Master
- ***uint32_t FDCAN_TTOperationStatusTypeDef::ClockQuality***
  Specifies the Quality of Clock Speed. This parameter is only relevant in Level 0 and Level 2, otherwise fixed to 1. This parameter can be:
  – 0 : Local clock speed not synchronized to Time Master clock speed
  – 1 : Synchronization Deviation = SDL
- ***uint32_t FDCAN_TTOperationStatusTypeDef::RefTrigOffset***
  Specifies the Actual Reference Trigger Offset Value. This parameter can be a number between 0 and 0xFF
- ***uint32_t FDCAN_TTOperationStatusTypeDef::GTimeDiscPending***
  Specifies the Global Time Discontinuity State. This parameter can be:
  – 0 : No global time preset pending
  – 1 : Node waits for the global time preset to take effect
- ***uint32_t FDCAN_TTOperationStatusTypeDef::GapFinished***
  Specifies whether a Gap is finished. This parameter can be:
  – 0 : Reset at the end of each reference message
  – 1 : Gap finished
- ***uint32_t FDCAN_TTOperationStatusTypeDef::MasterPriority***
  Specifies the Priority of actual Time Master. This parameter can be a number between 0 and 0x7
- ***uint32_t FDCAN_TTOperationStatusTypeDef::GapStarted***
  Specifies whether a Gap is started. This parameter can be:
  – 0 : No Gap in schedule
  – 1 : Gap time after Basic Cycle has started
- ***uint32_t FDCAN_TTOperationStatusTypeDef::WaitForEvt***
  Specifies whether a Gap is announced. This parameter can be:
  – 0 : No Gap announced, reset by a reference message with Next_is_Gap = 0
  – 1 : Reference message with Next_is_Gap = 1 received
- ***uint32_t FDCAN_TTOperationStatusTypeDef::AppWdgEvt***
  Specifies the Application Watchdog State. This parameter can be:
  – 0 : Application Watchdog served in time
  – 1 : Failed to serve Application Watchdog in time
- ***uint32_t FDCAN_TTOperationStatusTypeDef::ECSPending***
  Specifies the External Clock Synchronization State. This parameter can be:
  – 0 : No external clock synchronization pending
  – 1 : Node waits for external clock synchronization to take effect
- ***uint32_t FDCAN_TTOperationStatusTypeDef::PhaseLock***
  Specifies the Phase Lock State. This parameter can be:
  – 0 : Phase outside range
  – 1 : Phase inside range

30.1.13 FDCAN_MsgRamAddressTypeDef

FDCAN_MsgRamAddressTypeDef is defined in the stm32h7xx_hal_fdcan.h

Data Fields

- ***uint32_t StandardFilterSA***
- ***uint32_t ExtendedFilterSA***
- ***uint32_t RxFIFO0SA***
- ***uint32_t RxFIFO1SA***
- ***uint32_t RxBufferSA***
- ***uint32_t TxEventFIFOSA***
- ***uint32_t TxBufferSA***
- ***uint32_t TxFIFOQSA***
- ***uint32_t TTMemorySA***
- ***uint32_t EndAddress***

Field Documentation

- ***uint32_t FDCAN_MsgRamAddressTypeDef::StandardFilterSA***
  Specifies the Standard Filter List Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::ExtendedFilterSA***
  Specifies the Extended Filter List Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::RxFIFO0SA***
  Specifies the Rx FIFO 0 Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::RxFIFO1SA***
  Specifies the Rx FIFO 1 Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::RxBufferSA***
  Specifies the Rx Buffer Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::TxEventFIFOSA***
  Specifies the Tx Event FIFO Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::TxBufferSA***
  Specifies the Tx Buffers Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::TxFIFOQSA***
  Specifies the Tx FIFO/Queue Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::TTMemorySA***
  Specifies the Trigger Memory Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::EndAddress***
  Specifies the End Address of the allocated RAM. This parameter must be a 32-bit word address

30.1.14 __FDCAN_HandleTypeDef

__FDCAN_HandleTypeDef is defined in the stm32h7xx_hal_fdcan.h

Data Fields

- ***FDCAN_GlobalTypeDef * Instance***
- ***TTCAN_TypeDef * ttcan***
- ***FDCAN_InitTypeDef Init***
- ***FDCAN_MsgRamAddressTypeDef msgRam***
- ***uint32_t LatestTxFifoQRequest***
- ***__IO HAL_FDCAN_StateTypeDef State***
- ***HAL_LockTypeDef Lock***
- ***__IO uint32_t ErrorCode***
- ***void(* ClockCalibrationCallback***
- ***void(* TxEventFifoCallback***
- ***void(* RxFifo0Callback***
- ***void(* RxFifo1Callback***
- ***void(* TxFifoEmptyCallback***

- ***void(* TxBufferCompleteCallback***
- ***void(* TxBufferAbortCallback***
- ***void(* RxBufferNewMessageCallback***
- ***void(* HighPriorityMessageCallback***
- ***void(* TimestampWraparoundCallback***
- ***void(* TimeoutOccurredCallback***
- ***void(* ErrorCallback***
- ***void(* ErrorStatusCallback***
- ***void(* TT_ScheduleSyncCallback***
- ***void(* TT_TimeMarkCallback***
- ***void(* TT_StopWatchCallback***
- ***void(* TT_GlobalTimeCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***FDCAN_GlobalTypeDef* __FDCAN_HandleTypeDef::Instance***
  Register base address
- ***TTCAN_TypeDef* __FDCAN_HandleTypeDef::ttcan***
  TT register base address
- ***FDCAN_InitTypeDef __FDCAN_HandleTypeDef::Init***
  FDCAN required parameters
- ***FDCAN_MsgRamAddressTypeDef __FDCAN_HandleTypeDef::msgRam***
  FDCAN Message RAM blocks
- ***uint32_t __FDCAN_HandleTypeDef::LatestTxFifoQRequest***
  FDCAN Tx buffer index of latest Tx FIFO/Queue request
- ***__IO HAL_FDCAN_StateTypeDef __FDCAN_HandleTypeDef::State***
  FDCAN communication state
- ***HAL_LockTypeDef __FDCAN_HandleTypeDef::Lock***
  FDCAN locking object
- ***__IO uint32_t __FDCAN_HandleTypeDef::ErrorCode***
  FDCAN Error code
- ***void(* __FDCAN_HandleTypeDef::ClockCalibrationCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t ClkCalibrationITs)***
  FDCAN Clock Calibration callback
- ***void(* __FDCAN_HandleTypeDef::TxEventFifoCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t TxEventFifoITs)***
  FDCAN Tx Event Fifo callback
- ***void(* __FDCAN_HandleTypeDef::RxFifo0Callback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t RxFifo0ITs)***
  FDCAN Rx Fifo 0 callback
- ***void(* __FDCAN_HandleTypeDef::RxFifo1Callback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t RxFifo1ITs)***
  FDCAN Rx Fifo 1 callback
- ***void(* __FDCAN_HandleTypeDef::TxFifoEmptyCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Tx Fifo Empty callback
- ***void(* __FDCAN_HandleTypeDef::TxBufferCompleteCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t BufferIndexes)***
  FDCAN Tx Buffer complete callback

- ***void(* __FDCAN_HandleTypeDef::TxBufferAbortCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t BufferIndexes)***
  FDCAN Tx Buffer abort callback
- ***void(* __FDCAN_HandleTypeDef::RxBufferNewMessageCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Rx Buffer New Message callback
- ***void(* __FDCAN_HandleTypeDef::HighPriorityMessageCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN High priority message callback
- ***void(* __FDCAN_HandleTypeDef::TimestampWraparoundCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Timestamp wraparound callback
- ***void(* __FDCAN_HandleTypeDef::TimeoutOccurredCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Timeout occurred callback
- ***void(* __FDCAN_HandleTypeDef::ErrorCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Error callback
- ***void(* __FDCAN_HandleTypeDef::ErrorStatusCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t ErrorStatusITs)***
  FDCAN Error status callback
- ***void(* __FDCAN_HandleTypeDef::TT_ScheduleSyncCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t TTSchedSyncITs)***
  FDCAN T Schedule Synchronization callback
- ***void(* __FDCAN_HandleTypeDef::TT_TimeMarkCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t TTTimeMarkITs)***
  FDCAN TT Time Mark callback
- ***void(* __FDCAN_HandleTypeDef::TT_StopWatchCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t SWTime, uint32_t SWCycleCount)***
  FDCAN TT Stop Watch callback
- ***void(* __FDCAN_HandleTypeDef::TT_GlobalTimeCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t TTGlobTimeITs)***
  FDCAN TT Global Time callback
- ***void(* __FDCAN_HandleTypeDef::MspInitCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Msp Init callback
- ***void(* __FDCAN_HandleTypeDef::MspDeInitCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Msp DeInit callback

30.2 FDCAN Firmware driver API description

The following section lists the various functions of the FDCAN library.

30.2.1 How to use this driver

1. Initialize the FDCAN peripheral using HAL_FDCAN_Init function.

2. If needed , configure the reception filters and optional features using the following configuration functions:
   - HAL_FDCAN_ConfigClockCalibration
   - HAL_FDCAN_ConfigFilter
   - HAL_FDCAN_ConfigGlobalFilter
   - HAL_FDCAN_ConfigExtendedIdMask
   - HAL_FDCAN_ConfigRxFifoOverwrite
   - HAL_FDCAN_ConfigFifoWatermark
   - HAL_FDCAN_ConfigRamWatchdog
   - HAL_FDCAN_ConfigTimestampCounter
   - HAL_FDCAN_EnableTimestampCounter
   - HAL_FDCAN_DisableTimestampCounter
   - HAL_FDCAN_ConfigTimeoutCounter
   - HAL_FDCAN_EnableTimeoutCounter
   - HAL_FDCAN_DisableTimeoutCounter
   - HAL_FDCAN_ConfigTxDelayCompensation
   - HAL_FDCAN_EnableTxDelayCompensation
   - HAL_FDCAN_DisableTxDelayCompensation
   - HAL_FDCAN_EnableISOMode
   - HAL_FDCAN_DisableISOMode
   - HAL_FDCAN_EnableEdgeFiltering
   - HAL_FDCAN_DisableEdgeFiltering
   - HAL_FDCAN_TT_ConfigOperation
   - HAL_FDCAN_TT_ConfigReferenceMessage
   - HAL_FDCAN_TT_ConfigTrigger
3. Start the FDCAN module using HAL_FDCAN_Start function. At this level the node is active on the bus: it can send and receive messages.
4. The following Tx control functions can only be called when the FDCAN module is started:
   - HAL_FDCAN_AddMessageToTxFifoQ
   - HAL_FDCAN_EnableTxBufferRequest
   - HAL_FDCAN_AbortTxRequest
5. After having submitted a Tx request in Tx Fifo or Queue, it is possible to get Tx buffer location used to place the Tx request thanks to HAL_FDCAN_GetLatestTxFifoQRequestBuffer API. It is then possible to abort later on the corresponding Tx Request using HAL_FDCAN_AbortTxRequest API.
6. When a message is received into the FDCAN message RAM, it can be retrieved using the HAL_FDCAN_GetRxMessage function.
7. Calling the HAL_FDCAN_Stop function stops the FDCAN module by entering it to initialization mode and re-enabling access to configuration registers through the configuration functions listed here above.
8. All other control functions can be called any time after initialization phase, no matter if the FDCAN module is started or stopped.

Polling mode operation

1. Reception and transmission states can be monitored via the following functions:
   - HAL_FDCAN_IsRxBufferMessageAvailable
   - HAL_FDCAN_IsTxBufferMessagePending
   - HAL_FDCAN_GetRxFifoFillLevel
   - HAL_FDCAN_GetTxFifoFreeLevel

Interrupt mode operation

1. There are two interrupt lines: line 0 and 1. By default, all interrupts are assigned to line 0. Interrupt lines can be configured using HAL_FDCAN_ConfigInterruptLines function.

2. Notifications are activated using HAL_FDCAN_ActivateNotification function. Then, the process can be controlled through one of the available user callbacks: HAL_FDCAN_xxxCallback.

Callback registration

30.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize and configure the FDCAN.
- De-initialize the FDCAN.
- Enter FDCAN peripheral in power down mode.
- Exit power down mode.
- Register callbacks.
- Unregister callbacks.

This section contains the following APIs:

- ***HAL_FDCAN_Init()***
- ***HAL_FDCAN_DeInit()***
- ***HAL_FDCAN_MspInit()***
- ***HAL_FDCAN_MspDeInit()***
- ***HAL_FDCAN_EnterPowerDownMode()***
- ***HAL_FDCAN_ExitPowerDownMode()***
- ***HAL_FDCAN_RegisterCallback()***
- ***HAL_FDCAN_UnRegisterCallback()***
- ***HAL_FDCAN_RegisterClockCalibrationCallback()***
- ***HAL_FDCAN_UnRegisterClockCalibrationCallback()***
- ***HAL_FDCAN_RegisterTxEventFifoCallback()***
- ***HAL_FDCAN_UnRegisterTxEventFifoCallback()***
- ***HAL_FDCAN_RegisterRxFifo0Callback()***
- ***HAL_FDCAN_UnRegisterRxFifo0Callback()***
- ***HAL_FDCAN_RegisterRxFifo1Callback()***
- ***HAL_FDCAN_UnRegisterRxFifo1Callback()***
- ***HAL_FDCAN_RegisterTxBufferCompleteCallback()***
- ***HAL_FDCAN_UnRegisterTxBufferCompleteCallback()***
- ***HAL_FDCAN_RegisterTxBufferAbortCallback()***
- ***HAL_FDCAN_UnRegisterTxBufferAbortCallback()***
- ***HAL_FDCAN_RegisterErrorStatusCallback()***
- ***HAL_FDCAN_UnRegisterErrorStatusCallback()***
- ***HAL_FDCAN_RegisterTTScheduleSyncCallback()***
- ***HAL_FDCAN_UnRegisterTTScheduleSyncCallback()***
- ***HAL_FDCAN_RegisterTTTimeMarkCallback()***
- ***HAL_FDCAN_UnRegisterTTTimeMarkCallback()***
- ***HAL_FDCAN_RegisterTTStopWatchCallback()***
- ***HAL_FDCAN_UnRegisterTTStopWatchCallback()***
- ***HAL_FDCAN_RegisterTTGlobalTimeCallback()***
- ***HAL_FDCAN_UnRegisterTTGlobalTimeCallback()***
- ***HAL_FDCAN_RegisterCallback()***

30.2.3 Configuration functions

This section provides functions allowing to:

- HAL_FDCAN_ConfigClockCalibration : Configure the FDCAN clock calibration unit

- HAL_FDCAN_GetClockCalibrationState : Get the clock calibration state
- HAL_FDCAN_ResetClockCalibrationState : Reset the clock calibration state
- HAL_FDCAN_GetClockCalibrationCounter : Get the clock calibration counters values
- HAL_FDCAN_ConfigFilter : Configure the FDCAN reception filters
- HAL_FDCAN_ConfigGlobalFilter : Configure the FDCAN global filter
- HAL_FDCAN_ConfigExtendedIdMask : Configure the extended ID mask
- HAL_FDCAN_ConfigRxFifoOverwrite : Configure the Rx FIFO operation mode
- HAL_FDCAN_ConfigFifoWatermark : Configure the FIFO watermark
- HAL_FDCAN_ConfigRamWatchdog : Configure the RAM watchdog
- HAL_FDCAN_ConfigTimestampCounter : Configure the timestamp counter
- HAL_FDCAN_EnableTimestampCounter : Enable the timestamp counter
- HAL_FDCAN_DisableTimestampCounter : Disable the timestamp counter
- HAL_FDCAN_GetTimestampCounter : Get the timestamp counter value
- HAL_FDCAN_ResetTimestampCounter : Reset the timestamp counter to zero
- HAL_FDCAN_ConfigTimeoutCounter : Configure the timeout counter
- HAL_FDCAN_EnableTimeoutCounter : Enable the timeout counter
- HAL_FDCAN_DisableTimeoutCounter : Disable the timeout counter
- HAL_FDCAN_GetTimeoutCounter : Get the timeout counter value
- HAL_FDCAN_ResetTimeoutCounter : Reset the timeout counter to its start value
- HAL_FDCAN_ConfigTxDelayCompensation : Configure the transmitter delay compensation
- HAL_FDCAN_EnableTxDelayCompensation : Enable the transmitter delay compensation
- HAL_FDCAN_DisableTxDelayCompensation : Disable the transmitter delay compensation
- HAL_FDCAN_EnableISOMode : Enable ISO 11898-1 protocol mode
- HAL_FDCAN_DisableISOMode : Disable ISO 11898-1 protocol mode
- HAL_FDCAN_EnableEdgeFiltering : Enable edge filtering during bus integration
- HAL_FDCAN_DisableEdgeFiltering : Disable edge filtering during bus integration

This section contains the following APIs:

- ***HAL_FDCAN_ConfigClockCalibration()***
- ***HAL_FDCAN_GetClockCalibrationState()***
- ***HAL_FDCAN_ResetClockCalibrationState()***
- ***HAL_FDCAN_GetClockCalibrationCounter()***
- ***HAL_FDCAN_ConfigFilter()***
- ***HAL_FDCAN_ConfigGlobalFilter()***
- ***HAL_FDCAN_ConfigExtendedIdMask()***
- ***HAL_FDCAN_ConfigRxFifoOverwrite()***
- ***HAL_FDCAN_ConfigFifoWatermark()***
- ***HAL_FDCAN_ConfigRamWatchdog()***
- ***HAL_FDCAN_ConfigTimestampCounter()***
- ***HAL_FDCAN_EnableTimestampCounter()***
- ***HAL_FDCAN_DisableTimestampCounter()***
- ***HAL_FDCAN_GetTimestampCounter()***
- ***HAL_FDCAN_ResetTimestampCounter()***
- ***HAL_FDCAN_ConfigTimeoutCounter()***
- ***HAL_FDCAN_EnableTimeoutCounter()***
- ***HAL_FDCAN_DisableTimeoutCounter()***
- ***HAL_FDCAN_GetTimeoutCounter()***
- ***HAL_FDCAN_ResetTimeoutCounter()***
- ***HAL_FDCAN_ConfigTxDelayCompensation()***
- ***HAL_FDCAN_EnableTxDelayCompensation()***

- *HAL_FDCAN_DisableTxDelayCompensation()*
- *HAL_FDCAN_EnableISOMode()*
- *HAL_FDCAN_DisableISOMode()*
- *HAL_FDCAN_EnableEdgeFiltering()*
- *HAL_FDCAN_DisableEdgeFiltering()*

30.2.4 Control functions

This section provides functions allowing to:

- HAL_FDCAN_Start : Start the FDCAN module
- HAL_FDCAN_Stop : Stop the FDCAN module and enable access to configuration registers
- HAL_FDCAN_AddMessageToTxFifoQ : Add a message to the Tx FIFO/Queue and activate the corresponding transmission request
- HAL_FDCAN_AddMessageToTxBuffer : Add a message to a dedicated Tx buffer
- HAL_FDCAN_EnableTxBufferRequest : Enable transmission request
- HAL_FDCAN_GetLatestTxFifoQRequestBuffer : Get Tx buffer index of latest Tx FIFO/Queue request
- HAL_FDCAN_AbortTxRequest : Abort transmission request
- HAL_FDCAN_GetRxMessage : Get an FDCAN frame from the Rx Buffer/FIFO zone into the message RAM
- HAL_FDCAN_GetTxEvent : Get an FDCAN Tx event from the Tx Event FIFO zone into the message RAM
- HAL_FDCAN_GetHighPriorityMessageStatus : Get high priority message status
- HAL_FDCAN_GetProtocolStatus : Get protocol status
- HAL_FDCAN_GetErrorCounters : Get error counter values
- HAL_FDCAN_IsRxBufferMessageAvailable : Check if a new message is received in the selected Rx buffer
- HAL_FDCAN_IsTxBufferMessagePending : Check if a transmission request is pending on the selected Tx buffer
- HAL_FDCAN_GetRxFifoFillLevel : Return Rx FIFO fill level
- HAL_FDCAN_GetTxFifoFreeLevel : Return Tx FIFO free level
- HAL_FDCAN_IsRestrictedOperationMode : Check if the FDCAN peripheral entered Restricted Operation Mode
- HAL_FDCAN_ExitRestrictedOperationMode : Exit Restricted Operation Mode

This section contains the following APIs:

- *HAL_FDCAN_Start()*
- *HAL_FDCAN_Stop()*
- *HAL_FDCAN_AddMessageToTxFifoQ()*
- *HAL_FDCAN_AddMessageToTxBuffer()*
- *HAL_FDCAN_EnableTxBufferRequest()*
- *HAL_FDCAN_GetLatestTxFifoQRequestBuffer()*
- *HAL_FDCAN_AbortTxRequest()*
- *HAL_FDCAN_GetRxMessage()*
- *HAL_FDCAN_GetTxEvent()*
- *HAL_FDCAN_GetHighPriorityMessageStatus()*
- *HAL_FDCAN_GetProtocolStatus()*
- *HAL_FDCAN_GetErrorCounters()*
- *HAL_FDCAN_IsRxBufferMessageAvailable()*
- *HAL_FDCAN_IsTxBufferMessagePending()*
- *HAL_FDCAN_GetRxFifoFillLevel()*
- *HAL_FDCAN_GetTxFifoFreeLevel()*
- *HAL_FDCAN_IsRestrictedOperationMode()*
- *HAL_FDCAN_ExitRestrictedOperationMode()*

30.2.5 TT Configuration and control functions

This section provides functions allowing to:

- HAL_FDCAN_TT_ConfigOperation : Initialize TT operation parameters
- HAL_FDCAN_TT_ConfigReferenceMessage : Configure the reference message
- HAL_FDCAN_TT_ConfigTrigger : Configure the FDCAN trigger
- HAL_FDCAN_TT_SetGlobalTime : Schedule global time adjustment
- HAL_FDCAN_TT_SetClockSynchronization : Schedule TUR numerator update
- HAL_FDCAN_TT_ConfigStopWatch : Configure stop watch source and polarity
- HAL_FDCAN_TT_ConfigRegisterTimeMark : Configure register time mark pulse generation
- HAL_FDCAN_TT_EnableRegisterTimeMarkPulse : Enable register time mark pulse generation
- HAL_FDCAN_TT_DisableRegisterTimeMarkPulse : Disable register time mark pulse generation
- HAL_FDCAN_TT_EnableTriggerTimeMarkPulse : Enable trigger time mark pulse generation
- HAL_FDCAN_TT_DisableTriggerTimeMarkPulse : Disable trigger time mark pulse generation
- HAL_FDCAN_TT_EnableHardwareGapControl : Enable gap control by input pin fdcan1_evt
- HAL_FDCAN_TT_DisableHardwareGapControl : Disable gap control by input pin fdcan1_evt
- HAL_FDCAN_TT_EnableTimeMarkGapControl : Enable gap control (finish only) by register time mark IT
- HAL_FDCAN_TT_DisableTimeMarkGapControl : Disable gap control by register time mark interrupt
- HAL_FDCAN_TT_SetNextIsGap : Transmit next reference message with Next_is_Gap = "1"
- HAL_FDCAN_TT_SetEndOfGap : Finish a Gap by requesting start of reference message
- HAL_FDCAN_TT_ConfigExternalSyncPhase : Configure target phase used for external synchronization
- HAL_FDCAN_TT_EnableExternalSynchronization : Synchronize the phase of the FDCAN schedule to an external schedule
- HAL_FDCAN_TT_DisableExternalSynchronization : Disable external schedule synchronization
- HAL_FDCAN_TT_GetOperationStatus : Get TT operation status

This section contains the following APIs:

- ***HAL_FDCAN_TT_ConfigOperation()***
- ***HAL_FDCAN_TT_ConfigReferenceMessage()***
- ***HAL_FDCAN_TT_ConfigTrigger()***
- ***HAL_FDCAN_TT_SetGlobalTime()***
- ***HAL_FDCAN_TT_SetClockSynchronization()***
- ***HAL_FDCAN_TT_ConfigStopWatch()***
- ***HAL_FDCAN_TT_ConfigRegisterTimeMark()***
- ***HAL_FDCAN_TT_EnableRegisterTimeMarkPulse()***
- ***HAL_FDCAN_TT_DisableRegisterTimeMarkPulse()***
- ***HAL_FDCAN_TT_EnableTriggerTimeMarkPulse()***
- ***HAL_FDCAN_TT_DisableTriggerTimeMarkPulse()***
- ***HAL_FDCAN_TT_EnableHardwareGapControl()***
- ***HAL_FDCAN_TT_DisableHardwareGapControl()***
- ***HAL_FDCAN_TT_EnableTimeMarkGapControl()***
- ***HAL_FDCAN_TT_DisableTimeMarkGapControl()***
- ***HAL_FDCAN_TT_SetNextIsGap()***
- ***HAL_FDCAN_TT_SetEndOfGap()***
- ***HAL_FDCAN_TT_ConfigExternalSyncPhase()***
- ***HAL_FDCAN_TT_EnableExternalSynchronization()***
- ***HAL_FDCAN_TT_DisableExternalSynchronization()***
- ***HAL_FDCAN_TT_GetOperationStatus()***

30.2.6 Interrupts management

This section provides functions allowing to:

- HAL_FDCAN_ConfigInterruptLines : Assign interrupts to either Interrupt line 0 or 1
- HAL_FDCAN_TT_ConfigInterruptLines : Assign TT interrupts to either Interrupt line 0 or 1
- HAL_FDCAN_ActivateNotification : Enable interrupts
- HAL_FDCAN_DeactivateNotification : Disable interrupts
- HAL_FDCAN_TT_ActivateNotification : Enable TT interrupts
- HAL_FDCAN_TT_DeactivateNotification : Disable TT interrupts
- HAL_FDCAN_IRQHandler : Handles FDCAN interrupt request

This section contains the following APIs:

- ***HAL_FDCAN_ConfigInterruptLines()***
- ***HAL_FDCAN_TT_ConfigInterruptLines()***
- ***HAL_FDCAN_ActivateNotification()***
- ***HAL_FDCAN_DeactivateNotification()***
- ***HAL_FDCAN_TT_ActivateNotification()***
- ***HAL_FDCAN_TT_DeactivateNotification()***
- ***HAL_FDCAN_IRQHandler()***

30.2.7 Callback functions

This subsection provides the following callback functions:

- HAL_FDCAN_ClockCalibrationCallback
- HAL_FDCAN_TxEventFifoCallback
- HAL_FDCAN_RxFifo0Callback
- HAL_FDCAN_RxFifo1Callback
- HAL_FDCAN_TxFifoEmptyCallback
- HAL_FDCAN_TxBufferCompleteCallback
- HAL_FDCAN_TxBufferAbortCallback
- HAL_FDCAN_RxBufferNewMessageCallback
- HAL_FDCAN_HighPriorityMessageCallback
- HAL_FDCAN_TimestampWraparoundCallback
- HAL_FDCAN_TimeoutOccurredCallback
- HAL_FDCAN_ErrorCallback
- HAL_FDCAN_ErrorStatusCallback
- HAL_FDCAN_TT_ScheduleSyncCallback
- HAL_FDCAN_TT_TimeMarkCallback
- HAL_FDCAN_TT_StopWatchCallback
- HAL_FDCAN_TT_GlobalTimeCallback

This section contains the following APIs:

- ***HAL_FDCAN_ClockCalibrationCallback()***
- ***HAL_FDCAN_TxEventFifoCallback()***
- ***HAL_FDCAN_RxFifo0Callback()***
- ***HAL_FDCAN_RxFifo1Callback()***
- ***HAL_FDCAN_TxFifoEmptyCallback()***
- ***HAL_FDCAN_TxBufferCompleteCallback()***
- ***HAL_FDCAN_TxBufferAbortCallback()***
- ***HAL_FDCAN_RxBufferNewMessageCallback()***
- ***HAL_FDCAN_TimestampWraparoundCallback()***
- ***HAL_FDCAN_TimeoutOccurredCallback()***
- ***HAL_FDCAN_HighPriorityMessageCallback()***
- ***HAL_FDCAN_ErrorCallback()***
- ***HAL_FDCAN_ErrorStatusCallback()***

- *HAL_FDCAN_TT_ScheduleSyncCallback()*
- *HAL_FDCAN_TT_TimeMarkCallback()*
- *HAL_FDCAN_TT_StopWatchCallback()*
- *HAL_FDCAN_TT_GlobalTimeCallback()*

30.2.8 Peripheral State functions

This subsection provides functions allowing to :

- HAL_FDCAN_GetState() : Return the FDCAN state.
- HAL_FDCAN_GetError() : Return the FDCAN error code if any.

This section contains the following APIs:

- *HAL_FDCAN_GetState()*
- *HAL_FDCAN_GetError()*

30.2.9 Detailed description of functions

HAL_FDCAN_Init

Function name

HAL_StatusTypeDef HAL_FDCAN_Init (FDCAN_HandleTypeDef * hfdcan)

Function description

Initializes the FDCAN peripheral according to the specified parameters in the FDCAN_InitTypeDef structure.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_DeInit

Function name

HAL_StatusTypeDef HAL_FDCAN_DeInit (FDCAN_HandleTypeDef * hfdcan)

Function description

Deinitializes the FDCAN peripheral registers to their default reset values.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_MspInit

Function name

void HAL_FDCAN_MspInit (FDCAN_HandleTypeDef * hfdcan)

Function description

Initializes the FDCAN MSP.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_MspDeInit

Function name

void HAL_FDCAN_MspDeInit (FDCAN_HandleTypeDef * hfdcan)

Function description

DeInitializes the FDCAN MSP.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_EnterPowerDownMode

Function name

HAL_StatusTypeDef HAL_FDCAN_EnterPowerDownMode (FDCAN_HandleTypeDef * hfdcan)

Function description

Enter FDCAN peripheral in sleep mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_ExitPowerDownMode

Function name

HAL_StatusTypeDef HAL_FDCAN_ExitPowerDownMode (FDCAN_HandleTypeDef * hfdcan)

Function description

Exit power down mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_RegisterCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterCallback (FDCAN_HandleTypeDef * hfdcan, HAL_FDCAN_CallbackIDTypeDef CallbackID, pFDCAN_CallbackTypeDef pCallback)

Function description

HAL_FDCAN_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterCallback (FDCAN_HandleTypeDef * hfdcan, HAL_FDCAN_CallbackIDTypeDef CallbackID)

Function description

Unregister a FDCAN CallBack.

Parameters

- **hfdcan:** pointer to a FDCAN_HandleTypeDef structure that contains the configuration information for FDCAN module
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_FDCAN_TX_FIFO_EMPTY_CB_ID Tx Fifo Empty callback ID
  - HAL_FDCAN_RX_BUFFER_NEW_MSG_CB_ID Rx buffer new message callback ID
  - HAL_FDCAN_HIGH_PRIO_MESSAGE_CB_ID High priority message callback ID
  - HAL_FDCAN_TIMESTAMP_WRAPAROUND_CB_ID Timestamp wraparound callback ID
  - HAL_FDCAN_TIMEOUT_OCCURRED_CB_ID Timeout occurred callback ID
  - HAL_FDCAN_ERROR_CALLBACK_CB_ID Error callback ID
  - HAL_FDCAN_MSPINIT_CB_ID MspInit callback ID
  - HAL_FDCAN_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_FDCAN_RegisterClockCalibrationCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterClockCalibrationCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_ClockCalibrationCallbackTypeDef pCallback)

Function description

Register Clock Calibration FDCAN Callback To be used instead of the weak HAL_FDCAN_ClockCalibrationCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Clock Calibration Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterClockCalibrationCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterClockCalibrationCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Clock Calibration FDCAN Callback Clock Calibration FDCAN Callback is redirected to the weak HAL_FDCAN_ClockCalibrationCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterTxEventFifoCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTxEventFifoCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TxEventFifoCallbackTypeDef pCallback)

Function description

Register Tx Event Fifo FDCAN Callback To be used instead of the weak HAL_FDCAN_TxEventFifoCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Tx Event Fifo Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterTxEventFifoCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTxEventFifoCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Tx Event Fifo FDCAN Callback Tx Event Fifo FDCAN Callback is redirected to the weak HAL_FDCAN_TxEventFifoCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterRxFifo0Callback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterRxFifo0Callback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_RxFifo0CallbackTypeDef pCallback)

Function description

Register Rx Fifo 0 FDCAN Callback To be used instead of the weak HAL_FDCAN_RxFifo0Callback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Rx Fifo 0 Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterRxFifo0Callback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterRxFifo0Callback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Rx Fifo 0 FDCAN Callback Rx Fifo 0 FDCAN Callback is redirected to the weak HAL_FDCAN_RxFifo0Callback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterRxFifo1Callback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterRxFifo1Callback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_RxFifo1CallbackTypeDef pCallback)

Function description

Register Rx Fifo 1 FDCAN Callback To be used instead of the weak HAL_FDCAN_RxFifo1Callback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Rx Fifo 1 Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterRxFifo1Callback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterRxFifo1Callback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Rx Fifo 1 FDCAN Callback Rx Fifo 1 FDCAN Callback is redirected to the weak HAL_FDCAN_RxFifo1Callback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterTxBufferCompleteCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTxBufferCompleteCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TxBufferCompleteCallbackTypeDef pCallback)

Function description

Register Tx Buffer Complete FDCAN Callback To be used instead of the weak HAL_FDCAN_TxBufferCompleteCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Tx Buffer Complete Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterTxBufferCompleteCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTxBufferCompleteCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Tx Buffer Complete FDCAN Callback Tx Buffer Complete FDCAN Callback is redirected to the weak HAL_FDCAN_TxBufferCompleteCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterTxBufferAbortCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTxBufferAbortCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TxBufferAbortCallbackTypeDef pCallback)

Function description

Register Tx Buffer Abort FDCAN Callback To be used instead of the weak HAL_FDCAN_TxBufferAbortCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Tx Buffer Abort Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterTxBufferAbortCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTxBufferAbortCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Tx Buffer Abort FDCAN Callback Tx Buffer Abort FDCAN Callback is redirected to the weak HAL_FDCAN_TxBufferAbortCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterErrorStatusCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterErrorStatusCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_ErrorStatusCallbackTypeDef pCallback)

Function description

Register Error Status FDCAN Callback To be used instead of the weak HAL_FDCAN_ErrorStatusCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Error Status Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterErrorStatusCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterErrorStatusCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Error Status FDCAN Callback Error Status FDCAN Callback is redirected to the weak HAL_FDCAN_ErrorStatusCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterTTScheduleSyncCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTTScheduleSyncCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TT_ScheduleSyncCallbackTypeDef pCallback)

Function description

Register TT Schedule Synchronization FDCAN Callback To be used instead of the weak HAL_FDCAN_TT_ScheduleSyncCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the TT Schedule Synchronization Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterTTScheduleSyncCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTTScheduleSyncCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the TT Schedule Synchronization FDCAN Callback TT Schedule Synchronization Callback is redirected to the weak HAL_FDCAN_TT_ScheduleSyncCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterTTTimeMarkCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTTTimeMarkCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TT_TimeMarkCallbackTypeDef pCallback)

Function description

Register TT Time Mark FDCAN Callback To be used instead of the weak HAL_FDCAN_TT_TimeMarkCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the TT Time Mark Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterTTTimeMarkCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTTTimeMarkCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the TT Time Mark FDCAN Callback TT Time Mark Callback is redirected to the weak HAL_FDCAN_TT_TimeMarkCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterTTStopWatchCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTTStopWatchCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TT_StopWatchCallbackTypeDef pCallback)

Function description

Register TT Stop Watch FDCAN Callback To be used instead of the weak HAL_FDCAN_TT_StopWatchCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the TT Stop Watch Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterTTStopWatchCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTTStopWatchCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the TT Stop Watch FDCAN Callback TT Stop Watch Callback is redirected to the weak HAL_FDCAN_TT_StopWatchCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterTTGlobalTimeCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTTGlobalTimeCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TT_GlobalTimeCallbackTypeDef pCallback)

Function description

Register TT Global Time FDCAN Callback To be used instead of the weak HAL_FDCAN_TT_GlobalTimeCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the TT Global Time Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterTTGlobalTimeCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTTGlobalTimeCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the TT Global Time FDCAN Callback TT Global Time Callback is redirected to the weak HAL_FDCAN_TT_GlobalTimeCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_ConfigClockCalibration

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigClockCalibration (FDCAN_HandleTypeDef * hfdcan, FDCAN_ClkCalUnitTypeDef * sCcuConfig)

Function description

Configure the FDCAN clock calibration unit according to the specified parameters in the FDCAN_ClkCalUnitTypeDef structure.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **sCcuConfig:** pointer to an FDCAN_ClkCalUnitTypeDef structure that contains the clock calibration information

Return values

- **HAL:** status

HAL_FDCAN_GetClockCalibrationState

Function name

uint32_t HAL_FDCAN_GetClockCalibrationState (FDCAN_HandleTypeDef * hfdcan)

Function description

Get the clock calibration state.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **State:** clock calibration state (can be a value of
  - FDCAN_calibration_state)

HAL_FDCAN_ResetClockCalibrationState

Function name

HAL_StatusTypeDef HAL_FDCAN_ResetClockCalibrationState (FDCAN_HandleTypeDef * hfdcan)

Function description

Reset the clock calibration state.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_GetClockCalibrationCounter

Function name

uint32_t HAL_FDCAN_GetClockCalibrationCounter (FDCAN_HandleTypeDef * hfdcan, uint32_t Counter)

Function description

Get the clock calibration counter value.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **Counter:** clock calibration counter. This parameter can be a value of
  - FDCAN_calibration_counter.

Return values

- **Value:** clock calibration counter value

HAL_FDCAN_ConfigFilter

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigFilter (FDCAN_HandleTypeDef * hfdcan, FDCAN_FilterTypeDef * sFilterConfig)

Function description

Configure the FDCAN reception filter according to the specified parameters in the FDCAN_FilterTypeDef structure.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **sFilterConfig:** pointer to an FDCAN_FilterTypeDef structure that contains the filter configuration information

Return values

- **HAL:** status

HAL_FDCAN_ConfigGlobalFilter

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigGlobalFilter (FDCAN_HandleTypeDef * hfdcan, uint32_t NonMatchingStd, uint32_t NonMatchingExt, uint32_t RejectRemoteStd, uint32_t RejectRemoteExt)

Function description

Configure the FDCAN global filter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **NonMatchingStd:** Defines how received messages with 11-bit IDs that do not match any element of the filter list are treated. This parameter can be a value of
  - FDCAN_Non_Matching_Frames.
- **NonMatchingExt:** Defines how received messages with 29-bit IDs that do not match any element of the filter list are treated. This parameter can be a value of
  - FDCAN_Non_Matching_Frames.
- **RejectRemoteStd:** Filter or reject all the remote 11-bit IDs frames. This parameter can be a value of
  - FDCAN_Reject_Remote_Frames.
- **RejectRemoteExt:** Filter or reject all the remote 29-bit IDs frames. This parameter can be a value of
  - FDCAN_Reject_Remote_Frames.

Return values

- **HAL:** status

HAL_FDCAN_ConfigExtendedIdMask

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigExtendedIdMask (FDCAN_HandleTypeDef * hfdcan, uint32_t Mask)

Function description

Configure the extended ID mask.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **Mask:** Extended ID Mask. This parameter must be a number between 0 and 0x1FFFFFFF

Return values

- **HAL:** status

HAL_FDCAN_ConfigRxFifoOverwrite

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigRxFifoOverwrite (FDCAN_HandleTypeDef * hfdcan, uint32_t RxFifo, uint32_t OperationMode)

Function description

Configure the Rx FIFO operation mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **RxFifo:** Rx FIFO. This parameter can be one of the following values:
  - FDCAN_RX_FIFO0: Rx FIFO 0
  - FDCAN_RX_FIFO1: Rx FIFO 1
- **OperationMode:** operation mode. This parameter can be a value of
  - FDCAN_Rx_FIFO_operation_mode.

Return values

- **HAL:** status

HAL_FDCAN_ConfigFifoWatermark

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigFifoWatermark (FDCAN_HandleTypeDef * hfdcan, uint32_t FIFO, uint32_t Watermark)

Function description

Configure the FIFO watermark.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **FIFO:** select the FIFO to be configured. This parameter can be a value of
  - FDCAN_FIFO_watermark.
- **Watermark:** level for FIFO watermark interrupt. This parameter must be a number between:
  - 0 and 32, if FIFO is FDCAN_CFG_TX_EVENT_FIFO
  - 0 and 64, if FIFO is FDCAN_CFG_RX_FIFO0 or FDCAN_CFG_RX_FIFO1

Return values

- **HAL:** status

HAL_FDCAN_ConfigRamWatchdog

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigRamWatchdog (FDCAN_HandleTypeDef * hfdcan, uint32_t CounterStartValue)

Function description

Configure the RAM watchdog.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **CounterStartValue:** Start value of the Message RAM Watchdog Counter, This parameter must be a number between 0x00 and 0xFF, with the reset value of 0x00 the counter is disabled.

Return values

- **HAL:** status

HAL_FDCAN_ConfigTimestampCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigTimestampCounter (FDCAN_HandleTypeDef * hfdcan, uint32_t TimestampPrescaler)

Function description

Configure the timestamp counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TimestampPrescaler:** Timestamp Counter Prescaler. This parameter can be a value of
  - FDCAN_Timestamp_Prescaler.

Return values

- **HAL:** status

HAL_FDCAN_EnableTimestampCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableTimestampCounter (FDCAN_HandleTypeDef * hfdcan, uint32_t TimestampOperation)

Function description

Enable the timestamp counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TimestampOperation:** Timestamp counter operation. This parameter can be a value of
  - FDCAN_Timestamp.

Return values

- **HAL:** status

HAL_FDCAN_DisableTimestampCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableTimestampCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable the timestamp counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_GetTimestampCounter

Function name

uint16_t HAL_FDCAN_GetTimestampCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

Get the timestamp counter value.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **Value:** Timestamp counter value

HAL_FDCAN_ResetTimestampCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_ResetTimestampCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

Reset the timestamp counter to zero.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_ConfigTimeoutCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigTimeoutCounter (FDCAN_HandleTypeDef * hfdcan, uint32_t TimeoutOperation, uint32_t TimeoutPeriod)

Function description

Configure the timeout counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TimeoutOperation:** Timeout counter operation. This parameter can be a value of
  - FDCAN_Timeout_Operation.
- **TimeoutPeriod:** Start value of the timeout down-counter. This parameter must be a number between 0x0000 and 0xFFFF

Return values

- **HAL:** status

HAL_FDCAN_EnableTimeoutCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableTimeoutCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

Enable the timeout counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_DisableTimeoutCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableTimeoutCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable the timeout counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_GetTimeoutCounter

Function name

uint16_t HAL_FDCAN_GetTimeoutCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

Get the timeout counter value.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **Value:** Timeout counter value

HAL_FDCAN_ResetTimeoutCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_ResetTimeoutCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

Reset the timeout counter to its start value.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_ConfigTxDelayCompensation

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigTxDelayCompensation (FDCAN_HandleTypeDef * hfdcan, uint32_t TdcOffset, uint32_t TdcFilter)

Function description

Configure the transmitter delay compensation.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TdcOffset:** Transmitter Delay Compensation Offset. This parameter must be a number between 0x00 and 0x7F.
- **TdcFilter:** Transmitter Delay Compensation Filter Window Length. This parameter must be a number between 0x00 and 0x7F.

Return values

- **HAL:** status

HAL_FDCAN_EnableTxDelayCompensation

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableTxDelayCompensation (FDCAN_HandleTypeDef * hfdcan)

Function description

Enable the transmitter delay compensation.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_DisableTxDelayCompensation

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableTxDelayCompensation (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable the transmitter delay compensation.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_EnableISOMode

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableISOMode (FDCAN_HandleTypeDef * hfdcan)

Function description

Enable ISO 11898-1 protocol mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_DisableISOMode

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableISOMode (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable ISO 11898-1 protocol mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_EnableEdgeFiltering

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableEdgeFiltering (FDCAN_HandleTypeDef * hfdcan)

Function description

Enable edge filtering during bus integration.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_DisableEdgeFiltering

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableEdgeFiltering (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable edge filtering during bus integration.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_Start

Function name

HAL_StatusTypeDef HAL_FDCAN_Start (FDCAN_HandleTypeDef * hfdcan)

Function description

Start the FDCAN module.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_Stop

Function name

HAL_StatusTypeDef HAL_FDCAN_Stop (FDCAN_HandleTypeDef * hfdcan)

Function description

Stop the FDCAN module and enable access to configuration registers.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_AddMessageToTxFifoQ

Function name

HAL_StatusTypeDef HAL_FDCAN_AddMessageToTxFifoQ (FDCAN_HandleTypeDef * hfdcan, FDCAN_TxHeaderTypeDef * pTxHeader, uint8_t * pTxData)

Function description

Add a message to the Tx FIFO/Queue and activate the corresponding transmission request.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **pTxHeader:** pointer to a FDCAN_TxHeaderTypeDef structure.
- **pTxData:** pointer to a buffer containing the payload of the Tx frame.

Return values

- **HAL:** status

HAL_FDCAN_AddMessageToTxBuffer

Function name

HAL_StatusTypeDef HAL_FDCAN_AddMessageToTxBuffer (FDCAN_HandleTypeDef * hfdcan, FDCAN_TxHeaderTypeDef * pTxHeader, uint8_t * pTxData, uint32_t BufferIndex)

Function description

Add a message to a dedicated Tx buffer.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **pTxHeader:** pointer to a FDCAN_TxHeaderTypeDef structure.
- **pTxData:** pointer to a buffer containing the payload of the Tx frame.
- **BufferIndex:** index of the buffer to be configured. This parameter can be a value of
  - FDCAN_Tx_location.

Return values

- **HAL:** status

HAL_FDCAN_EnableTxBufferRequest

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableTxBufferRequest (FDCAN_HandleTypeDef * hfdcan, uint32_t BufferIndex)

Function description

Enable transmission request.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **BufferIndex:** buffer index. This parameter can be any combination of
  - FDCAN_Tx_location.

Return values

- **HAL:** status

HAL_FDCAN_GetLatestTxFifoQRequestBuffer

Function name

uint32_t HAL_FDCAN_GetLatestTxFifoQRequestBuffer (FDCAN_HandleTypeDef * hfdcan)

Function description

Get Tx buffer index of latest Tx FIFO/Queue request.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **Tx:** buffer index of last Tx FIFO/Queue request
  - Any value of
    - FDCAN_Tx_location if Tx request has been submitted.
  - 0 if no Tx FIFO/Queue request have been submitted.

HAL_FDCAN_AbortTxRequest

Function name

HAL_StatusTypeDef HAL_FDCAN_AbortTxRequest (FDCAN_HandleTypeDef * hfdcan, uint32_t BufferIndex)

Function description

Abort transmission request.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **BufferIndex:** buffer index. This parameter can be any combination of
  - FDCAN_Tx_location.

Return values

- **HAL:** status

HAL_FDCAN_GetRxMessage

Function name

HAL_StatusTypeDef HAL_FDCAN_GetRxMessage (FDCAN_HandleTypeDef * hfdcan, uint32_t RxLocation, FDCAN_RxHeaderTypeDef * pRxHeader, uint8_t * pRxData)

Function description

Get an FDCAN frame from the Rx Buffer/FIFO zone into the message RAM.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **RxLocation:** Location of the received message to be read. This parameter can be a value of
  - FDCAN_Rx_location.
- **pRxHeader:** pointer to a FDCAN_RxHeaderTypeDef structure.
- **pRxData:** pointer to a buffer where the payload of the Rx frame will be stored.

Return values

- **HAL:** status

HAL_FDCAN_GetTxEvent

Function name

HAL_StatusTypeDef HAL_FDCAN_GetTxEvent (FDCAN_HandleTypeDef * hfdcan, FDCAN_TxEventFifoTypeDef * pTxEvent)

Function description

Get an FDCAN Tx event from the Tx Event FIFO zone into the message RAM.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **pTxEvent:** pointer to a FDCAN_TxEventFifoTypeDef structure.

Return values

- **HAL:** status

HAL_FDCAN_GetHighPriorityMessageStatus

Function name

HAL_StatusTypeDef HAL_FDCAN_GetHighPriorityMessageStatus (FDCAN_HandleTypeDef * hfdcan, FDCAN_HpMsgStatusTypeDef * HpMsgStatus)

Function description

Get high priority message status.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **HpMsgStatus:** pointer to an FDCAN_HpMsgStatusTypeDef structure.

Return values

- **HAL:** status

HAL_FDCAN_GetProtocolStatus

Function name

HAL_StatusTypeDef HAL_FDCAN_GetProtocolStatus (FDCAN_HandleTypeDef * hfdcan, FDCAN_ProtocolStatusTypeDef * ProtocolStatus)

Function description

Get protocol status.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **ProtocolStatus:** pointer to an FDCAN_ProtocolStatusTypeDef structure.

Return values

- **HAL:** status

HAL_FDCAN_GetErrorCounters

Function name

HAL_StatusTypeDef HAL_FDCAN_GetErrorCounters (FDCAN_HandleTypeDef * hfdcan, FDCAN_ErrorCountersTypeDef * ErrorCounters)

Function description

Get error counter values.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **ErrorCounters:** pointer to an FDCAN_ErrorCountersTypeDef structure.

Return values

- **HAL:** status

HAL_FDCAN_IsRxBufferMessageAvailable

Function name

uint32_t HAL_FDCAN_IsRxBufferMessageAvailable (FDCAN_HandleTypeDef * hfdcan, uint32_t RxBufferIndex)

Function description

Check if a new message is received in the selected Rx buffer.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **RxBufferIndex:** Rx buffer index. This parameter must be a number between 0 and 63.

Return values

- **Status:**
  - 0 : No new message on RxBufferIndex.
  - 1 : New message received on RxBufferIndex.

HAL_FDCAN_IsTxBufferMessagePending

Function name

uint32_t HAL_FDCAN_IsTxBufferMessagePending (FDCAN_HandleTypeDef * hfdcan, uint32_t TxBufferIndex)

Function description

Check if a transmission request is pending on the selected Tx buffer.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TxBufferIndex:** Tx buffer index. This parameter can be any combination of
  - FDCAN_Tx_location.

Return values

- **Status:**
  - 0 : No pending transmission request on TxBufferIndex.
  - 1 : Pending transmission request on TxBufferIndex.

HAL_FDCAN_GetRxFifoFillLevel

Function name

uint32_t HAL_FDCAN_GetRxFifoFillLevel (FDCAN_HandleTypeDef * hfdcan, uint32_t RxFifo)

Function description

Return Rx FIFO fill level.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **RxFifo:** Rx FIFO. This parameter can be one of the following values:
  - FDCAN_RX_FIFO0: Rx FIFO 0
  - FDCAN_RX_FIFO1: Rx FIFO 1

Return values

- **Level:** Rx FIFO fill level.

HAL_FDCAN_GetTxFifoFreeLevel

Function name

uint32_t HAL_FDCAN_GetTxFifoFreeLevel (FDCAN_HandleTypeDef * hfdcan)

Function description

Return Tx FIFO free level: number of consecutive free Tx FIFO elements starting from Tx FIFO GetIndex.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **Level:** Tx FIFO free level.

HAL_FDCAN_IsRestrictedOperationMode

Function name

uint32_t HAL_FDCAN_IsRestrictedOperationMode (FDCAN_HandleTypeDef * hfdcan)

Function description

Check if the FDCAN peripheral entered Restricted Operation Mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **Status:**
  - 0 : Normal FDCAN operation.
  - 1 : Restricted Operation Mode active.

HAL_FDCAN_ExitRestrictedOperationMode

Function name

HAL_StatusTypeDef HAL_FDCAN_ExitRestrictedOperationMode (FDCAN_HandleTypeDef * hfdcan)

Function description

Exit Restricted Operation Mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_TT_ConfigOperation

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_ConfigOperation (FDCAN_HandleTypeDef * hfdcan, FDCAN_TT_ConfigTypeDef * pTTParams)

Function description

Initialize TT operation parameters.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **pTTParams:** pointer to a FDCAN_TT_ConfigTypeDef structure.

Return values

- **HAL:** status

HAL_FDCAN_TT_ConfigReferenceMessage

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_ConfigReferenceMessage (FDCAN_HandleTypeDef * hfdcan, uint32_t IdType, uint32_t Identifier, uint32_t Payload)

Function description

Configure the reference message.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **IdType:** Identifier Type. This parameter can be a value of
  - FDCAN_id_type.
- **Identifier:** Reference Identifier. This parameter must be a number between:
  - 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  - 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- **Payload:** Enable or disable the additional payload. This parameter can be a value of
  - FDCAN_TT_Reference_Message_Payload. This parameter is ignored in case of time slaves. If this parameter is set to FDCAN_TT_REF_MESSAGE_ADD_PAYLOAD, the following elements are taken from Tx Buffer 0:
    - MessageMarker
    - TxEventFifoControl
    - DataLength
    - Data Bytes (payload):
      - bytes 2-8, for Level 1
      - bytes 5-8, for Level 0 and Level 2

Return values

- **HAL:** status

HAL_FDCAN_TT_ConfigTrigger

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_ConfigTrigger (FDCAN_HandleTypeDef * hfdcan, FDCAN_TriggerTypeDef * sTriggerConfig)

Function description

Configure the FDCAN trigger according to the specified parameters in the FDCAN_TriggerTypeDef structure.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **sTriggerConfig:** pointer to an FDCAN_TriggerTypeDef structure that contains the trigger configuration information

Return values

- **HAL:** status

HAL_FDCAN_TT_SetGlobalTime

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_SetGlobalTime (FDCAN_HandleTypeDef * hfdcan, uint32_t TimePreset)

Function description

Schedule global time adjustment for the next reference message.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TimePreset:** time preset value. This parameter must be a number between:
  - 0x0000 and 0x7FFF, Next_Master_Ref_Mark = Current_Master_Ref_Mark + TimePreset or
  - 0x8001 and 0xFFFF, Next_Master_Ref_Mark = Current_Master_Ref_Mark - (0x10000 - TimePreset)

Return values

- **HAL:** status

HAL_FDCAN_TT_SetClockSynchronization

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_SetClockSynchronization (FDCAN_HandleTypeDef * hfdcan, uint32_t NewTURNumerator)

Function description

Schedule TUR numerator update for the next reference message.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **NewTURNumerator:** new value of the TUR numerator. This parameter must be a number between 0x10000 and 0x1FFFF.

Return values

- **HAL:** status

HAL_FDCAN_TT_ConfigStopWatch

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_ConfigStopWatch (FDCAN_HandleTypeDef * hfdcan, uint32_t Source, uint32_t Polarity)

Function description

Configure stop watch source and polarity.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **Source:** stop watch source. This parameter can be a value of
  - FDCAN_TT_stop_watch_source.
- **Polarity:** stop watch polarity. This parameter can be a value of
  - FDCAN_TT_stop_watch_polarity.

Return values

- **HAL:** status

HAL_FDCAN_TT_ConfigRegisterTimeMark

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_ConfigRegisterTimeMark (FDCAN_HandleTypeDef * hfdcan, uint32_t TimeMarkSource, uint32_t TimeMarkValue, uint32_t RepeatFactor, uint32_t StartCycle)

Function description

Configure register time mark pulse generation.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TimeMarkSource:** time mark source. This parameter can be a value of
  - FDCAN_TT_time_mark_source.
- **TimeMarkValue:** time mark value (reference). This parameter must be a number between 0 and 0xFFFF.
- **RepeatFactor:** repeat factor of the cycle for which the time mark is valid. This parameter can be a value of
  - FDCAN_TT_Repeat_Factor.
- **StartCycle:** index of the first cycle in which the time mark becomes valid. This parameter is ignored if RepeatFactor is set to FDCAN_TT_REPEAT_EVERY_CYCLE. This parameter must be a number between 0 and RepeatFactor.

Return values

- **HAL:** status

HAL_FDCAN_TT_EnableRegisterTimeMarkPulse

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_EnableRegisterTimeMarkPulse (FDCAN_HandleTypeDef * hfdcan)

Function description

Enable register time mark pulse generation.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_TT_DisableRegisterTimeMarkPulse

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_DisableRegisterTimeMarkPulse (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable register time mark pulse generation.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_TT_EnableTriggerTimeMarkPulse

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_EnableTriggerTimeMarkPulse (FDCAN_HandleTypeDef * hfdcan)

Function description

Enable trigger time mark pulse generation.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_TT_DisableTriggerTimeMarkPulse

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_DisableTriggerTimeMarkPulse (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable trigger time mark pulse generation.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_TT_EnableHardwareGapControl

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_EnableHardwareGapControl (FDCAN_HandleTypeDef * hfdcan)

Function description

Enable gap control by input pin fdcan1_evt.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_TT_DisableHardwareGapControl

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_DisableHardwareGapControl (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable gap control by input pin fdcan1_evt.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_TT_EnableTimeMarkGapControl

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_EnableTimeMarkGapControl (FDCAN_HandleTypeDef * hfdcan)

Function description

Enable gap control (finish only) by register time mark interrupt.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_TT_DisableTimeMarkGapControl

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_DisableTimeMarkGapControl (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable gap control by register time mark interrupt.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_TT_SetNextIsGap

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_SetNextIsGap (FDCAN_HandleTypeDef * hfdcan)

Function description

Transmit next reference message with Next_is_Gap = "1".

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_TT_SetEndOfGap

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_SetEndOfGap (FDCAN_HandleTypeDef * hfdcan)

Function description

Finish a Gap by requesting start of reference message.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_TT_ConfigExternalSyncPhase

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_ConfigExternalSyncPhase (FDCAN_HandleTypeDef * hfdcan, uint32_t TargetPhase)

Function description

Configure target phase used for external synchronization by event trigger input pin fdcan1_evt.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TargetPhase:** defines target value of cycle time when a rising edge of fdcan1_evt is expected. This parameter must be a number between 0 and 0xFFFF.

Return values

- **HAL:** status

HAL_FDCAN_TT_EnableExternalSynchronization

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_EnableExternalSynchronization (FDCAN_HandleTypeDef * hfdcan)

Function description

Synchronize the phase of the FDCAN schedule to an external schedule using event trigger input pin fdcan1_evt.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_TT_DisableExternalSynchronization

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_DisableExternalSynchronization (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable external schedule synchronization.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_TT_GetOperationStatus

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_GetOperationStatus (FDCAN_HandleTypeDef * hfdcan, FDCAN_TTOperationStatusTypeDef * TTOpStatus)

Function description

Get TT operation status.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TTOpStatus:** pointer to an FDCAN_TTOperationStatusTypeDef structure.

Return values

- **HAL:** status

HAL_FDCAN_ConfigInterruptLines

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigInterruptLines (FDCAN_HandleTypeDef * hfdcan, uint32_t ITList, uint32_t InterruptLine)

Function description

Assign interrupts to either Interrupt line 0 or 1.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **ITList:** indicates which interrupts will be assigned to the selected interrupt line. This parameter can be any combination of
  - FDCAN_Interrupts.
- **InterruptLine:** Interrupt line. This parameter can be a value of
  - FDCAN_Interrupt_Line.

Return values

- **HAL:** status

HAL_FDCAN_TT_ConfigInterruptLines

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_ConfigInterruptLines (FDCAN_HandleTypeDef * hfdcan, uint32_t TTITList, uint32_t InterruptLine)

Function description

Assign TT interrupts to either Interrupt line 0 or 1.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TTITList:** indicates which interrupts will be assigned to the selected interrupt line. This parameter can be any combination of
  - FDCAN_TTInterrupts.
- **InterruptLine:** Interrupt line. This parameter can be a value of
  - FDCAN_Interrupt_Line.

Return values

- **HAL:** status

HAL_FDCAN_ActivateNotification

Function name

HAL_StatusTypeDef HAL_FDCAN_ActivateNotification (FDCAN_HandleTypeDef * hfdcan, uint32_t ActiveITs, uint32_t BufferIndexes)

Function description

Enable interrupts.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **ActiveITs:** indicates which interrupts will be enabled. This parameter can be any combination of
  - FDCAN_Interrupts.
- **BufferIndexes:** Tx Buffer Indexes. This parameter can be any combination of
  - FDCAN_Tx_location. This parameter is ignored if ActiveITs does not include one of the following:
    - FDCAN_IT_TX_COMPLETE
    - FDCAN_IT_TX_ABORT_COMPLETE

Return values

- **HAL:** status

HAL_FDCAN_DeactivateNotification

Function name

HAL_StatusTypeDef HAL_FDCAN_DeactivateNotification (FDCAN_HandleTypeDef * hfdcan, uint32_t InactiveITs)

Function description

Disable interrupts.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **InactiveITs:** indicates which interrupts will be disabled. This parameter can be any combination of
  - FDCAN_Interrupts.

Return values

- **HAL:** status

HAL_FDCAN_TT_ActivateNotification

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_ActivateNotification (FDCAN_HandleTypeDef * hfdcan, uint32_t ActiveTTITs)

Function description

Enable TT interrupts.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **ActiveTTITs:** indicates which TT interrupts will be enabled. This parameter can be any combination of
  - FDCAN_TTInterrupts.

Return values

- **HAL:** status

HAL_FDCAN_TT_DeactivateNotification

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_DeactivateNotification (FDCAN_HandleTypeDef * hfdcan, uint32_t InactiveTTITs)

Function description

Disable TT interrupts.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **InactiveTTITs:** indicates which TT interrupts will be disabled. This parameter can be any combination of
  – FDCAN_TTInterrupts.

Return values

- **HAL:** status

HAL_FDCAN_IRQHandler

Function name

void HAL_FDCAN_IRQHandler (FDCAN_HandleTypeDef * hfdcan)

Function description

Handles FDCAN interrupt request.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_ClockCalibrationCallback

Function name

void HAL_FDCAN_ClockCalibrationCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t ClkCalibrationITs)

Function description

Clock Calibration callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **ClkCalibrationITs:** indicates which Clock Calibration interrupts are signaled. This parameter can be any combination of
  – FDCAN_Clock_Calibration_Interrupts.

Return values

- **None:**

HAL_FDCAN_TxEventFifoCallback

Function name

void HAL_FDCAN_TxEventFifoCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t TxEventFifoITs)

Function description

Tx Event callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TxEventFifoITs:** indicates which Tx Event FIFO interrupts are signaled. This parameter can be any combination of
  – FDCAN_Tx_Event_Fifo_Interrupts.

Return values

- **None:**

HAL_FDCAN_RxFifo0Callback

Function name

void HAL_FDCAN_RxFifo0Callback (FDCAN_HandleTypeDef * hfdcan, uint32_t RxFifo0ITs)

Function description

Rx FIFO 0 callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **RxFifo0ITs:** indicates which Rx FIFO 0 interrupts are signaled. This parameter can be any combination of
  – FDCAN_Rx_Fifo0_Interrupts.

Return values

- **None:**

HAL_FDCAN_RxFifo1Callback

Function name

void HAL_FDCAN_RxFifo1Callback (FDCAN_HandleTypeDef * hfdcan, uint32_t RxFifo1ITs)

Function description

Rx FIFO 1 callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **RxFifo1ITs:** indicates which Rx FIFO 1 interrupts are signaled. This parameter can be any combination of
  – FDCAN_Rx_Fifo1_Interrupts.

Return values

- **None:**

HAL_FDCAN_TxFifoEmptyCallback

Function name

void HAL_FDCAN_TxFifoEmptyCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

Tx FIFO Empty callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_TxBufferCompleteCallback

Function name

void HAL_FDCAN_TxBufferCompleteCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t BufferIndexes)

Function description

Transmission Complete callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **BufferIndexes:** Indexes of the transmitted buffers. This parameter can be any combination of
  - FDCAN_Tx_location.

Return values

- **None:**

HAL_FDCAN_TxBufferAbortCallback

Function name

void HAL_FDCAN_TxBufferAbortCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t BufferIndexes)

Function description

Transmission Cancellation callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **BufferIndexes:** Indexes of the aborted buffers. This parameter can be any combination of
  - FDCAN_Tx_location.

Return values

- **None:**

HAL_FDCAN_RxBufferNewMessageCallback

Function name

void HAL_FDCAN_RxBufferNewMessageCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

Rx Buffer New Message callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_HighPriorityMessageCallback

Function name

void HAL_FDCAN_HighPriorityMessageCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

High Priority Message callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_TimestampWraparoundCallback

Function name

void HAL_FDCAN_TimestampWraparoundCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

Timestamp Wraparound callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_TimeoutOccurredCallback

Function name

void HAL_FDCAN_TimeoutOccurredCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

Timeout Occurred callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_ErrorCallback

Function name

void HAL_FDCAN_ErrorCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

Error callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_ErrorStatusCallback

Function name

void HAL_FDCAN_ErrorStatusCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t ErrorStatusITs)

Function description

Error status callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **ErrorStatusITs:** indicates which Error Status interrupts are signaled. This parameter can be any combination of
  - FDCAN_Error_Status_Interrupts.

Return values

- **None:**

HAL_FDCAN_TT_ScheduleSyncCallback

Function name

void HAL_FDCAN_TT_ScheduleSyncCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t TTSchedSyncITs)

Function description

TT Schedule Synchronization callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TTSchedSyncITs:** indicates which TT Schedule Synchronization interrupts are signaled. This parameter can be any combination of
  - FDCAN_TTScheduleSynchronization_Interrupts.

Return values

- **None:**

HAL_FDCAN_TT_TimeMarkCallback

Function name

void HAL_FDCAN_TT_TimeMarkCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t TTTimeMarkITs)

Function description

TT Time Mark callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TTTimeMarkITs:** indicates which TT Schedule Synchronization interrupts are signaled. This parameter can be any combination of
  - FDCAN_TTTimeMark_Interrupts.

Return values

- **None:**

HAL_FDCAN_TT_StopWatchCallback

Function name

void HAL_FDCAN_TT_StopWatchCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t SWTime, uint32_t SWCycleCount)

Function description

TT Stop Watch callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **SWTime:** Time Value captured at the Stop Watch Trigger pin (fdcan1_swt) falling/rising edge (as configured via HAL_FDCAN_TTConfigStopWatch). This parameter is a number between 0 and 0xFFFF.
- **SWCycleCount:** Cycle count value captured together with SWTime. This parameter is a number between 0 and 0x3F.

Return values

- **None:**

HAL_FDCAN_TT_GlobalTimeCallback

Function name

void HAL_FDCAN_TT_GlobalTimeCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t TTGlobTimeITs)

Function description

TT Global Time callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TTGlobTimeITs:** indicates which TT Global Time interrupts are signaled. This parameter can be any combination of
  - FDCAN_TTGlobalTime_Interrupts.

Return values

- **None:**

HAL_FDCAN_GetError

Function name

uint32_t HAL_FDCAN_GetError (FDCAN_HandleTypeDef * hfdcan)

Function description

Return the FDCAN error code.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **FDCAN:** Error Code

HAL_FDCAN_GetState

Function name

HAL_FDCAN_StateTypeDef HAL_FDCAN_GetState (FDCAN_HandleTypeDef * hfdcan)

Function description

Return the FDCAN state.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** state

30.3 FDCAN Firmware driver defines

The following section lists the various define and macros of the module.

30.3.1 FDCAN

FDCAN

FDCAN Bit Rate Switching

FDCAN_BRS_OFF

FDCAN frames transmitted/received without bit rate switching

FDCAN_BRS_ON

FDCAN frames transmitted/received with bit rate switching

FDCAN Calibration Counter

FDCAN_CALIB_TIME_QUANTA_COUNTER

Time Quanta Counter

FDCAN_CALIB_CLOCK_PERIOD_COUNTER

Oscillator Clock Period Counter

FDCAN_CALIB_WATCHDOG_COUNTER

Calibration Watchdog Counter

FDCAN Calibration Field Length

FDCAN_CALIB_FIELD_LENGTH_32

Calibration field length is 32 bits

FDCAN_CALIB_FIELD_LENGTH_64

Calibration field length is 64 bits

FDCAN Calibration State

FDCAN_CLOCK_NOT_CALIBRATED

Clock not calibrated

FDCAN_CLOCK_BASIC_CALIBRATED

Clock basic calibrated

FDCAN_CLOCK_PRECISION_CALIBRATED

Clock precision calibrated

FDCAN Clock Calibration

FDCAN_CLOCK_CALIBRATION_DISABLE

Disable Clock Calibration

FDCAN_CLOCK_CALIBRATION_ENABLE

Enable Clock Calibration

Clock Calibration Interrupts

FDCAN_IT_CALIB_STATE_CHANGED

Clock calibration state changed

FDCAN_IT_CALIB_WATCHDOG_EVENT

Clock calibration watchdog event occurred

FDCAN Clock Divider

FDCAN_CLOCK_DIV1

Divide kernel clock by 1

FDCAN_CLOCK_DIV2

Divide kernel clock by 2

FDCAN_CLOCK_DIV4

Divide kernel clock by 4

FDCAN_CLOCK_DIV6

Divide kernel clock by 6

FDCAN_CLOCK_DIV8

Divide kernel clock by 8

FDCAN_CLOCK_DIV10

Divide kernel clock by 10

FDCAN_CLOCK_DIV12

Divide kernel clock by 12

FDCAN_CLOCK_DIV14

Divide kernel clock by 14

FDCAN_CLOCK_DIV16

Divide kernel clock by 16

FDCAN_CLOCK_DIV18

Divide kernel clock by 18

FDCAN_CLOCK_DIV20

Divide kernel clock by 20

FDCAN_CLOCK_DIV22

Divide kernel clock by 22

FDCAN_CLOCK_DIV24

Divide kernel clock by 24

FDCAN_CLOCK_DIV26

Divide kernel clock by 26

FDCAN_CLOCK_DIV28

Divide kernel clock by 28

FDCAN_CLOCK_DIV30

Divide kernel clock by 30

FDCAN communication state

FDCAN_COM_STATE_SYNC

Node is synchronizing on CAN communication

FDCAN_COM_STATE_IDLE

Node is neither receiver nor transmitter

FDCAN_COM_STATE_RX

Node is operating as receiver

FDCAN_COM_STATE_TX

Node is operating as transmitter

FDCAN Counter Interrupts

FDCAN_IT_TIMESTAMP_WRAPAROUND

Timestamp counter wrapped around

FDCAN_IT_TIMEOUT_OCCURRED

Timeout reached

FDCAN Data Field Size

FDCAN_DATA_BYTES_8

8 bytes data field

FDCAN_DATA_BYTES_12

12 bytes data field

FDCAN_DATA_BYTES_16

16 bytes data field

FDCAN_DATA_BYTES_20

20 bytes data field

FDCAN_DATA_BYTES_24

24 bytes data field

FDCAN_DATA_BYTES_32

32 bytes data field

FDCAN_DATA_BYTES_48

48 bytes data field

FDCAN_DATA_BYTES_64

64 bytes data field

FDCAN Data Length Code

FDCAN_DLC_BYTES_0

0 bytes data field

FDCAN_DLC_BYTES_1

1 bytes data field

FDCAN_DLC_BYTES_2

2 bytes data field

FDCAN_DLC_BYTES_3

3 bytes data field

FDCAN_DLC_BYTES_4

4 bytes data field

FDCAN_DLC_BYTES_5

5 bytes data field

FDCAN_DLC_BYTES_6

6 bytes data field

FDCAN_DLC_BYTES_7

7 bytes data field

FDCAN_DLC_BYTES_8

8 bytes data field

FDCAN_DLC_BYTES_12

12 bytes data field

FDCAN_DLC_BYTES_16

16 bytes data field

FDCAN_DLC_BYTES_20

20 bytes data field

FDCAN_DLC_BYTES_24

24 bytes data field

FDCAN_DLC_BYTES_32

32 bytes data field

FDCAN_DLC_BYTES_48

48 bytes data field

FDCAN_DLC_BYTES_64

64 bytes data field

FDCAN Error Interrupts

FDCAN_IT_RAM_ACCESS_FAILURE

Message RAM access failure occurred

FDCAN_IT_ERROR_LOGGING_OVERFLOW

Overflow of FDCAN Error Logging Counter occurred

FDCAN_IT_RAM_WATCHDOG

Message RAM Watchdog event due to missing READY

FDCAN_IT_ARB_PROTOCOL_ERROR

Protocol error in arbitration phase detected

FDCAN_IT_DATA_PROTOCOL_ERROR

Protocol error in data phase detected

FDCAN_IT_RESERVED_ADDRESS_ACCESS

Access to reserved address occurred

FDCAN Error State Indicator

FDCAN_ESI_ACTIVE

Transmitting node is error active

FDCAN_ESI_PASSIVE

Transmitting node is error passive

FDCAN Error Status Interrupts

FDCAN_IT_ERROR_PASSIVE

Error_Passive status changed

FDCAN_IT_ERROR_WARNING

Error_Warning status changed

FDCAN_IT_BUS_OFF

Bus_Off status changed

FDCAN Event Type

FDCAN_TX_EVENT

Tx event

FDCAN_TX_IN_SPITE_OF_ABORT

Transmission in spite of cancellation

FDCAN Exported Macros

__HAL_FDCAN_RESET_HANDLE_STATE

Description:

- Reset FDCAN handle state.

Parameters:

- __HANDLE__: FDCAN handle.

Return value:

- None

__HAL_FDCAN_ENABLE_IT

Description:

- Enable the specified FDCAN interrupts.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN interrupt. This parameter can be any combination of
  - FDCAN_Interrupts

Return value:

- None

__HAL_FDCAN_DISABLE_IT

Description:

- Disable the specified FDCAN interrupts.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN interrupt. This parameter can be any combination of
  - FDCAN_Interrupts

Return value:

- None

__HAL_FDCAN_GET_IT

Description:

- Check whether the specified FDCAN interrupt is set or not.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN interrupt. This parameter can be one of
  - FDCAN_Interrupts

Return value:

- ITStatus

__HAL_FDCAN_CLEAR_IT

Description:

- Clear the specified FDCAN interrupts.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: specifies the interrupts to clear. This parameter can be any combination of
  - FDCAN_Interrupts

Return value:

- None

__HAL_FDCAN_GET_FLAG

Description:

- Check whether the specified FDCAN flag is set or not.

Parameters:

- __HANDLE__: FDCAN handle.
- __FLAG__: FDCAN flag. This parameter can be one of
  - FDCAN_flags

Return value:

- FlagStatus

__HAL_FDCAN_CLEAR_FLAG

Description:

- Clear the specified FDCAN flags.

Parameters:

- __HANDLE__: FDCAN handle.
- __FLAG__: specifies the flags to clear. This parameter can be any combination of
  - FDCAN_flags

Return value:

- None

__HAL_FDCAN_GET_IT_SOURCE

Description:

- Check if the specified FDCAN interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: specifies the FDCAN interrupt source to check. This parameter can be a value of
  - FDCAN_Interrupts

Return value:

- ITStatus

__HAL_FDCAN_TT_ENABLE_IT

Description:

- Enable the specified FDCAN TT interrupts.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN TT interrupt. This parameter can be any combination of
  - FDCAN_TTInterrupts

Return value:

- None

__HAL_FDCAN_TT_DISABLE_IT

Description:

- Disable the specified FDCAN TT interrupts.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN TT interrupt. This parameter can be any combination of
  - FDCAN_TTInterrupts

Return value:

- None

__HAL_FDCAN_TT_GET_IT

Description:

- Check whether the specified FDCAN TT interrupt is set or not.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN TT interrupt. This parameter can be one of
  - FDCAN_TTInterrupts

Return value:

- ITStatus

__HAL_FDCAN_TT_CLEAR_IT

Description:

- Clear the specified FDCAN TT interrupts.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: specifies the TT interrupts to clear. This parameter can be any combination of
  - FDCAN_TTInterrupts

Return value:

- None

__HAL_FDCAN_TT_GET_FLAG

Description:

- Check whether the specified FDCAN TT flag is set or not.

Parameters:

- __HANDLE__: FDCAN handle.
- __FLAG__: FDCAN TT flag. This parameter can be one of
  - FDCAN_TTflags

Return value:

- FlagStatus

__HAL_FDCAN_TT_CLEAR_FLAG

Description:

- Clear the specified FDCAN TT flags.

Parameters:

- __HANDLE__: FDCAN handle.
- __FLAG__: specifies the TT flags to clear. This parameter can be any combination of
  - FDCAN_TTflags

Return value:

- None

__HAL_FDCAN_TT_GET_IT_SOURCE

Description:

- Check if the specified FDCAN TT interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: specifies the FDCAN TT interrupt source to check. This parameter can be a value of
  - FDCAN_TTInterrupts

Return value:

- ITStatus

FDCAN FIFO watermark

FDCAN_CFG_TX_EVENT_FIFO

Tx event FIFO

FDCAN_CFG_RX_FIFO0

Rx FIFO0

FDCAN_CFG_RX_FIFO1

Rx FIFO1

FDCAN Filter Configuration

FDCAN_FILTER_DISABLE

Disable filter element

FDCAN_FILTER_TO_RXFIFO0

Store in Rx FIFO 0 if filter matches

FDCAN_FILTER_TO_RXFIFO1

Store in Rx FIFO 1 if filter matches

FDCAN_FILTER_REJECT

Reject ID if filter matches

FDCAN_FILTER_HP

Set high priority if filter matches

FDCAN_FILTER_TO_RXFIFO0_HP

Set high priority and store in FIFO 0 if filter matches

FDCAN_FILTER_TO_RXFIFO1_HP

Set high priority and store in FIFO 1 if filter matches

FDCAN_FILTER_TO_RXBUFFER

Store into Rx Buffer, configuration of FilterType ignored

FDCAN Filter Type

FDCAN_FILTER_RANGE

Range filter from FilterID1 to FilterID2

FDCAN_FILTER_DUAL

Dual ID filter for FilterID1 or FilterID2

FDCAN_FILTER_MASK

Classic filter: FilterID1 = filter, FilterID2 = mask

FDCAN_FILTER_RANGE_NO_EIDM

Range filter from FilterID1 to FilterID2, EIDM mask not applied

FDCAN Flags

FDCAN_FLAG_TX_COMPLETE

Transmission Completed

FDCAN_FLAG_TX_ABORT_COMPLETE

Transmission Cancellation Finished

FDCAN_FLAG_TX_FIFO_EMPTY

Tx FIFO Empty

FDCAN_FLAG_RX_HIGH_PRIORITY_MSG

High priority message received

FDCAN_FLAG_RX_BUFFER_NEW_MESSAGE

At least one received message stored into a Rx Buffer

FDCAN_FLAG_TX_EVT_FIFO_ELT_LOST

Tx Event FIFO element lost

FDCAN_FLAG_TX_EVT_FIFO_FULL

Tx Event FIFO full

FDCAN_FLAG_TX_EVT_FIFO_WATERMARK

Tx Event FIFO fill level reached watermark

FDCAN_FLAG_TX_EVT_FIFO_NEW_DATA

Tx Handler wrote Tx Event FIFO element

FDCAN_FLAG_RX_FIFO0_MESSAGE_LOST

Rx FIFO 0 message lost

FDCAN_FLAG_RX_FIFO0_FULL

Rx FIFO 0 full

FDCAN_FLAG_RX_FIFO0_WATERMARK

Rx FIFO 0 fill level reached watermark

FDCAN_FLAG_RX_FIFO0_NEW_MESSAGE

New message written to Rx FIFO 0

FDCAN_FLAG_RX_FIFO1_MESSAGE_LOST

Rx FIFO 1 message lost

FDCAN_FLAG_RX_FIFO1_FULL

Rx FIFO 1 full

FDCAN_FLAG_RX_FIFO1_WATERMARK

Rx FIFO 1 fill level reached watermark

FDCAN_FLAG_RX_FIFO1_NEW_MESSAGE

New message written to Rx FIFO 1

FDCAN_FLAG_RAM_ACCESS_FAILURE

Message RAM access failure occurred

FDCAN_FLAG_ERROR_LOGGING_OVERFLOW

Overflow of FDCAN Error Logging Counter occurred

FDCAN_FLAG_ERROR_PASSIVE

Error_Passive status changed

FDCAN_FLAG_ERROR_WARNING

Error_Warning status changed

FDCAN_FLAG_BUS_OFF

Bus_Off status changed

FDCAN_FLAG_RAM_WATCHDOG

Message RAM Watchdog event due to missing READY

FDCAN_FLAG_ARB_PROTOCOL_ERROR

Protocol error in arbitration phase detected

FDCAN_FLAG_DATA_PROTOCOL_ERROR

Protocol error in data phase detected

FDCAN_FLAG_RESERVED_ADDRESS_ACCESS

Access to reserved address occurred

FDCAN_FLAG_TIMESTAMP_WRAPAROUND

Timestamp counter wrapped around

FDCAN_FLAG_TIMEOUT_OCCURRED

Timeout reached

FDCAN_FLAG_CALIB_STATE_CHANGED

Clock calibration state changed

FDCAN_FLAG_CALIB_WATCHDOG_EVENT

Clock calibration watchdog event occurred

FDCAN format

FDCAN_CLASSIC_CAN

Frame transmitted/received in Classic CAN format

FDCAN_FD_CAN

Frame transmitted/received in FDCAN format

FDCAN Frame Format

FDCAN_FRAME_CLASSIC

Classic mode

FDCAN_FRAME_FD_NO_BRS

FD mode without BitRate Switching

FDCAN_FRAME_FD_BRS

FD mode with BitRate Switching

FDCAN Frame Type

FDCAN_DATA_FRAME

Data frame

FDCAN_REMOTE_FRAME

Remote frame

FDCAN High Priority Message Storage

FDCAN_HP_STORAGE_NO_FIFO

No FIFO selected

FDCAN_HP_STORAGE_MSG_LOST

FIFO message lost

FDCAN_HP_STORAGE_RXFIFO0

Message stored in FIFO 0

FDCAN_HP_STORAGE_RXFIFO1

Message stored in FIFO 1

FDCAN ID Type

FDCAN_STANDARD_ID

Standard ID element

FDCAN_EXTENDED_ID

Extended ID element

FDCAN interrupt line

FDCAN_INTERRUPT_LINE0

Interrupt Line 0

FDCAN_INTERRUPT_LINE1

Interrupt Line 1

FDCAN non-matching frames

FDCAN_ACCEPT_IN_RX_FIFO0

Accept in Rx FIFO 0

FDCAN_ACCEPT_IN_RX_FIFO1

Accept in Rx FIFO 1

FDCAN_REJECT

Reject

FDCAN Operating Mode

FDCAN_MODE_NORMAL

Normal mode

FDCAN_MODE_RESTRICTED_OPERATION

Restricted Operation mode

FDCAN_MODE_BUS_MONITORING

Bus Monitoring mode

FDCAN_MODE_INTERNAL_LOOPBACK

Internal LoopBack mode

FDCAN_MODE_EXTERNAL_LOOPBACK

External LoopBack mode

FDCAN Operation Mode

FDCAN_TT_COMMUNICATION_LEVEL1

Time triggered communication, level 1

FDCAN_TT_COMMUNICATION_LEVEL2

Time triggered communication, level 2

FDCAN_TT_COMMUNICATION_LEVEL0

Time triggered communication, level 0

FDCAN protocol error code

FDCAN_PROTOCOL_ERROR_NONE

No error occurred

FDCAN_PROTOCOL_ERROR_STUFF

Stuff error

FDCAN_PROTOCOL_ERROR_FORM

Form error

FDCAN_PROTOCOL_ERROR_ACK

Acknowledge error

FDCAN_PROTOCOL_ERROR_BIT1

Bit 1 (recessive) error

FDCAN_PROTOCOL_ERROR_BIT0

Bit 0 (dominant) error

FDCAN_PROTOCOL_ERROR_CRC

CRC check sum error

FDCAN_PROTOCOL_ERROR_NO_CHANGE

No change since last read

FDCAN reject remote frames

FDCAN_FILTER_REMOTE

Filter remote frames

FDCAN_REJECT_REMOTE

Reject all remote frames

FDCAN Rx FIFO 0 Interrupts

FDCAN_IT_RX_FIFO0_MESSAGE_LOST

Rx FIFO 0 message lost

FDCAN_IT_RX_FIFO0_FULL

Rx FIFO 0 full

FDCAN_IT_RX_FIFO0_WATERMARK

Rx FIFO 0 fill level reached watermark

FDCAN_IT_RX_FIFO0_NEW_MESSAGE

New message written to Rx FIFO 0

FDCAN Rx FIFO 1 Interrupts

FDCAN_IT_RX_FIFO1_MESSAGE_LOST

Rx FIFO 1 message lost

FDCAN_IT_RX_FIFO1_FULL

Rx FIFO 1 full

FDCAN_IT_RX_FIFO1_WATERMARK

Rx FIFO 1 fill level reached watermark

FDCAN_IT_RX_FIFO1_NEW_MESSAGE

New message written to Rx FIFO 1

FDCAN FIFO operation mode

FDCAN_RX_FIFO_BLOCKING

Rx FIFO blocking mode

FDCAN_RX_FIFO_OVERWRITE

Rx FIFO overwrite mode

FDCAN Rx Interrupts

FDCAN_IT_RX_HIGH_PRIORITY_MSG

High priority message received

FDCAN_IT_RX_BUFFER_NEW_MESSAGE

At least one received message stored into a Rx Buffer

FDCAN Rx Location

FDCAN_RX_FIFO0

Get received message from Rx FIFO 0

FDCAN_RX_FIFO1

Get received message from Rx FIFO 1

FDCAN_RX_BUFFER0

Get received message from Rx Buffer 0

FDCAN_RX_BUFFER1

Get received message from Rx Buffer 1

FDCAN_RX_BUFFER2

Get received message from Rx Buffer 2

FDCAN_RX_BUFFER3

Get received message from Rx Buffer 3

FDCAN_RX_BUFFER4

Get received message from Rx Buffer 4

FDCAN_RX_BUFFER5

Get received message from Rx Buffer 5

FDCAN_RX_BUFFER6

Get received message from Rx Buffer 6

FDCAN_RX_BUFFER7

Get received message from Rx Buffer 7

FDCAN_RX_BUFFER8

Get received message from Rx Buffer 8

FDCAN_RX_BUFFER9

Get received message from Rx Buffer 9

FDCAN_RX_BUFFER10

Get received message from Rx Buffer 10

FDCAN_RX_BUFFER11

Get received message from Rx Buffer 11

FDCAN_RX_BUFFER12

Get received message from Rx Buffer 12

FDCAN_RX_BUFFER13

Get received message from Rx Buffer 13

FDCAN_RX_BUFFER14

Get received message from Rx Buffer 14

FDCAN_RX_BUFFER15

Get received message from Rx Buffer 15

FDCAN_RX_BUFFER16

Get received message from Rx Buffer 16

FDCAN_RX_BUFFER17

Get received message from Rx Buffer 17

FDCAN_RX_BUFFER18

Get received message from Rx Buffer 18

FDCAN_RX_BUFFER19

Get received message from Rx Buffer 19

FDCAN_RX_BUFFER20

Get received message from Rx Buffer 20

FDCAN_RX_BUFFER21

Get received message from Rx Buffer 21

FDCAN_RX_BUFFER22

Get received message from Rx Buffer 22

FDCAN_RX_BUFFER23

Get received message from Rx Buffer 23

FDCAN_RX_BUFFER24

Get received message from Rx Buffer 24

FDCAN_RX_BUFFER25

Get received message from Rx Buffer 25

FDCAN_RX_BUFFER26

Get received message from Rx Buffer 26

FDCAN_RX_BUFFER27

Get received message from Rx Buffer 27

FDCAN_RX_BUFFER28

Get received message from Rx Buffer 28

FDCAN_RX_BUFFER29

Get received message from Rx Buffer 29

FDCAN_RX_BUFFER30

Get received message from Rx Buffer 30

FDCAN_RX_BUFFER31

Get received message from Rx Buffer 31

FDCAN_RX_BUFFER32

Get received message from Rx Buffer 32

FDCAN_RX_BUFFER33

Get received message from Rx Buffer 33

FDCAN_RX_BUFFER34

Get received message from Rx Buffer 34

FDCAN_RX_BUFFER35

Get received message from Rx Buffer 35

FDCAN_RX_BUFFER36

Get received message from Rx Buffer 36

FDCAN_RX_BUFFER37

Get received message from Rx Buffer 37

FDCAN_RX_BUFFER38

Get received message from Rx Buffer 38

FDCAN_RX_BUFFER39

Get received message from Rx Buffer 39

FDCAN_RX_BUFFER40

Get received message from Rx Buffer 40

FDCAN_RX_BUFFER41

Get received message from Rx Buffer 41

FDCAN_RX_BUFFER42

Get received message from Rx Buffer 42

FDCAN_RX_BUFFER43

Get received message from Rx Buffer 43

FDCAN_RX_BUFFER44

Get received message from Rx Buffer 44

FDCAN_RX_BUFFER45

Get received message from Rx Buffer 45

FDCAN_RX_BUFFER46

Get received message from Rx Buffer 46

FDCAN_RX_BUFFER47

Get received message from Rx Buffer 47

FDCAN_RX_BUFFER48

Get received message from Rx Buffer 48

FDCAN_RX_BUFFER49

Get received message from Rx Buffer 49

FDCAN_RX_BUFFER50

Get received message from Rx Buffer 50

FDCAN_RX_BUFFER51

Get received message from Rx Buffer 51

FDCAN_RX_BUFFER54

Get received message from Rx Buffer 54

FDCAN_RX_BUFFER55

Get received message from Rx Buffer 55

FDCAN_RX_BUFFER56

Get received message from Rx Buffer 56

FDCAN_RX_BUFFER57

Get received message from Rx Buffer 57

FDCAN_RX_BUFFER58

Get received message from Rx Buffer 58

FDCAN_RX_BUFFER59

Get received message from Rx Buffer 59

FDCAN_RX_BUFFER60

Get received message from Rx Buffer 60

FDCAN_RX_BUFFER61

Get received message from Rx Buffer 61

FDCAN_RX_BUFFER62

Get received message from Rx Buffer 62

FDCAN_RX_BUFFER63

Get received message from Rx Buffer 63

FDCAN timeout operation

FDCAN_TIMEOUT_CONTINUOUS

Timeout continuous operation

FDCAN_TIMEOUT_TX_EVENT_FIFO

Timeout controlled by Tx Event FIFO

FDCAN_TIMEOUT_RX_FIFO0

Timeout controlled by Rx FIFO 0

FDCAN_TIMEOUT_RX_FIFO1

Timeout controlled by Rx FIFO 1

FDCAN timestamp

FDCAN_TIMESTAMP_INTERNAL

Timestamp counter value incremented according to TCP

FDCAN_TIMESTAMP_EXTERNAL

External timestamp counter value used

FDCAN timestamp prescaler

FDCAN_TIMESTAMP_PRESC_1

Timestamp counter time unit in equal to CAN bit time

FDCAN_TIMESTAMP_PRESC_2

Timestamp counter time unit in equal to CAN bit time multiplied by 2

FDCAN_TIMESTAMP_PRESC_3

Timestamp counter time unit in equal to CAN bit time multiplied by 3

FDCAN_TIMESTAMP_PRESC_4

Timestamp counter time unit in equal to CAN bit time multiplied by 4

FDCAN_TIMESTAMP_PRESC_5

Timestamp counter time unit in equal to CAN bit time multiplied by 5

FDCAN_TIMESTAMP_PRESC_6

Timestamp counter time unit in equal to CAN bit time multiplied by 6

FDCAN_TIMESTAMP_PRESC_7

Timestamp counter time unit in equal to CAN bit time multiplied by 7

FDCAN_TIMESTAMP_PRESC_8

Timestamp counter time unit in equal to CAN bit time multiplied by 8

FDCAN_TIMESTAMP_PRESC_9

Timestamp counter time unit in equal to CAN bit time multiplied by 9

FDCAN_TIMESTAMP_PRESC_10

Timestamp counter time unit in equal to CAN bit time multiplied by 10

FDCAN_TIMESTAMP_PRESC_11

Timestamp counter time unit in equal to CAN bit time multiplied by 11

FDCAN_TIMESTAMP_PRESC_12

Timestamp counter time unit in equal to CAN bit time multiplied by 12

FDCAN_TIMESTAMP_PRESC_13

Timestamp counter time unit in equal to CAN bit time multiplied by 13

FDCAN_TIMESTAMP_PRESC_14

Timestamp counter time unit in equal to CAN bit time multiplied by 14

FDCAN_TIMESTAMP_PRESC_15

Timestamp counter time unit in equal to CAN bit time multiplied by 15

FDCAN_TIMESTAMP_PRESC_16

Timestamp counter time unit in equal to CAN bit time multiplied by 16

FDCAN TT Disturbing Error Interrupts

FDCAN_TT_IT_GLOBAL_TIME_ERROR

Global Time Error

FDCAN_TT_IT_TX_COUNT_UNDERFLOW

Tx Count Underflow

FDCAN_TT_IT_TX_COUNT_OVERFLOW

Tx Count Overflow

FDCAN_TT_IN_SCHEDULE

Synchronized to schedule

FDCAN TT time mark event external

FDCAN_TT_TM_NO_EXTERNAL_EVENT

No action

FDCAN_TT_TM_GEN_EXTERNAL_EVENT

External event (pulse) is generated when trigger becomes active

FDCAN TT time mark event internal

FDCAN_TT_TM_NO_INTERNAL_EVENT

No action

FDCAN_TT_TM_GEN_INTERNAL_EVENT

Internal event is generated when trigger becomes active

FDCAN TT Time Mark Source

FDCAN_TT_REG_TIMEMARK_DIABLED

No Register Time Mark Interrupt generated

FDCAN_TT_REG_TIMEMARK_CYC_TIME

Register Time Mark Interrupt if Time Mark = cycle time

FDCAN_TT_REG_TIMEMARK_LOC_TIME

Register Time Mark Interrupt if Time Mark = local time

FDCAN_TT_REG_TIMEMARK_GLO_TIME

Register Time Mark Interrupt if Time Mark = global time

FDCAN TT Time Master

FDCAN_TT_SLAVE

Time slave

FDCAN_TT_POTENTIAL_MASTER

Potential time master

FDCAN TT trigger type

FDCAN_TT_TX_REF_TRIGGER

Transmit reference message in strictly time-triggered operation

FDCAN_TT_TX_REF_TRIGGER_GAP

Transmit reference message in external event-synchronized time-triggered operation

FDCAN_TT_TX_TRIGGER_SINGLE

Start a single transmission in an exclusive time window

FDCAN_TT_TX_TRIGGER_CONTINUOUS

Start a continuous transmission in an exclusive time window

FDCAN_TT_TX_TRIGGER_ARBITRATION

Start a transmission in an arbitration time window

FDCAN_TT_TX_TRIGGER_MERGED

Start a merged arbitration window

FDCAN_TT_WATCH_TRIGGER

Check for missing reference messages in strictly time-triggered operation

FDCAN_TT_WATCH_TRIGGER_GAP

Check for missing reference messages in external event-synchronized time-triggered operation

FDCAN_TT_RX_TRIGGER

Check for the reception of periodic messages in exclusive time windows

FDCAN_TT_TIME_BASE_TRIGGER

Generate internal/external events depending on TmEventInt/TmEventExt configuration

FDCAN_TT_END_OF_LIST

Illegal trigger, to be assigned to the unused triggers after a FDCAN_TT_WATCH_TRIGGER or FDCAN_TT_WATCH_TRIGGER_GAP

31 HAL FLASH Generic Driver

31.1 FLASH Firmware driver registers structures

31.1.1 FLASH_ProcessTypeDef

FLASH_ProcessTypeDef is defined in the stm32h7xx_hal_flash.h

Data Fields

- ***__IO FLASH_ProcedureTypeDef ProcedureOnGoing***
- ***__IO uint32_t NbSectorsToErase***
- ***__IO uint32_t VoltageForErase***
- ***__IO uint32_t Sector***
- ***__IO uint32_t Address***
- ***HAL_LockTypeDef Lock***
- ***__IO uint32_t ErrorCode***

Field Documentation

- ***__IO FLASH_ProcedureTypeDef FLASH_ProcessTypeDef::ProcedureOnGoing***
  Internal variable to indicate which procedure is ongoing or not in IT context
- ***__IO uint32_t FLASH_ProcessTypeDef::NbSectorsToErase***
  Internal variable to save the remaining sectors to erase in IT context
- ***__IO uint32_t FLASH_ProcessTypeDef::VoltageForErase***
  Internal variable to provide voltage range selected by user in IT context
- ***__IO uint32_t FLASH_ProcessTypeDef::Sector***
  Internal variable to define the current sector which is erasing
- ***__IO uint32_t FLASH_ProcessTypeDef::Address***
  Internal variable to save address selected for program
- ***HAL_LockTypeDef FLASH_ProcessTypeDef::Lock***
  FLASH locking object
- ***__IO uint32_t FLASH_ProcessTypeDef::ErrorCode***
  FLASH error code

31.2 FLASH Firmware driver API description

The following section lists the various functions of the FLASH library.

31.2.1 FLASH peripheral features

The Flash memory interface manages CPU AXI I-Code and D-Code accesses to the Flash memory. It implements the erase and program Flash memory operations and the read and write protection mechanisms.

The FLASH main features are:

- Flash memory read operations
- Flash memory program/erase operations
- Read / write protections
- Option bytes programming
- Error code correction (ECC) : Data in flash are 266-bits word (10 bits added per flash word)

31.2.2 How to use this driver

This driver provides functions and macros to configure and program the FLASH memory of all STM32H7xx devices.

1. FLASH Memory IO Programming functions:
   - Lock and Unlock the FLASH interface using HAL_FLASH_Unlock() and HAL_FLASH_Lock() functions
   - Program functions: 256-bit word only
   - There Two modes of programming :
     - Polling mode using HAL_FLASH_Program() function
     - Interrupt mode using HAL_FLASH_Program_IT() function
2. Interrupts and flags management functions :
   - Handle FLASH interrupts by calling HAL_FLASH_IRQHandler()
   - Callback functions are called when the flash operations are finished : HAL_FLASH_EndOfOperationCallback() when everything is ok, otherwise HAL_FLASH_OperationErrorCallback()
   - Get error flag status by calling HAL_FLASH_GetError()
3. Option bytes management functions :
   - Lock and Unlock the option bytes using HAL_FLASH_OB_Unlock() and HAL_FLASH_OB_Lock() functions
   - Launch the reload of the option bytes using HAL_FLASH_OB_Launch() function. In this case, a reset is generated

In addition to these functions, this driver includes a set of macros allowing to handle the following operations:

- Set the latency
- Enable/Disable the FLASH interrupts
- Monitor the FLASH flags status

Note: For any Flash memory program operation (erase or program), the CPU clock frequency (HCLK) must be at least 1MHz.

Note: The contents of the Flash memory are not guaranteed if a device reset occurs during a Flash memory operation.

Note: The application can simultaneously request a read and a write operation through each AXI interface. As the Flash memory is divided into two independent banks, the embedded Flash memory interface can drive different operations at the same time on each bank. For example a read, write or erase operation can be executed on bank 1 while another read, write or erase operation is executed on bank 2.

31.2.3 Programming operation functions

This subsection provides a set of functions allowing to manage the FLASH program operations.

This section contains the following APIs:

- ***HAL_FLASH_Program()***
- ***HAL_FLASH_Program_IT()***
- ***HAL_FLASH_IRQHandler()***
- ***HAL_FLASH_EndOfOperationCallback()***
- ***HAL_FLASH_OperationErrorCallback()***

31.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the FLASH memory operations.

This section contains the following APIs:

- ***HAL_FLASH_Unlock()***
- ***HAL_FLASH_Lock()***
- ***HAL_FLASH_OB_Unlock()***
- ***HAL_FLASH_OB_Lock()***
- ***HAL_FLASH_OB_Launch()***

31.2.5 Peripheral Errors functions

This subsection permits to get in run-time Errors of the FLASH peripheral.

This section contains the following APIs:

- *HAL_FLASH_GetError()*

31.2.6 Detailed description of functions

HAL_FLASH_Program

Function name

HAL_StatusTypeDef HAL_FLASH_Program (uint32_t TypeProgram, uint32_t FlashAddress, uint32_t DataAddress)

Function description

Program a flash word at a specified address.

Parameters

- **TypeProgram:** Indicate the way to program at a specified address. This parameter can be a value of FLASH Type Program
- **FlashAddress:** specifies the address to be programmed. This parameter shall be aligned to the Flash word:
  - 256 bits for STM32H74x/5X devices (8x 32bits words)
  - 128 bits for STM32H7Ax/BX devices (4x 32bits words)
  - 256 bits for STM32H72x/3X devices (8x 32bits words)
- **DataAddress:** specifies the address of data to be programmed. This parameter shall be 32-bit aligned

Return values

- **HAL_StatusTypeDef:** HAL Status

HAL_FLASH_Program_IT

Function name

HAL_StatusTypeDef HAL_FLASH_Program_IT (uint32_t TypeProgram, uint32_t FlashAddress, uint32_t DataAddress)

Function description

Program a flash word at a specified address with interrupt enabled.

Parameters

- **TypeProgram:** Indicate the way to program at a specified address. This parameter can be a value of FLASH Type Program
- **FlashAddress:** specifies the address to be programmed. This parameter shall be aligned to the Flash word:
  - 256 bits for STM32H74x/5X devices (8x 32bits words)
  - 128 bits for STM32H7Ax/BX devices (4x 32bits words)
  - 256 bits for STM32H72x/3X devices (8x 32bits words)
- **DataAddress:** specifies the address of data to be programmed. This parameter shall be 32-bit aligned

Return values

- **HAL:** Status

HAL_FLASH_IRQHandler

Function name

void HAL_FLASH_IRQHandler (void)

Function description

This function handles FLASH interrupt request.

Return values

- **None:**

HAL_FLASH_EndOfOperationCallback

Function name

void HAL_FLASH_EndOfOperationCallback (uint32_t ReturnValue)

Function description

FLASH end of operation interrupt callback.

Parameters

- **ReturnValue:** The value saved in this parameter depends on the ongoing procedure Mass Erase: Bank number which has been requested to erase Sectors Erase: Sector which has been erased (if 0xFFFFFFFF, it means that all the selected sectors have been erased) Program: Address which was selected for data program

Return values

- **None:**

HAL_FLASH_OperationErrorCallback

Function name

void HAL_FLASH_OperationErrorCallback (uint32_t ReturnValue)

Function description

FLASH operation error interrupt callback.

Parameters

- **ReturnValue:** The value saved in this parameter depends on the ongoing procedure Mass Erase: Bank number which has been requested to erase Sectors Erase: Sector number which returned an error Program: Address which was selected for data program

Return values

- **None:**

HAL_FLASH_Unlock

Function name

HAL_StatusTypeDef HAL_FLASH_Unlock (void)

Function description

Unlock the FLASH control registers access.

Return values

- **HAL:** Status

HAL_FLASH_Lock

Function name

HAL_StatusTypeDef HAL_FLASH_Lock (void)

Function description

Locks the FLASH control registers access.

Return values

- **HAL:** Status

HAL_FLASH_OB_Unlock

Function name

HAL_StatusTypeDef HAL_FLASH_OB_Unlock (void)

Function description

Unlock the FLASH Option Control Registers access.

Return values

- **HAL:** Status

HAL_FLASH_OB_Lock

Function name

HAL_StatusTypeDef HAL_FLASH_OB_Lock (void)

Function description

Lock the FLASH Option Control Registers access.

Return values

- **HAL:** Status

HAL_FLASH_OB_Launch

Function name

HAL_StatusTypeDef HAL_FLASH_OB_Launch (void)

Function description

Launch the option bytes loading.

Return values

- **HAL:** Status

HAL_FLASH_GetError

Function name

uint32_t HAL_FLASH_GetError (void)

Function description

Get the specific FLASH error flag.

Return values

- **HAL_FLASH_ERRORCode:** The returned value can be:
  - HAL_FLASH_ERROR_NONE : No error set
  - HAL_FLASH_ERROR_WRP_BANK1 : Write Protection Error on Bank 1
  - HAL_FLASH_ERROR_PGS_BANK1 : Program Sequence Error on Bank 1
  - HAL_FLASH_ERROR_STRB_BANK1 : Strobe Error on Bank 1
  - HAL_FLASH_ERROR_INC_BANK1 : Inconsistency Error on Bank 1
  - HAL_FLASH_ERROR_OPE_BANK1 : Operation Error on Bank 1
  - HAL_FLASH_ERROR_RDP_BANK1 : Read Protection Error on Bank 1
  - HAL_FLASH_ERROR_RDS_BANK1 : Read Secured Error on Bank 1
  - HAL_FLASH_ERROR_SNECC_BANK1: ECC Single Correction Error on Bank 1
  - HAL_FLASH_ERROR_DBECC_BANK1: ECC Double Detection Error on Bank 1
  - HAL_FLASH_ERROR_CRCRD_BANK1: CRC Read Error on Bank 1
  - HAL_FLASH_ERROR_WRP_BANK2 : Write Protection Error on Bank 2
  - HAL_FLASH_ERROR_PGS_BANK2 : Program Sequence Error on Bank 2
  - HAL_FLASH_ERROR_STRB_BANK2 : Strobe Error on Bank 2
  - HAL_FLASH_ERROR_INC_BANK2 : Inconsistency Error on Bank 2
  - HAL_FLASH_ERROR_OPE_BANK2 : Operation Error on Bank 2
  - HAL_FLASH_ERROR_RDP_BANK2 : Read Protection Error on Bank 2
  - HAL_FLASH_ERROR_RDS_BANK2 : Read Secured Error on Bank 2
  - HAL_FLASH_ERROR_SNECC_BANK2: SNECC Error on Bank 2
  - HAL_FLASH_ERROR_DBECC_BANK2: Double Detection ECC on Bank 2
  - HAL_FLASH_ERROR_CRCRD_BANK2: CRC Read Error on Bank 2

FLASH_WaitForLastOperation

Function name

HAL_StatusTypeDef FLASH_WaitForLastOperation (uint32_t Timeout, uint32_t Bank)

Function description

Wait for a FLASH operation to complete.

Parameters

- **Timeout:** maximum flash operation timeout
- **Bank:** flash FLASH_BANK_1 or FLASH_BANK_2

Return values

- **HAL_StatusTypeDef:** HAL Status

FLASH_OB_WaitForLastOperation

Function name

HAL_StatusTypeDef FLASH_OB_WaitForLastOperation (uint32_t Timeout)

Function description

Wait for a FLASH Option Bytes change operation to complete.

Parameters

- **Timeout:** maximum flash operation timeout

Return values

- **HAL_StatusTypeDef:** HAL Status

FLASH_CRC_WaitForLastOperation

Function name

HAL_StatusTypeDef FLASH_CRC_WaitForLastOperation (uint32_t Timeout, uint32_t Bank)

Function description

Wait for a FLASH CRC computation to complete.

Parameters

- **Timeout:** maximum flash operation timeout
- **Bank:** flash FLASH_BANK_1 or FLASH_BANK_2

Return values

- **HAL_StatusTypeDef:** HAL Status

31.3 FLASH Firmware driver defines

The following section lists the various define and macros of the module.

31.3.1 FLASH

FLASH

FLASH Error Code

HAL_FLASH_ERROR_NONE

No error

HAL_FLASH_ERROR_WRP

Write Protection Error

HAL_FLASH_ERROR_PGS

Program Sequence Error

HAL_FLASH_ERROR_STRB

Strobe Error

HAL_FLASH_ERROR_INC

Inconsistency Error

HAL_FLASH_ERROR_OPE

Operation Error

HAL_FLASH_ERROR_RDP

Read Protection Error

HAL_FLASH_ERROR_RDS

Read Secured Error

HAL_FLASH_ERROR_SNECC

ECC Single Correction Error

HAL_FLASH_ERROR_DBECC

ECC Double Detection Error

HAL_FLASH_ERROR_CRCRD

CRC Read Error

HAL_FLASH_ERROR_WRP_BANK1

Write Protection Error on Bank 1

HAL_FLASH_ERROR_PGS_BANK1

Program Sequence Error on Bank 1

HAL_FLASH_ERROR_STRB_BANK1

Strobe Error on Bank 1

HAL_FLASH_ERROR_INC_BANK1

Inconsistency Error on Bank 1

HAL_FLASH_ERROR_OPE_BANK1

Operation Error on Bank 1

HAL_FLASH_ERROR_RDP_BANK1

Read Protection Error on Bank 1

HAL_FLASH_ERROR_RDS_BANK1

Read Secured Error on Bank 1

HAL_FLASH_ERROR_SNECC_BANK1

ECC Single Correction Error on Bank 1

HAL_FLASH_ERROR_DBECC_BANK1

ECC Double Detection Error on Bank 1

HAL_FLASH_ERROR_CRCRD_BANK1

CRC Read Error on Bank1

HAL_FLASH_ERROR_WRP_BANK2

Write Protection Error on Bank 2

HAL_FLASH_ERROR_PGS_BANK2

Program Sequence Error on Bank 2

HAL_FLASH_ERROR_STRB_BANK2

Strobe Error on Bank 2

HAL_FLASH_ERROR_INC_BANK2

Inconsistency Error on Bank 2

HAL_FLASH_ERROR_OPE_BANK2

Operation Error on Bank 2

HAL_FLASH_ERROR_RDP_BANK2

Read Protection Error on Bank 2

HAL_FLASH_ERROR_RDS_BANK2

Read Secured Error on Bank 2

HAL_FLASH_ERROR_SNECC_BANK2

ECC Single Correction Error on Bank 2

HAL_FLASH_ERROR_DBECC_BANK2

ECC Double Detection Error on Bank 2

HAL_FLASH_ERROR_CRCRD_BANK2

CRC Read Error on Bank2

HAL_FLASH_ERROR_OB_CHANGE

Option Byte Change Error

FLASH Exported Macros

__HAL_FLASH_SET_LATENCY

Description:

- Set the FLASH Latency.

Parameters:

- __LATENCY__: FLASH Latency The value of this parameter depend on device used within the same series

Return value:

- none

__HAL_FLASH_GET_LATENCY

Description:

- Get the FLASH Latency.

Return value:

- FLASH: Latency The value of this parameter depend on device used within the same series

__HAL_FLASH_ENABLE_IT_BANK1

Description:

- Enable the specified FLASH interrupt.

Parameters:

- __INTERRUPT__: : FLASH interrupt In case of Bank 1 This parameter can be any combination of the following values:
  - FLASH_IT_EOP_BANK1 : End of FLASH Bank 1 Operation Interrupt source
  - FLASH_IT_WRPERR_BANK1 : Write Protection Error on Bank 1 Interrupt source
  - FLASH_IT_PGSERR_BANK1 : Program Sequence Error on Bank 1 Interrupt source
  - FLASH_IT_STRBERR_BANK1 : Strobe Error on Bank 1 Interrupt source
  - FLASH_IT_INCERR_BANK1 : Inconsistency Error on Bank 1 Interrupt source
  - FLASH_IT_OPERR_BANK1 : Operation Error on Bank 1 Interrupt source
  - FLASH_IT_RDPERR_BANK1 : Read protection Error on Bank 1 Interrupt source
  - FLASH_IT_RDSERR_BANK1 : Read secure Error on Bank 1 Interrupt source
  - FLASH_IT_SNECCERR_BANK1 : Single ECC Error Correction on Bank 1 Interrupt source
  - FLASH_IT_DBECCERR_BANK1 : Double Detection ECC Error on Bank 1 Interrupt source
  - FLASH_IT_CRCEND_BANK1 : CRC End on Bank 1 Interrupt source
  - FLASH_IT_CRCRDERR_BANK1 : CRC Read error on Bank 1 Interrupt source
  - FLASH_IT_ALL_BANK1 : All Bank 1 Interrupt sources
  - FLASH_IT_EOP_BANK2 : End of FLASH Bank 2 Operation Interrupt source
  - FLASH_IT_WRPERR_BANK2 : Write Protection Error on Bank 2 Interrupt source
  - FLASH_IT_PGSERR_BANK2 : Program Sequence Error on Bank 2 Interrupt source
  - FLASH_IT_STRBERR_BANK2 : Strobe Error on Bank 2 Interrupt source
  - FLASH_IT_INCERR_BANK2 : Inconsistency Error on Bank 2 Interrupt source
  - FLASH_IT_OPERR_BANK2 : Operation Error on Bank 2 Interrupt source
  - FLASH_IT_RDPERR_BANK2 : Read protection Error on Bank 2 Interrupt source
  - FLASH_IT_RDSERR_BANK2 : Read secure Error on Bank 2 Interrupt source
  - FLASH_IT_SNECCERR_BANK2 : Single ECC Error Correction on Bank 2 Interrupt source
  - FLASH_IT_DBECCERR_BANK2 : Double Detection ECC Error on Bank 2 Interrupt source
  - FLASH_IT_CRCEND_BANK2 : CRC End on Bank 2 Interrupt source
  - FLASH_IT_CRCRDERR_BANK2 : CRC Read error on Bank 2 Interrupt source
  - FLASH_IT_ALL_BANK2 : All Bank 2 Interrupt sources

Return value:

- none

__HAL_FLASH_ENABLE_IT_BANK2

__HAL_FLASH_ENABLE_IT

__HAL_FLASH_DISABLE_IT_BANK1

Description:

- Disable the specified FLASH interrupt.

Parameters:

- __INTERRUPT__: : FLASH interrupt In case of Bank 1 This parameter can be any combination of the following values:
  - FLASH_IT_EOP_BANK1 : End of FLASH Bank 1 Operation Interrupt source
  - FLASH_IT_WRPERR_BANK1 : Write Protection Error on Bank 1 Interrupt source
  - FLASH_IT_PGSERR_BANK1 : Program Sequence Error on Bank 1 Interrupt source
  - FLASH_IT_STRBERR_BANK1 : Strobe Error on Bank 1 Interrupt source
  - FLASH_IT_INCERR_BANK1 : Inconsistency Error on Bank 1 Interrupt source
  - FLASH_IT_OPERR_BANK1 : Operation Error on Bank 1 Interrupt source
  - FLASH_IT_RDPERR_BANK1 : Read protection Error on Bank 1 Interrupt source
  - FLASH_IT_RDSERR_BANK1 : Read secure Error on Bank 1 Interrupt source
  - FLASH_IT_SNECCERR_BANK1 : Single ECC Error Correction on Bank 1 Interrupt source
  - FLASH_IT_DBECCERR_BANK1 : Double Detection ECC Error on Bank 1 Interrupt source
  - FLASH_IT_CRCEND_BANK1 : CRC End on Bank 1 Interrupt source
  - FLASH_IT_CRCRDERR_BANK1 : CRC Read error on Bank 1 Interrupt source
  - FLASH_IT_ALL_BANK1 : All Bank 1 Interrupt sources
  - FLASH_IT_EOP_BANK2 : End of FLASH Bank 2 Operation Interrupt source
  - FLASH_IT_WRPERR_BANK2 : Write Protection Error on Bank 2 Interrupt source
  - FLASH_IT_PGSERR_BANK2 : Program Sequence Error on Bank 2 Interrupt source
  - FLASH_IT_STRBERR_BANK2 : Strobe Error on Bank 2 Interrupt source
  - FLASH_IT_INCERR_BANK2 : Inconsistency Error on Bank 2 Interrupt source
  - FLASH_IT_OPERR_BANK2 : Operation Error on Bank 2 Interrupt source
  - FLASH_IT_RDPERR_BANK2 : Read protection Error on Bank 2 Interrupt source
  - FLASH_IT_RDSERR_BANK2 : Read secure Error on Bank 2 Interrupt source
  - FLASH_IT_SNECCERR_BANK2 : Single ECC Error Correction on Bank 2 Interrupt source
  - FLASH_IT_DBECCERR_BANK2 : Double Detection ECC Error on Bank 2 Interrupt source
  - FLASH_IT_CRCEND_BANK2 : CRC End on Bank 2 Interrupt source
  - FLASH_IT_CRCRDERR_BANK2 : CRC Read error on Bank 2 Interrupt source
  - FLASH_IT_ALL_BANK2 : All Bank 2 Interrupt sources

Return value:

- none

__HAL_FLASH_DISABLE_IT_BANK2

__HAL_FLASH_DISABLE_IT

__HAL_FLASH_GET_FLAG_BANK1

Description:

- Checks whether the specified FLASH flag is set or not.

Parameters:

- __FLAG__: specifies the FLASH flag to check. In case of Bank 1 This parameter can be one of the following values :
  - FLASH_FLAG_BSY_BANK1 : FLASH Bank 1 Busy flag
  - FLASH_FLAG_WBNE_BANK1 : Write Buffer Not Empty on Bank 1 flag
  - FLASH_FLAG_QW_BANK1 : Wait Queue on Bank 1 flag
  - FLASH_FLAG_CRC_BUSY_BANK1 : CRC module is working on Bank 1 flag
  - FLASH_FLAG_EOP_BANK1 : End Of Program on Bank 1 flag
  - FLASH_FLAG_WRPERR_BANK1 : Write Protection Error on Bank 1 flag
  - FLASH_FLAG_PGSERR_BANK1 : Program Sequence Error on Bank 1 flag
  - FLASH_FLAG_STRBER_BANK1 : Program Alignment Error on Bank 1 flag
  - FLASH_FLAG_INCERR_BANK1 : Inconsistency Error on Bank 1 flag
  - FLASH_FLAG_OPERR_BANK1 : Operation Error on Bank 1 flag
  - FLASH_FLAG_RDPERR_BANK1 : Read Protection Error on Bank 1 flag
  - FLASH_FLAG_RDSERR_BANK1 : Read secure Error on Bank 1 flag
  - FLASH_FLAG_SNECCE_BANK1 : Single ECC Error Correction on Bank 1 flag
  - FLASH_FLAG_DBECCE_BANK1 : Double Detection ECC Error on Bank 1 flag
  - FLASH_FLAG_CRCEND_BANK1 : CRC End on Bank 1 flag
  - FLASH_FLAG_CRCRDERR_BANK1 : CRC Read error on Bank 1 flag
  - FLASH_FLAG_BSY_BANK2 : FLASH Bank 2 Busy flag
  - FLASH_FLAG_WBNE_BANK2 : Write Buffer Not Empty on Bank 2 flag
  - FLASH_FLAG_QW_BANK2 : Wait Queue on Bank 2 flag
  - FLASH_FLAG_CRC_BUSY_BANK2 : CRC module is working on Bank 2 flag
  - FLASH_FLAG_EOP_BANK2 : End Of Program on Bank 2 flag
  - FLASH_FLAG_WRPERR_BANK2 : Write Protection Error on Bank 2 flag
  - FLASH_FLAG_PGSERR_BANK2 : Program Sequence Error on Bank 2 flag
  - FLASH_FLAG_STRBER_BANK2 : Program Alignment Error on Bank 2 flag
  - FLASH_FLAG_INCERR_BANK2 : Inconsistency Error on Bank 2 flag
  - FLASH_FLAG_OPERR_BANK2 : Operation Error on Bank 2 flag
  - FLASH_FLAG_RDPERR_BANK2 : Read Protection Error on Bank 2 flag
  - FLASH_FLAG_RDSERR_BANK2 : Read secure Error on Bank 2 flag
  - FLASH_FLAG_SNECCE_BANK2 : Single ECC Error Correction on Bank 2 flag
  - FLASH_FLAG_DBECCE_BANK2 : Double Detection ECC Error on Bank 2 flag
  - FLASH_FLAG_CRCEND_BANK2 : CRC End on Bank 2 flag
  - FLASH_FLAG_CRCRDERR_BANK2 : CRC Read error on Bank 2 flag

Return value:

- The: new state of FLASH_FLAG (SET or RESET).

__HAL_FLASH_GET_FLAG_BANK2

__HAL_FLASH_GET_FLAG

__HAL_FLASH_CLEAR_FLAG_BANK1

Description:

- Clear the specified FLASH flag.

Parameters:

- __FLAG__: specifies the FLASH flags to clear. In case of Bank 1, this parameter can be any combination of the following values:
  - FLASH_FLAG_EOP_BANK1 : End Of Program on Bank 1 flag
  - FLASH_FLAG_WRPERR_BANK1 : Write Protection Error on Bank 1 flag
  - FLASH_FLAG_PGSERR_BANK1 : Program Sequence Error on Bank 1 flag
  - FLASH_FLAG_STRBER_BANK1 : Program Alignment Error on Bank 1 flag
  - FLASH_FLAG_INCERR_BANK1 : Inconsistency Error on Bank 1 flag
  - FLASH_FLAG_OPERR_BANK1 : Operation Error on Bank 1 flag
  - FLASH_FLAG_RDPERR_BANK1 : Read Protection Error on Bank 1 flag
  - FLASH_FLAG_RDSERR_BANK1 : Read secure Error on Bank 1 flag
  - FLASH_FLAG_SNECCE_BANK1 : Single ECC Error Correction on Bank 1 flag
  - FLASH_FLAG_DBECCE_BANK1 : Double Detection ECC Error on Bank 1 flag
  - FLASH_FLAG_CRCEND_BANK1 : CRC End on Bank 1 flag
  - FLASH_FLAG_CRCRDERR_BANK1 : CRC Read error on Bank 1 flag
  - FLASH_FLAG_ALL_ERRORS_BANK1 : All Bank 1 error flags
  - FLASH_FLAG_ALL_BANK1 : All Bank 1 flags
  - FLASH_FLAG_EOP_BANK2 : End Of Program on Bank 2 flag
  - FLASH_FLAG_WRPERR_BANK2 : Write Protection Error on Bank 2 flag
  - FLASH_FLAG_PGSERR_BANK2 : Program Sequence Error on Bank 2 flag
  - FLASH_FLAG_STRBER_BANK2 : Program Alignment Error on Bank 2 flag
  - FLASH_FLAG_INCERR_BANK2 : Inconsistency Error on Bank 2 flag
  - FLASH_FLAG_OPERR_BANK2 : Operation Error on Bank 2 flag
  - FLASH_FLAG_RDPERR_BANK2 : Read Protection Error on Bank 2 flag
  - FLASH_FLAG_RDSERR_BANK2 : Read secure Error on Bank 2 flag
  - FLASH_FLAG_SNECCE_BANK2 : Single ECC Error Correction on Bank 2 flag
  - FLASH_FLAG_DBECCE_BANK2 : Double Detection ECC Error on Bank 2 flag
  - FLASH_FLAG_CRCEND_BANK2 : CRC End on Bank 2 flag
  - FLASH_FLAG_CRCRDERR_BANK2 : CRC Read error on Bank 2 flag
  - FLASH_FLAG_ALL_ERRORS_BANK2 : All Bank 2 error flags
  - FLASH_FLAG_ALL_BANK2 : All Bank 2 flags

Return value:

- none

32 HAL FLASH Extension Driver

32.1 FLASHEx Firmware driver registers structures

32.1.1 FLASH_EraseInitTypeDef

FLASH_EraseInitTypeDef is defined in the stm32h7xx_hal_flash_ex.h

Data Fields

- ***uint32_t TypeErase***
- ***uint32_t Banks***
- ***uint32_t Sector***
- ***uint32_t NbSectors***
- ***uint32_t VoltageRange***

Field Documentation

- ***uint32_t FLASH_EraseInitTypeDef::TypeErase***
  Mass erase or sector Erase. This parameter can be a value of ***FLASHEx_Type_Erase***
- ***uint32_t FLASH_EraseInitTypeDef::Banks***
  Select banks to erase when Mass erase is enabled. This parameter must be a value of ***FLASHEx_Banks***
- ***uint32_t FLASH_EraseInitTypeDef::Sector***
  Initial FLASH sector to erase when Mass erase is disabled This parameter must be a value of ***FLASH_Sectors***
- ***uint32_t FLASH_EraseInitTypeDef::NbSectors***
  Number of sectors to be erased. This parameter must be a value between 1 and (max number of sectors - value of Initial sector)
- ***uint32_t FLASH_EraseInitTypeDef::VoltageRange***
  The device voltage range which defines the erase parallelism This parameter must be a value of ***FLASHEx_Voltage_Range***

32.1.2 FLASH_OBProgramInitTypeDef

FLASH_OBProgramInitTypeDef is defined in the stm32h7xx_hal_flash_ex.h

Data Fields

- ***uint32_t OptionType***
- ***uint32_t WRPState***
- ***uint32_t WRPSector***
- ***uint32_t RDPLevel***
- ***uint32_t BORLevel***
- ***uint32_t USERType***
- ***uint32_t USERConfig***
- ***uint32_t Banks***
- ***uint32_t PCROPConfig***
- ***uint32_t PCROPStartAddr***
- ***uint32_t PCROPEndAddr***
- ***uint32_t BootConfig***
- ***uint32_t BootAddr0***
- ***uint32_t BootAddr1***
- ***uint32_t CM4BootConfig***
- ***uint32_t CM4BootAddr0***
- ***uint32_t CM4BootAddr1***

- ***uint32_t SecureAreaConfig***
- ***uint32_t SecureAreaStartAddr***
- ***uint32_t SecureAreaEndAddr***

Field Documentation

- ***uint32_t FLASH_OBProgramInitTypeDef::OptionType***
  Option byte to be configured. This parameter can be a value of ***FLASHEx_Option_Type***
- ***uint32_t FLASH_OBProgramInitTypeDef::WRPState***
  Write protection activation or deactivation. This parameter can be a value of ***FLASHEx_WRP_State***
- ***uint32_t FLASH_OBProgramInitTypeDef::WRPSector***
  Specifies the sector(s) to be write protected. The value of this parameter depend on device used within the same series
- ***uint32_t FLASH_OBProgramInitTypeDef::RDPLevel***
  Set the read protection level. This parameter can be a value of ***FLASHEx_Option_Bytes_Read_Protection***
- ***uint32_t FLASH_OBProgramInitTypeDef::BORLevel***
  Set the BOR Level. This parameter can be a value of ***FLASHEx_BOR_Reset_Level***
- ***uint32_t FLASH_OBProgramInitTypeDef::USERType***
  User option byte(s) to be configured (used for OPTIONBYTE_USER). This parameter can be a combination of ***FLASHEx_OB_USER_Type***
- ***uint32_t FLASH_OBProgramInitTypeDef::USERConfig***
  Program the FLASH User Option Byte: IWDG_SW / RST_STOP / RST_STDBY / IWDG_FREEZE_STOP / IWDG_FREEZE_SANDBY / IO_HSLV / SWAP_BANK_OPT
- ***uint32_t FLASH_OBProgramInitTypeDef::Banks***
  Select banks for WRP , PCROP and secure area config . This parameter must be a value of ***FLASHEx_Banks***
- ***uint32_t FLASH_OBProgramInitTypeDef::PCROPConfig***
  specifies if the PCROP area shall be erased or not when RDP level decreased from Level 1 to Level 0 or during a mass erase. This parameter must be a value of ***FLASHEx_OB_PCROP_RDP*** enumeration
- ***uint32_t FLASH_OBProgramInitTypeDef::PCROPStartAddr***
  PCROP Start address (used for OPTIONBYTE_PCROP). This parameter must be a value between begin and end of a bank
- ***uint32_t FLASH_OBProgramInitTypeDef::PCROPEndAddr***
  PCROP End address (used for OPTIONBYTE_PCROP). This parameter must be a value between PCROP Start address and end of a bank
- ***uint32_t FLASH_OBProgramInitTypeDef::BootConfig***
  Specifies if the Boot Address to be configured BOOT_ADD0, BOOT_ADD1 or both. This parameter must be a value of ***FLASHEx_OB_BOOT_OPTION*** enumeration
- ***uint32_t FLASH_OBProgramInitTypeDef::BootAddr0***
  Boot Address 0. This parameter must be a value between begin and end of a bank
- ***uint32_t FLASH_OBProgramInitTypeDef::BootAddr1***
  Boot Address 1. This parameter must be a value between begin and end of a bank
- ***uint32_t FLASH_OBProgramInitTypeDef::CM4BootConfig***
  specifies if the CM4 boot Address to be configured BOOT_ADD0, BOOT_ADD1 or both. This parameter must be a value of ***FLASHEx_OB_BOOT_OPTION*** enumeration
- ***uint32_t FLASH_OBProgramInitTypeDef::CM4BootAddr0***
  CM4 Boot Address 0. This parameter must be a value between begin and end of a bank
- ***uint32_t FLASH_OBProgramInitTypeDef::CM4BootAddr1***
  CM4 Boot Address 1. This parameter must be a value between begin and end of a bank
- ***uint32_t FLASH_OBProgramInitTypeDef::SecureAreaConfig***
  specifies if the bank secured area shall be erased or not when RDP level decreased from Level 1 to Level 0 or during a mass erase. This parameter must be a value of ***FLASHEx_OB_SECURE_RDP*** enumeration

- ***uint32_t FLASH_OBProgramInitTypeDef::SecureAreaStartAddr***
  Bank Secure area Start address. This parameter must be a value between begin address and end address of bank1
- ***uint32_t FLASH_OBProgramInitTypeDef::SecureAreaEndAddr***
  Bank Secure area End address. This parameter must be a value between Secure Area Start address and end address of a bank1

32.1.3 FLASH_CRCInitTypeDef

FLASH_CRCInitTypeDef is defined in the stm32h7xx_hal_flash_ex.h

Data Fields

- ***uint32_t TypeCRC***
- ***uint32_t BurstSize***
- ***uint32_t Bank***
- ***uint32_t Sector***
- ***uint32_t NbSectors***
- ***uint32_t CRCStartAddr***
- ***uint32_t CRCEndAddr***

Field Documentation

- ***uint32_t FLASH_CRCInitTypeDef::TypeCRC***
  CRC Selection Type. This parameter can be a value of ***FLASHEx_CRC_Selection_Type***
- ***uint32_t FLASH_CRCInitTypeDef::BurstSize***
  CRC Burst Size. This parameter can be a value of ***FLASHEx_CRC_Burst_Size***
- ***uint32_t FLASH_CRCInitTypeDef::Bank***
  Select bank where CRC computation is enabled. This parameter must be FLASH_BANK_1 or FLASH_BANK_2
- ***uint32_t FLASH_CRCInitTypeDef::Sector***
  Initial FLASH sector from which starts the CRC computation This parameter must be a value of ***FLASH_Sectors***
- ***uint32_t FLASH_CRCInitTypeDef::NbSectors***
  Number of sectors to be computed. This parameter must be a value between 1 and (max number of sectors - value of Initial sector)
- ***uint32_t FLASH_CRCInitTypeDef::CRCStartAddr***
  CRC Start address. This parameter must be a value between begin address and end address of a bank
- ***uint32_t FLASH_CRCInitTypeDef::CRCEndAddr***
  CRC End address. This parameter must be a value between CRC Start address and end address of a bank

32.2 FLASHEx Firmware driver API description

The following section lists the various functions of the FLASHEx library.

32.2.1 Flash Extension features

Comparing to other previous devices, the FLASH interface for STM32H7xx devices contains the following additional features

- Capacity up to 2 Mbyte with dual bank architecture supporting read-while-write capability (RWW)
- Dual bank memory organization
- PCROP protection for all banks
- Global readout protection (RDP)
- Write protection
- Secure access only protection
- Bank / register swapping (when Dual-Bank)
- Cyclic Redundancy Check (CRC)

32.2.2 How to use this driver

This driver provides functions to configure and program the FLASH memory of all STM32H7xx devices. It includes

1. FLASH Memory Erase functions:
   - Lock and Unlock the FLASH interface using HAL_FLASH_Unlock() and HAL_FLASH_Lock() functions
   - Erase function: Sector erase, bank erase and dual-bank mass erase
   - There are two modes of erase :
     - Polling Mode using HAL_FLASHEx_Erase()
     - Interrupt Mode using HAL_FLASHEx_Erase_IT()
2. Option Bytes Programming functions: Use HAL_FLASHEx_OBProgram() to:
   - Set/Reset the write protection per bank
   - Set the Read protection Level
   - Set the BOR level
   - Program the user Option Bytes
   - PCROP protection configuration and control per bank
   - Secure area configuration and control per bank
   - Core Boot address configuration
   - TCM / AXI shared RAM configuration
   - CPU Frequency Boost configuration
3. FLASH Memory Lock and unlock per Bank: HAL_FLASHEx_Lock_Bank1(), HAL_FLASHEx_Unlock_Bank1(), HAL_FLASHEx_Lock_Bank2() and HAL_FLASHEx_Unlock_Bank2() functions
4. FLASH CRC computation function: Use HAL_FLASHEx_ComputeCRC() to:
   - Enable CRC feature
   - Program the desired burst size
   - Define the user Flash Area on which the CRC has be computed
   - Perform the CRC computation
   - Disable CRC feature

32.2.3 Extended programming operation functions

This subsection provides a set of functions allowing to manage the Extension FLASH programming operations Operations.

This section contains the following APIs:

- ***HAL_FLASHEx_Erase()***
- ***HAL_FLASHEx_Erase_IT()***
- ***HAL_FLASHEx_OBProgram()***
- ***HAL_FLASHEx_OBGetConfig()***
- ***HAL_FLASHEx_Unlock_Bank1()***
- ***HAL_FLASHEx_Lock_Bank1()***
- ***HAL_FLASHEx_Unlock_Bank2()***
- ***HAL_FLASHEx_Lock_Bank2()***
- ***HAL_FLASHEx_ComputeCRC()***

32.2.4 Detailed description of functions

HAL_FLASHEx_Erase

Function name

HAL_StatusTypeDef HAL_FLASHEx_Erase (FLASH_EraseInitTypeDef * pEraseInit, uint32_t * SectorError)

Function description

Perform a mass erase or erase the specified FLASH memory sectors.

Parameters

- **pEraseInit:** pointer to an FLASH_EraseInitTypeDef structure that contains the configuration information for the erasing.
- **SectorError:** pointer to variable that contains the configuration information on faulty sector in case of error (0xFFFFFFFF means that all the sectors have been correctly erased)

Return values

- **HAL:** Status

HAL_FLASHEx_Erase_IT

Function name

HAL_StatusTypeDef HAL_FLASHEx_Erase_IT (FLASH_EraseInitTypeDef * pEraseInit)

Function description

Perform a mass erase or erase the specified FLASH memory sectors with interrupt enabled.

Parameters

- **pEraseInit:** pointer to an FLASH_EraseInitTypeDef structure that contains the configuration information for the erasing.

Return values

- **HAL:** Status

HAL_FLASHEx_OBProgram

Function name

HAL_StatusTypeDef HAL_FLASHEx_OBProgram (FLASH_OBProgramInitTypeDef * pOBInit)

Function description

Program option bytes.

Parameters

- **pOBInit:** pointer to an FLASH_OBProgramInitTypeDef structure that contains the configuration information for the programming.

Return values

- **HAL:** Status

HAL_FLASHEx_OBGetConfig

Function name

void HAL_FLASHEx_OBGetConfig (FLASH_OBProgramInitTypeDef * pOBInit)

Function description

Get the Option byte configuration.

Parameters

- **pOBInit:** pointer to an FLASH_OBProgramInitTypeDef structure that contains the configuration information for the programming.

Return values

- **None:**

Notes

- The parameter Banks of the pOBInit structure must be set exclusively to FLASH_BANK_1 or FLASH_BANK_2, as this parameter is use to get the given Bank WRP, PCROP and secured area configuration.

HAL_FLASHEx_Unlock_Bank1

Function name

HAL_StatusTypeDef HAL_FLASHEx_Unlock_Bank1 (void)

Function description

Unlock the FLASH Bank1 control registers access.

Return values

- **HAL:** Status

HAL_FLASHEx_Lock_Bank1

Function name

HAL_StatusTypeDef HAL_FLASHEx_Lock_Bank1 (void)

Function description

Locks the FLASH Bank1 control registers access.

Return values

- **HAL:** Status

HAL_FLASHEx_Unlock_Bank2

Function name

HAL_StatusTypeDef HAL_FLASHEx_Unlock_Bank2 (void)

Function description

Unlock the FLASH Bank2 control registers access.

Return values

- **HAL:** Status

HAL_FLASHEx_Lock_Bank2

Function name

HAL_StatusTypeDef HAL_FLASHEx_Lock_Bank2 (void)

Function description

Locks the FLASH Bank2 control registers access.

Return values

- **HAL:** Status

HAL_FLASHEx_ComputeCRC

Function name

HAL_StatusTypeDef HAL_FLASHEx_ComputeCRC (FLASH_CRCInitTypeDef * pCRCInit, uint32_t * CRC_Result)

Function description

FLASH_Erase_Sector

Function name

void FLASH_Erase_Sector (uint32_t Sector, uint32_t Banks, uint32_t VoltageRange)

Function description

Erase the specified FLASH memory sector.

Parameters

- **Sector:** FLASH sector to erase This parameter can be a value of FLASH Sectors
- **Banks:** Banks to be erased This parameter can be one of the following values:
  - FLASH_BANK_1: Bank1 to be erased
  - FLASH_BANK_2: Bank2 to be erased
  - FLASH_BANK_BOTH: Bank1 and Bank2 to be erased
- **VoltageRange:** The device program/erase parallelism. This parameter can be one of the following values:
  - FLASH_VOLTAGE_RANGE_1 : Flash program/erase by 8 bits
  - FLASH_VOLTAGE_RANGE_2 : Flash program/erase by 16 bits
  - FLASH_VOLTAGE_RANGE_3 : Flash program/erase by 32 bits
  - FLASH_VOLTAGE_RANGE_4 : Flash program/erase by 64 bits

Return values

- **None:**

32.3 FLASHEx Firmware driver defines

The following section lists the various define and macros of the module.

32.3.1 FLASHEx

FLASHEx

FLASH Banks

FLASH_BANK_1

Bank 1

FLASH_BANK_2

Bank 2

FLASH_BANK_BOTH

Bank1 and Bank2

FLASH Boot Address

OB_BOOTADDR_ITCM_RAM

Boot from ITCM RAM (0x00000000)

OB_BOOTADDR_SYSTEM

Boot from System memory bootloader (0x00100000)

OB_BOOTADDR_ITCM_FLASH

Boot from Flash on ITCM interface (0x00200000)

OB_BOOTADDR_AXIM_FLASH

Boot from Flash on AXIM interface (0x08000000)

OB_BOOTADDR_DTCM_RAM

Boot from DTCM RAM (0x20000000)

OB_BOOTADDR_SRAM1

Boot from SRAM1 (0x20010000)

OB_BOOTADDR_SRAM2

Boot from SRAM2 (0x2004C000)

FLASH BOR Reset Level

OB_BOR_LEVEL0

Reset level threshold is set to 1.6V

OB_BOR_LEVEL1

Reset level threshold is set to 2.1V

OB_BOR_LEVEL2

Reset level threshold is set to 2.4V

OB_BOR_LEVEL3

Reset level threshold is set to 2.7V

FLASH CRC Burst Size

FLASH_CRC_BURST_SIZE_4

Every burst has a size of 4 Flash words (256-bit)

FLASH_CRC_BURST_SIZE_16

Every burst has a size of 16 Flash words (256-bit)

FLASH_CRC_BURST_SIZE_64

Every burst has a size of 64 Flash words (256-bit)

FLASH_CRC_BURST_SIZE_256

Every burst has a size of 256 Flash words (256-bit)

FLASH CRC Selection Type

FLASH_CRC_ADDR

CRC selection type by address

FLASH_CRC_SECTORS

CRC selection type by sectors

FLASH_CRC_BANK

CRC selection type by bank

FLASH Exported Macros

__HAL_FLASH_CALC_BOOT_BASE_ADR

Description:

- Calculate the FLASH Boot Base Address (BOOT_ADD0 or BOOT_ADD1)

Parameters:

- __ADDRESS__: FLASH Boot Address (in the range 0x0000 0000 to 0x2004 FFFF with a granularity of 16KB)

Return value:

- The: FLASH Boot Base Address

Notes:

- Returned value BOOT_ADDx[15:0] corresponds to boot address [29:14].

__HAL_FLASH_SET_PSIZE

Description:

- Set the FLASH Program/Erase parallelism.

Parameters:

- __PSIZE__: FLASH Program/Erase parallelism This parameter can be a value of
- __BANK__: Flash bank (FLASH_BANK_1 or FLASH_BANK_2)

Return value:

- none

__HAL_FLASH_GET_PSIZE

Description:

- Get the FLASH Program/Erase parallelism.

Parameters:

- __BANK__: Flash bank (FLASH_BANK_1 or FLASH_BANK_2)

Return value:

- FLASH: Program/Erase parallelism This return value can be a value of

__HAL_FLASH_SET_PROGRAM_DELAY

Description:

- Set the FLASH Programming Delay.

Parameters:

- __DELAY__: FLASH Programming Delay This parameter can be a value of

Return value:

- none

__HAL_FLASH_GET_PROGRAM_DELAY

Description:

- Get the FLASH Programming Delay.

Return value:

- FLASH: Programming Delay This return value can be a value of

- ***__IO uint32_t ErrorCode***

Field Documentation

- ***FMAC_TypeDef* __FMAC_HandleTypeDef::Instance***
  Register base address
- ***uint32_t __FMAC_HandleTypeDef::FilterParam***
  Filter configuration (operation and parameters). Set to 0 if no valid configuration was applied.
- ***uint8_t __FMAC_HandleTypeDef::InputAccess***
  Access to the input buffer (internal memory area): DMA, IT, Polling, None. This parameter can be a value of ***FMAC_Buffer_Access***.
- ***uint8_t __FMAC_HandleTypeDef::OutputAccess***
  Access to the output buffer (internal memory area): DMA, IT, Polling, None. This parameter can be a value of ***FMAC_Buffer_Access***.
- ***int16_t* __FMAC_HandleTypeDef::pInput***
  Pointer to FMAC input data buffer

- ***uint16_t __FMAC_HandleTypeDef::InputCurrentSize***
  Number of the input elements already written into FMAC
- ***uint16_t* __FMAC_HandleTypeDef::pInputSize***
  Number of input elements to write (memory allocated to pInput). In case of early interruption of the filter operation, its value will be updated.
- ***int16_t* __FMAC_HandleTypeDef::pOutput***
  Pointer to FMAC output data buffer
- ***uint16_t __FMAC_HandleTypeDef::OutputCurrentSize***
  Number of the output elements already read from FMAC
- ***uint16_t* __FMAC_HandleTypeDef::pOutputSize***
  Number of output elements to read (memory allocated to pOutput). In case of early interruption of the filter operation, its value will be updated.
- ***DMA_HandleTypeDef* __FMAC_HandleTypeDef::hdmaIn***
  FMAC peripheral input data DMA handle parameters
- ***DMA_HandleTypeDef* __FMAC_HandleTypeDef::hdmaOut***
  FMAC peripheral output data DMA handle parameters
- ***DMA_HandleTypeDef* __FMAC_HandleTypeDef::hdmaPreload***
  FMAC peripheral preloaded data (X1, X2 and Y) DMA handle parameters
- ***void(* __FMAC_HandleTypeDef::ErrorCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC error callback
- ***void(* __FMAC_HandleTypeDef::HalfGetDataCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC get half data callback
- ***void(* __FMAC_HandleTypeDef::GetDataCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC get data callback
- ***void(* __FMAC_HandleTypeDef::HalfOutputDataReadyCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC half output data ready callback
- ***void(* __FMAC_HandleTypeDef::OutputDataReadyCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC output data ready callback
- ***void(* __FMAC_HandleTypeDef::FilterConfigCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC filter configuration callback
- ***void(* __FMAC_HandleTypeDef::FilterPreloadCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC filter preload callback
- ***void(* __FMAC_HandleTypeDef::MspInitCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC Msp Init callback
- ***void(* __FMAC_HandleTypeDef::MspDeInitCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC Msp DeInit callback
- ***HAL_LockTypeDef __FMAC_HandleTypeDef::Lock***
  FMAC locking object
- ***__IO HAL_FMAC_StateTypeDef __FMAC_HandleTypeDef::State***
  FMAC state related to global handle management This parameter can be a value of **HAL_FMAC_StateTypeDef**
- ***__IO HAL_FMAC_StateTypeDef __FMAC_HandleTypeDef::RdState***
  FMAC state related to read operations (access to Y buffer) This parameter can be a value of **HAL_FMAC_StateTypeDef**
- ***__IO HAL_FMAC_StateTypeDef __FMAC_HandleTypeDef::WrState***
  FMAC state related to write operations (access to X1 buffer) This parameter can be a value of **HAL_FMAC_StateTypeDef**
- ***__IO uint32_t __FMAC_HandleTypeDef::ErrorCode***
  FMAC peripheral error code This parameter can be a value of ***FMAC_Error_Code***

33.1.2 FMAC_FilterConfigTypeDef

FMAC_FilterConfigTypeDef is defined in the stm32h7xx_hal_fmac.h

Data Fields

- ***uint8_t InputBaseAddress***
- ***uint8_t InputBufferSize***
- ***uint32_t InputThreshold***
- ***uint8_t CoeffBaseAddress***
- ***uint8_t CoeffBufferSize***
- ***uint8_t OutputBaseAddress***
- ***uint8_t OutputBufferSize***
- ***uint32_t OutputThreshold***
- ***int16_t * pCoeffA***
- ***uint8_t CoeffASize***
- ***int16_t * pCoeffB***
- ***uint8_t CoeffBSize***
- ***uint8_t InputAccess***
- ***uint8_t OutputAccess***
- ***uint32_t Clip***
- ***uint32_t Filter***
- ***uint8_t P***
- ***uint8_t Q***
- ***uint8_t R***

Field Documentation

- ***uint8_t FMAC_FilterConfigTypeDef::InputBaseAddress***

  Base address of the input buffer (X1) within the internal memory (0x00 to 0xFF). Ignored if InputBufferSize is set to 0 (previous configuration kept). Note: the buffers can overlap or even coincide exactly.
- ***uint8_t FMAC_FilterConfigTypeDef::InputBufferSize***

  Number of 16-bit words allocated to the input buffer (including the optional "headroom"). 0 if a previous configuration should be kept.
- ***uint32_t FMAC_FilterConfigTypeDef::InputThreshold***

  Input threshold: the buffer full flag will be set if the number of free spaces in the buffer is lower than this threshold. This parameter can be a value of ***FMAC_Data_Buffer_Threshold***.
- ***uint8_t FMAC_FilterConfigTypeDef::CoeffBaseAddress***

  Base address of the coefficient buffer (X2) within the internal memory (0x00 to 0xFF). Ignored if CoeffBufferSize is set to 0 (previous configuration kept). Note: the buffers can overlap or even coincide exactly.
- ***uint8_t FMAC_FilterConfigTypeDef::CoeffBufferSize***

  Number of 16-bit words allocated to the coefficient buffer. 0 if a previous configuration should be kept.
- ***uint8_t FMAC_FilterConfigTypeDef::OutputBaseAddress***

  Base address of the output buffer (Y) within the internal memory (0x00 to 0xFF). Ignored if OuputBufferSize is set to 0 (previous configuration kept). Note: the buffers can overlap or even coincide exactly.
- ***uint8_t FMAC_FilterConfigTypeDef::OutputBufferSize***

  Number of 16-bit words allocated to the output buffer (including the optional "headroom"). 0 if a previous configuration should be kept.
- ***uint32_t FMAC_FilterConfigTypeDef::OutputThreshold***

  Output threshold: the buffer empty flag will be set if the number of unread values in the buffer is lower than this threshold. This parameter can be a value of ***FMAC_Data_Buffer_Threshold***.
- ***int16_t* FMAC_FilterConfigTypeDef::pCoeffA***

  [IIR only] Initialization of the coefficient vector A. If not needed, it should be set to NULL.
- ***uint8_t FMAC_FilterConfigTypeDef::CoeffASize***

  Size of the coefficient vector A.

- ***int16_t* FMAC_FilterConfigTypeDef::pCoeffB***

  Initialization of the coefficient vector B. If not needed (re-use of a previously loaded buffer), it should be set to NULL.
- ***uint8_t FMAC_FilterConfigTypeDef::CoeffBSize***

  Size of the coefficient vector B.
- ***uint8_t FMAC_FilterConfigTypeDef::InputAccess***

  Access to the input buffer (internal memory area): DMA, IT, Polling, None. This parameter can be a value of ***FMAC_Buffer_Access***.
- ***uint8_t FMAC_FilterConfigTypeDef::OutputAccess***

  Access to the output buffer (internal memory area): DMA, IT, Polling, None. This parameter can be a value of ***FMAC_Buffer_Access***.
- ***uint32_t FMAC_FilterConfigTypeDef::Clip***

  Enable or disable the clipping feature. If the q1.15 range is exceeded, wrapping is done when the clipping feature is disabled and saturation is done when the clipping feature is enabled. This parameter can be a value of ***FMAC_Clip_State***.
- ***uint32_t FMAC_FilterConfigTypeDef::Filter***

  Filter type. This parameter can be a value of ***FMAC_Functions*** (filter related values).
- ***uint8_t FMAC_FilterConfigTypeDef::P***

  Parameter P (vector length, number of filter taps, etc.).
- ***uint8_t FMAC_FilterConfigTypeDef::Q***

  Parameter Q (vector length, etc.). Ignored if not needed.
- ***uint8_t FMAC_FilterConfigTypeDef::R***

  Parameter R (gain, etc.). Ignored if not needed.

33.2 FMAC Firmware driver API description

The following section lists the various functions of the FMAC library.

33.2.1 How to use this driver

The FMAC HAL driver can be used as follows:

1. Initialize the FMAC low level resources by implementing the HAL_FMAC_MspInit():
   - Enable the FMAC interface clock using __HAL_RCC_FMAC_CLK_ENABLE().
   - In case of using interrupts (e.g. access configured as FMAC_BUFFER_ACCESS_IT):
     - Configure the FMAC interrupt priority using HAL_NVIC_SetPriority().
     - Enable the FMAC IRQ handler using HAL_NVIC_EnableIRQ().
     - In FMAC IRQ handler, call HAL_FMAC_IRQHandler().
   - In case of using DMA to control data transfer (e.g. access configured as FMAC_BUFFER_ACCESS_DMA):
     - Enable the DMA interface clock using __HAL_RCC_DMA1_CLK_ENABLE() or __HAL_RCC_DMA2_CLK_ENABLE() depending on the used DMA instance.
     - Enable the DMAMUX1 interface clock using __HAL_RCC_DMAMUX1_CLK_ENABLE().
     - If the initialization of the internal buffers (coefficients, input, output) is done via DMA, configure and enable one DMA channel for managing data transfer from memory to memory (preload channel).
     - If the input buffer is accessed via DMA, configure and enable one DMA channel for managing data transfer from memory to peripheral (input channel).
     - If the output buffer is accessed via DMA, configure and enable one DMA channel for managing data transfer from peripheral to memory (output channel).
     - Associate the initialized DMA handle(s) to the FMAC DMA handle(s) using __HAL_LINKDMA().
     - Configure the priority and enable the NVIC for the transfer complete interrupt on the enabled DMA channel(s) using HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ().

2. Initialize the FMAC HAL using HAL_FMAC_Init(). This function resorts to HAL_FMAC_MspInit() for low-level initialization.
3. Configure the FMAC processing (filter) using HAL_FMAC_FilterConfig() or HAL_FMAC_FilterConfig_DMA(). This function:
   - Defines the memory area within the FMAC internal memory (input, coefficients, output) and the associated threshold (input, output).
   - Configures the filter and its parameters:
     - Finite Impulse Response (FIR) filter (also known as convolution).
     - Infinite Impulse Response (IIR) filter (direct form 1).
   - Choose the way to access to the input and output buffers: none, polling, DMA, IT. "none" means the input and/or output data will be handled by another IP (ADC, DAC, etc.).
   - Enable the error interruptions in the input access and/or the output access is done through IT/DMA. If an error occurs, the interruption will be triggered in loop. In order to recover, the user will have to reset the IP with the sequence HAL_FMAC_DeInit / HAL_FMAC_Init. Optionally, he can also disable the interrupt using __HAL_FMAC_DISABLE_IT; the error status will be kept, but no more interrupt will be triggered.
   - Write the provided coefficients into the internal memory using polling mode (HAL_FMAC_FilterConfig()) or DMA (HAL_FMAC_FilterConfig_DMA()). In the DMA case, HAL_FMAC_FilterConfigCallback() is called when the handling is over.
4. Optionally, the user can enable the error interruption related to saturation by calling __HAL_FMAC_ENABLE_IT. This helps in debugging the filter. If a saturation occurs, the interruption will be triggered in loop. In order to recover, the user will have to:
   - Disable the interruption by calling __HAL_FMAC_DISABLE_IT if the user wishes to continue all the same.
   - Reset the IP with the sequence HAL_FMAC_DeInit / HAL_FMAC_Init.
5. Optionally, preload input (FIR, IIR) and output (IIR) data using HAL_FMAC_FilterPreload() or HAL_FMAC_FilterPreload_DMA(). In the DMA case, HAL_FMAC_FilterPreloadCallback() is called when the handling is over. This step is optional as the filter can be started without preloaded data.
6. Start the FMAC processing (filter) using HAL_FMAC_FilterStart(). This function also configures the output buffer that will be filled from the circular internal output buffer. The function returns immediately without updating the provided buffer. The IP processing will be active until HAL_FMAC_FilterStop() is called.
7. If the input internal buffer is accessed via DMA, HAL_FMAC_HalfGetDataCallback() will be called to indicate that half of the input buffer has been handled.
8. If the input internal buffer is accessed via DMA or interrupt, HAL_FMAC_GetDataCallback() will be called to require new input data. It will be provided through HAL_FMAC_AppendFilterData() if the DMA isn't in circular mode.
9. If the output internal buffer is accessed via DMA, HAL_FMAC_HalfOutputDataReadyCallback() will be called to indicate that half of the output buffer has been handled.
10. If the output internal buffer is accessed via DMA or interrupt, HAL_FMAC_OutputDataReadyCallback() will be called to require a new output buffer. It will be provided through HAL_FMAC_ConfigFilterOutputBuffer() if the DMA isn't in circular mode.
11. In all modes except none, provide new input data to be processed via HAL_FMAC_AppendFilterData(). This function should only be called once the previous input data has been handled (the preloaded input data isn't concerned).
12. In all modes except none, provide a new output buffer to be filled via HAL_FMAC_ConfigFilterOutputBuffer(). This function should only be called once the previous user's output buffer has been filled.
13. In polling mode, handle the input and output data using HAL_FMAC_PollFilterData(). This function:
    - Write the user's input data (provided via HAL_FMAC_AppendFilterData()) into the FMAC input memory area.
    - Read the FMAC output memory area and write it into the user's output buffer. It will return either when:
    - the user's output buffer is filled.
    - the user's input buffer has been handled. The unused data (unread input data or free output data) will not be saved. The user will have to use the updated input and output sizes to keep track of them.
14. Stop the FMAC processing (filter) using HAL_FMAC_FilterStop().

15. Call HAL_FMAC_DeInit() to de-initialize the FMAC peripheral. This function resorts to HAL_FMAC_MspDeInit() for low-level de-initialization.

33.2.2 Callback registration

The compilation define USE_HAL_FMAC_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.

Use Function HAL_FMAC_RegisterCallback() to register a user callback. Function HAL_FMAC_RegisterCallback() allows to register following callbacks:

- ErrorCallback : Error Callback.
- HalfGetDataCallback : Get Half Data Callback.
- GetDataCallback : Get Data Callback.
- HalfOutputDataReadyCallback : Half Output Data Ready Callback.
- OutputDataReadyCallback : Output Data Ready Callback.
- FilterConfigCallback : Filter Configuration Callback.
- FilterPreloadCallback : Filter Preload Callback.
- MspInitCallback : FMAC MspInit.
- MspDeInitCallback : FMAC MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_FMAC_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. HAL_FMAC_UnRegisterCallback() takes as parameters the HAL peripheral handle and the Callback ID. This function allows to reset following callbacks:

- ErrorCallback : Error Callback.
- HalfGetDataCallback : Get Half Data Callback.
- GetDataCallback : Get Data Callback.
- HalfOutputDataReadyCallback : Half Output Data Ready Callback.
- OutputDataReadyCallback : Output Data Ready Callback.
- FilterConfigCallback : Filter Configuration Callback.
- FilterPreloadCallback : Filter Preload Callback.
- MspInitCallback : FMAC MspInit.
- MspDeInitCallback : FMAC MspDeInit.

By default, after the HAL_FMAC_Init() and when the state is HAL_FMAC_STATE_RESET all callbacks are set to the corresponding weak (surcharged) functions: examples GetDataCallback(), OutputDataReadyCallback(). Exception done for MspInit and MspDeInit functions that are respectively reset to the legacy weak (surcharged) functions in the HAL_FMAC_Init() and HAL_FMAC_DeInit() only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_FMAC_Init() and HAL_FMAC_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in HAL_FMAC_STATE_READY state only. Exception done MspInit/ MspDeInit that can be registered/unregistered in HAL_FMAC_STATE_READY or HAL_FMAC_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_FMAC_RegisterCallback() before calling HAL_FMAC_DeInit() or HAL_FMAC_Init() function.

When the compilation define USE_HAL_FMAC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and weak (surcharged) callbacks are used.

33.2.3 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the FMAC peripheral and the associated handle
- DeInitialize the FMAC peripheral
- Initialize the FMAC MSP (MCU Specific Package)
- De-Initialize the FMAC MSP
- Register a User FMAC Callback
- Unregister a FMAC CallBack

This section contains the following APIs:

- *HAL_FMAC_Init()*
- *HAL_FMAC_DeInit()*
- *HAL_FMAC_MspInit()*
- *HAL_FMAC_MspDeInit()*
- *HAL_FMAC_RegisterCallback()*
- *HAL_FMAC_UnRegisterCallback()*

33.2.4 Peripheral Control functions

This section provides functions allowing to:

- Configure the FMAC peripheral: memory area, filter type and parameters, way to access to the input and output memory area (none, polling, IT, DMA).
- Start the FMAC processing (filter).
- Handle the input data that will be provided into FMAC.
- Handle the output data provided by FMAC.
- Stop the FMAC processing (filter).

This section contains the following APIs:

- *HAL_FMAC_FilterConfig()*
- *HAL_FMAC_FilterConfig_DMA()*
- *HAL_FMAC_FilterPreload()*
- *HAL_FMAC_FilterPreload_DMA()*
- *HAL_FMAC_FilterStart()*
- *HAL_FMAC_AppendFilterData()*
- *HAL_FMAC_ConfigFilterOutputBuffer()*
- *HAL_FMAC_PollFilterData()*
- *HAL_FMAC_FilterStop()*

33.2.5 Callback functions

This section provides Interruption and DMA callback functions:

- DMA or Interrupt: the user's input data is half written (DMA only) or completely written.
- DMA or Interrupt: the user's output buffer is half filled (DMA only) or completely filled.
- DMA or Interrupt: error handling.

This section contains the following APIs:

- *HAL_FMAC_ErrorCallback()*
- *HAL_FMAC_HalfGetDataCallback()*
- *HAL_FMAC_GetDataCallback()*
- *HAL_FMAC_HalfOutputDataReadyCallback()*
- *HAL_FMAC_OutputDataReadyCallback()*
- *HAL_FMAC_FilterConfigCallback()*
- *HAL_FMAC_FilterPreloadCallback()*

33.2.6 IRQ handler management

This section provides IRQ handler function.

This section contains the following APIs:

- *HAL_FMAC_IRQHandler()*

33.2.7 Peripheral State and Error functions

This subsection provides functions allowing to

- Check the FMAC state
- Get error code

This section contains the following APIs:

- *HAL_FMAC_GetState()*
- *HAL_FMAC_GetError()*

33.2.8 Detailed description of functions

HAL_FMAC_Init

Function name

HAL_StatusTypeDef HAL_FMAC_Init (FMAC_HandleTypeDef * hfmac)

Function description

Initialize the FMAC peripheral and the associated handle.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure.

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_DeInit

Function name

HAL_StatusTypeDef HAL_FMAC_DeInit (FMAC_HandleTypeDef * hfmac)

Function description

De-initialize the FMAC peripheral.

Parameters

- **hfmac:** pointer to a FMAC structure.

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_MspInit

Function name

void HAL_FMAC_MspInit (FMAC_HandleTypeDef * hfmac)

Function description

Initialize the FMAC MSP.

Parameters

- **hfmac:** FMAC handle.

Return values

- **None:**

HAL_FMAC_MspDeInit

Function name

void HAL_FMAC_MspDeInit (FMAC_HandleTypeDef * hfmac)

Function description

De-initialize the FMAC MSP.

Parameters

- **hfmac:** FMAC handle.

Return values

- **None:**

HAL_FMAC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_FMAC_RegisterCallback (FMAC_HandleTypeDef * hfmac, HAL_FMAC_CallbackIDTypeDef CallbackID, pFMAC_CallbackTypeDef pCallback)

Function description

Register a User FMAC Callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **CallbackID:** ID of the callback to be registered. This parameter can be one of the following values:
  - HAL_FMAC_ERROR_CB_ID Error Callback ID
  - HAL_FMAC_HALF_GET_DATA_CB_ID Get Half Data Callback ID
  - HAL_FMAC_GET_DATA_CB_ID Get Data Callback ID
  - HAL_FMAC_HALF_OUTPUT_DATA_READY_CB_ID Half Output Data Ready Callback ID
  - HAL_FMAC_OUTPUT_DATA_READY_CB_ID Output Data Ready Callback ID
  - HAL_FMAC_FILTER_CONFIG_CB_ID Filter Configuration Callback ID
  - HAL_FMAC_FILTER_PRELOAD_CB_ID Filter Preload Callback ID
  - HAL_FMAC_MSPINIT_CB_ID FMAC MspInit ID
  - HAL_FMAC_MSPDEINIT_CB_ID FMAC MspDeInit ID
- **pCallback:** pointer to the Callback function.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The User FMAC Callback is to be used instead of the weak predefined callback.

HAL_FMAC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_FMAC_UnRegisterCallback (FMAC_HandleTypeDef * hfmac, HAL_FMAC_CallbackIDTypeDef CallbackID)

Function description

Unregister a FMAC CallBack.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module
- **CallbackID:** ID of the callback to be unregistered. This parameter can be one of the following values:
  - HAL_FMAC_ERROR_CB_ID Error Callback ID
  - HAL_FMAC_HALF_GET_DATA_CB_ID Get Half Data Callback ID
  - HAL_FMAC_GET_DATA_CB_ID Get Data Callback ID
  - HAL_FMAC_HALF_OUTPUT_DATA_READY_CB_ID Half Output Data Ready Callback ID
  - HAL_FMAC_OUTPUT_DATA_READY_CB_ID Output Data Ready Callback ID
  - HAL_FMAC_FILTER_CONFIG_CB_ID Filter Configuration Callback ID
  - HAL_FMAC_FILTER_PRELOAD_CB_ID Filter Preload Callback ID
  - HAL_FMAC_MSPINIT_CB_ID FMAC MspInit ID
  - HAL_FMAC_MSPDEINIT_CB_ID FMAC MspDeInit ID

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The FMAC callback is redirected to the weak predefined callback.

HAL_FMAC_FilterConfig

Function name

HAL_StatusTypeDef HAL_FMAC_FilterConfig (FMAC_HandleTypeDef * hfmac, FMAC_FilterConfigTypeDef * pConfig)

Function description

Configure the FMAC filter.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pConfig:** pointer to a FMAC_FilterConfigTypeDef structure that contains the FMAC configuration information.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The configuration is done according to the parameters specified in the FMAC_FilterConfigTypeDef structure. The provided data will be loaded using polling mode.

HAL_FMAC_FilterConfig_DMA

Function name

HAL_StatusTypeDef HAL_FMAC_FilterConfig_DMA (FMAC_HandleTypeDef * hfmac, FMAC_FilterConfigTypeDef * pConfig)

Function description

Configure the FMAC filter.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pConfig:** pointer to a FMAC_FilterConfigTypeDef structure that contains the FMAC configuration information.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The configuration is done according to the parameters specified in the FMAC_FilterConfigTypeDef structure. The provided data will be loaded using DMA.

HAL_FMAC_FilterPreload

Function name

HAL_StatusTypeDef HAL_FMAC_FilterPreload (FMAC_HandleTypeDef * hfmac, int16_t * pInput, uint8_t InputSize, int16_t * pOutput, uint8_t OutputSize)

Function description

Preload the input (FIR, IIR) and output data (IIR) of the FMAC filter.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pInput:** Preloading of the first elements of the input buffer (X1). If not needed (no data available when starting), it should be set to NULL.
- **InputSize:** Size of the input vector. As pInput is used for preloading data, it cannot be bigger than the input memory area.
- **pOutput:** [IIR] Preloading of the first elements of the output vector (Y). If not needed, it should be set to NULL.
- **OutputSize:** Size of the output vector. As pOutput is used for preloading data, it cannot be bigger than the output memory area.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The set(s) of data will be used by FMAC as soon as HAL_FMAC_FilterStart is called. The provided data will be loaded using polling mode.
- The input and the output buffers can be filled by calling several times HAL_FMAC_FilterPreload (each call filling partly the buffers). In case of overflow (too much data provided through all these calls), an error will be returned.

HAL_FMAC_FilterPreload_DMA

Function name

HAL_StatusTypeDef HAL_FMAC_FilterPreload_DMA (FMAC_HandleTypeDef * hfmac, int16_t * pInput, uint8_t InputSize, int16_t * pOutput, uint8_t OutputSize)

Function description

Preload the input (FIR, IIR) and output data (IIR) of the FMAC filter.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pInput:** Preloading of the first elements of the input buffer (X1). If not needed (no data available when starting), it should be set to NULL.
- **InputSize:** Size of the input vector. As pInput is used for preloading data, it cannot be bigger than the input memory area.
- **pOutput:** [IIR] Preloading of the first elements of the output vector (Y). If not needed, it should be set to NULL.
- **OutputSize:** Size of the output vector. As pOutput is used for preloading data, it cannot be bigger than the output memory area.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The set(s) of data will be used by FMAC as soon as HAL_FMAC_FilterStart is called. The provided data will be loaded using DMA.
- The input and the output buffers can be filled by calling several times HAL_FMAC_FilterPreload (each call filling partly the buffers). In case of overflow (too much data provided through all these calls), an error will be returned.

HAL_FMAC_FilterStart

Function name

HAL_StatusTypeDef HAL_FMAC_FilterStart (FMAC_HandleTypeDef * hfmac, int16_t * pOutput, uint16_t * pOutputSize)

Function description

Start the FMAC processing according to the existing FMAC configuration.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pOutput:** pointer to buffer where output data of FMAC processing will be stored in the next steps. If it is set to NULL, the output will not be read and it will be up to an external IP to empty the output buffer.
- **pOutputSize:** pointer to the size of the output buffer. The number of read data will be written here.

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_AppendFilterData

Function name

HAL_StatusTypeDef HAL_FMAC_AppendFilterData (FMAC_HandleTypeDef * hfmac, int16_t * pInput, uint16_t * pInputSize)

Function description

Provide a new input buffer that will be loaded into the FMAC input memory area.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pInput:** New input vector (additional input data).
- **pInputSize:** Size of the input vector (if all the data can't be written, it will be updated with the number of data read from FMAC).

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_ConfigFilterOutputBuffer

Function name

HAL_StatusTypeDef HAL_FMAC_ConfigFilterOutputBuffer (FMAC_HandleTypeDef * hfmac, int16_t * pOutput, uint16_t * pOutputSize)

Function description

Provide a new output buffer to be filled with the data computed by FMAC unit.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pOutput:** New output vector.
- **pOutputSize:** Size of the output vector (if the vector can't be entirely filled, pOutputSize will be updated with the number of data read from FMAC).

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_PollFilterData

Function name

HAL_StatusTypeDef HAL_FMAC_PollFilterData (FMAC_HandleTypeDef * hfmac, uint32_t Timeout)

Function description

Handle the input and/or output data in polling mode.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **Timeout:** timeout value.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- This function writes the previously provided user's input data and fills the previously provided user's output buffer, according to the existing FMAC configuration (polling mode only). The function returns when the input data has been handled or when the output data is filled. The possible unused data isn't kept. It will be up to the user to handle it. The previously provided pInputSize and pOutputSize will be used to indicate to the size of the read/written data to the user.

HAL_FMAC_FilterStop

Function name

HAL_StatusTypeDef HAL_FMAC_FilterStop (FMAC_HandleTypeDef * hfmac)

Function description

Stop the FMAC processing.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_ErrorCallback

Function name

void HAL_FMAC_ErrorCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC error callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_HalfGetDataCallback

Function name

void HAL_FMAC_HalfGetDataCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC get half data callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_GetDataCallback

Function name

void HAL_FMAC_GetDataCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC get data callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_HalfOutputDataReadyCallback

Function name

void HAL_FMAC_HalfOutputDataReadyCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC half output data ready callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_OutputDataReadyCallback

Function name

void HAL_FMAC_OutputDataReadyCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC output data ready callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_FilterConfigCallback

Function name

void HAL_FMAC_FilterConfigCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC filter configuration callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_FilterPreloadCallback

Function name

void HAL_FMAC_FilterPreloadCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC filter preload callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_IRQHandler

Function name

void HAL_FMAC_IRQHandler (FMAC_HandleTypeDef * hfmac)

Function description

Handle FMAC interrupt request.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_GetState

Function name

HAL_FMAC_StateTypeDef HAL_FMAC_GetState (FMAC_HandleTypeDef * hfmac)

Function description

Return the FMAC state.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **HAL_FMAC_StateTypeDef:** FMAC state

HAL_FMAC_GetError

Function name

uint32_t HAL_FMAC_GetError (FMAC_HandleTypeDef * hfmac)

Function description

Return the FMAC peripheral error.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **uint32_t:** Error bit-map based on FMAC Error code

Notes

- The returned error is a bit-map combination of possible errors.

33.3 FMAC Firmware driver defines

The following section lists the various define and macros of the module.

33.3.1 FMAC

FMAC

FMAC Buffer Access

FMAC_BUFFER_ACCESS_NONE

Buffer handled by an external IP (ADC for instance)

FMAC_BUFFER_ACCESS_DMA

Buffer accessed through DMA

FMAC_BUFFER_ACCESS_POLLING

Buffer accessed through polling

FMAC_BUFFER_ACCESS_IT

Buffer accessed through interruptions

FMAC Clip State

FMAC_CLIP_DISABLED

Clipping disabled

FMAC_CLIP_ENABLED

Clipping enabled

FMAC Data Buffer Threshold

FMAC_THRESHOLD_1

Input: Buffer full flag set if the number of free spaces in the buffer is less than 1. Output: Buffer empty flag set if the number of unread values in the buffer is less than 1.

FMAC_THRESHOLD_2

Input: Buffer full flag set if the number of free spaces in the buffer is less than 2. Output: Buffer empty flag set if the number of unread values in the buffer is less than 2.

FMAC_THRESHOLD_4

Input: Buffer full flag set if the number of free spaces in the buffer is less than 4. Output: Buffer empty flag set if the number of unread values in the buffer is less than 4.

FMAC_THRESHOLD_8

Input: Buffer full flag set if the number of free spaces in the buffer is less than 8. Output: Buffer empty flag set if the number of unread values in the buffer is less than 8.

FMAC_THRESHOLD_NO_VALUE

The configured threshold value shouldn't be changed

FMAC Error code

HAL_FMAC_ERROR_NONE

No error

HAL_FMAC_ERROR_SAT

Saturation error

HAL_FMAC_ERROR_UNFL

Underflow error

HAL_FMAC_ERROR_OVFL

Overflow error

HAL_FMAC_ERROR_DMA

DMA error

HAL_FMAC_ERROR_RESET

Reset error

HAL_FMAC_ERROR_PARAM

Parameter error

HAL_FMAC_ERROR_INVALID_CALLBACK

Invalid Callback error

HAL_FMAC_ERROR_TIMEOUT

Timeout error

FMAC Exported Macros

__HAL_FMAC_RESET_HANDLE_STATE

Description:

- Reset FMAC handle state.

Parameters:

- __HANDLE__: FMAC handle.

Return value:

- None

__HAL_FMAC_ENABLE_IT

Description:

- Enable the specified FMAC interrupt.

Parameters:

- __HANDLE__: FMAC handle.
- __INTERRUPT__: FMAC Interrupt. This parameter can be any combination of the following values:
  - FMAC_IT_RIEN Read interrupt enable
  - FMAC_IT_WIEN Write interrupt enable
  - FMAC_IT_OVFLIEN Overflow error interrupt enable
  - FMAC_IT_UNFLIEN Underflow error interrupt enable
  - FMAC_IT_SATIEN Saturation error interrupt enable (this helps in debugging a filter)

Return value:

- None

__HAL_FMAC_DISABLE_IT

Description:

- Disable the FMAC interrupt.

Parameters:

- __HANDLE__: FMAC handle.
- __INTERRUPT__: FMAC Interrupt. This parameter can be any combination of the following values:
  - FMAC_IT_RIEN Read interrupt enable
  - FMAC_IT_WIEN Write interrupt enable
  - FMAC_IT_OVFLIEN Overflow error interrupt enable
  - FMAC_IT_UNFLIEN Underflow error interrupt enable
  - FMAC_IT_SATIEN Saturation error interrupt enable (this helps in debugging a filter)

Return value:

- None

__HAL_FMAC_GET_IT

Description:

- Check whether the specified FMAC interrupt occurred or not.

Parameters:

- __HANDLE__: FMAC handle.
- __INTERRUPT__: FMAC interrupt to check. This parameter can be any combination of the following values:
  - FMAC_FLAG_YEMPTY Y Buffer Empty Flag
  - FMAC_FLAG_X1FULL X1 Buffer Full Flag
  - FMAC_FLAG_OVFL Overflow Error Flag
  - FMAC_FLAG_UNFL Underflow Error Flag
  - FMAC_FLAG_SAT Saturation Error Flag

Return value:

- SET: (interrupt occurred) or RESET (interrupt did not occurred)

__HAL_FMAC_CLEAR_IT

Description:

- Clear specified FMAC interrupt status.

Parameters:

- __HANDLE__: FMAC handle.
- __INTERRUPT__: FMAC interrupt to clear.

Return value:

- None

__HAL_FMAC_GET_FLAG

Description:

- Check whether the specified FMAC status flag is set or not.

Parameters:

- __HANDLE__: FMAC handle.
- __FLAG__: FMAC flag to check. This parameter can be any combination of the following values:
  - FMAC_FLAG_YEMPTY Y Buffer Empty Flag
  - FMAC_FLAG_X1FULL X1 Buffer Full Flag
  - FMAC_FLAG_OVFL Overflow Error Flag
  - FMAC_FLAG_UNFL Underflow Error Flag
  - FMAC_FLAG_SAT Saturation error Flag

Return value:

- SET: (flag is set) or RESET (flag is reset)

__HAL_FMAC_CLEAR_FLAG

Description:

- Clear specified FMAC status flag.

Parameters:

- __HANDLE__: FMAC handle.
- __FLAG__: FMAC flag to clear.

Return value:

- None

__HAL_FMAC_GET_IT_SOURCE

Description:

- Check whether the specified FMAC interrupt is enabled or not.

Parameters:

- __HANDLE__: FMAC handle.
- __INTERRUPT__: FMAC interrupt to check. This parameter can be one of the following values:
  - FMAC_IT_RIEN Read interrupt enable
  - FMAC_IT_WIEN Write interrupt enable
  - FMAC_IT_OVFLIEN Overflow error interrupt enable
  - FMAC_IT_UNFLIEN Underflow error interrupt enable
  - FMAC_IT_SATIEN Saturation error interrupt enable (this helps in debugging a filter)

Return value:

- FlagStatus

FMAC status flags

FMAC_FLAG_YEMPTY

Y Buffer Empty Flag

FMAC_FLAG_X1FULL

X1 Buffer Full Flag

FMAC_FLAG_OVFL

Overflow Error Flag

FMAC_FLAG_UNFL

Underflow Error Flag

FMAC_FLAG_SAT

Saturation Error Flag (this helps in debugging a filter)

FMAC Functions

FMAC_FUNC_LOAD_X1

Load X1 buffer

FMAC_FUNC_LOAD_X2

Load X2 buffer

FMAC_FUNC_LOAD_Y

Load Y buffer

FMAC_FUNC_CONVO_FIR

Convolution (FIR filter)

FMAC_FUNC_IIR_DIRECT_FORM_1

IIR filter (direct form 1)

FMAC Interrupts Enable bit

FMAC_IT_RIEN

Read Interrupt Enable

FMAC_IT_WIEN

Write Interrupt Enable

FMAC_IT_OVFLIEN

Overflow Error Interrupt Enable

FMAC_IT_UNFLIEN

Underflow Error Interrupt Enable

FMAC_IT_SATIEN

Saturation Error Interrupt Enable (this helps in debugging a filter)

34 HAL GFXMMU Generic Driver

34.1 GFXMMU Firmware driver registers structures

34.1.1 GFXMMU_BuffersTypeDef

GFXMMU_BuffersTypeDef is defined in the stm32h7xx_hal_gfxmmu.h

Data Fields

- ***uint32_t Buf0Address***
- ***uint32_t Buf1Address***
- ***uint32_t Buf2Address***
- ***uint32_t Buf3Address***

Field Documentation

- ***uint32_t GFXMMU_BuffersTypeDef::Buf0Address***
  Physical address of buffer 0.
- ***uint32_t GFXMMU_BuffersTypeDef::Buf1Address***
  Physical address of buffer 1.
- ***uint32_t GFXMMU_BuffersTypeDef::Buf2Address***
  Physical address of buffer 2.
- ***uint32_t GFXMMU_BuffersTypeDef::Buf3Address***
  Physical address of buffer 3.

34.1.2 GFXMMU_CachePrefetchTypeDef

GFXMMU_CachePrefetchTypeDef is defined in the stm32h7xx_hal_gfxmmu.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t CacheLock***
- ***uint32_t CacheLockBuffer***
- ***uint32_t CacheForce***
- ***uint32_t OutterBufferability***
- ***uint32_t OutterCachability***
- ***uint32_t Prefetch***

Field Documentation

- ***FunctionalState GFXMMU_CachePrefetchTypeDef::Activation***
  Cache and pre-fetch enable/disable.
  Note:
  – : All following parameters are useful only if cache and pre-fetch are enabled.
- ***uint32_t GFXMMU_CachePrefetchTypeDef::CacheLock***
  Locking the cache to a buffer. This parameter can be a value of ***GFXMMU_CacheLock***.
- ***uint32_t GFXMMU_CachePrefetchTypeDef::CacheLockBuffer***
  Buffer on which the cache is locked. This parameter can be a value of ***GFXMMU_CacheLockBuffer***.
  Note:
  – : Useful only when lock of the cache is enabled.
- ***uint32_t GFXMMU_CachePrefetchTypeDef::CacheForce***
  Forcing the cache regardless MPU attributes. This parameter can be a value of ***GFXMMU_CacheForce***.
  Note:
  – : Useful only when lock of the cache is enabled.

- ***uint32_t GFXMMU_CachePrefetchTypeDef::OutterBufferability***
  Bufferability of an access generated by the GFXMMU cache. This parameter can be a value of ***GFXMMU_OutterBufferability***.
- ***uint32_t GFXMMU_CachePrefetchTypeDef::OutterCachability***
  Cachability of an access generated by the GFXMMU cache. This parameter can be a value of ***GFXMMU_OutterCachability***.
- ***uint32_t GFXMMU_CachePrefetchTypeDef::Prefetch***
  Pre-fetch enable/disable. This parameter can be a value of ***GFXMMU_Prefetch***.

34.1.3 GFXMMU_InterruptsTypeDef

GFXMMU_InterruptsTypeDef is defined in the stm32h7xx_hal_gfxmmu.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t UsedInterrupts***

Field Documentation

- ***FunctionalState GFXMMU_InterruptsTypeDef::Activation***
  Interrupts enable/disable
- ***uint32_t GFXMMU_InterruptsTypeDef::UsedInterrupts***
  Interrupts used. This parameter can be a values combination of ***GFXMMU_Interrupts***.
  Note:
  – : Useful only when interrupts are enabled.

34.1.4 GFXMMU_InitTypeDef

GFXMMU_InitTypeDef is defined in the stm32h7xx_hal_gfxmmu.h

Data Fields

- ***uint32_t BlocksPerLine***
- ***uint32_t DefaultValue***
- ***GFXMMU_BuffersTypeDef Buffers***
- ***GFXMMU_CachePrefetchTypeDef CachePrefetch***
- ***GFXMMU_InterruptsTypeDef Interrupts***

Field Documentation

- ***uint32_t GFXMMU_InitTypeDef::BlocksPerLine***
  Number of blocks of 16 bytes per line. This parameter can be a value of ***GFXMMU_BlocksPerLine***.
- ***uint32_t GFXMMU_InitTypeDef::DefaultValue***
  Value returned when virtual memory location not physically mapped.
- ***GFXMMU_BuffersTypeDef GFXMMU_InitTypeDef::Buffers***
  Physical buffers addresses.
- ***GFXMMU_CachePrefetchTypeDef GFXMMU_InitTypeDef::CachePrefetch***
  Cache and pre-fetch parameters.
- ***GFXMMU_InterruptsTypeDef GFXMMU_InitTypeDef::Interrupts***
  Interrupts parameters.

34.1.5 __GFXMMU_HandleTypeDef

__GFXMMU_HandleTypeDef is defined in the stm32h7xx_hal_gfxmmu.h

Data Fields

- ***GFXMMU_TypeDef * Instance***
- ***GFXMMU_InitTypeDef Init***
- ***HAL_GFXMMU_StateTypeDef State***
- ***__IO uint32_t ErrorCode***

- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***GFXMMU_TypeDef* __GFXMMU_HandleTypeDef::Instance***
  GFXMMU instance
- ***GFXMMU_InitTypeDef __GFXMMU_HandleTypeDef::Init***
  GFXMMU init parameters
- ***HAL_GFXMMU_StateTypeDef __GFXMMU_HandleTypeDef::State***
  GFXMMU state
- ***__IO uint32_t __GFXMMU_HandleTypeDef::ErrorCode***
  GFXMMU error code
- ***void(* __GFXMMU_HandleTypeDef::ErrorCallback)(struct __GFXMMU_HandleTypeDef *hgfxmmu)***
  GFXMMU error callback
- ***void(* __GFXMMU_HandleTypeDef::MspInitCallback)(struct __GFXMMU_HandleTypeDef *hgfxmmu)***
  GFXMMU MSP init callback
- ***void(* __GFXMMU_HandleTypeDef::MspDeInitCallback)(struct __GFXMMU_HandleTypeDef *hgfxmmu)***
  GFXMMU MSP de-init callback

34.1.6 GFXMMU_LutLineTypeDef

GFXMMU_LutLineTypeDef is defined in the stm32h7xx_hal_gfxmmu.h

Data Fields

- ***uint32_t LineNumber***
- ***uint32_t LineStatus***
- ***uint32_t FirstVisibleBlock***
- ***uint32_t LastVisibleBlock***
- ***int32_t LineOffset***

Field Documentation

- ***uint32_t GFXMMU_LutLineTypeDef::LineNumber***
  LUT line number. This parameter must be a number between Min_Data = 0 and Max_Data = 1023.
- ***uint32_t GFXMMU_LutLineTypeDef::LineStatus***
  LUT line enable/disable. This parameter can be a value of ***GFXMMU_LutLineStatus***.
- ***uint32_t GFXMMU_LutLineTypeDef::FirstVisibleBlock***
  First visible block on this line. This parameter must be a number between Min_Data = 0 and Max_Data = 255.
- ***uint32_t GFXMMU_LutLineTypeDef::LastVisibleBlock***
  Last visible block on this line. This parameter must be a number between Min_Data = 0 and Max_Data = 255.
- ***int32_t GFXMMU_LutLineTypeDef::LineOffset***
  Offset of block 0 of the current line in physical buffer. This parameter must be a number between Min_Data = -4080 and Max_Data = 4190208.

  Note:

  – : Line offset has to be computed with the following formula: LineOffset = [(Blocks already used) - (1st visible block)]*BlockSize.

34.2 GFXMMU Firmware driver API description

The following section lists the various functions of the GFXMMU library.

34.2.1 How to use this driver

Initialization

1. As prerequisite, fill in the HAL_GFXMMU_MspInit() :
   – Enable GFXMMU clock interface with __HAL_RCC_GFXMMU_CLK_ENABLE().
   – If interrupts are used, enable and configure GFXMMU global interrupt with HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ().
2. Configure the number of blocks per line, default value, physical buffer addresses, cache and pre-fetch parameters and interrupts using the HAL_GFXMMU_Init() function.

LUT configuration

1. Use HAL_GFXMMU_DisableLutLines() to deactivate all LUT lines (or a range of lines).
2. Use HAL_GFXMMU_ConfigLut() to copy LUT from flash to look up RAM.
3. Use HAL_GFXMMU_ConfigLutLine() to configure one line of LUT.

Force flush and/or invalidate of cache

1. Use HAL_GFXMMU_ConfigForceCache() to flush and/or invalidate cache.

Modify physical buffer addresses

1. Use HAL_GFXMMU_ModifyBuffers() to modify physical buffer addresses.

Modify cache and pre-fetch parameters

1. Use HAL_GFXMMU_ModifyCachePrefetch() to modify cache and pre-fetch parameters.

Error management

1. If interrupts are used, HAL_GFXMMU_IRQHandler() will be called when an error occurs. This function will call HAL_GFXMMU_ErrorCallback(). Use HAL_GFXMMU_GetError() to get the error code.

De-initialization

1. As prerequisite, fill in the HAL_GFXMMU_MspDeInit() :
   – Disable GFXMMU clock interface with __HAL_RCC_GFXMMU_CLK_ENABLE().
   – If interrupts has been used, disable GFXMMU global interrupt with HAL_NVIC_DisableIRQ().
2. De-initialize GFXMMU using the HAL_GFXMMU_DeInit() function.

Callback registration

The compilation define USE_HAL_GFXMMU_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use functions HAL_GFXMMU_RegisterCallback() to register a user callback.

Function HAL_GFXMMU_RegisterCallback() allows to register following callbacks:

- ErrorCallback : GFXMMU error.
- MspInitCallback : GFXMMU MspInit.
- MspDeInitCallback : GFXMMU MspDeInit.

This function takes as parameters the HAL peripheral handle, the callback ID and a pointer to the user callback function.

Use function HAL_GFXMMU_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. HAL_GFXMMU_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the callback ID.

This function allows to reset following callbacks:

- ErrorCallback : GFXMMU error.
- MspInitCallback : GFXMMU MspInit.
- MspDeInitCallback : GFXMMU MspDeInit.

By default, after the HAL_GFXMMU_Init and if the state is HAL_GFXMMU_STATE_RESET all callbacks are reset to the corresponding legacy weak (surcharged) functions: examples HAL_GFXMMU_ErrorCallback(). Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (surcharged) functions in the HAL_GFXMMU_Init and HAL_GFXMMU_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_GFXMMU_Init and HAL_GFXMMU_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_GFXMMU_RegisterCallback before calling HAL_GFXMMU_DeInit or HAL_GFXMMU_Init function.

When the compilation define USE_HAL_GFXMMU_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

34.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the GFXMMU.
- De-initialize the GFXMMU.

This section contains the following APIs:

- ***HAL_GFXMMU_Init()***
- ***HAL_GFXMMU_DeInit()***
- ***HAL_GFXMMU_MspInit()***
- ***HAL_GFXMMU_MspDeInit()***
- ***HAL_GFXMMU_RegisterCallback()***
- ***HAL_GFXMMU_UnRegisterCallback()***

34.2.3 Operation functions

This section provides functions allowing to:

- Configure LUT.
- Force flush and/or invalidate of cache.
- Modify physical buffer addresses.
- Modify cache and pre-fetch parameters.
- Manage error.

This section contains the following APIs:

- ***HAL_GFXMMU_ConfigLut()***
- ***HAL_GFXMMU_DisableLutLines()***
- ***HAL_GFXMMU_ConfigLutLine()***
- ***HAL_GFXMMU_ConfigForceCache()***
- ***HAL_GFXMMU_ModifyBuffers()***
- ***HAL_GFXMMU_ModifyCachePrefetch()***
- ***HAL_GFXMMU_IRQHandler()***
- ***HAL_GFXMMU_ErrorCallback()***

34.2.4 State functions

This section provides functions allowing to:

- Get GFXMMU handle state.
- Get GFXMMU error code.

This section contains the following APIs:

- ***HAL_GFXMMU_GetState()***
- ***HAL_GFXMMU_GetError()***

34.2.5 Detailed description of functions

HAL_GFXMMU_Init

Function name

HAL_StatusTypeDef HAL_GFXMMU_Init (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

Initialize the GFXMMU according to the specified parameters in the GFXMMU_InitTypeDef structure and initialize the associated handle.

Parameters

- **hgfxmmu:** GFXMMU handle.

Return values

- **HAL:** status.

HAL_GFXMMU_DeInit

Function name

HAL_StatusTypeDef HAL_GFXMMU_DeInit (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

De-initialize the GFXMMU.

Parameters

- **hgfxmmu:** GFXMMU handle.

Return values

- **HAL:** status.

HAL_GFXMMU_MspInit

Function name

void HAL_GFXMMU_MspInit (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

Initialize the GFXMMU MSP.

Parameters

- **hgfxmmu:** GFXMMU handle.

Return values

- **None.:**

HAL_GFXMMU_MspDeInit

Function name

void HAL_GFXMMU_MspDeInit (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

De-initialize the GFXMMU MSP.

Parameters

- **hgfxmmu:** GFXMMU handle.

Return values

- **None.:**

HAL_GFXMMU_RegisterCallback

Function name

HAL_StatusTypeDef HAL_GFXMMU_RegisterCallback (GFXMMU_HandleTypeDef * hgfxmmu, HAL_GFXMMU_CallbackIDTypeDef CallbackID, pGFXMMU_CallbackTypeDef pCallback)

Function description

Register a user GFXMMU callback to be used instead of the weak predefined callback.

Parameters

- **hgfxmmu:** GFXMMU handle.
- **CallbackID:** ID of the callback to be registered. This parameter can be one of the following values:
  - HAL_GFXMMU_ERROR_CB_ID error callback ID.
  - HAL_GFXMMU_MSPINIT_CB_ID MSP init callback ID.
  - HAL_GFXMMU_MSPDEINIT_CB_ID MSP de-init callback ID.
- **pCallback:** pointer to the callback function.

Return values

- **HAL:** status.

HAL_GFXMMU_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_GFXMMU_UnRegisterCallback (GFXMMU_HandleTypeDef * hgfxmmu, HAL_GFXMMU_CallbackIDTypeDef CallbackID)

Function description

Unregister a user GFXMMU callback.

Parameters

- **hgfxmmu:** GFXMMU handle.
- **CallbackID:** ID of the callback to be unregistered. This parameter can be one of the following values:
  - HAL_GFXMMU_ERROR_CB_ID error callback ID.
  - HAL_GFXMMU_MSPINIT_CB_ID MSP init callback ID.
  - HAL_GFXMMU_MSPDEINIT_CB_ID MSP de-init callback ID.

Return values

- **HAL:** status.

HAL_GFXMMU_ConfigLut

Function name

HAL_StatusTypeDef HAL_GFXMMU_ConfigLut (GFXMMU_HandleTypeDef * hgfxmmu, uint32_t FirstLine, uint32_t LinesNumber, uint32_t Address)

Function description

This function allows to copy LUT from flash to look up RAM.

Parameters

- **hgfxmmu:** GFXMMU handle.
- **FirstLine:** First line enabled on LUT. This parameter must be a number between Min_Data = 0 and Max_Data = 1023.
- **LinesNumber:** Number of lines enabled on LUT. This parameter must be a number between Min_Data = 1 and Max_Data = 1024.
- **Address:** Start address of LUT in flash.

Return values

- **HAL:** status.

HAL_GFXMMU_DisableLutLines

Function name

HAL_StatusTypeDef HAL_GFXMMU_DisableLutLines (GFXMMU_HandleTypeDef * hgfxmmu, uint32_t FirstLine, uint32_t LinesNumber)

Function description

This function allows to disable a range of LUT lines.

Parameters

- **hgfxmmu:** GFXMMU handle.
- **FirstLine:** First line to disable on LUT. This parameter must be a number between Min_Data = 0 and Max_Data = 1023.
- **LinesNumber:** Number of lines to disable on LUT. This parameter must be a number between Min_Data = 1 and Max_Data = 1024.

Return values

- **HAL:** status.

HAL_GFXMMU_ConfigLutLine

Function name

HAL_StatusTypeDef HAL_GFXMMU_ConfigLutLine (GFXMMU_HandleTypeDef * hgfxmmu, GFXMMU_LutLineTypeDef * lutLine)

Function description

This function allows to configure one line of LUT.

Parameters

- **hgfxmmu:** GFXMMU handle.
- **lutLine:** LUT line parameters.

Return values

- **HAL:** status.

HAL_GFXMMU_ConfigForceCache

Function name

HAL_StatusTypeDef HAL_GFXMMU_ConfigForceCache (GFXMMU_HandleTypeDef * hgfxmmu, uint32_t ForceParam)

Function description

This function allows to force flush and/or invalidate of cache.

Parameters

- **hgfxmmu:** GFXMMU handle.
- **ForceParam:** Force cache parameter. This parameter can be a values combination of GFXMMU cache force parameter.

Return values

- **HAL:** status.

HAL_GFXMMU_ModifyBuffers

Function name

HAL_StatusTypeDef HAL_GFXMMU_ModifyBuffers (GFXMMU_HandleTypeDef * hgfxmmu, GFXMMU_BuffersTypeDef * Buffers)

Function description

This function allows to modify physical buffer addresses.

Parameters

- **hgfxmmu:** GFXMMU handle.
- **Buffers:** Buffers parameters.

Return values

- **HAL:** status.

HAL_GFXMMU_ModifyCachePrefetch

Function name

HAL_StatusTypeDef HAL_GFXMMU_ModifyCachePrefetch (GFXMMU_HandleTypeDef * hgfxmmu, GFXMMU_CachePrefetchTypeDef * CachePrefetch)

Function description

This function allows to modify cache and pre-fetch parameters.

Parameters

- **hgfxmmu:** GFXMMU handle.
- **CachePrefetch:** Cache and pre-fetch parameters.

Return values

- **HAL:** status.

HAL_GFXMMU_IRQHandler

Function name

void HAL_GFXMMU_IRQHandler (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

This function handles the GFXMMU interrupts.

Parameters

- **hgfxmmu:** GFXMMU handle.

Return values

- **None.:**

HAL_GFXMMU_ErrorCallback

Function name

void HAL_GFXMMU_ErrorCallback (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

Error callback.

Parameters

- **hgfxmmu:** GFXMMU handle.

Return values

- **None.:**

HAL_GFXMMU_GetState

Function name

HAL_GFXMMU_StateTypeDef HAL_GFXMMU_GetState (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

This function allows to get the current GFXMMU handle state.

Parameters

- **hgfxmmu:** GFXMMU handle.

Return values

- **GFXMMU:** state.

HAL_GFXMMU_GetError

Function name

uint32_t HAL_GFXMMU_GetError (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

This function allows to get the current GFXMMU error code.

Parameters

- **hgfxmmu:** GFXMMU handle.

Return values

- **GFXMMU:** error code.

34.3 GFXMMU Firmware driver defines

The following section lists the various define and macros of the module.

34.3.1 GFXMMU

GFXMMU

GFXMMU blocks per line

GFXMMU_256BLOCKS

256 blocks of 16 bytes per line

GFXMMU_192BLOCKS

192 blocks of 16 bytes per line

GFXMMU cache force

GFXMMU_CACHE_FORCE_DISABLE

Caching not forced

GFXMMU_CACHE_FORCE_ENABLE

Caching forced

GFXMMU cache force parameter

GFXMMU_CACHE_FORCE_FLUSH

Force cache flush

GFXMMU_CACHE_FORCE_INVALIDATE

Force cache invalidate

GFXMMU cache lock

GFXMMU_CACHE_LOCK_DISABLE

Cache not locked to a buffer

GFXMMU_CACHE_LOCK_ENABLE

Cache locked to a buffer

GFXMMU cache lock buffer

GFXMMU_CACHE_LOCK_BUFFER0

Cache locked to buffer 0

GFXMMU_CACHE_LOCK_BUFFER1

Cache locked to buffer 1

GFXMMU_CACHE_LOCK_BUFFER2

Cache locked to buffer 2

GFXMMU_CACHE_LOCK_BUFFER3

Cache locked to buffer 3

GFXMMU Error Code

GFXMMU_ERROR_NONE

No error

GFXMMU_ERROR_BUFFER0_OVERFLOW

Buffer 0 overflow

GFXMMU_ERROR_BUFFER1_OVERFLOW

Buffer 1 overflow

GFXMMU_ERROR_BUFFER2_OVERFLOW

Buffer 2 overflow

GFXMMU_ERROR_BUFFER3_OVERFLOW

Buffer 3 overflow

GFXMMU_ERROR_AHB_MASTER

AHB master error

GFXMMU_ERROR_INVALID_CALLBACK

Invalid callback error

GFXMMU Exported Macros

__HAL_GFXMMU_RESET_HANDLE_STATE

Description:

- Reset GFXMMU handle state.

Parameters:

- __HANDLE__: GFXMMU handle.

Return value:

- None

GFXMMU interrupts

GFXMMU_AHB_MASTER_ERROR_IT

AHB master error interrupt

GFXMMU_BUFFER0_OVERFLOW_IT

Buffer 0 overflow interrupt

GFXMMU_BUFFER1_OVERFLOW_IT

Buffer 1 overflow interrupt

GFXMMU_BUFFER2_OVERFLOW_IT

Buffer 2 overflow interrupt

GFXMMU_BUFFER3_OVERFLOW_IT

Buffer 3 overflow interrupt

GFXMMU LUT line status

GFXMMU_LUT_LINE_DISABLE

LUT line disabled

GFXMMU_LUT_LINE_ENABLE

LUT line enabled

GFXMMU outer bufferability

GFXMMU_OUTTER_BUFFERABILITY_DISABLE

No bufferable

GFXMMU_OUTTER_BUFFERABILITY_ENABLE

Bufferable

GFXMMU outer cachability

GFXMMU_OUTTER_CACHABILITY_DISABLE

No cacheable

GFXMMU_OUTTER_CACHABILITY_ENABLE

Cacheable

GFXMMU pre-fetch

GFXMMU_PREFETCH_DISABLE

Pre-fetch disable

GFXMMU_PREFETCH_ENABLE

Pre-fetch enable

35 HAL GPIO Generic Driver

35.1 GPIO Firmware driver registers structures

35.1.1 GPIO_InitTypeDef

GPIO_InitTypeDef is defined in the stm32h7xx_hal_gpio.h

Data Fields

- ***uint32_t Pin***
- ***uint32_t Mode***
- ***uint32_t Pull***
- ***uint32_t Speed***
- ***uint32_t Alternate***

Field Documentation

- ***uint32_t GPIO_InitTypeDef::Pin***
  Specifies the GPIO pins to be configured. This parameter can be any value of ***GPIO_pins_define***
- ***uint32_t GPIO_InitTypeDef::Mode***
  Specifies the operating mode for the selected pins. This parameter can be a value of ***GPIO_mode_define***
- ***uint32_t GPIO_InitTypeDef::Pull***
  Specifies the Pull-up or Pull-Down activation for the selected pins. This parameter can be a value of ***GPIO_pull_define***
- ***uint32_t GPIO_InitTypeDef::Speed***
  Specifies the speed for the selected pins. This parameter can be a value of ***GPIO_speed_define***
- ***uint32_t GPIO_InitTypeDef::Alternate***
  Peripheral to be connected to the selected pins. This parameter can be a value of ***GPIO_Alternate_function_selection***

35.2 GPIO Firmware driver API description

The following section lists the various functions of the GPIO library.

35.2.1 GPIO Peripheral features

- Each port bit of the general-purpose I/O (GPIO) ports can be individually configured by software in several modes:
  - Input mode
  - Analog mode
  - Output mode
  - Alternate function mode
  - External interrupt/event lines
- During and just after reset, the alternate functions and external interrupt lines are not active and the I/O ports are configured in input floating mode.
- All GPIO pins have weak internal pull-up and pull-down resistors, which can be activated or not.
- In Output or Alternate mode, each IO can be configured on open-drain or push-pull type and the IO speed can be selected depending on the VDD value.
- The microcontroller IO pins are connected to onboard peripherals/modules through a multiplexer that allows only one peripheral alternate function (AF) connected to an IO pin at a time. In this way, there can be no conflict between peripherals sharing the same IO pin.

- All ports have external interrupt/event capability. To use external interrupt lines, the port must be configured in input mode. All available GPIO pins are connected to the 16 external interrupt/event lines from EXTI0 to EXTI15. The external interrupt/event controller consists of up to 23 edge detectors (16 lines are connected to GPIO) for generating event/interrupt requests (each input line can be independently configured to select the type (interrupt or event) and the corresponding trigger event (rising or falling or both). Each line can also be masked independently.

35.2.2 How to use this driver

1. Enable the GPIO AHB clock using the following function: __HAL_RCC_GPIOx_CLK_ENABLE().
2. Configure the GPIO pin(s) using HAL_GPIO_Init().
   - Configure the IO mode using "Mode" member from GPIO_InitTypeDef structure
   - Activate Pull-up, Pull-down resistor using "Pull" member from GPIO_InitTypeDef structure.
   - In case of Output or alternate function mode selection: the speed is configured through "Speed" member from GPIO_InitTypeDef structure.
   - In alternate mode is selection, the alternate function connected to the IO is configured through "Alternate" member from GPIO_InitTypeDef structure.
   - Analog mode is required when a pin is to be used as ADC channel or DAC output.
   - In case of external interrupt/event selection the "Mode" member from GPIO_InitTypeDef structure select the type (interrupt or event) and the corresponding trigger event (rising or falling or both).
3. In case of external interrupt/event mode selection, configure NVIC IRQ priority mapped to the EXTI line using HAL_NVIC_SetPriority() and enable it using HAL_NVIC_EnableIRQ().
4. To get the level of a pin configured in input mode use HAL_GPIO_ReadPin().
5. To set/reset the level of a pin configured in output mode use HAL_GPIO_WritePin()/HAL_GPIO_TogglePin().
6. To lock pin configuration until next reset use HAL_GPIO_LockPin().
7. During and just after reset, the alternate functions are not active and the GPIO pins are configured in input floating mode (except JTAG pins).
8. The LSE oscillator pins OSC32_IN and OSC32_OUT can be used as general purpose (PC14 and PC15, respectively) when the LSE oscillator is off. The LSE has priority over the GPIO function.
9. The HSE oscillator pins OSC_IN/OSC_OUT can be used as general purpose PH0 and PH1, respectively, when the HSE oscillator is off. The HSE has priority over the GPIO function.

35.2.3 Initialization and de-initialization functions

This section provides functions allowing to initialize and de-initialize the GPIOs to be ready for use.

This section contains the following APIs:

- *HAL_GPIO_Init()*
- *HAL_GPIO_DeInit()*

35.2.4 IO operation functions

This section contains the following APIs:

- *HAL_GPIO_ReadPin()*
- *HAL_GPIO_WritePin()*
- *HAL_GPIO_TogglePin()*
- *HAL_GPIO_LockPin()*
- *HAL_GPIO_EXTI_IRQHandler()*
- *HAL_GPIO_EXTI_Callback()*

35.2.5 Detailed description of functions

HAL_GPIO_Init

Function name

void HAL_GPIO_Init (GPIO_TypeDef * GPIOx, GPIO_InitTypeDef * GPIO_Init)

Function description

Initializes the GPIOx peripheral according to the specified parameters in the GPIO_Init.

Parameters

- **GPIOx:** where x can be (A..K) to select the GPIO peripheral.
- **GPIO_Init:** pointer to a GPIO_InitTypeDef structure that contains the configuration information for the specified GPIO peripheral.

Return values

- **None:**

HAL_GPIO_DeInit

Function name

void HAL_GPIO_DeInit (GPIO_TypeDef * GPIOx, uint32_t GPIO_Pin)

Function description

De-initializes the GPIOx peripheral registers to their default reset values.

Parameters

- **GPIOx:** where x can be (A..K) to select the GPIO peripheral.
- **GPIO_Pin:** specifies the port bit to be written. This parameter can be one of GPIO_PIN_x where x can be (0..15).

Return values

- **None:**

HAL_GPIO_ReadPin

Function name

GPIO_PinState HAL_GPIO_ReadPin (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin)

Function description

Reads the specified input port pin.

Parameters

- **GPIOx:** where x can be (A..K) to select the GPIO peripheral.
- **GPIO_Pin:** specifies the port bit to read. This parameter can be GPIO_PIN_x where x can be (0..15).

Return values

- **The:** input port pin value.

HAL_GPIO_WritePin

Function name

void HAL_GPIO_WritePin (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin, GPIO_PinState PinState)

Function description

Sets or clears the selected data port bit.

Parameters

- **GPIOx:** where x can be (A..K) to select the GPIO peripheral.
- **GPIO_Pin:** specifies the port bit to be written. This parameter can be one of GPIO_PIN_x where x can be (0..15).
- **PinState:** specifies the value to be written to the selected bit. This parameter can be one of the GPIO_PinState enum values:
  - GPIO_PIN_RESET: to clear the port pin
  - GPIO_PIN_SET: to set the port pin

Return values

- **None:**

Notes

- This function uses GPIOx_BSRR register to allow atomic read/modify accesses. In this way, there is no risk of an IRQ occurring between the read and the modify access.

HAL_GPIO_TogglePin

Function name

void HAL_GPIO_TogglePin (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin)

Function description

Toggles the specified GPIO pins.

Parameters

- **GPIOx:** Where x can be (A..K) to select the GPIO peripheral.
- **GPIO_Pin:** Specifies the pins to be toggled.

Return values

- **None:**

HAL_GPIO_LockPin

Function name

HAL_StatusTypeDef HAL_GPIO_LockPin (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin)

Function description

Locks GPIO Pins configuration registers.

Parameters

- **GPIOx:** where x can be (A..K) to select the GPIO peripheral for STM32H7 family
- **GPIO_Pin:** specifies the port bit to be locked. This parameter can be any combination of GPIO_PIN_x where x can be (0..15).

Return values

- **None:**

Notes

- The locked registers are GPIOx_MODER, GPIOx_OTYPER, GPIOx_OSPEEDR, GPIOx_PUPDR, GPIOx_AFRL and GPIOx_AFRH.
- The configuration of the locked GPIO pins can no longer be modified until the next reset.

HAL_GPIO_EXTI_IRQHandler

Function name

void HAL_GPIO_EXTI_IRQHandler (uint16_t GPIO_Pin)

Function description

Handle EXTI interrupt request.

Parameters

- **GPIO_Pin:** Specifies the port pin connected to corresponding EXTI line.

Return values

- **None:**

HAL_GPIO_EXTI_Callback

Function name

void HAL_GPIO_EXTI_Callback (uint16_t GPIO_Pin)

Function description

EXTI line detection callback.

Parameters

- **GPIO_Pin:** Specifies the port pin connected to corresponding EXTI line.

Return values

- **None:**

__HAL_GPIO_EXTI_GET_FLAG

Description:

- Checks whether the specified EXTI line flag is set or not.

Parameters:

- __EXTI_LINE__: specifies the EXTI line flag to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- The: new state of __EXTI_LINE__ (SET or RESET).

__HAL_GPIO_EXTI_CLEAR_FLAG

Description:

- Clears the EXTI's line pending flags.

Parameters:

- __EXTI_LINE__: specifies the EXTI lines flags to clear. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

__HAL_GPIO_EXTI_GET_IT

Description:

- Checks whether the specified EXTI line is asserted or not.

Parameters:

- __EXTI_LINE__: specifies the EXTI line to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- The: new state of __EXTI_LINE__ (SET or RESET).

__HAL_GPIO_EXTI_CLEAR_IT

Description:

- Clears the EXTI's line pending bits.

Parameters:

- __EXTI_LINE__: specifies the EXTI lines to clear. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

__HAL_GPIO_EXTID2_GET_FLAG

Description:

- Checks whether the specified EXTI line flag is set or not.

Parameters:

- __EXTI_LINE__: specifies the EXTI line flag to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- The: new state of __EXTI_LINE__ (SET or RESET).

__HAL_GPIO_EXTID2_CLEAR_FLAG

Description:

- Clears the EXTI's line pending flags.

Parameters:

- __EXTI_LINE__: specifies the EXTI lines flags to clear. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

__HAL_GPIO_EXTID2_GET_IT

Description:

- Checks whether the specified EXTI line is asserted or not.

Parameters:

- __EXTI_LINE__: specifies the EXTI line to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- The: new state of __EXTI_LINE__ (SET or RESET).

__HAL_GPIO_EXTID2_CLEAR_IT

Description:

- Clears the EXTI's line pending bits.

Parameters:

- __EXTI_LINE__: specifies the EXTI lines to clear. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

__HAL_GPIO_EXTI_GENERATE_SWIT

Description:

- Generates a Software interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the EXTI line to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- None

  HASH digest computation completion callback
- ***void(* __HASH_HandleTypeDef::ErrorCallback)(struct __HASH_HandleTypeDef *hhash)***
  HASH error callback
- ***void(* __HASH_HandleTypeDef::MspInitCallback)(struct __HASH_HandleTypeDef *hhash)***
  HASH Msp Init callback
- ***void(* __HASH_HandleTypeDef::MspDeInitCallback)(struct __HASH_HandleTypeDef *hhash)***
  HASH Msp DeInit callback

37.2 HASH Firmware driver API description

The following section lists the various functions of the HASH library.

37.2.1 How to use this driver

The HASH HAL driver can be used as follows:

1. Initialize the HASH low level resources by implementing the HAL_HASH_MspInit():
   a. Enable the HASH interface clock using __HASH_CLK_ENABLE()
   b. When resorting to interrupt-based APIs (e.g. HAL_HASH_xxx_Start_IT())
      - Configure the HASH interrupt priority using HAL_NVIC_SetPriority()
      - Enable the HASH IRQ handler using HAL_NVIC_EnableIRQ()
      - In HASH IRQ handler, call HAL_HASH_IRQHandler() API
   c. When resorting to DMA-based APIs (e.g. HAL_HASH_xxx_Start_DMA())
      - Enable the DMAx interface clock using __DMAx_CLK_ENABLE()
      - Configure and enable one DMA stream to manage data transfer from memory to peripheral (input stream). Managing data transfer from peripheral to memory can be performed only using CPU.
      - Associate the initialized DMA handle to the HASH DMA handle using __HAL_LINKDMA()
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA stream: use HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ()
2. Initialize the HASH HAL using HAL_HASH_Init(). This function:
   a. resorts to HAL_HASH_MspInit() for low-level initialization,
   b. configures the data type: 1-bit, 8-bit, 16-bit or 32-bit.
3. Three processing schemes are available:
   a. Polling mode: processing APIs are blocking functions i.e. they process the data and wait till the digest computation is finished, e.g. HAL_HASH_xxx_Start() for HASH or HAL_HMAC_xxx_Start() for HMAC
   b. Interrupt mode: processing APIs are not blocking functions i.e. they process the data under interrupt, e.g. HAL_HASH_xxx_Start_IT() for HASH or HAL_HMAC_xxx_Start_IT() for HMAC
   c. DMA mode: processing APIs are not blocking functions and the CPU is not used for data transfer i.e. the data transfer is ensured by DMA, e.g. HAL_HASH_xxx_Start_DMA() for HASH or HAL_HMAC_xxx_Start_DMA() for HMAC. Note that in DMA mode, a call to HAL_HASH_xxx_Finish() is then required to retrieve the digest.
4. When the processing function is called after HAL_HASH_Init(), the HASH peripheral is initialized and processes the buffer fed in input. When the input data have all been fed to the Peripheral, the digest computation can start.
5. Multi-buffer processing is possible in polling, interrupt and DMA modes.
   a. In polling mode, only multi-buffer HASH processing is possible. API HAL_HASH_xxx_Accumulate() must be called for each input buffer, except for the last one. User must resort to HAL_HASH_xxx_Accumulate_End() to enter the last one and retrieve as well the computed digest.
   b. In interrupt mode, API HAL_HASH_xxx_Accumulate_IT() must be called for each input buffer, except for the last one. User must resort to HAL_HASH_xxx_Accumulate_End_IT() to enter the last one and retrieve as well the computed digest.
   c. In DMA mode, multi-buffer HASH and HMAC processing are possible.
      - HASH processing: once initialization is done, MDMAT bit must be set through __HAL_HASH_SET_MDMAT() macro. From that point, each buffer can be fed to the Peripheral through HAL_HASH_xxx_Start_DMA() API. Before entering the last buffer, reset the MDMAT bit with __HAL_HASH_RESET_MDMAT() macro then wrap-up the HASH processing in feeding the last input buffer through the same API HAL_HASH_xxx_Start_DMA(). The digest can then be retrieved with a call to API HAL_HASH_xxx_Finish().
      - HMAC processing (requires to resort to extended functions): after initialization, the key and the first input buffer are entered in the Peripheral with the API HAL_HMACEx_xxx_Step1_2_DMA(). This carries out HMAC step 1 and starts step 2. The following buffers are next entered with the API HAL_HMACEx_xxx_Step2_DMA(). At this point, the HMAC processing is still carrying out step 2. Then, step 2 for the last input buffer and step 3 are carried out by a single call to HAL_HMACEx_xxx_Step2_3_DMA(). The digest can finally be retrieved with a call to API HAL_HASH_xxx_Finish().

6. Context swapping.
   a. Two APIs are available to suspend HASH or HMAC processing:
      - HAL_HASH_SwFeed_ProcessSuspend() when data are entered by software (polling or IT mode),
      - HAL_HASH_DMAFeed_ProcessSuspend() when data are entered by DMA.
   b. When HASH or HMAC processing is suspended, HAL_HASH_ContextSaving() allows to save in memory the Peripheral context. This context can be restored afterwards to resume the HASH processing thanks to HAL_HASH_ContextRestoring().
   c. Once the HASH Peripheral has been restored to the same configuration as that at suspension time, processing can be restarted with the same API call (same API, same handle, same parameters) as done before the suspension. Relevant parameters to restart at the proper location are internally saved in the HASH handle.
7. Call HAL_HASH_DeInit() to deinitialize the HASH peripheral.

Remarks on message length

1. HAL in interruption mode (interruptions driven)
   a. Due to HASH peripheral hardware design, the peripheral interruption is triggered every 64 bytes. This is why, for driver implementation simplicity's sake, user is requested to enter a message the length of which is a multiple of 4 bytes.
   b. When the message length (in bytes) is not a multiple of words, a specific field exists in HASH_STR to specify which bits to discard at the end of the complete message to process only the message bits and not extra bits.
   c. If user needs to perform a hash computation of a large input buffer that is spread around various places in memory and where each piece of this input buffer is not necessarily a multiple of 4 bytes in size, it becomes necessary to use a temporary buffer to format the data accordingly before feeding them to the Peripheral. It is advised to the user to
      - achieve the first formatting operation by software then enter the data
      - while the Peripheral is processing the first input set, carry out the second formatting operation by software, to be ready when DINIS occurs.
      - repeat step 2 until the whole message is processed.

1. HAL in DMA mode
   a. Again, due to hardware design, the DMA transfer to feed the data can only be done on a word-basis. The same field described above in HASH_STR is used to specify which bits to discard at the end of the DMA transfer to process only the message bits and not extra bits. Due to hardware implementation, this is possible only at the end of the complete message. When several DMA transfers are needed to enter the message, this is not applicable at the end of the intermediary transfers.
   b. Similarly to the interruption-driven mode, it is suggested to the user to format the consecutive chunks of data by software while the DMA transfer and processing is on-going for the first parts of the message. Due to the 32-bit alignment required for the DMA transfer, it is underlined that the software formatting operation is more complex than in the IT mode.

Callback registration

1. The compilation define USE_HAL_HASH_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use function HAL_HASH_RegisterCallback() to register a user callback.
2. Function HAL_HASH_RegisterCallback() allows to register following callbacks: (+) InCpltCallback : callback for input completion. (+) DgstCpltCallback : callback for digest computation completion. (+) ErrorCallback : callback for error. (+) MspInitCallback : HASH MspInit. (+) MspDeInitCallback : HASH MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.
3. Use function HAL_HASH_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. HAL_HASH_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks: (+) InCpltCallback : callback for input completion. (+) DgstCpltCallback : callback for digest computation completion. (+) ErrorCallback : callback for error. (+) MspInitCallback : HASH MspInit. (+) MspDeInitCallback : HASH MspDeInit.

4. By default, after the HAL_HASH_Init and if the state is HAL_HASH_STATE_RESET all callbacks are reset to the corresponding legacy weak (surcharged) functions: examples HAL_HASH_InCpltCallback(), HAL_HASH_DgstCpltCallback() Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (surcharged) functions in the HAL_HASH_Init and HAL_HASH_DeInit only when these callbacks are null (not registered beforehand) If not, MspInit or MspDeInit are not null, the HAL_HASH_Init and HAL_HASH_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand). Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/ MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_HASH_RegisterCallback before calling HAL_HASH_DeInit or HAL_HASH_Init function. When The compilation define USE_HAL_HASH_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

(#) The compilation define USE_HAL_HASH_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use function HAL_HASH_RegisterCallback() to register a user callback. (#) Function HAL_HASH_RegisterCallback() allows to register following callbacks:

- InCpltCallback : callback for input completion.
- DgstCpltCallback : callback for digest computation completion.
- ErrorCallback : callback for error.
- MspInitCallback : HASH MspInit.
- MspDeInitCallback : HASH MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. (#) Use function HAL_HASH_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. HAL_HASH_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:
- InCpltCallback : callback for input completion.
- DgstCpltCallback : callback for digest computation completion.
- ErrorCallback : callback for error.
- MspInitCallback : HASH MspInit.
- MspDeInitCallback : HASH MspDeInit. (#) By default, after the HAL_HASH_Init and if the state is HAL_HASH_STATE_RESET all callbacks are reset to the corresponding legacy weak (surcharged) functions: examples HAL_HASH_InCpltCallback(), HAL_HASH_DgstCpltCallback() Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (surcharged) functions in the HAL_HASH_Init and HAL_HASH_DeInit only when these callbacks are null (not registered beforehand) If not, MspInit or MspDeInit are not null, the HAL_HASH_Init and HAL_HASH_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand). Callbacks can be registered/ unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_HASH_RegisterCallback before calling HAL_HASH_DeInit or HAL_HASH_Init function. When The compilation define USE_HAL_HASH_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

37.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the HASH according to the specified parameters in the HASH_InitTypeDef and create the associated handle
- DeInitialize the HASH peripheral
- Initialize the HASH MCU Specific Package (MSP)
- DeInitialize the HASH MSP

This section provides as well call back functions definitions for user code to manage:

- Input data transfer to Peripheral completion
- Calculated digest retrieval completion
- Error management

This section contains the following APIs:

- ***HAL_HASH_Init()***
- ***HAL_HASH_DeInit()***

- *HAL_HASH_MspInit()*
- *HAL_HASH_MspDeInit()*
- *HAL_HASH_InCpltCallback()*
- *HAL_HASH_DgstCpltCallback()*
- *HAL_HASH_ErrorCallback()*
- *HAL_HASH_RegisterCallback()*
- *HAL_HASH_UnRegisterCallback()*

37.2.3 Polling mode HASH processing functions

This section provides functions allowing to calculate in polling mode the hash value using one of the following algorithms:

- MD5
  - HAL_HASH_MD5_Start()
  - HAL_HASH_MD5_Accmlt()
  - HAL_HASH_MD5_Accmlt_End()
- SHA1
  - HAL_HASH_SHA1_Start()
  - HAL_HASH_SHA1_Accmlt()
  - HAL_HASH_SHA1_Accmlt_End()

For a single buffer to be hashed, user can resort to HAL_HASH_xxx_Start().

In case of multi-buffer HASH processing (a single digest is computed while several buffers are fed to the Peripheral), the user can resort to successive calls to HAL_HASH_xxx_Accumulate() and wrap-up the digest computation by a call to HAL_HASH_xxx_Accumulate_End().

This section contains the following APIs:

- *HAL_HASH_MD5_Start()*
- *HAL_HASH_MD5_Accmlt()*
- *HAL_HASH_MD5_Accmlt_End()*
- *HAL_HASH_SHA1_Start()*
- *HAL_HASH_SHA1_Accmlt()*
- *HAL_HASH_SHA1_Accmlt_End()*

37.2.4 Interruption mode HASH processing functions

This section provides functions allowing to calculate in interrupt mode the hash value using one of the following algorithms:

- MD5
  - HAL_HASH_MD5_Start_IT()
  - HAL_HASH_MD5_Accmlt_IT()
  - HAL_HASH_MD5_Accmlt_End_IT()
- SHA1
  - HAL_HASH_SHA1_Start_IT()
  - HAL_HASH_SHA1_Accmlt_IT()
  - HAL_HASH_SHA1_Accmlt_End_IT()

API HAL_HASH_IRQHandler() manages each HASH interruption.

Note that HAL_HASH_IRQHandler() manages as well HASH Peripheral interruptions when in HMAC processing mode.

This section contains the following APIs:

- *HAL_HASH_MD5_Start_IT()*
- *HAL_HASH_MD5_Accmlt_IT()*
- *HAL_HASH_MD5_Accmlt_End_IT()*
- *HAL_HASH_SHA1_Start_IT()*

- *HAL_HASH_SHA1_Accmlt_IT()*
- *HAL_HASH_SHA1_Accmlt_End_IT()*
- *HAL_HASH_IRQHandler()*

37.2.5 DMA mode HASH processing functions

This section provides functions allowing to calculate in DMA mode the hash value using one of the following algorithms:

- MD5
  - HAL_HASH_MD5_Start_DMA()
  - HAL_HASH_MD5_Finish()
- SHA1
  - HAL_HASH_SHA1_Start_DMA()
  - HAL_HASH_SHA1_Finish()

When resorting to DMA mode to enter the data in the Peripheral, user must resort to HAL_HASH_xxx_Start_DMA() then read the resulting digest with HAL_HASH_xxx_Finish().

In case of multi-buffer HASH processing, MDMAT bit must first be set before the successive calls to HAL_HASH_xxx_Start_DMA(). Then, MDMAT bit needs to be reset before the last call to HAL_HASH_xxx_Start_DMA(). Digest is finally retrieved thanks to HAL_HASH_xxx_Finish().

This section contains the following APIs:

- *HAL_HASH_MD5_Start_DMA()*
- *HAL_HASH_MD5_Finish()*
- *HAL_HASH_SHA1_Start_DMA()*
- *HAL_HASH_SHA1_Finish()*

37.2.6 Polling mode HMAC processing functions

This section provides functions allowing to calculate in polling mode the HMAC value using one of the following algorithms:

- MD5
  - HAL_HMAC_MD5_Start()
- SHA1
  - HAL_HMAC_SHA1_Start()

This section contains the following APIs:

- *HAL_HMAC_MD5_Start()*
- *HAL_HMAC_SHA1_Start()*

37.2.7 Interrupt mode HMAC processing functions

This section provides functions allowing to calculate in interrupt mode the HMAC value using one of the following algorithms:

- MD5
  - HAL_HMAC_MD5_Start_IT()
- SHA1
  - HAL_HMAC_SHA1_Start_IT()

This section contains the following APIs:

- *HAL_HMAC_MD5_Start_IT()*
- *HAL_HMAC_SHA1_Start_IT()*

37.2.8 DMA mode HMAC processing functions

This section provides functions allowing to calculate in DMA mode the HMAC value using one of the following algorithms:

- MD5
  - HAL_HMAC_MD5_Start_DMA()
- SHA1
  - HAL_HMAC_SHA1_Start_DMA()

When resorting to DMA mode to enter the data in the Peripheral for HMAC processing, user must resort to HAL_HMAC_xxx_Start_DMA() then read the resulting digest with HAL_HASH_xxx_Finish().

This section contains the following APIs:

- ***HAL_HMAC_MD5_Start_DMA()***
- ***HAL_HMAC_SHA1_Start_DMA()***

37.2.9 Peripheral State methods

This section permits to get in run-time the state and the peripheral handle status of the peripheral:

- HAL_HASH_GetState()
- HAL_HASH_GetStatus()

Additionally, this subsection provides functions allowing to save and restore the HASH or HMAC processing context in case of calculation suspension:

- HAL_HASH_ContextSaving()
- HAL_HASH_ContextRestoring()

This subsection provides functions allowing to suspend the HASH processing

- when input are fed to the Peripheral by software
  - HAL_HASH_SwFeed_ProcessSuspend()
- when input are fed to the Peripheral by DMA
  - HAL_HASH_DMAFeed_ProcessSuspend()

This section contains the following APIs:

- ***HAL_HASH_GetState()***
- ***HAL_HASH_GetStatus()***
- ***HAL_HASH_ContextSaving()***
- ***HAL_HASH_ContextRestoring()***
- ***HAL_HASH_SwFeed_ProcessSuspend()***
- ***HAL_HASH_DMAFeed_ProcessSuspend()***
- ***HAL_HASH_GetError()***

37.2.10 Detailed description of functions

HAL_HASH_Init

Function name

HAL_StatusTypeDef HAL_HASH_Init (HASH_HandleTypeDef * hhash)

Function description

Initialize the HASH according to the specified parameters in the HASH_HandleTypeDef and create the associated handle.

Parameters

- **hhash:** HASH handle

Return values

- **HAL:** status

Notes

- Only MDMAT and DATATYPE bits of HASH Peripheral are set by HAL_HASH_Init(), other configuration bits are set by HASH or HMAC processing APIs.
- MDMAT bit is systematically reset by HAL_HASH_Init(). To set it for multi-buffer HASH processing, user needs to resort to __HAL_HASH_SET_MDMAT() macro. For HMAC multi-buffer processing, the relevant APIs manage themselves the MDMAT bit.

HAL_HASH_DeInit

Function name

HAL_StatusTypeDef HAL_HASH_DeInit (HASH_HandleTypeDef * hhash)

Function description

DeInitialize the HASH peripheral.

Parameters

- **hhash:** HASH handle.

Return values

- **HAL:** status

HAL_HASH_MspInit

Function name

void HAL_HASH_MspInit (HASH_HandleTypeDef * hhash)

Function description

Initialize the HASH MSP.

Parameters

- **hhash:** HASH handle.

Return values

- **None:**

HAL_HASH_MspDeInit

Function name

void HAL_HASH_MspDeInit (HASH_HandleTypeDef * hhash)

Function description

DeInitialize the HASH MSP.

Parameters

- **hhash:** HASH handle.

Return values

- **None:**

HAL_HASH_InCpltCallback

Function name

void HAL_HASH_InCpltCallback (HASH_HandleTypeDef * hhash)

Function description

Input data transfer complete call back.

Parameters

- **hhash:** HASH handle.

Return values

- **None:**

Notes

- HAL_HASH_InCpltCallback() is called when the complete input message has been fed to the Peripheral. This API is invoked only when input data are entered under interruption or through DMA.
- In case of HASH or HMAC multi-buffer DMA feeding case (MDMAT bit set), HAL_HASH_InCpltCallback() is called at the end of each buffer feeding to the Peripheral.

HAL_HASH_DgstCpltCallback

Function name

void HAL_HASH_DgstCpltCallback (HASH_HandleTypeDef * hhash)

Function description

Digest computation complete call back.

Parameters

- **hhash:** HASH handle.

Return values

- **None:**

Notes

- HAL_HASH_DgstCpltCallback() is used under interruption, is not relevant with DMA.

HAL_HASH_ErrorCallback

Function name

void HAL_HASH_ErrorCallback (HASH_HandleTypeDef * hhash)

Function description

Error callback.

Parameters

- **hhash:** HASH handle.

Return values

- **None:**

Notes

- Code user can resort to hhash->Status (HAL_ERROR, HAL_TIMEOUT,...) to retrieve the error type.

HAL_HASH_RegisterCallback

Function name

HAL_StatusTypeDef HAL_HASH_RegisterCallback (HASH_HandleTypeDef * hhash, HAL_HASH_CallbackIDTypeDef CallbackID, pHASH_CallbackTypeDef pCallback)

Function description

Register a User HASH Callback To be used instead of the weak (surcharged) predefined callback.

Parameters

- **hhash:** HASH handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_HASH_INPUTCPLT_CB_ID HASH input completion Callback ID
  - HAL_HASH_DGSTCPLT_CB_ID HASH digest computation completion Callback ID
  - HAL_HASH_ERROR_CB_ID HASH error Callback ID
  - HAL_HASH_MSPINIT_CB_ID HASH MspInit callback ID
  - HAL_HASH_MSPDEINIT_CB_ID HASH MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

HAL_HASH_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_HASH_UnRegisterCallback (HASH_HandleTypeDef * hhash, HAL_HASH_CallbackIDTypeDef CallbackID)

Function description

Unregister a HASH Callback HASH Callback is redirected to the weak (surcharged) predefined callback.

Parameters

- **hhash:** HASH handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_HASH_INPUTCPLT_CB_ID HASH input completion Callback ID
  - HAL_HASH_DGSTCPLT_CB_ID HASH digest computation completion Callback ID
  - HAL_HASH_ERROR_CB_ID HASH error Callback ID
  - HAL_HASH_MSPINIT_CB_ID HASH MspInit callback ID
  - HAL_HASH_MSPDEINIT_CB_ID HASH MspDeInit callback ID

Return values

- **status:**

HAL_HASH_SHA1_Start

Function name

HAL_StatusTypeDef HAL_HASH_SHA1_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Initialize the HASH peripheral in SHA1 mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 20 bytes.
- **Timeout:** Timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASH_MD5_Start

Function name

HAL_StatusTypeDef HAL_HASH_MD5_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Initialize the HASH peripheral in MD5 mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 16 bytes.
- **Timeout:** Timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASH_MD5_Accmlt

Function name

HAL_StatusTypeDef HAL_HASH_MD5_Accmlt (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

If not already done, initialize the HASH peripheral in MD5 mode then processes pInBuffer.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASH_MD5_Accmlt() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASH_MD5_Accmlt_End().
- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- Digest is not retrieved by this API, user must resort to HAL_HASH_MD5_Accmlt_End() to read it, feeding at the same time the last input buffer to the Peripheral.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only HAL_HASH_MD5_Accmlt_End() is able to manage the ending buffer with a length in bytes not a multiple of 4.

HAL_HASH_SHA1_Accmlt

Function name

HAL_StatusTypeDef HAL_HASH_SHA1_Accmlt (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

If not already done, initialize the HASH peripheral in SHA1 mode then processes pInBuffer.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASH_SHA1_Accmlt() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASH_SHA1_Accmlt_End().
- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- Digest is not retrieved by this API, user must resort to HAL_HASH_SHA1_Accmlt_End() to read it, feeding at the same time the last input buffer to the Peripheral.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only HAL_HASH_SHA1_Accmlt_End() is able to manage the ending buffer with a length in bytes not a multiple of 4.

HAL_HASH_MD5_Accmlt_End

Function name

HAL_StatusTypeDef HAL_HASH_MD5_Accmlt_End (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

End computation of a single HASH signature after several calls to HAL_HASH_MD5_Accmlt() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 16 bytes.
- **Timeout:** Timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASH_SHA1_Accmlt_End

Function name

HAL_StatusTypeDef HAL_HASH_SHA1_Accmlt_End (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

End computation of a single HASH signature after several calls to HAL_HASH_SHA1_Accmlt() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 20 bytes.
- **Timeout:** Timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASH_SHA1_Start_IT

Function name

HAL_StatusTypeDef HAL_HASH_SHA1_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

Initialize the HASH peripheral in SHA1 mode, next process pInBuffer then read the computed digest in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 20 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASH_SHA1_Accmlt_IT

Function name

HAL_StatusTypeDef HAL_HASH_SHA1_Accmlt_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

If not already done, initialize the HASH peripheral in SHA1 mode then processes pInBuffer in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASH_SHA1_Accmlt_IT() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASH_SHA1_Accmlt_End_IT().
- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only HAL_HASH_SHA1_Accmlt_End_IT() is able to manage the ending buffer with a length in bytes not a multiple of 4.

HAL_HASH_SHA1_Accmlt_End_IT

Function name

HAL_StatusTypeDef HAL_HASH_SHA1_Accmlt_End_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

End computation of a single HASH signature after several calls to HAL_HASH_SHA1_Accmlt_IT() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 20 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASH_MD5_Start_IT

Function name

HAL_StatusTypeDef HAL_HASH_MD5_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

Initialize the HASH peripheral in MD5 mode, next process pInBuffer then read the computed digest in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 16 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASH_MD5_Accmlt_IT

Function name

HAL_StatusTypeDef HAL_HASH_MD5_Accmlt_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

If not already done, initialize the HASH peripheral in MD5 mode then processes pInBuffer in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASH_MD5_Accmlt_IT() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASH_MD5_Accmlt_End_IT().
- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only HAL_HASH_MD5_Accmlt_End_IT() is able to manage the ending buffer with a length in bytes not a multiple of 4.

HAL_HASH_MD5_Accmlt_End_IT

Function name

HAL_StatusTypeDef HAL_HASH_MD5_Accmlt_End_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

End computation of a single HASH signature after several calls to HAL_HASH_MD5_Accmlt_IT() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 16 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASH_IRQHandler

Function name

void HAL_HASH_IRQHandler (HASH_HandleTypeDef * hhash)

Function description

Handle HASH interrupt request.

Parameters

- **hhash:** HASH handle.

Return values

- **None:**

Notes

- HAL_HASH_IRQHandler() handles interrupts in HMAC processing as well.
- In case of error reported during the HASH interruption processing, HAL_HASH_ErrorCallback() API is called so that user code can manage the error. The error type is available in hhash->Status field.

HAL_HASH_SHA1_Start_DMA

Function name

HAL_StatusTypeDef HAL_HASH_SHA1_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

Initialize the HASH peripheral in SHA1 mode then initiate a DMA transfer to feed the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Once the DMA transfer is finished, HAL_HASH_SHA1_Finish() API must be called to retrieve the computed digest.

HAL_HASH_SHA1_Finish

Function name

HAL_StatusTypeDef HAL_HASH_SHA1_Finish (HASH_HandleTypeDef * hhash, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Return the computed digest in SHA1 mode.

Parameters

- **hhash:** HASH handle.
- **pOutBuffer:** pointer to the computed digest. Digest size is 20 bytes.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- The API waits for DCIS to be set then reads the computed digest.
- HAL_HASH_SHA1_Finish() can be used as well to retrieve the digest in HMAC SHA1 mode.

HAL_HASH_MD5_Start_DMA

Function name

HAL_StatusTypeDef HAL_HASH_MD5_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

Initialize the HASH peripheral in MD5 mode then initiate a DMA transfer to feed the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Once the DMA transfer is finished, HAL_HASH_MD5_Finish() API must be called to retrieve the computed digest.

HAL_HASH_MD5_Finish

Function name

HAL_StatusTypeDef HAL_HASH_MD5_Finish (HASH_HandleTypeDef * hhash, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Return the computed digest in MD5 mode.

Parameters

- **hhash:** HASH handle.
- **pOutBuffer:** pointer to the computed digest. Digest size is 16 bytes.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- The API waits for DCIS to be set then reads the computed digest.
- HAL_HASH_MD5_Finish() can be used as well to retrieve the digest in HMAC MD5 mode.

HAL_HMAC_SHA1_Start

Function name

HAL_StatusTypeDef HAL_HMAC_SHA1_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Initialize the HASH peripheral in HMAC SHA1 mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 20 bytes.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HAL_HMAC_MD5_Start

Function name

HAL_StatusTypeDef HAL_HMAC_MD5_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Initialize the HASH peripheral in HMAC MD5 mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 16 bytes.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HAL_HMAC_MD5_Start_IT

Function name

HAL_StatusTypeDef HAL_HMAC_MD5_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

Initialize the HASH peripheral in HMAC MD5 mode, next process pInBuffer then read the computed digest in interrupt mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 16 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HAL_HMAC_SHA1_Start_IT

Function name

HAL_StatusTypeDef HAL_HMAC_SHA1_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

Initialize the HASH peripheral in HMAC SHA1 mode, next process pInBuffer then read the computed digest in interrupt mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 20 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HAL_HMAC_SHA1_Start_DMA

Function name

HAL_StatusTypeDef HAL_HMAC_SHA1_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

Initialize the HASH peripheral in HMAC SHA1 mode then initiate the required DMA transfers to feed the key and the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Once the DMA transfers are finished (indicated by hhash->State set back to HAL_HASH_STATE_READY), HAL_HASH_SHA1_Finish() API must be called to retrieve the computed digest.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- If MDMAT bit is set before calling this function (multi-buffer HASH processing case), the input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. For the processing of the last buffer of the thread, MDMAT bit must be reset and the buffer length (in bytes) doesn't have to be a multiple of 4.

HAL_HMAC_MD5_Start_DMA

Function name

HAL_StatusTypeDef HAL_HMAC_MD5_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

Initialize the HASH peripheral in HMAC MD5 mode then initiate the required DMA transfers to feed the key and the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Once the DMA transfers are finished (indicated by hhash->State set back to HAL_HASH_STATE_READY), HAL_HASH_MD5_Finish() API must be called to retrieve the computed digest.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- If MDMAT bit is set before calling this function (multi-buffer HASH processing case), the input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. For the processing of the last buffer of the thread, MDMAT bit must be reset and the buffer length (in bytes) doesn't have to be a multiple of 4.

HAL_HASH_GetState

Function name

HAL_HASH_StateTypeDef HAL_HASH_GetState (HASH_HandleTypeDef * hhash)

Function description

Return the HASH handle state.

Parameters

- **hhash:** HASH handle.

Return values

- **HAL:** HASH state

Notes

- The API yields the current state of the handle (BUSY, READY,...).

HAL_HASH_GetStatus

Function name

HAL_StatusTypeDef HAL_HASH_GetStatus (HASH_HandleTypeDef * hhash)

Function description

Return the HASH HAL status.

Parameters

- **hhash:** HASH handle.

Return values

- **HAL:** status

Notes

- The API yields the HAL status of the handle: it is the result of the latest HASH processing and allows to report any issue (e.g. HAL_TIMEOUT).

HAL_HASH_ContextSaving

Function name

void HAL_HASH_ContextSaving (HASH_HandleTypeDef * hhash, uint8_t * pMemBuffer)

Function description

Save the HASH context in case of processing suspension.

Parameters

- **hhash:** HASH handle.
- **pMemBuffer:** pointer to the memory buffer where the HASH context is saved.

Return values

- **None:**

Notes

- The IMR, STR, CR then all the CSR registers are saved in that order. Only the r/w bits are read to be restored later on.
- By default, all the context swap registers (there are HASH_NUMBER_OF_CSR_REGISTERS of those) are saved.
- pMemBuffer points to a buffer allocated by the user. The buffer size must be at least (HASH_NUMBER_OF_CSR_REGISTERS + 3) * 4 uint8 long.

HAL_HASH_ContextRestoring

Function name

void HAL_HASH_ContextRestoring (HASH_HandleTypeDef * hhash, uint8_t * pMemBuffer)

Function description

Restore the HASH context in case of processing resumption.

Parameters

- **hhash:** HASH handle.
- **pMemBuffer:** pointer to the memory buffer where the HASH context is stored.

Return values

- **None:**

Notes

- The IMR, STR, CR then all the CSR registers are restored in that order. Only the r/w bits are restored.
- By default, all the context swap registers (HASH_NUMBER_OF_CSR_REGISTERS of those) are restored (all of them have been saved by default beforehand).

HAL_HASH_SwFeed_ProcessSuspend

Function name

void HAL_HASH_SwFeed_ProcessSuspend (HASH_HandleTypeDef * hhash)

Function description

Initiate HASH processing suspension when in polling or interruption mode.

Parameters

- **hhash:** HASH handle.

Return values

- **None:**

Notes

- Set the handle field SuspendRequest to the appropriate value so that the on-going HASH processing is suspended as soon as the required conditions are met. Note that the actual suspension is carried out by the functions HASH_WriteData() in polling mode and HASH_IT() in interruption mode.

HAL_HASH_DMAFeed_ProcessSuspend

Function name

HAL_StatusTypeDef HAL_HASH_DMAFeed_ProcessSuspend (HASH_HandleTypeDef * hhash)

Function description

Suspend the HASH processing when in DMA mode.

Parameters

- **hhash:** HASH handle.

Return values

- **HAL:** status

Notes

- When suspension attempt occurs at the very end of a DMA transfer and all the data have already been entered in the Peripheral, hhash->State is set to HAL_HASH_STATE_READY and the API returns HAL_ERROR. It is recommended to wrap-up the processing in reading the digest as usual.

HAL_HASH_GetError

Function name

uint32_t HAL_HASH_GetError (HASH_HandleTypeDef * hhash)

Function description

Return the HASH handle error code.

Parameters

- **hhash:** pointer to a HASH_HandleTypeDef structure.

Return values

- **HASH:** Error Code

HASH_Start

Function name

HAL_StatusTypeDef HASH_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout, uint32_t Algorithm)

Function description

Initialize the HASH peripheral, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest.
- **Timeout:** Timeout value.
- **Algorithm:** HASH algorithm.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HASH_Accumulate

Function name

HAL_StatusTypeDef HASH_Accumulate (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint32_t Algorithm)

Function description

If not already done, initialize the HASH peripheral then processes pInBuffer.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.
- **Algorithm:** HASH algorithm.

Return values

- **HAL:** status

Notes

- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HASH_Accumulate_IT

Function name

HAL_StatusTypeDef HASH_Accumulate_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint32_t Algorithm)

Function description

If not already done, initialize the HASH peripheral then processes pInBuffer in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.
- **Algorithm:** HASH algorithm.

Return values

- **HAL:** status

Notes

- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HASH_Start_IT

Function name

HAL_StatusTypeDef HASH_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Algorithm)

Function description

Initialize the HASH peripheral, next process pInBuffer then read the computed digest in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest.
- **Algorithm:** HASH algorithm.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HASH_Start_DMA

Function name

HAL_StatusTypeDef HASH_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint32_t Algorithm)

Function description

Initialize the HASH peripheral then initiate a DMA transfer to feed the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **Algorithm:** HASH algorithm.

Return values

- **HAL:** status

Notes

- If MDMAT bit is set before calling this function (multi-buffer HASH processing case), the input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. For the processing of the last buffer of the thread, MDMAT bit must be reset and the buffer length (in bytes) doesn't have to be a multiple of 4.

HASH_Finish

Function name

HAL_StatusTypeDef HASH_Finish (HASH_HandleTypeDef * hhash, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Return the computed digest.

Parameters

- **hhash:** HASH handle.
- **pOutBuffer:** pointer to the computed digest.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- The API waits for DCIS to be set then reads the computed digest.

HMAC_Start

Function name

HAL_StatusTypeDef HMAC_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout, uint32_t Algorithm)

Function description

Initialize the HASH peripheral in HMAC mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest.
- **Timeout:** Timeout value.
- **Algorithm:** HASH algorithm.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HMAC_Start_IT

Function name

HAL_StatusTypeDef HMAC_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Algorithm)

Function description

Initialize the HASH peripheral in HMAC mode, next process pInBuffer then read the computed digest in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest.
- **Algorithm:** HASH algorithm.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HMAC_Start_DMA

Function name

HAL_StatusTypeDef HMAC_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint32_t Algorithm)

Function description

Initialize the HASH peripheral in HMAC mode then initiate the required DMA transfers to feed the key and the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **Algorithm:** HASH algorithm.

Return values

- **HAL:** status

Notes

- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- In case of multi-buffer HMAC processing, the input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only the length of the last buffer of the thread doesn't have to be a multiple of 4.

37.3 HASH Firmware driver defines

The following section lists the various define and macros of the module.

37.3.1 HASH

HASH

HASH algorithm mode

HASH_ALGOMODE_HASH

Algorithm is HASH

HASH_ALGOMODE_HMAC

Algorithm is HMAC

HASH algorithm selection

HASH_ALGOSELECTION_SHA1

HASH function is SHA1

HASH_ALGOSELECTION_MD5

HASH function is MD5

HASH_ALGOSELECTION_SHA224

HASH function is SHA224

HASH_ALGOSELECTION_SHA256

HASH function is SHA256

HASH input data type

HASH_DATATYPE_32B

32-bit data. No swapping

HASH_DATATYPE_16B

16-bit data. Each half word is swapped

HASH_DATATYPE_8B

8-bit data. All bytes are swapped

HASH_DATATYPE_1B

1-bit data. In the word all bits are swapped

HASH Digest Calculation Status

HASH_DIGEST_CALCULATION_NOT_STARTED

DCAL not set after input data written in DIN register

HASH_DIGEST_CALCULATION_STARTED

DCAL set after input data written in DIN register

HASH DMA suspension words limit

HASH_DMA_SUSPENSION_WORDS_LIMIT

Number of words below which DMA suspension is aborted

HASH Error Definition

HAL_HASH_ERROR_NONE

No error

HAL_HASH_ERROR_IT

IT-based process error

HAL_HASH_ERROR_DMA

DMA-based process error

HAL_HASH_ERROR_INVALID_CALLBACK

Invalid Callback error

HASH Exported Macros

__HAL_HASH_GET_FLAG

Description:

- Check whether or not the specified HASH flag is set.

Parameters:

- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - HASH_FLAG_DINIS A new block can be entered into the input buffer.
  - HASH_FLAG_DCIS Digest calculation complete.
  - HASH_FLAG_DMAS DMA interface is enabled (DMAE=1) or a transfer is ongoing.
  - HASH_FLAG_BUSY The hash core is Busy : processing a block of data.
  - HASH_FLAG_DINNE DIN not empty : the input buffer contains at least one word of data.

Return value:

- The: new state of __FLAG__ (TRUE or FALSE).

__HAL_HASH_CLEAR_FLAG

Description:

- Clear the specified HASH flag.

Parameters:

- __FLAG__: specifies the flag to clear. This parameter can be one of the following values:
  - HASH_FLAG_DINIS A new block can be entered into the input buffer.
  - HASH_FLAG_DCIS Digest calculation complete

Return value:

- None

__HAL_HASH_ENABLE_IT

Description:

- Enable the specified HASH interrupt.

Parameters:

- __INTERRUPT__: specifies the HASH interrupt source to enable. This parameter can be one of the following values:
  - HASH_IT_DINI A new block can be entered into the input buffer (DIN)
  - HASH_IT_DCI Digest calculation complete

Return value:

- None

__HAL_HASH_DISABLE_IT

Description:

- Disable the specified HASH interrupt.

Parameters:

- __INTERRUPT__: specifies the HASH interrupt source to disable. This parameter can be one of the following values:
  - HASH_IT_DINI A new block can be entered into the input buffer (DIN)
  - HASH_IT_DCI Digest calculation complete

Return value:

- None

__HAL_HASH_RESET_HANDLE_STATE

Description:

- Reset HASH handle state.

Parameters:

- __HANDLE__: HASH handle.

Return value:

- None

__HAL_HASH_RESET_HANDLE_STATUS

Description:

- Reset HASH handle status.

Parameters:

- __HANDLE__: HASH handle.

Return value:

- None

__HAL_HASH_SET_MDMAT

Description:

- Enable the multi-buffer DMA transfer mode.

Return value:

- None

Notes:

- This bit is set when hashing large files when multiple DMA transfers are needed.

__HAL_HASH_RESET_MDMAT

Description:

- Disable the multi-buffer DMA transfer mode.

Return value:

- None

__HAL_HASH_START_DIGEST

Description:

- Start the digest computation.

Return value:

- None

__HAL_HASH_SET_NBVALIDBITS

Description:

- Set the number of valid bits in the last word written in data register DIN.

Parameters:

- __SIZE__: size in bytes of last data written in Data register.

Return value:

- None

__HAL_HASH_INIT

Description:

- Reset the HASH core.

Return value:

- None

HASH flags definitions

HASH_FLAG_DINIS

16 locations are free in the DIN : a new block can be entered in the Peripheral

HASH_FLAG_DCIS

Digest calculation complete

HASH_FLAG_DMAS

DMA interface is enabled (DMAE=1) or a transfer is ongoing

HASH_FLAG_BUSY

The hash core is Busy, processing a block of data

HASH_FLAG_DINNE

DIN not empty : the input buffer contains at least one word of data

HMAC key length type

HASH_HMAC_KEYTYPE_SHORTKEY

HMAC Key size is <= 64 bytes

HASH_HMAC_KEYTYPE_LONGKEY

HMAC Key size is > 64 bytes

HASH interrupts definitions

HASH_IT_DINI

A new block can be entered into the input buffer (DIN)

HASH_IT_DCI

Digest calculation complete

HASH Number of Context Swap Registers

HASH_NUMBER_OF_CSR_REGISTERS

Number of Context Swap Registers

HASH TimeOut Value

HASH_TIMEOUTVALUE

Time-out value

38 HAL HASH Extension Driver

38.1 HASHEx Firmware driver API description

The following section lists the various functions of the HASHEx library.

38.1.1 HASH peripheral extended features

The SHA-224 and SHA-256 HASH and HMAC processing can be carried out exactly the same way as for SHA-1 or MD-5 algorithms.

1. Three modes are available.
   a. Polling mode: processing APIs are blocking functions i.e. they process the data and wait till the digest computation is finished, e.g. HAL_HASHEx_xxx_Start()
   b. Interrupt mode: processing APIs are not blocking functions i.e. they process the data under interrupt, e.g. HAL_HASHEx_xxx_Start_IT()
   c. DMA mode: processing APIs are not blocking functions and the CPU is not used for data transfer i.e. the data transfer is ensured by DMA, e.g. HAL_HASHEx_xxx_Start_DMA(). Note that in DMA mode, a call to HAL_HASHEx_xxx_Finish() is then required to retrieve the digest.
2. Multi-buffer processing is possible in polling, interrupt and DMA modes.
   a. In polling mode, only multi-buffer HASH processing is possible. API HAL_HASHEx_xxx_Accumulate() must be called for each input buffer, except for the last one. User must resort to HAL_HASHEx_xxx_Accumulate_End() to enter the last one and retrieve as well the computed digest.
   b. In interrupt mode, API HAL_HASHEx_xxx_Accumulate_IT() must be called for each input buffer, except for the last one. User must resort to HAL_HASHEx_xxx_Accumulate_End_IT() to enter the last one and retrieve as well the computed digest.
   c. In DMA mode, multi-buffer HASH and HMAC processing are possible.
      - HASH processing: once initialization is done, MDMAT bit must be set through __HAL_HASH_SET_MDMAT() macro. From that point, each buffer can be fed to the Peripheral through HAL_HASHEx_xxx_Start_DMA() API. Before entering the last buffer, reset the MDMAT bit with __HAL_HASH_RESET_MDMAT() macro then wrap-up the HASH processing in feeding the last input buffer through the same API HAL_HASHEx_xxx_Start_DMA(). The digest can then be retrieved with a call to API HAL_HASHEx_xxx_Finish().
      - HMAC processing (MD-5, SHA-1, SHA-224 and SHA-256 must all resort to extended functions): after initialization, the key and the first input buffer are entered in the Peripheral with the API HAL_HMACEx_xxx_Step1_2_DMA(). This carries out HMAC step 1 and starts step 2. The following buffers are next entered with the API HAL_HMACEx_xxx_Step2_DMA(). At this point, the HMAC processing is still carrying out step 2. Then, step 2 for the last input buffer and step 3 are carried out by a single call to HAL_HMACEx_xxx_Step2_3_DMA(). The digest can finally be retrieved with a call to API HAL_HASH_xxx_Finish() for MD-5 and SHA-1, to HAL_HASHEx_xxx_Finish() for SHA-224 and SHA-256.

38.1.2 Polling mode HASH extended processing functions

This section provides functions allowing to calculate in polling mode the hash value using one of the following algorithms:

- SHA224
  - HAL_HASHEx_SHA224_Start()
  - HAL_HASHEx_SHA224_Accmlt()
  - HAL_HASHEx_SHA224_Accmlt_End()
- SHA256
  - HAL_HASHEx_SHA256_Start()
  - HAL_HASHEx_SHA256_Accmlt()
  - HAL_HASHEx_SHA256_Accmlt_End()

For a single buffer to be hashed, user can resort to HAL_HASH_xxx_Start().

In case of multi-buffer HASH processing (a single digest is computed while several buffers are fed to the Peripheral), the user can resort to successive calls to HAL_HASHEx_xxx_Accumulate() and wrap-up the digest computation by a call to HAL_HASHEx_xxx_Accumulate_End().

This section contains the following APIs:

- ***HAL_HASHEx_SHA224_Start()***
- ***HAL_HASHEx_SHA224_Accmlt()***
- ***HAL_HASHEx_SHA224_Accmlt_End()***
- ***HAL_HASHEx_SHA256_Start()***
- ***HAL_HASHEx_SHA256_Accmlt()***
- ***HAL_HASHEx_SHA256_Accmlt_End()***

38.1.3 Interruption mode HASH extended processing functions

This section provides functions allowing to calculate in interrupt mode the hash value using one of the following algorithms:

- SHA224
  - HAL_HASHEx_SHA224_Start_IT()
  - HAL_HASHEx_SHA224_Accmlt_IT()
  - HAL_HASHEx_SHA224_Accmlt_End_IT()
- SHA256
  - HAL_HASHEx_SHA256_Start_IT()
  - HAL_HASHEx_SHA256_Accmlt_IT()
  - HAL_HASHEx_SHA256_Accmlt_End_IT()

This section contains the following APIs:

- ***HAL_HASHEx_SHA224_Start_IT()***
- ***HAL_HASHEx_SHA224_Accmlt_IT()***
- ***HAL_HASHEx_SHA224_Accmlt_End_IT()***
- ***HAL_HASHEx_SHA256_Start_IT()***
- ***HAL_HASHEx_SHA256_Accmlt_IT()***
- ***HAL_HASHEx_SHA256_Accmlt_End_IT()***

38.1.4 DMA mode HASH extended processing functions

This section provides functions allowing to calculate in DMA mode the hash value using one of the following algorithms:

- SHA224
  - HAL_HASHEx_SHA224_Start_DMA()
  - HAL_HASHEx_SHA224_Finish()
- SHA256
  - HAL_HASHEx_SHA256_Start_DMA()
  - HAL_HASHEx_SHA256_Finish()

When resorting to DMA mode to enter the data in the Peripheral, user must resort to HAL_HASHEx_xxx_Start_DMA() then read the resulting digest with HAL_HASHEx_xxx_Finish().

In case of multi-buffer HASH processing, MDMAT bit must first be set before the successive calls to HAL_HASHEx_xxx_Start_DMA(). Then, MDMAT bit needs to be reset before the last call to HAL_HASHEx_xxx_Start_DMA(). Digest is finally retrieved thanks to HAL_HASHEx_xxx_Finish().

This section contains the following APIs:

- ***HAL_HASHEx_SHA224_Start_DMA()***
- ***HAL_HASHEx_SHA224_Finish()***
- ***HAL_HASHEx_SHA256_Start_DMA()***
- ***HAL_HASHEx_SHA256_Finish()***

38.1.5 Polling mode HMAC extended processing functions

This section provides functions allowing to calculate in polling mode the HMAC value using one of the following algorithms:

- SHA224
  - HAL_HMACEx_SHA224_Start()
- SHA256
  - HAL_HMACEx_SHA256_Start()

This section contains the following APIs:

- ***HAL_HMACEx_SHA224_Start()***
- ***HAL_HMACEx_SHA256_Start()***

38.1.6 Interrupt mode HMAC extended processing functions

This section provides functions allowing to calculate in interrupt mode the HMAC value using one of the following algorithms:

- SHA224
  - HAL_HMACEx_SHA224_Start_IT()
- SHA256
  - HAL_HMACEx_SHA256_Start_IT()

This section contains the following APIs:

- ***HAL_HMACEx_SHA224_Start_IT()***
- ***HAL_HMACEx_SHA256_Start_IT()***

38.1.7 DMA mode HMAC extended processing functions

This section provides functions allowing to calculate in DMA mode the HMAC value using one of the following algorithms:

- SHA224
  - HAL_HMACEx_SHA224_Start_DMA()
- SHA256
  - HAL_HMACEx_SHA256_Start_DMA()

When resorting to DMA mode to enter the data in the Peripheral for HMAC processing, user must resort to HAL_HMACEx_xxx_Start_DMA() then read the resulting digest with HAL_HASHEx_xxx_Finish().

This section contains the following APIs:

- ***HAL_HMACEx_SHA224_Start_DMA()***
- ***HAL_HMACEx_SHA256_Start_DMA()***

38.1.8 Multi-buffer DMA mode HMAC extended processing functions

This section provides functions to manage HMAC multi-buffer DMA-based processing for MD5, SHA1, SHA224 and SHA256 algorithms.

- MD5
  - HAL_HMACEx_MD5_Step1_2_DMA()
  - HAL_HMACEx_MD5_Step2_DMA()
  - HAL_HMACEx_MD5_Step2_3_DMA()
- SHA1
  - HAL_HMACEx_SHA1_Step1_2_DMA()
  - HAL_HMACEx_SHA1_Step2_DMA()
  - HAL_HMACEx_SHA1_Step2_3_DMA()

- SHA256
  - HAL_HMACEx_SHA224_Step1_2_DMA()
  - HAL_HMACEx_SHA224_Step2_DMA()
  - HAL_HMACEx_SHA224_Step2_3_DMA()
- SHA256
  - HAL_HMACEx_SHA256_Step1_2_DMA()
  - HAL_HMACEx_SHA256_Step2_DMA()
  - HAL_HMACEx_SHA256_Step2_3_DMA()

User must first start-up the multi-buffer DMA-based HMAC computation in calling HAL_HMACEx_xxx_Step1_2_DMA(). This carries out HMAC step 1 and intiates step 2 with the first input buffer.

The following buffers are next fed to the Peripheral with a call to the API HAL_HMACEx_xxx_Step2_DMA(). There may be several consecutive calls to this API.

Multi-buffer DMA-based HMAC computation is wrapped up by a call to HAL_HMACEx_xxx_Step2_3_DMA(). This finishes step 2 in feeding the last input buffer to the Peripheral then carries out step 3.

Digest is retrieved by a call to HAL_HASH_xxx_Finish() for MD-5 or SHA-1, to HAL_HASHEx_xxx_Finish() for SHA-224 or SHA-256.

If only two buffers need to be consecutively processed, a call to HAL_HMACEx_xxx_Step1_2_DMA() followed by a call to HAL_HMACEx_xxx_Step2_3_DMA() is sufficient.

This section contains the following APIs:

- ***HAL_HMACEx_MD5_Step1_2_DMA()***
- ***HAL_HMACEx_MD5_Step2_DMA()***
- ***HAL_HMACEx_MD5_Step2_3_DMA()***
- ***HAL_HMACEx_SHA1_Step1_2_DMA()***
- ***HAL_HMACEx_SHA1_Step2_DMA()***
- ***HAL_HMACEx_SHA1_Step2_3_DMA()***
- ***HAL_HMACEx_SHA224_Step1_2_DMA()***
- ***HAL_HMACEx_SHA224_Step2_DMA()***
- ***HAL_HMACEx_SHA224_Step2_3_DMA()***
- ***HAL_HMACEx_SHA256_Step1_2_DMA()***
- ***HAL_HMACEx_SHA256_Step2_DMA()***
- ***HAL_HMACEx_SHA256_Step2_3_DMA()***

38.1.9 Detailed description of functions

HAL_HASHEx_SHA224_Start

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA224_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Initialize the HASH peripheral in SHA224 mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 28 bytes.
- **Timeout:** Timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASHEx_SHA224_Accmlt

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA224_Accmlt (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

If not already done, initialize the HASH peripheral in SHA224 mode then processes pInBuffer.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASHEx_SHA224_Accmlt() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASHEx_SHA224_Accmlt_End().
- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- Digest is not retrieved by this API, user must resort to HAL_HASHEx_SHA224_Accmlt_End() to read it, feeding at the same time the last input buffer to the Peripheral.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only HAL_HASHEx_SHA224_Accmlt_End() is able to manage the ending buffer with a length in bytes not a multiple of 4.

HAL_HASHEx_SHA224_Accmlt_End

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA224_Accmlt_End (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

End computation of a single HASH signature after several calls to HAL_HASHEx_SHA224_Accmlt() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 28 bytes.
- **Timeout:** Timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASHEx_SHA256_Start

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA256_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Initialize the HASH peripheral in SHA256 mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 32 bytes.
- **Timeout:** Timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASHEx_SHA256_Accmlt

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA256_Accmlt (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

If not already done, initialize the HASH peripheral in SHA256 mode then processes pInBuffer.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASHEx_SHA256_Accmlt() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASHEx_SHA256_Accmlt_End().
- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- Digest is not retrieved by this API, user must resort to HAL_HASHEx_SHA256_Accmlt_End() to read it, feeding at the same time the last input buffer to the Peripheral.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only HAL_HASHEx_SHA256_Accmlt_End() is able to manage the ending buffer with a length in bytes not a multiple of 4.

HAL_HASHEx_SHA256_Accmlt_End

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA256_Accmlt_End (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

End computation of a single HASH signature after several calls to HAL_HASHEx_SHA256_Accmlt() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 32 bytes.
- **Timeout:** Timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASHEx_SHA224_Start_IT

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA224_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

Initialize the HASH peripheral in SHA224 mode, next process pInBuffer then read the computed digest in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 28 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASHEx_SHA224_Accmlt_IT

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA224_Accmlt_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

If not already done, initialize the HASH peripheral in SHA224 mode then processes pInBuffer in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASHEx_SHA224_Accmlt_IT() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASHEx_SHA224_Accmlt_End_IT().
- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only HAL_HASHEx_SHA224_Accmlt_End_IT() is able to manage the ending buffer with a length in bytes not a multiple of 4.

HAL_HASHEx_SHA224_Accmlt_End_IT

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA224_Accmlt_End_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

End computation of a single HASH signature after several calls to HAL_HASHEx_SHA224_Accmlt_IT() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 28 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASHEx_SHA256_Start_IT

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA256_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

Initialize the HASH peripheral in SHA256 mode, next process pInBuffer then read the computed digest in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 32 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASHEx_SHA256_Accmlt_IT

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA256_Accmlt_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

If not already done, initialize the HASH peripheral in SHA256 mode then processes pInBuffer in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASHEx_SHA256_Accmlt_IT() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASHEx_SHA256_Accmlt_End_IT().
- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only HAL_HASHEx_SHA256_Accmlt_End_IT() is able to manage the ending buffer with a length in bytes not a multiple of 4.

HAL_HASHEx_SHA256_Accmlt_End_IT

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA256_Accmlt_End_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

End computation of a single HASH signature after several calls to HAL_HASHEx_SHA256_Accmlt_IT() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 32 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASHEx_SHA224_Start_DMA

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA224_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

Initialize the HASH peripheral in SHA224 mode then initiate a DMA transfer to feed the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Once the DMA transfer is finished, HAL_HASHEx_SHA224_Finish() API must be called to retrieve the computed digest.

HAL_HASHEx_SHA224_Finish

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA224_Finish (HASH_HandleTypeDef * hhash, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Return the computed digest in SHA224 mode.

Parameters

- **hhash:** HASH handle.
- **pOutBuffer:** pointer to the computed digest. Digest size is 28 bytes.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- The API waits for DCIS to be set then reads the computed digest.
- HAL_HASHEx_SHA224_Finish() can be used as well to retrieve the digest in HMAC SHA224 mode.

HAL_HASHEx_SHA256_Start_DMA

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA256_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

Initialize the HASH peripheral in SHA256 mode then initiate a DMA transfer to feed the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Once the DMA transfer is finished, HAL_HASHEx_SHA256_Finish() API must be called to retrieve the computed digest.

HAL_HASHEx_SHA256_Finish

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA256_Finish (HASH_HandleTypeDef * hhash, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Return the computed digest in SHA256 mode.

Parameters

- **hhash:** HASH handle.
- **pOutBuffer:** pointer to the computed digest. Digest size is 32 bytes.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- The API waits for DCIS to be set then reads the computed digest.
- HAL_HASHEx_SHA256_Finish() can be used as well to retrieve the digest in HMAC SHA256 mode.

HAL_HMACEx_SHA224_Start

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA224_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Initialize the HASH peripheral in HMAC SHA224 mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 28 bytes.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HAL_HMACEx_SHA256_Start

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA256_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Initialize the HASH peripheral in HMAC SHA256 mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 32 bytes.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HAL_HMACEx_SHA224_Start_IT

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA224_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

Initialize the HASH peripheral in HMAC SHA224 mode, next process pInBuffer then read the computed digest in interrupt mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 28 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HAL_HMACEx_SHA256_Start_IT

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA256_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

Initialize the HASH peripheral in HMAC SHA256 mode, next process pInBuffer then read the computed digest in interrupt mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 32 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HAL_HMACEx_SHA224_Start_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA224_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

Initialize the HASH peripheral in HMAC SHA224 mode then initiate the required DMA transfers to feed the key and the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Once the DMA transfers are finished (indicated by hhash->State set back to HAL_HASH_STATE_READY), HAL_HASHEx_SHA224_Finish() API must be called to retrieve the computed digest.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- If MDMAT bit is set before calling this function (multi-buffer HASH processing case), the input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. For the processing of the last buffer of the thread, MDMAT bit must be reset and the buffer length (in bytes) doesn't have to be a multiple of 4.

HAL_HMACEx_SHA256_Start_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA256_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

Initialize the HASH peripheral in HMAC SHA224 mode then initiate the required DMA transfers to feed the key and the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Once the DMA transfers are finished (indicated by hhash->State set back to HAL_HASH_STATE_READY), HAL_HASHEx_SHA256_Finish() API must be called to retrieve the computed digest.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- If MDMAT bit is set before calling this function (multi-buffer HASH processing case), the input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. For the processing of the last buffer of the thread, MDMAT bit must be reset and the buffer length (in bytes) doesn't have to be a multiple of 4.

HAL_HMACEx_MD5_Step1_2_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_MD5_Step1_2_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

MD5 HMAC step 1 completion and step 2 start in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 1 consists in writing the inner hash function key in the Peripheral, step 2 consists in writing the message text.
- The API carries out the HMAC step 1 then starts step 2 with the first buffer entered to the Peripheral. DCAL bit is not automatically set after the message buffer feeding, allowing other messages DMA transfers to occur.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HAL_HMACEx_MD5_Step2_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_MD5_Step2_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

MD5 HMAC step 2 in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 2 consists in writing the message text in the Peripheral.
- The API carries on the HMAC step 2, applied to the buffer entered as input parameter. DCAL bit is not automatically set after the message buffer feeding, allowing other messages DMA transfers to occur.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HAL_HMACEx_MD5_Step2_3_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_MD5_Step2_3_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

MD5 HMAC step 2 wrap-up and step 3 completion in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 2 consists in writing the message text in the Peripheral, step 3 consists in writing the outer hash function key.
- The API wraps up the HMAC step 2 in processing the buffer entered as input parameter (the input buffer must be the last one of the multi-buffer thread) then carries out HMAC step 3.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- Once the DMA transfers are finished (indicated by hhash->State set back to HAL_HASH_STATE_READY), HAL_HASHEx_SHA256_Finish() API must be called to retrieve the computed digest.

HAL_HMACEx_SHA1_Step1_2_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA1_Step1_2_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA1 HMAC step 1 completion and step 2 start in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 1 consists in writing the inner hash function key in the Peripheral, step 2 consists in writing the message text.
- The API carries out the HMAC step 1 then starts step 2 with the first buffer entered to the Peripheral. DCAL bit is not automatically set after the message buffer feeding, allowing other messages DMA transfers to occur.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HAL_HMACEx_SHA1_Step2_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA1_Step2_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA1 HMAC step 2 in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 2 consists in writing the message text in the Peripheral.
- The API carries on the HMAC step 2, applied to the buffer entered as input parameter. DCAL bit is not automatically set after the message buffer feeding, allowing other messages DMA transfers to occur.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HAL_HMACEx_SHA1_Step2_3_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA1_Step2_3_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA1 HMAC step 2 wrap-up and step 3 completion in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 2 consists in writing the message text in the Peripheral, step 3 consists in writing the outer hash function key.
- The API wraps up the HMAC step 2 in processing the buffer entered as input parameter (the input buffer must be the last one of the multi-buffer thread) then carries out HMAC step 3.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- Once the DMA transfers are finished (indicated by hhash->State set back to HAL_HASH_STATE_READY), HAL_HASHEx_SHA256_Finish() API must be called to retrieve the computed digest.

HAL_HMACEx_SHA224_Step1_2_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA224_Step1_2_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA224 HMAC step 1 completion and step 2 start in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 1 consists in writing the inner hash function key in the Peripheral, step 2 consists in writing the message text.
- The API carries out the HMAC step 1 then starts step 2 with the first buffer entered to the Peripheral. DCAL bit is not automatically set after the message buffer feeding, allowing other messages DMA transfers to occur.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HAL_HMACEx_SHA224_Step2_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA224_Step2_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA224 HMAC step 2 in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 2 consists in writing the message text in the Peripheral.
- The API carries on the HMAC step 2, applied to the buffer entered as input parameter. DCAL bit is not automatically set after the message buffer feeding, allowing other messages DMA transfers to occur.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HAL_HMACEx_SHA224_Step2_3_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA224_Step2_3_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA224 HMAC step 2 wrap-up and step 3 completion in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 2 consists in writing the message text in the Peripheral, step 3 consists in writing the outer hash function key.
- The API wraps up the HMAC step 2 in processing the buffer entered as input parameter (the input buffer must be the last one of the multi-buffer thread) then carries out HMAC step 3.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- Once the DMA transfers are finished (indicated by hhash->State set back to HAL_HASH_STATE_READY), HAL_HASHEx_SHA256_Finish() API must be called to retrieve the computed digest.

HAL_HMACEx_SHA256_Step1_2_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA256_Step1_2_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA256 HMAC step 1 completion and step 2 start in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 1 consists in writing the inner hash function key in the Peripheral, step 2 consists in writing the message text.
- The API carries out the HMAC step 1 then starts step 2 with the first buffer entered to the Peripheral. DCAL bit is not automatically set after the message buffer feeding, allowing other messages DMA transfers to occur.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HAL_HMACEx_SHA256_Step2_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA256_Step2_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA256 HMAC step 2 in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 2 consists in writing the message text in the Peripheral.
- The API carries on the HMAC step 2, applied to the buffer entered as input parameter. DCAL bit is not automatically set after the message buffer feeding, allowing other messages DMA transfers to occur.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HAL_HMACEx_SHA256_Step2_3_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA256_Step2_3_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA256 HMAC step 2 wrap-up and step 3 completion in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 2 consists in writing the message text in the Peripheral, step 3 consists in writing the outer hash function key.
- The API wraps up the HMAC step 2 in processing the buffer entered as input parameter (the input buffer must be the last one of the multi-buffer thread) then carries out HMAC step 3.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- Once the DMA transfers are finished (indicated by hhash->State set back to HAL_HASH_STATE_READY), HAL_HASHEx_SHA256_Finish() API must be called to retrieve the computed digest.

39 HAL HCD Generic Driver

39.1 HCD Firmware driver registers structures

39.1.1 __HCD_HandleTypeDef

__HCD_HandleTypeDef is defined in the stm32h7xx_hal_hcd.h

39.2 HCD Firmware driver API description

The following section lists the various functions of the HCD library.

39.2.1 How to use this driver

1. Declare a HCD_HandleTypeDef handle structure, for example: HCD_HandleTypeDef hhcd;
2. Fill parameters of Init structure in HCD handle
3. Call HAL_HCD_Init() API to initialize the HCD peripheral (Core, Host core, ...)
4. Initialize the HCD low level resources through the HAL_HCD_MspInit() API:
   a. Enable the HCD/USB Low Level interface clock using the following macros
      - __HAL_RCC_USB_OTG_FS_CLK_ENABLE();
      - __HAL_RCC_USB_OTG_HS_CLK_ENABLE(); (For High Speed Mode)
      - __HAL_RCC_USB_OTG_HS_ULPI_CLK_ENABLE(); (For High Speed Mode)
   b. Initialize the related GPIO clocks
   c. Configure HCD pin-out
   d. Configure HCD NVIC interrupt
5. Associate the Upper USB Host stack to the HAL HCD Driver:
   a. hhcd.pData = phost;
6. Enable HCD transmission and reception:
   a. HAL_HCD_Start();

39.2.2 Initialization and de-initialization functions

This section provides functions allowing to:
This section contains the following APIs:

- ***HAL_HCD_Init()***
- ***HAL_HCD_HC_Init()***
- ***HAL_HCD_HC_Halt()***
- ***HAL_HCD_DeInit()***
- ***HAL_HCD_MspInit()***
- ***HAL_HCD_MspDeInit()***
- ***HAL_HCD_RegisterCallback()***
- ***HAL_HCD_UnRegisterCallback()***
- ***HAL_HCD_RegisterHC_NotifyURBChangeCallback()***
- ***HAL_HCD_UnRegisterHC_NotifyURBChangeCallback()***

39.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the USB Host Data Transfer
This section contains the following APIs:

- ***HAL_HCD_HC_SubmitRequest()***

- *HAL_HCD_IRQHandler()*
- *HAL_HCD_SOF_Callback()*
- *HAL_HCD_Connect_Callback()*
- *HAL_HCD_Disconnect_Callback()*
- *HAL_HCD_PortEnabled_Callback()*
- *HAL_HCD_PortDisabled_Callback()*
- *HAL_HCD_HC_NotifyURBChange_Callback()*
- *HAL_HCD_RegisterCallback()*
- *HAL_HCD_UnRegisterCallback()*
- *HAL_HCD_RegisterHC_NotifyURBChangeCallback()*
- *HAL_HCD_UnRegisterHC_NotifyURBChangeCallback()*

39.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the HCD data transfers.
This section contains the following APIs:

- *HAL_HCD_Start()*
- *HAL_HCD_Stop()*
- *HAL_HCD_ResetPort()*

39.2.5 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral and the data flow.
This section contains the following APIs:

- *HAL_HCD_GetState()*
- *HAL_HCD_HC_GetURBState()*
- *HAL_HCD_HC_GetXferCount()*
- *HAL_HCD_HC_GetState()*
- *HAL_HCD_GetCurrentFrame()*
- *HAL_HCD_GetCurrentSpeed()*

39.2.6 Detailed description of functions

HAL_HCD_Init

Function name

HAL_StatusTypeDef HAL_HCD_Init (HCD_HandleTypeDef * hhcd)

Function description

Initialize the host driver.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_DeInit

Function name

HAL_StatusTypeDef HAL_HCD_DeInit (HCD_HandleTypeDef * hhcd)

Function description

DeInitialize the host driver.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_HC_Init

Function name

HAL_StatusTypeDef HAL_HCD_HC_Init (HCD_HandleTypeDef * hhcd, uint8_t ch_num, uint8_t epnum, uint8_t dev_address, uint8_t speed, uint8_t ep_type, uint16_t mps)

Function description

Initialize a host channel.

Parameters

- **hhcd:** HCD handle
- **ch_num:** Channel number. This parameter can be a value from 1 to 15
- **epnum:** Endpoint number. This parameter can be a value from 1 to 15
- **dev_address:** Current device address This parameter can be a value from 0 to 255
- **speed:** Current device speed. This parameter can be one of these values: HCD_DEVICE_SPEED_HIGH: High speed mode, HCD_DEVICE_SPEED_FULL: Full speed mode, HCD_DEVICE_SPEED_LOW: Low speed mode
- **ep_type:** Endpoint Type. This parameter can be one of these values: EP_TYPE_CTRL: Control type, EP_TYPE_ISOC: Isochronous type, EP_TYPE_BULK: Bulk type, EP_TYPE_INTR: Interrupt type
- **mps:** Max Packet Size. This parameter can be a value from 0 to32K

Return values

- **HAL:** status

HAL_HCD_HC_Halt

Function name

HAL_StatusTypeDef HAL_HCD_HC_Halt (HCD_HandleTypeDef * hhcd, uint8_t ch_num)

Function description

Halt a host channel.

Parameters

- **hhcd:** HCD handle
- **ch_num:** Channel number. This parameter can be a value from 1 to 15

Return values

- **HAL:** status

HAL_HCD_MspInit

Function name

void HAL_HCD_MspInit (HCD_HandleTypeDef * hhcd)

Function description

Initialize the HCD MSP.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_MspDeInit

Function name

void HAL_HCD_MspDeInit (HCD_HandleTypeDef * hhcd)

Function description

DeInitialize the HCD MSP.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_RegisterCallback

Function name

HAL_StatusTypeDef HAL_HCD_RegisterCallback (HCD_HandleTypeDef * hhcd, HAL_HCD_CallbackIDTypeDef CallbackID, pHCD_CallbackTypeDef pCallback)

Function description

Register a User USB HCD Callback To be used instead of the weak predefined callback.

Parameters

- **hhcd:** USB HCD handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_HCD_SOF_CB_ID USB HCD SOF callback ID
  - HAL_HCD_CONNECT_CB_ID USB HCD Connect callback ID
  - HAL_HCD_DISCONNECT_CB_ID OTG HCD Disconnect callback ID
  - HAL_HCD_PORT_ENABLED_CB_ID USB HCD Port Enable callback ID
  - HAL_HCD_PORT_DISABLED_CB_ID USB HCD Port Disable callback ID
  - HAL_HCD_MSPINIT_CB_ID MspDeInit callback ID
  - HAL_HCD_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_HCD_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_HCD_UnRegisterCallback (HCD_HandleTypeDef * hhcd, HAL_HCD_CallbackIDTypeDef CallbackID)

Function description

Unregister an USB HCD Callback USB HCD callback is redirected to the weak predefined callback.

Parameters

- **hhcd:** USB HCD handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_HCD_SOF_CB_ID USB HCD SOF callback ID
  - HAL_HCD_CONNECT_CB_ID USB HCD Connect callback ID
  - HAL_HCD_DISCONNECT_CB_ID OTG HCD Disconnect callback ID
  - HAL_HCD_PORT_ENABLED_CB_ID USB HCD Port Enabled callback ID
  - HAL_HCD_PORT_DISABLED_CB_ID USB HCD Port Disabled callback ID
  - HAL_HCD_MSPINIT_CB_ID MspDeInit callback ID
  - HAL_HCD_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_HCD_RegisterHC_NotifyURBChangeCallback

Function name

HAL_StatusTypeDef HAL_HCD_RegisterHC_NotifyURBChangeCallback (HCD_HandleTypeDef * hhcd, pHCD_HC_NotifyURBChangeCallbackTypeDef pCallback)

Function description

Register USB HCD Host Channel Notify URB Change Callback To be used instead of the weak HAL_HCD_HC_NotifyURBChange_Callback() predefined callback.

Parameters

- **hhcd:** HCD handle
- **pCallback:** pointer to the USB HCD Host Channel Notify URB Change Callback function

Return values

- **HAL:** status

HAL_HCD_UnRegisterHC_NotifyURBChangeCallback

Function name

HAL_StatusTypeDef HAL_HCD_UnRegisterHC_NotifyURBChangeCallback (HCD_HandleTypeDef * hhcd)

Function description

Unregister the USB HCD Host Channel Notify URB Change Callback USB HCD Host Channel Notify URB Change Callback is redirected to the weak HAL_HCD_HC_NotifyURBChange_Callback() predefined callback.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_HC_SubmitRequest

Function name

HAL_StatusTypeDef HAL_HCD_HC_SubmitRequest (HCD_HandleTypeDef * hhcd, uint8_t ch_num, uint8_t direction, uint8_t ep_type, uint8_t token, uint8_t * pbuff, uint16_t length, uint8_t do_ping)

Function description

Submit a new URB for processing.

Parameters

- **hhcd:** HCD handle
- **ch_num:** Channel number. This parameter can be a value from 1 to 15
- **direction:** Channel number. This parameter can be one of these values: 0 : Output / 1 : Input
- **ep_type:** Endpoint Type. This parameter can be one of these values: EP_TYPE_CTRL: Control type/ EP_TYPE_ISOC: Isochronous type/ EP_TYPE_BULK: Bulk type/ EP_TYPE_INTR: Interrupt type/
- **token:** Endpoint Type. This parameter can be one of these values: 0: HC_PID_SETUP / 1: HC_PID_DATA1
- **pbuff:** pointer to URB data
- **length:** Length of URB data
- **do_ping:** activate do ping protocol (for high speed only). This parameter can be one of these values: 0 : do ping inactive / 1 : do ping active

Return values

- **HAL:** status

HAL_HCD_IRQHandler

Function name

void HAL_HCD_IRQHandler (HCD_HandleTypeDef * hhcd)

Function description

Handle HCD interrupt request.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_SOF_Callback

Function name

void HAL_HCD_SOF_Callback (HCD_HandleTypeDef * hhcd)

Function description

SOF callback.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_Connect_Callback

Function name

void HAL_HCD_Connect_Callback (HCD_HandleTypeDef * hhcd)

Function description

Connection Event callback.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_Disconnect_Callback

Function name

void HAL_HCD_Disconnect_Callback (HCD_HandleTypeDef * hhcd)

Function description

Disconnection Event callback.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_PortEnabled_Callback

Function name

void HAL_HCD_PortEnabled_Callback (HCD_HandleTypeDef * hhcd)

Function description

Port Enabled Event callback.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_PortDisabled_Callback

Function name

void HAL_HCD_PortDisabled_Callback (HCD_HandleTypeDef * hhcd)

Function description

Port Disabled Event callback.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_HC_NotifyURBChange_Callback

Function name

void HAL_HCD_HC_NotifyURBChange_Callback (HCD_HandleTypeDef * hhcd, uint8_t chnum, HCD_URBStateTypeDef urb_state)

Function description

Notify URB state change callback.

Parameters

- **hhcd:** HCD handle
- **chnum:** Channel number. This parameter can be a value from 1 to 15
- **urb_state:** This parameter can be one of these values: URB_IDLE/ URB_DONE/ URB_NOTREADY/ URB_NYET/ URB_ERROR/ URB_STALL/

Return values

- **None:**

HAL_HCD_ResetPort

Function name

HAL_StatusTypeDef HAL_HCD_ResetPort (HCD_HandleTypeDef * hhcd)

Function description

Reset the host port.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_Start

Function name

HAL_StatusTypeDef HAL_HCD_Start (HCD_HandleTypeDef * hhcd)

Function description

Start the host driver.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_Stop

Function name

HAL_StatusTypeDef HAL_HCD_Stop (HCD_HandleTypeDef * hhcd)

Function description

Stop the host driver.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_GetState

Function name

HCD_StateTypeDef HAL_HCD_GetState (HCD_HandleTypeDef * hhcd)

Function description

Return the HCD handle state.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** state

HAL_HCD_HC_GetURBState

Function name

HCD_URBStateTypeDef HAL_HCD_HC_GetURBState (HCD_HandleTypeDef * hhcd, uint8_t chnum)

Function description

Return URB state for a channel.

Parameters

- **hhcd:** HCD handle
- **chnum:** Channel number. This parameter can be a value from 1 to 15

Return values

- **URB:** state. This parameter can be one of these values: URB_IDLE/ URB_DONE/ URB_NOTREADY/ URB_NYET/ URB_ERROR/ URB_STALL

HAL_HCD_HC_GetState

Function name

HCD_HCStateTypeDef HAL_HCD_HC_GetState (HCD_HandleTypeDef * hhcd, uint8_t chnum)

Function description

Return the Host Channel state.

Parameters

- **hhcd:** HCD handle
- **chnum:** Channel number. This parameter can be a value from 1 to 15

Return values

- **Host:** channel state This parameter can be one of these values: HC_IDLE/ HC_XFRC/ HC_HALTED/ HC_NYET/ HC_NAK/ HC_STALL/ HC_XACTERR/ HC_BBLERR/ HC_DATATGLERR

HAL_HCD_HC_GetXferCount

Function name

uint32_t HAL_HCD_HC_GetXferCount (HCD_HandleTypeDef * hhcd, uint8_t chnum)

Function description

Return the last host transfer size.

Parameters

- **hhcd:** HCD handle
- **chnum:** Channel number. This parameter can be a value from 1 to 15

Return values

- **last:** transfer size in byte

HAL_HCD_GetCurrentFrame

Function name

uint32_t HAL_HCD_GetCurrentFrame (HCD_HandleTypeDef * hhcd)

Function description

Return the current Host frame number.

Parameters

- **hhcd:** HCD handle

Return values

- **Current:** Host frame number

HAL_HCD_GetCurrentSpeed

Function name

uint32_t HAL_HCD_GetCurrentSpeed (HCD_HandleTypeDef * hhcd)

Function description

Return the Host enumeration speed.

Parameters

- **hhcd:** HCD handle

Return values

- **Enumeration:** speed

39.3 HCD Firmware driver defines

The following section lists the various define and macros of the module.

39.3.1 HCD

HCD

HCD Device Speed

HCD_DEVICE_SPEED_HIGH

HCD_DEVICE_SPEED_FULL

HCD_DEVICE_SPEED_LOW

HCD Error Code definition

HAL_HCD_ERROR_INVALID_CALLBACK

Invalid Callback error

HCD Exported Macros

__HAL_HCD_ENABLE

__HAL_HCD_DISABLE

__HAL_HCD_GET_FLAG

__HAL_HCD_GET_CH_FLAG

__HAL_HCD_CLEAR_FLAG

__HAL_HCD_IS_INVALID_INTERRUPT

__HAL_HCD_CLEAR_HC_INT

__HAL_HCD_MASK_HALT_HC_INT

__HAL_HCD_UNMASK_HALT_HC_INT

__HAL_HCD_MASK_ACK_HC_INT

__HAL_HCD_UNMASK_ACK_HC_INT

HCD PHY Module

HCD_PHY_ULPI

HCD_PHY_EMBEDDED

HCD Speed

HCD_SPEED_HIGH

HCD_SPEED_FULL

HCD_SPEED_LOW

40 HAL HRTIM Generic Driver

40.1 HRTIM Firmware driver registers structures

40.1.1 HRTIM_InitTypeDef

HRTIM_InitTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t HRTIMInterruptResquests***
- ***uint32_t SyncOptions***
- ***uint32_t SyncInputSource***
- ***uint32_t SyncOutputSource***
- ***uint32_t SyncOutputPolarity***

Field Documentation

- ***uint32_t HRTIM_InitTypeDef::HRTIMInterruptResquests***

  Specifies which interrupts requests must enabled for the HRTIM instance. This parameter can be any combination of ***HRTIM_Common_Interrupt_Enable***
- ***uint32_t HRTIM_InitTypeDef::SyncOptions***

  Specifies how the HRTIM instance handles the external synchronization signals. The HRTIM instance can be configured to act as a slave (waiting for a trigger to be synchronized) or a master (generating a synchronization signal) or both. This parameter can be a combination of ***HRTIM_Synchronization_Options***.
- ***uint32_t HRTIM_InitTypeDef::SyncInputSource***

  Specifies the external synchronization input source (significant only when the HRTIM instance is configured as a slave). This parameter can be a value of ***HRTIM_Synchronization_Input_Source***.
- ***uint32_t HRTIM_InitTypeDef::SyncOutputSource***

  Specifies the source and event to be sent on the external synchronization outputs (significant only when the HRTIM instance is configured as a master). This parameter can be a value of ***HRTIM_Synchronization_Output_Source***
- ***uint32_t HRTIM_InitTypeDef::SyncOutputPolarity***

  Specifies the conditioning of the event to be sent on the external synchronization outputs (significant only when the HRTIM instance is configured as a master). This parameter can be a value of ***HRTIM_Synchronization_Output_Polarity***

40.1.2 HRTIM_TimerParamTypeDef

HRTIM_TimerParamTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t CaptureTrigger1***
- ***uint32_t CaptureTrigger2***
- ***uint32_t InterruptRequests***
- ***uint32_t DMARequests***
- ***uint32_t DMASrcAddress***
- ***uint32_t DMADstAddress***
- ***uint32_t DMASize***

Field Documentation

- ***uint32_t HRTIM_TimerParamTypeDef::CaptureTrigger1***

  Event(s) triggering capture unit 1. When the timer operates in Simple mode, this parameter can be a value of ***HRTIM_External_Event_Channels***. When the timer operates in Waveform mode, this parameter can be a combination of ***HRTIM_Capture_Unit_Trigger***.

- ***uint32_t HRTIM_TimerParamTypeDef::CaptureTrigger2***
  Event(s) triggering capture unit 2. When the timer operates in Simple mode, this parameter can be a value of ***HRTIM_External_Event_Channels***. When the timer operates in Waveform mode, this parameter can be a combination of ***HRTIM_Capture_Unit_Trigger***.
- ***uint32_t HRTIM_TimerParamTypeDef::InterruptRequests***
  Interrupts requests enabled for the timer.
- ***uint32_t HRTIM_TimerParamTypeDef::DMARequests***
  DMA requests enabled for the timer.
- ***uint32_t HRTIM_TimerParamTypeDef::DMASrcAddress***
  Address of the source address of the DMA transfer.
- ***uint32_t HRTIM_TimerParamTypeDef::DMADstAddress***
  Address of the destination address of the DMA transfer.
- ***uint32_t HRTIM_TimerParamTypeDef::DMASize***
  Size of the DMA transfer

40.1.3 __HRTIM_HandleTypeDef

__HRTIM_HandleTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***HRTIM_TypeDef * Instance***
- ***HRTIM_InitTypeDef Init***
- ***HRTIM_TimerParamTypeDef TimerParam***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_HRTIM_StateTypeDef State***
- ***DMA_HandleTypeDef * hdmaMaster***
- ***DMA_HandleTypeDef * hdmaTimerA***
- ***DMA_HandleTypeDef * hdmaTimerB***
- ***DMA_HandleTypeDef * hdmaTimerC***
- ***DMA_HandleTypeDef * hdmaTimerD***
- ***DMA_HandleTypeDef * hdmaTimerE***
- ***void(* Fault1Callback***
- ***void(* Fault2Callback***
- ***void(* Fault3Callback***
- ***void(* Fault4Callback***
- ***void(* Fault5Callback***
- ***void(* SystemFaultCallback***
- ***void(* BurstModePeriodCallback***
- ***void(* SynchronizationEventCallback***
- ***void(* ErrorCallback***
- ***void(* RegistersUpdateCallback***
- ***void(* RepetitionEventCallback***
- ***void(* Compare1EventCallback***
- ***void(* Compare2EventCallback***
- ***void(* Compare3EventCallback***
- ***void(* Compare4EventCallback***
- ***void(* Capture1EventCallback***
- ***void(* Capture2EventCallback***
- ***void(* DelayedProtectionCallback***
- ***void(* CounterResetCallback***
- ***void(* Output1SetCallback***
- ***void(* Output1ResetCallback***

- ***void(* Output2SetCallback***
- ***void(* Output2ResetCallback***
- ***void(* BurstDMATransferCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***HRTIM_TypeDef* __HRTIM_HandleTypeDef::Instance***
  Register base address
- ***HRTIM_InitTypeDef __HRTIM_HandleTypeDef::Init***
  HRTIM required parameters
- ***HRTIM_TimerParamTypeDef __HRTIM_HandleTypeDef::TimerParam[MAX_HRTIM_TIMER]***
  HRTIM timers - including the master - parameters
- ***HAL_LockTypeDef __HRTIM_HandleTypeDef::Lock***
  Locking object
- ***__IO HAL_HRTIM_StateTypeDef __HRTIM_HandleTypeDef::State***
  HRTIM communication state
- ***DMA_HandleTypeDef* __HRTIM_HandleTypeDef::hdmaMaster***
  Master timer DMA handle parameters
- ***DMA_HandleTypeDef* __HRTIM_HandleTypeDef::hdmaTimerA***
  Timer A DMA handle parameters
- ***DMA_HandleTypeDef* __HRTIM_HandleTypeDef::hdmaTimerB***
  Timer B DMA handle parameters
- ***DMA_HandleTypeDef* __HRTIM_HandleTypeDef::hdmaTimerC***
  Timer C DMA handle parameters
- ***DMA_HandleTypeDef* __HRTIM_HandleTypeDef::hdmaTimerD***
  Timer D DMA handle parameters
- ***DMA_HandleTypeDef* __HRTIM_HandleTypeDef::hdmaTimerE***
  Timer E DMA handle parameters
- ***void(* __HRTIM_HandleTypeDef::Fault1Callback)(struct __HRTIM_HandleTypeDef *hhrtim)***
  Fault 1 interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::Fault2Callback)(struct __HRTIM_HandleTypeDef *hhrtim)***
  Fault 2 interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::Fault3Callback)(struct __HRTIM_HandleTypeDef *hhrtim)***
  Fault 3 interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::Fault4Callback)(struct __HRTIM_HandleTypeDef *hhrtim)***
  Fault 4 interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::Fault5Callback)(struct __HRTIM_HandleTypeDef *hhrtim)***
  Fault 5 interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::SystemFaultCallback)(struct __HRTIM_HandleTypeDef *hhrtim)***
  System fault interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::BurstModePeriodCallback)(struct __HRTIM_HandleTypeDef *hhrtim)***
  Burst mode period interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::SynchronizationEventCallback)(struct __HRTIM_HandleTypeDef *hhrtim)***
  Sync Input interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::ErrorCallback)(struct __HRTIM_HandleTypeDef *hhrtim)***
  DMA error callback function pointer

- ***void(* __HRTIM_HandleTypeDef::RegistersUpdateCallback)(struct __HRTIM_HandleTypeDef *hhrtim, uint32_t TimerIdx)***
  Timer x Update interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::RepetitionEventCallback)(struct __HRTIM_HandleTypeDef *hhrtim, uint32_t TimerIdx)***
  Timer x Repetition interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::Compare1EventCallback)(struct __HRTIM_HandleTypeDef *hhrtim, uint32_t TimerIdx)***
  Timer x Compare 1 match interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::Compare2EventCallback)(struct __HRTIM_HandleTypeDef *hhrtim, uint32_t TimerIdx)***
  Timer x Compare 2 match interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::Compare3EventCallback)(struct __HRTIM_HandleTypeDef *hhrtim, uint32_t TimerIdx)***
  Timer x Compare 3 match interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::Compare4EventCallback)(struct __HRTIM_HandleTypeDef *hhrtim, uint32_t TimerIdx)***
  Timer x Compare 4 match interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::Capture1EventCallback)(struct __HRTIM_HandleTypeDef *hhrtim, uint32_t TimerIdx)***
  Timer x Capture 1 interrupts callback function pointer
- ***void(* __HRTIM_HandleTypeDef::Capture2EventCallback)(struct __HRTIM_HandleTypeDef *hhrtim, uint32_t TimerIdx)***
  Timer x Capture 2 interrupts callback function pointer
- ***void(* __HRTIM_HandleTypeDef::DelayedProtectionCallback)(struct __HRTIM_HandleTypeDef *hhrtim, uint32_t TimerIdx)***
  Timer x Delayed protection interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::CounterResetCallback)(struct __HRTIM_HandleTypeDef *hhrtim, uint32_t TimerIdx)***
  Timer x counter reset/roll-over interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::Output1SetCallback)(struct __HRTIM_HandleTypeDef *hhrtim, uint32_t TimerIdx)***
  Timer x output 1 set interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::Output1ResetCallback)(struct __HRTIM_HandleTypeDef *hhrtim, uint32_t TimerIdx)***
  Timer x output 1 reset interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::Output2SetCallback)(struct __HRTIM_HandleTypeDef *hhrtim, uint32_t TimerIdx)***
  Timer x output 2 set interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::Output2ResetCallback)(struct __HRTIM_HandleTypeDef *hhrtim, uint32_t TimerIdx)***
  Timer x output 2 reset interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::BurstDMATransferCallback)(struct __HRTIM_HandleTypeDef *hhrtim, uint32_t TimerIdx)***
  Timer x Burst DMA completed interrupt callback function pointer
- ***void(* __HRTIM_HandleTypeDef::MspInitCallback)(struct __HRTIM_HandleTypeDef *hhrtim)***
  HRTIM MspInit callback function pointer
- ***void(* __HRTIM_HandleTypeDef::MspDeInitCallback)(struct __HRTIM_HandleTypeDef *hhrtim)***
  HRTIM MspInit callback function pointer

40.1.4 HRTIM_TimeBaseCfgTypeDef

HRTIM_TimeBaseCfgTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t Period***
- ***uint32_t RepetitionCounter***
- ***uint32_t PrescalerRatio***
- ***uint32_t Mode***

Field Documentation

- ***uint32_t HRTIM_TimeBaseCfgTypeDef::Period***

  Specifies the timer period. The period value must be above 3 periods of the fHRTIM clock. Maximum value is = 0xFFDFU
- ***uint32_t HRTIM_TimeBaseCfgTypeDef::RepetitionCounter***

  Specifies the timer repetition period. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint32_t HRTIM_TimeBaseCfgTypeDef::PrescalerRatio***

  Specifies the timer clock prescaler ratio. This parameter can be any value of ***HRTIM_Prescaler_Ratio***
- ***uint32_t HRTIM_TimeBaseCfgTypeDef::Mode***

  Specifies the counter operating mode. This parameter can be any value of ***HRTIM_Counter_Operating_Mode***

40.1.5 HRTIM_SimpleOCChannelCfgTypeDef

HRTIM_SimpleOCChannelCfgTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t Mode***
- ***uint32_t Pulse***
- ***uint32_t Polarity***
- ***uint32_t IdleLevel***

Field Documentation

- ***uint32_t HRTIM_SimpleOCChannelCfgTypeDef::Mode***

  Specifies the output compare mode (toggle, active, inactive). This parameter can be any value of of ***HRTIM_Simple_OC_Mode***
- ***uint32_t HRTIM_SimpleOCChannelCfgTypeDef::Pulse***

  Specifies the compare value to be loaded into the Compare Register. The compare value must be above or equal to 3 periods of the fHRTIM clock
- ***uint32_t HRTIM_SimpleOCChannelCfgTypeDef::Polarity***

  Specifies the output polarity. This parameter can be any value of ***HRTIM_Output_Polarity***
- ***uint32_t HRTIM_SimpleOCChannelCfgTypeDef::IdleLevel***

  Specifies whether the output level is active or inactive when in IDLE state. This parameter can be any value of ***HRTIM_Output_IDLE_Level***

40.1.6 HRTIM_SimplePWMChannelCfgTypeDef

HRTIM_SimplePWMChannelCfgTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t Pulse***
- ***uint32_t Polarity***
- ***uint32_t IdleLevel***

Field Documentation

- ***uint32_t HRTIM_SimplePWMChannelCfgTypeDef::Pulse***

  Specifies the compare value to be loaded into the Compare Register. The compare value must be above or equal to 3 periods of the fHRTIM clock
- ***uint32_t HRTIM_SimplePWMChannelCfgTypeDef::Polarity***

  Specifies the output polarity. This parameter can be any value of ***HRTIM_Output_Polarity***

- ***uint32_t HRTIM_SimplePWMChannelCfgTypeDef::IdleLevel***

  Specifies whether the output level is active or inactive when in IDLE state. This parameter can be any value of ***HRTIM_Output_IDLE_Level***

40.1.7 HRTIM_SimpleCaptureChannelCfgTypeDef

HRTIM_SimpleCaptureChannelCfgTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t Event***
- ***uint32_t EventPolarity***
- ***uint32_t EventSensitivity***
- ***uint32_t EventFilter***

Field Documentation

- ***uint32_t HRTIM_SimpleCaptureChannelCfgTypeDef::Event***

  Specifies the external event triggering the capture. This parameter can be any 'EEVx' value of ***HRTIM_External_Event_Channels***
- ***uint32_t HRTIM_SimpleCaptureChannelCfgTypeDef::EventPolarity***

  Specifies the polarity of the external event (in case of level sensitivity). This parameter can be a value of ***HRTIM_External_Event_Polarity***
- ***uint32_t HRTIM_SimpleCaptureChannelCfgTypeDef::EventSensitivity***

  Specifies the sensitivity of the external event. This parameter can be a value of ***HRTIM_External_Event_Sensitivity***
- ***uint32_t HRTIM_SimpleCaptureChannelCfgTypeDef::EventFilter***

  Defines the frequency used to sample the External Event and the length of the digital filter. This parameter can be a value of ***HRTIM_External_Event_Filter***

40.1.8 HRTIM_SimpleOnePulseChannelCfgTypeDef

HRTIM_SimpleOnePulseChannelCfgTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t Pulse***
- ***uint32_t OutputPolarity***
- ***uint32_t OutputIdleLevel***
- ***uint32_t Event***
- ***uint32_t EventPolarity***
- ***uint32_t EventSensitivity***
- ***uint32_t EventFilter***

Field Documentation

- ***uint32_t HRTIM_SimpleOnePulseChannelCfgTypeDef::Pulse***

  Specifies the compare value to be loaded into the Compare Register. The compare value must be above or equal to 3 periods of the fHRTIM clock
- ***uint32_t HRTIM_SimpleOnePulseChannelCfgTypeDef::OutputPolarity***

  Specifies the output polarity. This parameter can be any value of ***HRTIM_Output_Polarity***
- ***uint32_t HRTIM_SimpleOnePulseChannelCfgTypeDef::OutputIdleLevel***

  Specifies whether the output level is active or inactive when in IDLE state. This parameter can be any value of ***HRTIM_Output_IDLE_Level***
- ***uint32_t HRTIM_SimpleOnePulseChannelCfgTypeDef::Event***

  Specifies the external event triggering the pulse generation. This parameter can be any 'EEVx' value of ***HRTIM_External_Event_Channels***
- ***uint32_t HRTIM_SimpleOnePulseChannelCfgTypeDef::EventPolarity***

  Specifies the polarity of the external event (in case of level sensitivity). This parameter can be a value of ***HRTIM_External_Event_Polarity***

- ***uint32_t HRTIM_SimpleOnePulseChannelCfgTypeDef::EventSensitivity***

  Specifies the sensitivity of the external event. This parameter can be a value of ***HRTIM_External_Event_Sensitivity***.
- ***uint32_t HRTIM_SimpleOnePulseChannelCfgTypeDef::EventFilter***

  Defines the frequency used to sample the External Event and the length of the digital filter. This parameter can be a value of ***HRTIM_External_Event_Filter***

40.1.9 HRTIM_TimerCfgTypeDef

HRTIM_TimerCfgTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t InterruptRequests***
- ***uint32_t DMARequests***
- ***uint32_t DMASrcAddress***
- ***uint32_t DMADstAddress***
- ***uint32_t DMASize***
- ***uint32_t HalfModeEnable***
- ***uint32_t StartOnSync***
- ***uint32_t ResetOnSync***
- ***uint32_t DACSynchro***
- ***uint32_t PreloadEnable***
- ***uint32_t UpdateGating***
- ***uint32_t BurstMode***
- ***uint32_t RepetitionUpdate***
- ***uint32_t PushPull***
- ***uint32_t FaultEnable***
- ***uint32_t FaultLock***
- ***uint32_t DeadTimeInsertion***
- ***uint32_t DelayedProtectionMode***
- ***uint32_t UpdateTrigger***
- ***uint32_t ResetTrigger***
- ***uint32_t ResetUpdate***

Field Documentation

- ***uint32_t HRTIM_TimerCfgTypeDef::InterruptRequests***

  Relevant for all HRTIM timers, including the master. Specifies which interrupts requests must enabled for the timer. This parameter can be any combination of ***HRTIM_Master_Interrupt_Enable*** or ***HRTIM_Timing_Unit_Interrupt_Enable***
- ***uint32_t HRTIM_TimerCfgTypeDef::DMARequests***

  Relevant for all HRTIM timers, including the master. Specifies which DMA requests must be enabled for the timer. This parameter can be any combination of ***HRTIM_Master_DMA_Request_Enable*** or ***HRTIM_Timing_Unit_DMA_Request_Enable***
- ***uint32_t HRTIM_TimerCfgTypeDef::DMASrcAddress***

  Relevant for all HRTIM timers, including the master. Specifies the address of the source address of the DMA transfer
- ***uint32_t HRTIM_TimerCfgTypeDef::DMADstAddress***

  Relevant for all HRTIM timers, including the master. Specifies the address of the destination address of the DMA transfer
- ***uint32_t HRTIM_TimerCfgTypeDef::DMASize***

  Relevant for all HRTIM timers, including the master. Specifies the size of the DMA transfer
- ***uint32_t HRTIM_TimerCfgTypeDef::HalfModeEnable***

  Relevant for all HRTIM timers, including the master. Specifies whether or not half mode is enabled This parameter can be any value of ***HRTIM_Half_Mode_Enable***

- ***uint32_t HRTIM_TimerCfgTypeDef::StartOnSync***

  Relevant for all HRTIM timers, including the master. Specifies whether or not timer is reset by a rising edge on the synchronization input (when enabled). This parameter can be any value of ***HRTIM_Start_On_Sync_Input_Event***
- ***uint32_t HRTIM_TimerCfgTypeDef::ResetOnSync***

  Relevant for all HRTIM timers, including the master. Specifies whether or not timer is reset by a rising edge on the synchronization input (when enabled). This parameter can be any value of ***HRTIM_Reset_On_Sync_Input_Event***
- ***uint32_t HRTIM_TimerCfgTypeDef::DACSynchro***

  Relevant for all HRTIM timers, including the master. Indicates whether or not the a DAC synchronization event is generated. This parameter can be any value of ***HRTIM_DAC_Synchronization***
- ***uint32_t HRTIM_TimerCfgTypeDef::PreloadEnable***

  Relevant for all HRTIM timers, including the master. Specifies whether or not register preload is enabled. This parameter can be any value of ***HRTIM_Register_Preload_Enable***
- ***uint32_t HRTIM_TimerCfgTypeDef::UpdateGating***

  Relevant for all HRTIM timers, including the master. Specifies how the update occurs with respect to a burst DMA transaction or update enable inputs (Slave timers only). This parameter can be any value of ***HRTIM_Update_Gating***
- ***uint32_t HRTIM_TimerCfgTypeDef::BurstMode***

  Relevant for all HRTIM timers, including the master. Specifies how the timer behaves during a burst mode operation. This parameter can be any value of ***HRTIM_Timer_Burst_Mode***
- ***uint32_t HRTIM_TimerCfgTypeDef::RepetitionUpdate***

  Relevant for all HRTIM timers, including the master. Specifies whether or not registers update is triggered by the repetition event. This parameter can be any value of ***HRTIM_Timer_Repetition_Update***
- ***uint32_t HRTIM_TimerCfgTypeDef::PushPull***

  Relevant for Timer A to Timer E. Specifies whether or not the push-pull mode is enabled. This parameter can be any value of ***HRTIM_Timer_Push_Pull_Mode***
- ***uint32_t HRTIM_TimerCfgTypeDef::FaultEnable***

  Relevant for Timer A to Timer E. Specifies which fault channels are enabled for the timer. This parameter can be a combination of ***HRTIM_Timer_Fault_Enabling***
- ***uint32_t HRTIM_TimerCfgTypeDef::FaultLock***

  Relevant for Timer A to Timer E. Specifies whether or not fault enabling status is write protected. This parameter can be a value of ***HRTIM_Timer_Fault_Lock***
- ***uint32_t HRTIM_TimerCfgTypeDef::DeadTimeInsertion***

  Relevant for Timer A to Timer E. Specifies whether or not dead-time insertion is enabled for the timer. This parameter can be a value of ***HRTIM_Timer_Deadtime_Insertion***
- ***uint32_t HRTIM_TimerCfgTypeDef::DelayedProtectionMode***

  Relevant for Timer A to Timer E. Specifies the delayed protection mode. This parameter can be a value of ***HRTIM_Timer_Delayed_Protection_Mode***
- ***uint32_t HRTIM_TimerCfgTypeDef::UpdateTrigger***

  Relevant for Timer A to Timer E. Specifies source(s) triggering the timer registers update. This parameter can be a combination of ***HRTIM_Timer_Update_Trigger***
- ***uint32_t HRTIM_TimerCfgTypeDef::ResetTrigger***

  Relevant for Timer A to Timer E. Specifies source(s) triggering the timer counter reset. This parameter can be a combination of ***HRTIM_Timer_Reset_Trigger***
- ***uint32_t HRTIM_TimerCfgTypeDef::ResetUpdate***

  Relevant for Timer A to Timer E. Specifies whether or not registers update is triggered when the timer counter is reset. This parameter can be a value of ***HRTIM_Timer_Reset_Update***

40.1.10 HRTIM_CompareCfgTypeDef

HRTIM_CompareCfgTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t CompareValue***

- ***uint32_t AutoDelayedMode***
- ***uint32_t AutoDelayedTimeout***

Field Documentation

- ***uint32_t HRTIM_CompareCfgTypeDef::CompareValue***

  Specifies the compare value of the timer compare unit. The minimum value must be greater than or equal to 3 periods of the fHRTIM clock. The maximum value must be less than or equal to 0xFFFFU - 1 periods of the fHRTIM clock
- ***uint32_t HRTIM_CompareCfgTypeDef::AutoDelayedMode***

  Specifies the auto delayed mode for compare unit 2 or 4. This parameter can be a value of ***HRTIM_Compare_Unit_Auto_Delayed_Mode***
- ***uint32_t HRTIM_CompareCfgTypeDef::AutoDelayedTimeout***

  Specifies compare value for timing unit 1 or 3 when auto delayed mode with time out is selected. CompareValue + AutoDelayedTimeout must be less than 0xFFFFU

40.1.11 HRTIM_CaptureCfgTypeDef

HRTIM_CaptureCfgTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t Trigger***

Field Documentation

- ***uint32_t HRTIM_CaptureCfgTypeDef::Trigger***

  Specifies source(s) triggering the capture. This parameter can be a combination of ***HRTIM_Capture_Unit_Trigger***

40.1.12 HRTIM_OutputCfgTypeDef

HRTIM_OutputCfgTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t Polarity***
- ***uint32_t SetSource***
- ***uint32_t ResetSource***
- ***uint32_t IdleMode***
- ***uint32_t IdleLevel***
- ***uint32_t FaultLevel***
- ***uint32_t ChopperModeEnable***
- ***uint32_t BurstModeEntryDelayed***

Field Documentation

- ***uint32_t HRTIM_OutputCfgTypeDef::Polarity***

  Specifies the output polarity. This parameter can be any value of ***HRTIM_Output_Polarity***
- ***uint32_t HRTIM_OutputCfgTypeDef::SetSource***

  Specifies the event(s) transitioning the output from its inactive level to its active level. This parameter can be a combination of ***HRTIM_Output_Set_Source***
- ***uint32_t HRTIM_OutputCfgTypeDef::ResetSource***

  Specifies the event(s) transitioning the output from its active level to its inactive level. This parameter can be a combination of ***HRTIM_Output_Reset_Source***
- ***uint32_t HRTIM_OutputCfgTypeDef::IdleMode***

  Specifies whether or not the output is affected by a burst mode operation. This parameter can be any value of ***HRTIM_Output_Idle_Mode***
- ***uint32_t HRTIM_OutputCfgTypeDef::IdleLevel***

  Specifies whether the output level is active or inactive when in IDLE state. This parameter can be any value of ***HRTIM_Output_IDLE_Level***

- ***uint32_t HRTIM_OutputCfgTypeDef::FaultLevel***
  Specifies whether the output level is active or inactive when in FAULT state. This parameter can be any value of ***HRTIM_Output_FAULT_Level***
- ***uint32_t HRTIM_OutputCfgTypeDef::ChopperModeEnable***
  Indicates whether or not the chopper mode is enabled This parameter can be any value of ***HRTIM_Output_Chopper_Mode_Enable***
- ***uint32_t HRTIM_OutputCfgTypeDef::BurstModeEntryDelayed***
  Indicates whether or not dead-time is inserted when entering the IDLE state during a burst mode operation. This parameters can be any value of ***HRTIM_Output_Burst_Mode_Entry_Delayed***

40.1.13 HRTIM_TimerEventFilteringCfgTypeDef

HRTIM_TimerEventFilteringCfgTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t Filter***
- ***uint32_t Latch***

Field Documentation

- ***uint32_t HRTIM_TimerEventFilteringCfgTypeDef::Filter***
  Specifies the type of event filtering within the timing unit. This parameter can be a value of ***HRTIM_Timer_External_Event_Filter***
- ***uint32_t HRTIM_TimerEventFilteringCfgTypeDef::Latch***
  Specifies whether or not the signal is latched. This parameter can be a value of ***HRTIM_Timer_External_Event_Latch***

40.1.14 HRTIM_DeadTimeCfgTypeDef

HRTIM_DeadTimeCfgTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t Prescaler***
- ***uint32_t RisingValue***
- ***uint32_t RisingSign***
- ***uint32_t RisingLock***
- ***uint32_t RisingSignLock***
- ***uint32_t FallingValue***
- ***uint32_t FallingSign***
- ***uint32_t FallingLock***
- ***uint32_t FallingSignLock***

Field Documentation

- ***uint32_t HRTIM_DeadTimeCfgTypeDef::Prescaler***
  Specifies the dead-time prescaler. This parameter can be a value of ***HRTIM_Deadtime_Prescaler_Ratio***
- ***uint32_t HRTIM_DeadTimeCfgTypeDef::RisingValue***
  Specifies the dead-time following a rising edge. This parameter can be a number between 0x0 and 0x1FFU
- ***uint32_t HRTIM_DeadTimeCfgTypeDef::RisingSign***
  Specifies whether the dead-time is positive or negative on rising edge. This parameter can be a value of ***HRTIM_Deadtime_Rising_Sign***
- ***uint32_t HRTIM_DeadTimeCfgTypeDef::RisingLock***
  Specifies whether or not dead-time rising settings (value and sign) are write protected. This parameter can be a value of ***HRTIM_Deadtime_Rising_Lock***
- ***uint32_t HRTIM_DeadTimeCfgTypeDef::RisingSignLock***
  Specifies whether or not dead-time rising sign is write protected. This parameter can be a value of ***HRTIM_Deadtime_Rising_Sign_Lock***
- ***uint32_t HRTIM_DeadTimeCfgTypeDef::FallingValue***
  Specifies the dead-time following a falling edge. This parameter can be a number between 0x0 and 0x1FFU

- ***uint32_t HRTIM_DeadTimeCfgTypeDef::FallingSign***

  Specifies whether the dead-time is positive or negative on falling edge. This parameter can be a value of ***HRTIM_Deadtime_Falling_Sign***
- ***uint32_t HRTIM_DeadTimeCfgTypeDef::FallingLock***

  Specifies whether or not dead-time falling settings (value and sign) are write protected. This parameter can be a value of ***HRTIM_Deadtime_Falling_Lock***
- ***uint32_t HRTIM_DeadTimeCfgTypeDef::FallingSignLock***

  Specifies whether or not dead-time falling sign is write protected. This parameter can be a value of ***HRTIM_Deadtime_Falling_Sign_Lock***

40.1.15 HRTIM_ChopperModeCfgTypeDef

HRTIM_ChopperModeCfgTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t CarrierFreq***
- ***uint32_t DutyCycle***
- ***uint32_t StartPulse***

Field Documentation

- ***uint32_t HRTIM_ChopperModeCfgTypeDef::CarrierFreq***

  Specifies the Timer carrier frequency value. This parameter can be a value of ***HRTIM_Chopper_Frequency***
- ***uint32_t HRTIM_ChopperModeCfgTypeDef::DutyCycle***

  Specifies the Timer chopper duty cycle value. This parameter can be a value of ***HRTIM_Chopper_Duty_Cycle***
- ***uint32_t HRTIM_ChopperModeCfgTypeDef::StartPulse***

  Specifies the Timer pulse width value. This parameter can be a value of ***HRTIM_Chopper_Start_Pulse_Width***

40.1.16 HRTIM_EventCfgTypeDef

HRTIM_EventCfgTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t Source***
- ***uint32_t Polarity***
- ***uint32_t Sensitivity***
- ***uint32_t Filter***
- ***uint32_t FastMode***

Field Documentation

- ***uint32_t HRTIM_EventCfgTypeDef::Source***

  Identifies the source of the external event. This parameter can be a value of ***HRTIM_External_Event_Sources***
- ***uint32_t HRTIM_EventCfgTypeDef::Polarity***

  Specifies the polarity of the external event (in case of level sensitivity). This parameter can be a value of ***HRTIM_External_Event_Polarity***
- ***uint32_t HRTIM_EventCfgTypeDef::Sensitivity***

  Specifies the sensitivity of the external event. This parameter can be a value of ***HRTIM_External_Event_Sensitivity***
- ***uint32_t HRTIM_EventCfgTypeDef::Filter***

  Defines the frequency used to sample the External Event and the length of the digital filter. This parameter can be a value of ***HRTIM_External_Event_Filter***
- ***uint32_t HRTIM_EventCfgTypeDef::FastMode***

  Indicates whether or not low latency mode is enabled for the external event. This parameter can be a value of ***HRTIM_External_Event_Fast_Mode***

40.1.17 HRTIM_FaultCfgTypeDef

HRTIM_FaultCfgTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t Source***
- ***uint32_t Polarity***
- ***uint32_t Filter***
- ***uint32_t Lock***

Field Documentation

- ***uint32_t HRTIM_FaultCfgTypeDef::Source***
  Identifies the source of the fault. This parameter can be a value of ***HRTIM_Fault_Sources***
- ***uint32_t HRTIM_FaultCfgTypeDef::Polarity***
  Specifies the polarity of the fault event. This parameter can be a value of ***HRTIM_Fault_Polarity***
- ***uint32_t HRTIM_FaultCfgTypeDef::Filter***
  Defines the frequency used to sample the Fault input and the length of the digital filter. This parameter can be a value of ***HRTIM_Fault_Filter***
- ***uint32_t HRTIM_FaultCfgTypeDef::Lock***
  Indicates whether or not fault programming bits are write protected. This parameter can be a value of ***HRTIM_Fault_Lock***

40.1.18 HRTIM_BurstModeCfgTypeDef

HRTIM_BurstModeCfgTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t Mode***
- ***uint32_t ClockSource***
- ***uint32_t Prescaler***
- ***uint32_t PreloadEnable***
- ***uint32_t Trigger***
- ***uint32_t IdleDuration***
- ***uint32_t Period***

Field Documentation

- ***uint32_t HRTIM_BurstModeCfgTypeDef::Mode***
  Specifies the burst mode operating mode. This parameter can be a value of ***HRTIM_Burst_Mode_Operating_Mode***
- ***uint32_t HRTIM_BurstModeCfgTypeDef::ClockSource***
  Specifies the burst mode clock source. This parameter can be a value of ***HRTIM_Burst_Mode_Clock_Source***
- ***uint32_t HRTIM_BurstModeCfgTypeDef::Prescaler***
  Specifies the burst mode prescaler. This parameter can be a value of ***HRTIM_Burst_Mode_Prescaler***
- ***uint32_t HRTIM_BurstModeCfgTypeDef::PreloadEnable***
  Specifies whether or not preload is enabled for burst mode related registers (HRTIM_BMCMPR and HRTIM_BMPER). This parameter can be a combination of ***HRTIM_Burst_Mode_Register_Preload_Enable***
- ***uint32_t HRTIM_BurstModeCfgTypeDef::Trigger***
  Specifies the event(s) triggering the burst operation. This parameter can be a combination of ***HRTIM_Burst_Mode_Trigger***
- ***uint32_t HRTIM_BurstModeCfgTypeDef::IdleDuration***
  Specifies number of periods during which the selected timers are in idle state. This parameter can be a number between 0x0 and 0xFFFF
- ***uint32_t HRTIM_BurstModeCfgTypeDef::Period***
  Specifies burst mode repetition period. This parameter can be a number between 0x1 and 0xFFFF

40.1.19 HRTIM_ADCTriggerCfgTypeDef

HRTIM_ADCTriggerCfgTypeDef is defined in the stm32h7xx_hal_hrtim.h

Data Fields

- ***uint32_t UpdateSource***
- ***uint32_t Trigger***

Field Documentation

- ***uint32_t HRTIM_ADCTriggerCfgTypeDef::UpdateSource***
  Specifies the ADC trigger update source. This parameter can be a value of ***HRTIM_ADC_Trigger_Update_Source***
- ***uint32_t HRTIM_ADCTriggerCfgTypeDef::Trigger***
  Specifies the event(s) triggering the ADC conversion. This parameter can be a combination of ***HRTIM_ADC_Trigger_Event***

40.2 HRTIM Firmware driver API description

The following section lists the various functions of the HRTIM library.

40.2.1 Simple mode versus waveform mode

The HRTIM HAL API is split into 2 categories:

1. Simple functions: these functions allow for using a HRTIM timer as a general purpose timer with high resolution capabilities. HRTIM simple modes are managed through the set of functions named HAL_HRTIM_Simple<Function>. These functions are similar in name and usage to the one defined for the TIM peripheral. When a HRTIM timer operates in simple mode, only a very limited set of HRTIM features are used. Following simple modes are proposed:
   – Output compare mode,
   – PWM output mode,
   – Input capture mode,
   – One pulse mode.
2. Waveform functions: These functions allow taking advantage of the HRTIM flexibility to produce numerous types of control signal. When a HRTIM timer operates in waveform mode, all the HRTIM features are accessible without any restriction. HRTIM waveform modes are managed through the set of functions named HAL_HRTIM_Waveform<Function>

40.2.2 How to use this driver

1. Initialize the HRTIM low level resources by implementing the HAL_HRTIM_MspInit() function:
   a. Enable the HRTIM clock source using __HRTIMx_CLK_ENABLE()
   b. Connect HRTIM pins to MCU I/Os
      ◦ Enable the clock for the HRTIM GPIOs using the following function: __HAL_RCC_GPIOx_CLK_ENABLE()
      ◦ Configure these GPIO pins in Alternate Function mode using HAL_GPIO_Init()
   c. When using DMA to control data transfer (e.g HAL_HRTIM_SimpleBaseStart_DMA())
      ◦ Enable the DMAx interface clock using __DMAx_CLK_ENABLE()
      ◦ Initialize the DMA handle
      ◦ Associate the initialized DMA handle to the appropriate DMA handle of the HRTIM handle using __HAL_LINKDMA()
      ◦ Initialize the DMA channel using HAL_DMA_Init()
      ◦ Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA channel using HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ()
   d. In case of using interrupt mode (e.g HAL_HRTIM_SimpleBaseStart_IT())
      ◦ Configure the priority and enable the NVIC for the concerned HRTIM interrupt using HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ()

2. Initialize the HRTIM HAL using HAL_HRTIM_Init(). The HRTIM configuration structure (field of the HRTIM handle) specifies which global interrupt of whole HRTIM must be enabled (Burst mode period, System fault, Faults). It also contains the HRTIM external synchronization configuration. HRTIM can act as a master (generating a synchronization signal) or as a slave (waiting for a trigger to be synchronized).
3. Configure HRTIM resources shared by all HRTIM timers
   a. Burst Mode Controller:
      - HAL_HRTIM_BurstModeConfig(): configures the HRTIM burst mode controller: operating mode (continuous or one-shot mode), clock (source, prescaler) , trigger(s), period, idle duration.
   b. External Events Conditioning:
      - HAL_HRTIM_EventConfig(): configures the conditioning of an external event channel: source, polarity, edge-sensitivity. External event can be used as triggers (timer reset, input capture, burst mode, ADC triggers, delayed protection) They can also be used to set or reset timer outputs. Up to 10 event channels are available.
      - HAL_HRTIM_EventPrescalerConfig(): configures the external event sampling clock (used for digital filtering).
   c. Fault Conditioning:
      - HAL_HRTIM_FaultConfig(): configures the conditioning of a fault channel: source, polarity, edge-sensitivity. Fault channels are used to disable the outputs in case of an abnormal operation. Up to 5 fault channels are available.
      - HAL_HRTIM_FaultPrescalerConfig(): configures the fault sampling clock (used for digital filtering).
      - HAL_HRTIM_FaultModeCtl(): Enables or disables fault input(s) circuitry. By default all fault inputs are disabled.
   d. ADC trigger:
      - HAL_HRTIM_ADCTriggerConfig(): configures the source triggering the update of the ADC trigger register and the ADC trigger. 4 independent triggers are available to start both the regular and the injected sequencers of the 2 ADCs
4. Configure HRTIM timer time base using HAL_HRTIM_TimeBaseConfig(). This function must be called whatever the HRTIM timer operating mode is (simple v.s. waveform). It configures mainly:
   a. The HRTIM timer counter operating mode (continuous v.s. one shot)
   b. The HRTIM timer clock prescaler
   c. The HRTIM timer period
   d. The HRTIM timer repetition counter

If the HRTIM timer operates in simple mode

1. Start or Stop simple timers
   – Simple time base: HAL_HRTIM_SimpleBaseStart(),HAL_HRTIM_SimpleBaseStop(), HAL_HRTIM_SimpleBaseStart_IT(),HAL_HRTIM_SimpleBaseStop_IT(), HAL_HRTIM_SimpleBaseStart_DMA(),HAL_HRTIM_SimpleBaseStop_DMA().
   – Simple output compare: HAL_HRTIM_SimpleOCChannelConfig(), HAL_HRTIM_SimpleOCStart(),HAL_HRTIM_SimpleOCStop(), HAL_HRTIM_SimpleOCStart_IT(),HAL_HRTIM_SimpleOCStop_IT(), HAL_HRTIM_SimpleOCStart_DMA(),HAL_HRTIM_SimpleOCStop_DMA(),
   – Simple PWM output: HAL_HRTIM_SimplePWMChannelConfig(), HAL_HRTIM_SimplePWMStart(),HAL_HRTIM_SimplePWMStop(), HAL_HRTIM_SimplePWMStart_IT(),HAL_HRTIM_SimplePWMStop_IT(), HAL_HRTIM_SimplePWMStart_DMA(),HAL_HRTIM_SimplePWMStop_DMA(),
   – Simple input capture: HAL_HRTIM_SimpleCaptureChannelConfig(), HAL_HRTIM_SimpleCaptureStart(),HAL_HRTIM_SimpleCaptureStop(), HAL_HRTIM_SimpleCaptureStart_IT(),HAL_HRTIM_SimpleCaptureStop_IT(), HAL_HRTIM_SimpleCaptureStart_DMA(),HAL_HRTIM_SimpleCaptureStop_DMA().
   – Simple one pulse: HAL_HRTIM_SimpleOnePulseChannelConfig(), HAL_HRTIM_SimpleOnePulseStart(),HAL_HRTIM_SimpleOnePulseStop(), HAL_HRTIM_SimpleOnePulseStart_IT(),HAL_HRTIM_SimpleOnePulseStop_It().

If the HRTIM timer operates in waveform mode

1. Completes waveform timer configuration
   - HAL_HRTIM_WaveformTimerConfig(): configuration of a HRTIM timer operating in wave form mode mainly consists in:
     - Enabling the HRTIM timer interrupts and DMA requests.
     - Enabling the half mode for the HRTIM timer.
     - Defining how the HRTIM timer reacts to external synchronization input.
     - Enabling the push-pull mode for the HRTIM timer.
     - Enabling the fault channels for the HRTIM timer.
     - Enabling the dead-time insertion for the HRTIM timer.
     - Setting the delayed protection mode for the HRTIM timer (source and outputs on which the delayed protection are applied).
     - Specifying the HRTIM timer update and reset triggers.
     - Specifying the HRTIM timer registers update policy (e.g. pre-load enabling).
   - HAL_HRTIM_TimerEventFilteringConfig(): configures external event blanking and windowing circuitry of a HRTIM timer:
     - Blanking: to mask external events during a defined time period a defined time period
     - Windowing, to enable external events only during a defined time period
   - HAL_HRTIM_DeadTimeConfig(): configures the dead-time insertion unit for a HRTIM timer. Allows to generate a couple of complementary signals from a single reference waveform, with programmable delays between active state.
   - HAL_HRTIM_ChopperModeConfig(): configures the parameters of the high-frequency carrier signal added on top of the timing unit output. Chopper mode can be enabled or disabled for each timer output separately (see HAL_HRTIM_WaveformOutputConfig()).
   - HAL_HRTIM_BurstDMAConfig(): configures the burst DMA burst controller. Allows having multiple HRTIM registers updated with a single DMA request. The burst DMA operation is started by calling HAL_HRTIM_BurstDMATransfer().
   - HAL_HRTIM_WaveformCompareConfig():configures the compare unit of a HRTIM timer. This operation consists in setting the compare value and possibly specifying the auto delayed mode for compare units 2 and 4 (allows to have compare events generated relatively to capture events). Note that when auto delayed mode is needed, the capture unit associated to the compare unit must be configured separately.
   - HAL_HRTIM_WaveformCaptureConfig(): configures the capture unit of a HRTIM timer. This operation consists in specifying the source(s) triggering the capture (timer register update event, external event, timer output set/reset event, other HRTIM timer related events).
   - HAL_HRTIM_WaveformOutputConfig(): configuration of a HRTIM timer output mainly consists in:
     - Setting the output polarity (active high or active low),
     - Defining the set/reset crossbar for the output,
     - Specifying the fault level (active or inactive) in IDLE and FAULT states.,
2. Set waveform timer output(s) level
   - HAL_HRTIM_WaveformSetOutputLevel(): forces the output to its active or inactive level. For example, when deadtime insertion is enabled it is necessary to force the output level by software to have the outputs in a complementary state as soon as the RUN mode is entered.
3. Enable or Disable waveform timer output(s)
   - HAL_HRTIM_WaveformOutputStart(),HAL_HRTIM_WaveformOutputStop().
4. Start or Stop waveform HRTIM timer(s).
   - HAL_HRTIM_WaveformCountStart(),HAL_HRTIM_WaveformCountStop(),
   - HAL_HRTIM_WaveformCountStart_IT(),HAL_HRTIM_WaveformCountStop_IT(),
   - HAL_HRTIM_WaveformCountStart_DMA(),HAL_HRTIM_WaveformCountStop_DMA(),
5. Burst mode controller enabling:
   - HAL_HRTIM_BurstModeCtl(): activates or de-activates the burst mode controller.

6. Some HRTIM operations can be triggered by software:
   - HAL_HRTIM_BurstModeSoftwareTrigger(): calling this function trigs the burst operation.
   - HAL_HRTIM_SoftwareCapture(): calling this function trigs the capture of the HRTIM timer counter.
   - HAL_HRTIM_SoftwareUpdate(): calling this function trigs the update of the pre-loadable registers of the HRTIM timer
   - HAL_HRTIM_SoftwareReset():calling this function resets the HRTIM timer counter.
7. Some functions can be used any time to retrieve HRTIM timer related information
   - HAL_HRTIM_GetCapturedValue(): returns actual value of the capture register of the designated capture unit.
   - HAL_HRTIM_WaveformGetOutputLevel(): returns actual level (ACTIVE/INACTIVE) of the designated timer output.
   - HAL_HRTIM_WaveformGetOutputState():returns actual state (IDLE/RUN/FAULT) of the designated timer output.
   - HAL_HRTIM_GetDelayedProtectionStatus():returns actual level (ACTIVE/INACTIVE) of the designated output when the delayed protection was triggered.
   - HAL_HRTIM_GetBurstStatus(): returns the actual status (ACTIVE/INACTIVE) of the burst mode controller.
   - HAL_HRTIM_GetCurrentPushPullStatus(): when the push-pull mode is enabled for the HRTIM timer (see HAL_HRTIM_WaveformTimerConfig()), the push-pull status indicates on which output the signal is currently active (e.g signal applied on output 1 and output 2 forced inactive or vice versa).
   - HAL_HRTIM_GetIdlePushPullStatus(): when the push-pull mode is enabled for the HRTIM timer (see HAL_HRTIM_WaveformTimerConfig()), the idle push-pull status indicates during which period the delayed protection request occurred (e.g. protection occurred when the output 1 was active and output 2 forced inactive or vice versa).
8. Some functions can be used any time to retrieve actual HRTIM status
   - HAL_HRTIM_GetState(): returns actual HRTIM instance HAL state.

Callback registration

The compilation flag USE_HAL_HRTIM_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_HRTIM_RegisterCallback() or HAL_HRTIM_TIMxRegisterCallback() to register an interrupt callback.

Function HAL_HRTIM_RegisterCallback() allows to register following callbacks:

- Fault1Callback : Fault 1 interrupt callback function
- Fault2Callback : Fault 2 interrupt callback function
- Fault3Callback : Fault 3 interrupt callback function
- Fault4Callback : Fault 4 interrupt callback function
- Fault5Callback : Fault 5 interrupt callback function
- SystemFaultCallback : System fault interrupt callback function
- BurstModePeriodCallback : Burst mode period interrupt callback function
- SynchronizationEventCallback : Sync Input interrupt callback function
- ErrorCallback : DMA error callback function
- MspInitCallback : HRTIM MspInit callback function
- MspDeInitCallback : HRTIM MspInit callback function

Function HAL_HRTIM_TIMxRegisterCallback() allows to register following callbacks:

- RegistersUpdateCallback : Timer x Update interrupt callback function
- RepetitionEventCallback : Timer x Repetition interrupt callback function
- Compare1EventCallback : Timer x Compare 1 match interrupt callback function
- Compare2EventCallback : Timer x Compare 2 match interrupt callback function
- Compare3EventCallback : Timer x Compare 3 match interrupt callback function
- Compare4EventCallback : Timer x Compare 4 match interrupt callback function
- Capture1EventCallback : Timer x Capture 1 interrupts callback function
- Capture2EventCallback : Timer x Capture 2 interrupts callback function

- DelayedProtectionCallback : Timer x Delayed protection interrupt callback function
- CounterResetCallback : Timer x counter reset/roll-over interrupt callback function
- Output1SetCallback : Timer x output 1 set interrupt callback function
- Output1ResetCallback : Timer x output 1 reset interrupt callback function
- Output2SetCallback : Timer x output 2 set interrupt callback function
- Output2ResetCallback : Timer x output 2 reset interrupt callback function
- BurstDMATransferCallback : Timer x Burst DMA completed interrupt callback function

Both functions take as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_HRTIM_UnRegisterCallback or HAL_HRTIM_TIMxUnRegisterCallback to reset a callback to the default weak function. Both functions take as parameters the HAL peripheral handle and the Callback ID.

By default, after the HAL_HRTIM_Init() and when the state is HAL_HRTIM_STATE_RESET all callbacks are set to the corresponding weak functions (e.g HAL_HRTIM_Fault1Callback) Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_HRTIM_Init()/ HAL_HRTIM_DeInit() only when these callbacks are null (not registered beforehand). If MspInit or MspDeInit are not null, the HAL_HRTIM_Init()/ HAL_HRTIM_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in HAL_HRTIM_STATE_READY state only. Exception done MspInit/MspDeInit functions that can be registered/unregistered in HAL_HRTIM_STATE_READY or HAL_HRTIM_STATE_RESET states, thus registered (user) MspInit/DeInit callbacks can be used during the Init/ DeInit. Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_HRTIM_RegisterCallback() before calling HAL_HRTIM_DeInit() or HAL_HRTIM_Init() function.

When the compilation flag USE_HAL_HRTIM_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

40.2.3 Initialization and Time Base Configuration functions

This section provides functions allowing to:

- Initialize a HRTIM instance
- De-initialize a HRTIM instance
- Initialize the HRTIM MSP
- De-initialize the HRTIM MSP
- Configure the time base unit of a HRTIM timer

This section contains the following APIs:

- ***HAL_HRTIM_Init()***
- ***HAL_HRTIM_DeInit()***
- ***HAL_HRTIM_MspInit()***
- ***HAL_HRTIM_MspDeInit()***
- ***HAL_HRTIM_TimeBaseConfig()***

40.2.4 Simple time base mode functions

This section provides functions allowing to:

- Start simple time base
- Stop simple time base
- Start simple time base and enable interrupt
- Stop simple time base and disable interrupt
- Start simple time base and enable DMA transfer
- Stop simple time base and disable DMA transfer

Note: When a HRTIM timer operates in simple time base mode, the timer counter counts from 0 to the period value.

This section contains the following APIs:

- ***HAL_HRTIM_SimpleBaseStart()***

- *HAL_HRTIM_SimpleBaseStop()*
- *HAL_HRTIM_SimpleBaseStart_IT()*
- *HAL_HRTIM_SimpleBaseStop_IT()*
- *HAL_HRTIM_SimpleBaseStart_DMA()*
- *HAL_HRTIM_SimpleBaseStop_DMA()*

40.2.5 Simple output compare functions

This section provides functions allowing to:

- Configure simple output channel
- Start simple output compare
- Stop simple output compare
- Start simple output compare and enable interrupt
- Stop simple output compare and disable interrupt
- Start simple output compare and enable DMA transfer
- Stop simple output compare and disable DMA transfer

Note: When a HRTIM timer operates in simple output compare mode the output level is set to a programmable value when a match is found between the compare register and the counter. Compare unit 1 is automatically associated to output 1 Compare unit 2 is automatically associated to output 2

This section contains the following APIs:

- *HAL_HRTIM_SimpleOCChannelConfig()*
- *HAL_HRTIM_SimpleOCStart()*
- *HAL_HRTIM_SimpleOCStop()*
- *HAL_HRTIM_SimpleOCStart_IT()*
- *HAL_HRTIM_SimpleOCStop_IT()*
- *HAL_HRTIM_SimpleOCStart_DMA()*
- *HAL_HRTIM_SimpleOCStop_DMA()*

40.2.6 Simple PWM output functions

This section provides functions allowing to:

- Configure simple PWM output channel
- Start simple PWM output
- Stop simple PWM output
- Start simple PWM output and enable interrupt
- Stop simple PWM output and disable interrupt
- Start simple PWM output and enable DMA transfer
- Stop simple PWM output and disable DMA transfer

Note: When a HRTIM timer operates in simple PWM output mode the output level is set to a programmable value when a match is found between the compare register and the counter and reset when the timer period is reached. Duty cycle is determined by the comparison value. Compare unit 1 is automatically associated to output 1 Compare unit 2 is automatically associated to output 2

This section contains the following APIs:

- *HAL_HRTIM_SimplePWMChannelConfig()*
- *HAL_HRTIM_SimplePWMStart()*
- *HAL_HRTIM_SimplePWMStop()*
- *HAL_HRTIM_SimplePWMStart_IT()*
- *HAL_HRTIM_SimplePWMStop_IT()*
- *HAL_HRTIM_SimplePWMStart_DMA()*
- *HAL_HRTIM_SimplePWMStop_DMA()*

40.2.7 Simple input capture functions

This section provides functions allowing to:

- Configure simple input capture channel
- Start simple input capture
- Stop simple input capture
- Start simple input capture and enable interrupt
- Stop simple input capture and disable interrupt
- Start simple input capture and enable DMA transfer
- Stop simple input capture and disable DMA transfer

Note: When a HRTIM timer operates in simple input capture mode the Capture Register (HRTIM_CPT1/2xR) is used to latch the value of the timer counter counter after a transition detected on a given external event input.

This section contains the following APIs:

- ***HAL_HRTIM_SimpleCaptureChannelConfig()***
- ***HAL_HRTIM_SimpleCaptureStart()***
- ***HAL_HRTIM_SimpleCaptureStop()***
- ***HAL_HRTIM_SimpleCaptureStart_IT()***
- ***HAL_HRTIM_SimpleCaptureStop_IT()***
- ***HAL_HRTIM_SimpleCaptureStart_DMA()***
- ***HAL_HRTIM_SimpleCaptureStop_DMA()***

40.2.8 Simple one pulse functions

This section provides functions allowing to:

- Configure one pulse channel
- Start one pulse generation
- Stop one pulse generation
- Start one pulse generation and enable interrupt
- Stop one pulse generation and disable interrupt

Note: When a HRTIM timer operates in simple one pulse mode the timer counter is started in response to transition detected on a given external event input to generate a pulse with a programmable length after a programmable delay.

This section contains the following APIs:

- ***HAL_HRTIM_SimpleOnePulseChannelConfig()***
- ***HAL_HRTIM_SimpleOnePulseStart()***
- ***HAL_HRTIM_SimpleOnePulseStop()***
- ***HAL_HRTIM_SimpleOnePulseStart_IT()***
- ***HAL_HRTIM_SimpleOnePulseStop_IT()***

40.2.9 HRTIM configuration functions

This section provides functions allowing to configure the HRTIM resources shared by all the HRTIM timers operating in waveform mode:

- Configure the burst mode controller
- Configure an external event conditioning
- Configure the external events sampling clock
- Configure a fault conditioning
- Enable or disable fault inputs
- Configure the faults sampling clock
- Configure an ADC trigger

This section contains the following APIs:

- *HAL_HRTIM_BurstModeConfig()*
- *HAL_HRTIM_EventConfig()*
- *HAL_HRTIM_EventPrescalerConfig()*
- *HAL_HRTIM_FaultConfig()*
- *HAL_HRTIM_FaultPrescalerConfig()*
- *HAL_HRTIM_FaultModeCtl()*
- *HAL_HRTIM_ADCTriggerConfig()*

40.2.10 HRTIM timer configuration and control functions

This section provides functions used to configure and control a HRTIM timer operating in waveform mode:

- Configure HRTIM timer general behavior
- Configure HRTIM timer event filtering
- Configure HRTIM timer deadtime insertion
- Configure HRTIM timer chopper mode
- Configure HRTIM timer burst DMA
- Configure HRTIM timer compare unit
- Configure HRTIM timer capture unit
- Configure HRTIM timer output
- Set HRTIM timer output level
- Enable HRTIM timer output
- Disable HRTIM timer output
- Start HRTIM timer
- Stop HRTIM timer
- Start HRTIM timer and enable interrupt
- Stop HRTIM timer and disable interrupt
- Start HRTIM timer and enable DMA transfer
- Stop HRTIM timer and disable DMA transfer
- Enable or disable the burst mode controller
- Start the burst mode controller (by software)
- Trigger a Capture (by software)
- Update the HRTIM timer preloadable registers (by software)
- Reset the HRTIM timer counter (by software)
- Start a burst DMA transfer
- Enable timer register update
- Disable timer register update

This section contains the following APIs:

- *HAL_HRTIM_WaveformTimerConfig()*
- *HAL_HRTIM_TimerEventFilteringConfig()*
- *HAL_HRTIM_DeadTimeConfig()*
- *HAL_HRTIM_ChopperModeConfig()*
- *HAL_HRTIM_BurstDMAConfig()*
- *HAL_HRTIM_WaveformCompareConfig()*
- *HAL_HRTIM_WaveformCaptureConfig()*
- *HAL_HRTIM_WaveformOutputConfig()*
- *HAL_HRTIM_WaveformSetOutputLevel()*
- *HAL_HRTIM_WaveformOutputStart()*
- *HAL_HRTIM_WaveformOutputStop()*
- *HAL_HRTIM_WaveformCountStart()*
- *HAL_HRTIM_WaveformCountStop()*

- *HAL_HRTIM_WaveformCountStart_IT()*
- *HAL_HRTIM_WaveformCountStop_IT()*
- *HAL_HRTIM_WaveformCountStart_DMA()*
- *HAL_HRTIM_WaveformCountStop_DMA()*
- *HAL_HRTIM_BurstModeCtl()*
- *HAL_HRTIM_BurstModeSoftwareTrigger()*
- *HAL_HRTIM_SoftwareCapture()*
- *HAL_HRTIM_SoftwareUpdate()*
- *HAL_HRTIM_SoftwareReset()*
- *HAL_HRTIM_BurstDMATransfer()*
- *HAL_HRTIM_UpdateEnable()*
- *HAL_HRTIM_UpdateDisable()*

40.2.11 Peripheral State functions

This section provides functions used to get HRTIM or HRTIM timer specific information:

- Get HRTIM HAL state
- Get captured value
- Get HRTIM timer output level
- Get HRTIM timer output state
- Get delayed protection status
- Get burst status
- Get current push-pull status
- Get idle push-pull status

This section contains the following APIs:

- *HAL_HRTIM_GetState()*
- *HAL_HRTIM_GetCapturedValue()*
- *HAL_HRTIM_WaveformGetOutputLevel()*
- *HAL_HRTIM_WaveformGetOutputState()*
- *HAL_HRTIM_GetDelayedProtectionStatus()*
- *HAL_HRTIM_GetBurstStatus()*
- *HAL_HRTIM_GetCurrentPushPullStatus()*
- *HAL_HRTIM_GetIdlePushPullStatus()*

40.2.12 Detailed description of functions

HAL_HRTIM_Init

Function name

HAL_StatusTypeDef HAL_HRTIM_Init (HRTIM_HandleTypeDef * hhrtim)

Function description

Initialize a HRTIM instance.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle

Return values

- **HAL:** status

HAL_HRTIM_DeInit

Function name

HAL_StatusTypeDef HAL_HRTIM_DeInit (HRTIM_HandleTypeDef * hhrtim)

Function description

De-initialize a HRTIM instance.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle

Return values

- **HAL:** status

HAL_HRTIM_MspInit

Function name

void HAL_HRTIM_MspInit (HRTIM_HandleTypeDef * hhrtim)

Function description

MSP initialization for a HRTIM instance.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle

Return values

- **None:**

HAL_HRTIM_MspDeInit

Function name

void HAL_HRTIM_MspDeInit (HRTIM_HandleTypeDef * hhrtim)

Function description

MSP de-initialization of a HRTIM instance.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle

Return values

- **None:**

HAL_HRTIM_TimeBaseConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_TimeBaseConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, const HRTIM_TimeBaseCfgTypeDef * pTimeBaseCfg)

Function description

Configure the time base unit of a timer.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **pTimeBaseCfg:** pointer to the time base configuration structure

Return values

- **HAL:** status

Notes

- This function must be called prior starting the timer
- The time-base unit initialization parameters specify: The timer counter operating mode (continuous, one shot), The timer clock prescaler, The timer period, The timer repetition counter.

HAL_HRTIM_SimpleBaseStart

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleBaseStart (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Start the counter of a timer operating in simple time base mode.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index. This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **HAL:** status

HAL_HRTIM_SimpleBaseStop

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleBaseStop (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Stop the counter of a timer operating in simple time base mode.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index. This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **HAL:** status

HAL_HRTIM_SimpleBaseStart_IT

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleBaseStart_IT (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Start the counter of a timer operating in simple time base mode (Timer repetition interrupt is enabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index. This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **HAL:** status

HAL_HRTIM_SimpleBaseStop_IT

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleBaseStop_IT (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Stop the counter of a timer operating in simple time base mode (Timer repetition interrupt is disabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index. This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **HAL:** status

HAL_HRTIM_SimpleBaseStart_DMA

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleBaseStart_DMA (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t SrcAddr, uint32_t DestAddr, uint32_t Length)

Function description

Start the counter of a timer operating in simple time base mode (Timer repetition DMA request is enabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index. This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **SrcAddr:** DMA transfer source address
- **DestAddr:** DMA transfer destination address
- **Length:** The length of data items (data size) to be transferred from source to destination

HAL_HRTIM_SimpleBaseStop_DMA

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleBaseStop_DMA (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Stop the counter of a timer operating in simple time base mode (Timer repetition DMA request is disabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index. This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **HAL:** status

HAL_HRTIM_SimpleOCChannelConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleOCChannelConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t OCChannel, const HRTIM_SimpleOCChannelCfgTypeDef * pSimpleOCChannelCfg)

Function description

Configure an output in simple output compare mode.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **OCChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2
- **pSimpleOCChannelCfg:** pointer to the simple output compare output configuration structure

Return values

- **HAL:** status

Notes

- When the timer operates in simple output compare mode: Output 1 is implicitly controlled by the compare unit 1 Output 2 is implicitly controlled by the compare unit 2 Output Set/Reset crossbar is set according to the selected output compare mode: Toggle: SETxyR = RSTxyR = CMPy Active: SETxyR = CMPy, RSTxyR = 0 Inactive: SETxy =0, RSTxy = CMPy

HAL_HRTIM_SimpleOCStart

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleOCStart (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t OCChannel)

Function description

Start the output compare signal generation on the designed timer output.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **OCChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **HAL:** status

HAL_HRTIM_SimpleOCStop

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleOCStop (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t OCChannel)

Function description

Stop the output compare signal generation on the designed timer output.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **OCChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **HAL:** status

HAL_HRTIM_SimpleOCStart_IT

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleOCStart_IT (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t OCChannel)

Function description

Start the output compare signal generation on the designed timer output (Interrupt is enabled (see note note below)).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **OCChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **HAL:** status

Notes

- Interrupt enabling depends on the chosen output compare mode Output toggle: compare match interrupt is enabled Output set active: output set interrupt is enabled Output set inactive: output reset interrupt is enabled

HAL_HRTIM_SimpleOCStop_IT

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleOCStop_IT (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t OCChannel)

Function description

Stop the output compare signal generation on the designed timer output (Interrupt is disabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **OCChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **HAL:** status

HAL_HRTIM_SimpleOCStart_DMA

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleOCStart_DMA (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t OCChannel, uint32_t SrcAddr, uint32_t DestAddr, uint32_t Length)

Function description

Start the output compare signal generation on the designed timer output (DMA request is enabled (see note below)).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **OCChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2
- **SrcAddr:** DMA transfer source address
- **DestAddr:** DMA transfer destination address
- **Length:** The length of data items (data size) to be transferred from source to destination

Return values

- **HAL:** status

Notes

- DMA request enabling depends on the chosen output compare mode Output toggle: compare match DMA request is enabled Output set active: output set DMA request is enabled Output set inactive: output reset DMA request is enabled

HAL_HRTIM_SimpleOCStop_DMA

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleOCStop_DMA (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t OCChannel)

Function description

Stop the output compare signal generation on the designed timer output (DMA request is disabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **OCChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **HAL:** status

HAL_HRTIM_SimplePWMChannelConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_SimplePWMChannelConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t PWMChannel, const HRTIM_SimplePWMChannelCfgTypeDef * pSimplePWMChannelCfg)

Function description

Configure an output in simple PWM mode.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **PWMChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2
- **pSimplePWMChannelCfg:** pointer to the simple PWM output configuration structure

Return values

- **HAL:** status

Notes

- When the timer operates in simple PWM output mode: Output 1 is implicitly controlled by the compare unit 1 Output 2 is implicitly controlled by the compare unit 2 Output Set/Reset crossbar is set as follows: Output 1: SETx1R = CMP1, RSTx1R = PER Output 2: SETx2R = CMP2, RST2R = PER
- When Simple PWM mode is used the registers preload mechanism is enabled (otherwise the behavior is not guaranteed).

HAL_HRTIM_SimplePWMStart

Function name

HAL_StatusTypeDef HAL_HRTIM_SimplePWMStart (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t PWMChannel)

Function description

Start the PWM output signal generation on the designed timer output.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **PWMChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **HAL:** status

HAL_HRTIM_SimplePWMStop

Function name

HAL_StatusTypeDef HAL_HRTIM_SimplePWMStop (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t PWMChannel)

Function description

Stop the PWM output signal generation on the designed timer output.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **PWMChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **HAL:** status

HAL_HRTIM_SimplePWMStart_IT

Function name

HAL_StatusTypeDef HAL_HRTIM_SimplePWMStart_IT (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t PWMChannel)

Function description

Start the PWM output signal generation on the designed timer output (The compare interrupt is enabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **PWMChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **HAL:** status

HAL_HRTIM_SimplePWMStop_IT

Function name

HAL_StatusTypeDef HAL_HRTIM_SimplePWMStop_IT (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t PWMChannel)

Function description

Stop the PWM output signal generation on the designed timer output (The compare interrupt is disabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **PWMChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **HAL:** status

HAL_HRTIM_SimplePWMStart_DMA

Function name

HAL_StatusTypeDef HAL_HRTIM_SimplePWMStart_DMA (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t PWMChannel, uint32_t SrcAddr, uint32_t DestAddr, uint32_t Length)

Function description

Start the PWM output signal generation on the designed timer output (The compare DMA request is enabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **PWMChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2
- **SrcAddr:** DMA transfer source address
- **DestAddr:** DMA transfer destination address
- **Length:** The length of data items (data size) to be transferred from source to destination

Return values

- **HAL:** status

HAL_HRTIM_SimplePWMStop_DMA

Function name

HAL_StatusTypeDef HAL_HRTIM_SimplePWMStop_DMA (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t PWMChannel)

Function description

Stop the PWM output signal generation on the designed timer output (The compare DMA request is disabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **PWMChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **HAL:** status

HAL_HRTIM_SimpleCaptureChannelConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleCaptureChannelConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t CaptureChannel, const HRTIM_SimpleCaptureChannelCfgTypeDef * pSimpleCaptureChannelCfg)

Function description

Configure a simple capture.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **CaptureChannel:** Capture unit This parameter can be one of the following values:
  - HRTIM_CAPTUREUNIT_1: Capture unit 1
  - HRTIM_CAPTUREUNIT_2: Capture unit 2
- **pSimpleCaptureChannelCfg:** pointer to the simple capture configuration structure

Return values

- **HAL:** status

Notes

- When the timer operates in simple capture mode the capture is triggered by the designated external event and GPIO input is implicitly used as event source. The cature can be triggered by a rising edge, a falling edge or both edges on event channel.

HAL_HRTIM_SimpleCaptureStart

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleCaptureStart (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t CaptureChannel)

Function description

Enable a simple capture on the designed capture unit.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **CaptureChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_CAPTUREUNIT_1: Capture unit 1
  - HRTIM_CAPTUREUNIT_2: Capture unit 2

Return values

- **HAL:** status

Notes

- The external event triggering the capture is available for all timing units. It can be used directly and is active as soon as the timing unit counter is enabled.

HAL_HRTIM_SimpleCaptureStop

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleCaptureStop (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t CaptureChannel)

Function description

Disable a simple capture on the designed capture unit.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **CaptureChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_CAPTUREUNIT_1: Capture unit 1
  - HRTIM_CAPTUREUNIT_2: Capture unit 2

Return values

- **HAL:** status

HAL_HRTIM_SimpleCaptureStart_IT

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleCaptureStart_IT (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t CaptureChannel)

Function description

Enable a simple capture on the designed capture unit (Capture interrupt is enabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **CaptureChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_CAPTUREUNIT_1: Capture unit 1
  - HRTIM_CAPTUREUNIT_2: Capture unit 2

Return values

- **HAL:** status

HAL_HRTIM_SimpleCaptureStop_IT

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleCaptureStop_IT (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t CaptureChannel)

Function description

Disable a simple capture on the designed capture unit (Capture interrupt is disabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **CaptureChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_CAPTUREUNIT_1: Capture unit 1
  - HRTIM_CAPTUREUNIT_2: Capture unit 2

Return values

- **HAL:** status

HAL_HRTIM_SimpleCaptureStart_DMA

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleCaptureStart_DMA (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t CaptureChannel, uint32_t SrcAddr, uint32_t DestAddr, uint32_t Length)

Function description

Enable a simple capture on the designed capture unit (Capture DMA request is enabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **CaptureChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_CAPTUREUNIT_1: Capture unit 1
  - HRTIM_CAPTUREUNIT_2: Capture unit 2
- **SrcAddr:** DMA transfer source address
- **DestAddr:** DMA transfer destination address
- **Length:** The length of data items (data size) to be transferred from source to destination

Return values

- **HAL:** status

HAL_HRTIM_SimpleCaptureStop_DMA

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleCaptureStop_DMA (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t CaptureChannel)

Function description

Disable a simple capture on the designed capture unit (Capture DMA request is disabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **CaptureChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_CAPTUREUNIT_1: Capture unit 1
  - HRTIM_CAPTUREUNIT_2: Capture unit 2

Return values

- **HAL:** status

HAL_HRTIM_SimpleOnePulseChannelConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleOnePulseChannelConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t OnePulseChannel, const HRTIM_SimpleOnePulseChannelCfgTypeDef * pSimpleOnePulseChannelCfg)

Function description

Configure an output simple one pulse mode.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **OnePulseChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2
- **pSimpleOnePulseChannelCfg:** pointer to the simple one pulse output configuration structure

Return values

- **HAL:** status

Notes

- When the timer operates in simple one pulse mode: the timer counter is implicitly started by the reset event, the reset of the timer counter is triggered by the designated external event GPIO input is implicitly used as event source, Output 1 is implicitly controlled by the compare unit 1, Output 2 is implicitly controlled by the compare unit 2. Output Set/Reset crossbar is set as follows: Output 1: SETx1R = CMP1, RSTx1R = PER Output 2: SETx2R = CMP2, RST2R = PER
- If HAL_HRTIM_SimpleOnePulseChannelConfig is called for both timer outputs, the reset event related configuration data provided in the second call will override the reset event related configuration data provided in the first call.

HAL_HRTIM_SimpleOnePulseStart

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleOnePulseStart (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t OnePulseChannel)

Function description

Enable the simple one pulse signal generation on the designed output.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **OnePulseChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **HAL:** status

HAL_HRTIM_SimpleOnePulseStop

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleOnePulseStop (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t OnePulseChannel)

Function description

Disable the simple one pulse signal generation on the designed output.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **OnePulseChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **HAL:** status

HAL_HRTIM_SimpleOnePulseStart_IT

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleOnePulseStart_IT (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t OnePulseChannel)

Function description

Enable the simple one pulse signal generation on the designed output (The compare interrupt is enabled (pulse start)).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **OnePulseChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **HAL:** status

HAL_HRTIM_SimpleOnePulseStop_IT

Function name

HAL_StatusTypeDef HAL_HRTIM_SimpleOnePulseStop_IT (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t OnePulseChannel)

Function description

Disable the simple one pulse signal generation on the designed output (The compare interrupt is disabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **OnePulseChannel:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **HAL:** status

HAL_HRTIM_BurstModeConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_BurstModeConfig (HRTIM_HandleTypeDef * hhrtim, const HRTIM_BurstModeCfgTypeDef * pBurstModeCfg)

Function description

Configure the burst mode feature of the HRTIM.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **pBurstModeCfg:** pointer to the burst mode configuration structure

Return values

- **HAL:** status

Notes

- This function must be called before starting the burst mode controller

HAL_HRTIM_EventConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_EventConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t Event, const HRTIM_EventCfgTypeDef * pEventCfg)

Function description

Configure the conditioning of an external event.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Event:** external event to configure This parameter can be one of the following values:
  - HRTIM_EVENT_NONE: no external Event
  - HRTIM_EVENT_1: External event 1
  - HRTIM_EVENT_2: External event 2
  - HRTIM_EVENT_3: External event 3
  - HRTIM_EVENT_4: External event 4
  - HRTIM_EVENT_5: External event 5
  - HRTIM_EVENT_6: External event 6
  - HRTIM_EVENT_7: External event 7
  - HRTIM_EVENT_8: External event 8
  - HRTIM_EVENT_9: External event 9
  - HRTIM_EVENT_10: External event 10
- **pEventCfg:** pointer to the event conditioning configuration structure

Return values

- **HAL:** status

Notes

- This function must be called before starting the timer

HAL_HRTIM_EventPrescalerConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_EventPrescalerConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t Prescaler)

Function description

Configure the external event conditioning block prescaler.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Prescaler:** Prescaler value This parameter can be one of the following values:
  - HRTIM_EVENTPRESCALER_DIV1: fEEVS=fHRTIM
  - HRTIM_EVENTPRESCALER_DIV2: fEEVS=fHRTIM / 2
  - HRTIM_EVENTPRESCALER_DIV4: fEEVS=fHRTIM / 4
  - HRTIM_EVENTPRESCALER_DIV8: fEEVS=fHRTIM / 8

Return values

- **HAL:** status

Notes

- This function must be called before starting the timer

HAL_HRTIM_FaultConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_FaultConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t Fault, const HRTIM_FaultCfgTypeDef * pFaultCfg)

Function description

Configure the conditioning of fault input.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Fault:** fault input to configure This parameter can be one of the following values:
  - HRTIM_FAULT_1: Fault input 1
  - HRTIM_FAULT_2: Fault input 2
  - HRTIM_FAULT_3: Fault input 3
  - HRTIM_FAULT_4: Fault input 4
  - HRTIM_FAULT_5: Fault input 5
- **pFaultCfg:** pointer to the fault conditioning configuration structure

Return values

- **HAL:** status

Notes

- This function must be called before starting the timer and before enabling faults inputs

HAL_HRTIM_FaultPrescalerConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_FaultPrescalerConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t Prescaler)

Function description

Configure the fault conditioning block prescaler.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Prescaler:** Prescaler value This parameter can be one of the following values:
  - HRTIM_FAULTPRESCALER_DIV1: fFLTS=fHRTIM
  - HRTIM_FAULTPRESCALER_DIV2: fFLTS=fHRTIM / 2
  - HRTIM_FAULTPRESCALER_DIV4: fFLTS=fHRTIM / 4
  - HRTIM_FAULTPRESCALER_DIV8: fFLTS=fHRTIM / 8

Return values

- **HAL:** status

Notes

- This function must be called before starting the timer and before enabling faults inputs

HAL_HRTIM_FaultModeCtl

Function name

void HAL_HRTIM_FaultModeCtl (HRTIM_HandleTypeDef * hhrtim, uint32_t Faults, uint32_t Enable)

Function description

Enable or disables the HRTIMx Fault mode.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Faults:** fault input(s) to enable or disable This parameter can be any combination of the following values:
  - HRTIM_FAULT_1: Fault input 1
  - HRTIM_FAULT_2: Fault input 2
  - HRTIM_FAULT_3: Fault input 3
  - HRTIM_FAULT_4: Fault input 4
  - HRTIM_FAULT_5: Fault input 5
- **Enable:** Fault(s) enabling This parameter can be one of the following values:
  - HRTIM_FAULTMODECTL_ENABLED: Fault(s) enabled
  - HRTIM_FAULTMODECTL_DISABLED: Fault(s) disabled

Return values

- **None:**

HAL_HRTIM_ADCTriggerConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_ADCTriggerConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t ADCTrigger, const HRTIM_ADCTriggerCfgTypeDef * pADCTriggerCfg)

Function description

Configure both the ADC trigger register update source and the ADC trigger source.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **ADCTrigger:** ADC trigger to configure This parameter can be one of the following values:
  - HRTIM_ADCTRIGGER_1: ADC trigger 1
  - HRTIM_ADCTRIGGER_2: ADC trigger 2
  - HRTIM_ADCTRIGGER_3: ADC trigger 3
  - HRTIM_ADCTRIGGER_4: ADC trigger 4
- **pADCTriggerCfg:** pointer to the ADC trigger configuration structure

Return values

- **HAL:** status

Notes

- This function must be called before starting the timer

HAL_HRTIM_WaveformTimerConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_WaveformTimerConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, const HRTIM_TimerCfgTypeDef * pTimerCfg)

Function description

Configure the general behavior of a timer operating in waveform mode.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **pTimerCfg:** pointer to the timer configuration structure

Return values

- **HAL:** status

Notes

- When the timer operates in waveform mode, all the features supported by the HRTIM are available without any limitation.
- This function must be called before starting the timer

HAL_HRTIM_WaveformCompareConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_WaveformCompareConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t CompareUnit, const HRTIM_CompareCfgTypeDef * pCompareCfg)

Function description

Configure the compare unit of a timer operating in waveform mode.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **CompareUnit:** Compare unit to configure This parameter can be one of the following values:
  - HRTIM_COMPAREUNIT_1: Compare unit 1
  - HRTIM_COMPAREUNIT_2: Compare unit 2
  - HRTIM_COMPAREUNIT_3: Compare unit 3
  - HRTIM_COMPAREUNIT_4: Compare unit 4
- **pCompareCfg:** pointer to the compare unit configuration structure

Return values

- **HAL:** status

Notes

- When auto delayed mode is required for compare unit 2 or compare unit 4, application has to configure separately the capture unit. Capture unit to configure in that case depends on the compare unit auto delayed mode is applied to (see below): Auto delayed on output compare 2: capture unit 1 must be configured Auto delayed on output compare 4: capture unit 2 must be configured
- This function must be called before starting the timer

HAL_HRTIM_WaveformCaptureConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_WaveformCaptureConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t CaptureUnit, const HRTIM_CaptureCfgTypeDef * pCaptureCfg)

Function description

Configure the capture unit of a timer operating in waveform mode.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **CaptureUnit:** Capture unit to configure This parameter can be one of the following values:
  - HRTIM_CAPTUREUNIT_1: Capture unit 1
  - HRTIM_CAPTUREUNIT_2: Capture unit 2
- **pCaptureCfg:** pointer to the compare unit configuration structure

Return values

- **HAL:** status

Notes

- This function must be called before starting the timer

HAL_HRTIM_WaveformOutputConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_WaveformOutputConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t Output, const HRTIM_OutputCfgTypeDef * pOutputCfg)

Function description

Configure the output of a timer operating in waveform mode.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **Output:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2
- **pOutputCfg:** pointer to the timer output configuration structure

Return values

- **HAL:** status

Notes

- This function must be called before configuring the timer and after configuring the deadtime insertion feature (if required).

HAL_HRTIM_WaveformSetOutputLevel

Function name

HAL_StatusTypeDef HAL_HRTIM_WaveformSetOutputLevel (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t Output, uint32_t OutputLevel)

Function description

Force the timer output to its active or inactive state.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **Output:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2
- **OutputLevel:** indicates whether the output is forced to its active or inactive level This parameter can be one of the following values:
  - HRTIM_OUTPUTLEVEL_ACTIVE: output is forced to its active level
  - HRTIM_OUTPUTLEVEL_INACTIVE: output is forced to its inactive level

Return values

- **HAL:** status

Notes

- The 'software set/reset trigger' bit in the output set/reset registers is automatically reset by hardware

HAL_HRTIM_TimerEventFilteringConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_TimerEventFilteringConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t Event, const HRTIM_TimerEventFilteringCfgTypeDef * pTimerEventFilteringCfg)

Function description

Configure the event filtering capabilities of a timer (blanking, windowing)

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **Event:** external event for which timer event filtering must be configured This parameter can be one of the following values:
  - HRTIM_EVENT_1: External event 1
  - HRTIM_EVENT_2: External event 2
  - HRTIM_EVENT_3: External event 3
  - HRTIM_EVENT_4: External event 4
  - HRTIM_EVENT_5: External event 5
  - HRTIM_EVENT_6: External event 6
  - HRTIM_EVENT_7: External event 7
  - HRTIM_EVENT_8: External event 8
  - HRTIM_EVENT_9: External event 9
  - HRTIM_EVENT_10: External event 10
- **pTimerEventFilteringCfg:** pointer to the timer event filtering configuration structure

Return values

- **HAL:** status

Notes

- This function must be called before starting the timer

HAL_HRTIM_DeadTimeConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_DeadTimeConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, const HRTIM_DeadTimeCfgTypeDef * pDeadTimeCfg)

Function description

Configure the dead-time insertion feature for a timer.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **pDeadTimeCfg:** pointer to the deadtime insertion configuration structure

Return values

- **HAL:** status

Notes

- This function must be called before starting the timer

HAL_HRTIM_ChopperModeConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_ChopperModeConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, const HRTIM_ChopperModeCfgTypeDef * pChopperModeCfg)

Function description

Configure the chopper mode feature for a timer.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **pChopperModeCfg:** pointer to the chopper mode configuration structure

Return values

- **HAL:** status

Notes

- This function must be called before configuring the timer output(s)

HAL_HRTIM_BurstDMAConfig

Function name

HAL_StatusTypeDef HAL_HRTIM_BurstDMAConfig (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t RegistersToUpdate)

Function description

Configure the burst DMA controller for a timer.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **RegistersToUpdate:** registers to be written by DMA This parameter can be any combination of the following values:
  - HRTIM_BURSTDMA_CR: HRTIM_MCR or HRTIM_TIMxCR
  - HRTIM_BURSTDMA_ICR: HRTIM_MICR or HRTIM_TIMxICR
  - HRTIM_BURSTDMA_DIER: HRTIM_MDIER or HRTIM_TIMxDIER
  - HRTIM_BURSTDMA_CNT: HRTIM_MCNT or HRTIM_TIMxCNT
  - HRTIM_BURSTDMA_PER: HRTIM_MPER or HRTIM_TIMxPER
  - HRTIM_BURSTDMA_REP: HRTIM_MREP or HRTIM_TIMxREP
  - HRTIM_BURSTDMA_CMP1: HRTIM_MCMP1 or HRTIM_TIMxCMP1
  - HRTIM_BURSTDMA_CMP2: HRTIM_MCMP2 or HRTIM_TIMxCMP2
  - HRTIM_BURSTDMA_CMP3: HRTIM_MCMP3 or HRTIM_TIMxCMP3
  - HRTIM_BURSTDMA_CMP4: HRTIM_MCMP4 or HRTIM_TIMxCMP4
  - HRTIM_BURSTDMA_DTR: HRTIM_TIMxDTR
  - HRTIM_BURSTDMA_SET1R: HRTIM_TIMxSET1R
  - HRTIM_BURSTDMA_RST1R: HRTIM_TIMxRST1R
  - HRTIM_BURSTDMA_SET2R: HRTIM_TIMxSET2R
  - HRTIM_BURSTDMA_RST2R: HRTIM_TIMxRST2R
  - HRTIM_BURSTDMA_EEFR1: HRTIM_TIMxEEFR1
  - HRTIM_BURSTDMA_EEFR2: HRTIM_TIMxEEFR2
  - HRTIM_BURSTDMA_RSTR: HRTIM_TIMxRSTR
  - HRTIM_BURSTDMA_CHPR: HRTIM_TIMxCHPR
  - HRTIM_BURSTDMA_OUTR: HRTIM_TIMxOUTR
  - HRTIM_BURSTDMA_FLTR: HRTIM_TIMxFLTR

Return values

- **HAL:** status

Notes

- This function must be called before starting the timer

HAL_HRTIM_WaveformCountStart

Function name

HAL_StatusTypeDef HAL_HRTIM_WaveformCountStart (HRTIM_HandleTypeDef * hhrtim, uint32_t Timers)

Function description

Start the counter of the designated timer(s) operating in waveform mode Timers can be combined (ORed) to allow for simultaneous counter start.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Timers:** Timer counter(s) to start This parameter can be any combination of the following values:
  - HRTIM_TIMERID_MASTER
  - HRTIM_TIMERID_TIMER_A
  - HRTIM_TIMERID_TIMER_B
  - HRTIM_TIMERID_TIMER_C
  - HRTIM_TIMERID_TIMER_D
  - HRTIM_TIMERID_TIMER_E

Return values

- **HAL:** status

HAL_HRTIM_WaveformCountStop

Function name

HAL_StatusTypeDef HAL_HRTIM_WaveformCountStop (HRTIM_HandleTypeDef * hhrtim, uint32_t Timers)

Function description

Stop the counter of the designated timer(s) operating in waveform mode Timers can be combined (ORed) to allow for simultaneous counter stop.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Timers:** Timer counter(s) to stop This parameter can be any combination of the following values:
  - HRTIM_TIMERID_MASTER
  - HRTIM_TIMERID_TIMER_A
  - HRTIM_TIMERID_TIMER_B
  - HRTIM_TIMERID_TIMER_C
  - HRTIM_TIMERID_TIMER_D
  - HRTIM_TIMERID_TIMER_E

Return values

- **HAL:** status

Notes

- The counter of a timer is stopped only if all timer outputs are disabled

HAL_HRTIM_WaveformCountStart_IT

Function name

HAL_StatusTypeDef HAL_HRTIM_WaveformCountStart_IT (HRTIM_HandleTypeDef * hhrtim, uint32_t Timers)

Function description

Start the counter of the designated timer(s) operating in waveform mode Timers can be combined (ORed) to allow for simultaneous counter start.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Timers:** Timer counter(s) to start This parameter can be any combination of the following values:
  - HRTIM_TIMERID_MASTER
  - HRTIM_TIMERID_TIMER_A
  - HRTIM_TIMERID_TIMER_B
  - HRTIM_TIMERID_TIMER_C
  - HRTIM_TIMERID_TIMER_D
  - HRTIM_TIMERID_TIMER_E

Return values

- **HAL:** status

Notes

- HRTIM interrupts (e.g. faults interrupts) and interrupts related to the timers to start are enabled within this function. Interrupts to enable are selected through HAL_HRTIM_WaveformTimerConfig function.

HAL_HRTIM_WaveformCountStop_IT

Function name

HAL_StatusTypeDef HAL_HRTIM_WaveformCountStop_IT (HRTIM_HandleTypeDef * hhrtim, uint32_t Timers)

Function description

Stop the counter of the designated timer(s) operating in waveform mode Timers can be combined (ORed) to allow for simultaneous counter stop.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Timers:** Timer counter(s) to stop This parameter can be any combination of the following values:
  - HRTIM_TIMERID_MASTER
  - HRTIM_TIMERID_TIMER_A
  - HRTIM_TIMERID_TIMER_B
  - HRTIM_TIMERID_TIMER_C
  - HRTIM_TIMERID_TIMER_D
  - HRTIM_TIMERID_TIMER_E

Return values

- **HAL:** status

Notes

- The counter of a timer is stopped only if all timer outputs are disabled
- All enabled timer related interrupts are disabled.

HAL_HRTIM_WaveformCountStart_DMA

Function name

HAL_StatusTypeDef HAL_HRTIM_WaveformCountStart_DMA (HRTIM_HandleTypeDef * hhrtim, uint32_t Timers)

Function description

Start the counter of the designated timer(s) operating in waveform mode Timers can be combined (ORed) to allow for simultaneous counter start.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Timers:** Timer counter(s) to start This parameter can be any combination of the following values:
  - HRTIM_TIMERID_MASTER
  - HRTIM_TIMERID_TIMER_A
  - HRTIM_TIMERID_TIMER_B
  - HRTIM_TIMERID_TIMER_C
  - HRTIM_TIMERID_TIMER_D
  - HRTIM_TIMERID_TIMER_E

Return values

- **HAL:** status

Notes

- This function enables the dma request(s) mentioned in the timer configuration data structure for every timers to start.
- The source memory address, the destination memory address and the size of each DMA transfer are specified at timer configuration time (see HAL_HRTIM_WaveformTimerConfig)

HAL_HRTIM_WaveformCountStop_DMA

Function name

HAL_StatusTypeDef HAL_HRTIM_WaveformCountStop_DMA (HRTIM_HandleTypeDef * hhrtim, uint32_t Timers)

Function description

Stop the counter of the designated timer(s) operating in waveform mode Timers can be combined (ORed) to allow for simultaneous counter stop.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Timers:** Timer counter(s) to stop This parameter can be any combination of the following values:
  - HRTIM_TIMERID_MASTER
  - HRTIM_TIMERID_TIMER_A
  - HRTIM_TIMERID_TIMER_B
  - HRTIM_TIMERID_TIMER_C
  - HRTIM_TIMERID_TIMER_D
  - HRTIM_TIMERID_TIMER_E

Return values

- **HAL:** status

Notes

- The counter of a timer is stopped only if all timer outputs are disabled
- All enabled timer related DMA requests are disabled.

HAL_HRTIM_WaveformOutputStart

Function name

HAL_StatusTypeDef HAL_HRTIM_WaveformOutputStart (HRTIM_HandleTypeDef * hhrtim, uint32_t OutputsToStart)

Function description

Enable the generation of the waveform signal on the designated output(s) Outputs can be combined (ORed) to allow for simultaneous output enabling.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **OutputsToStart:** Timer output(s) to enable This parameter can be any combination of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **HAL:** status

HAL_HRTIM_WaveformOutputStop

Function name

HAL_StatusTypeDef HAL_HRTIM_WaveformOutputStop (HRTIM_HandleTypeDef * hhrtim, uint32_t OutputsToStop)

Function description

Disable the generation of the waveform signal on the designated output(s) Outputs can be combined (ORed) to allow for simultaneous output disabling.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **OutputsToStop:** Timer output(s) to disable This parameter can be any combination of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **HAL:** status

HAL_HRTIM_BurstModeCtl

Function name

HAL_StatusTypeDef HAL_HRTIM_BurstModeCtl (HRTIM_HandleTypeDef * hhrtim, uint32_t Enable)

Function description

Enable or disables the HRTIM burst mode controller.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Enable:** Burst mode controller enabling This parameter can be one of the following values:
  - HRTIM_BURSTMODECTL_ENABLED: Burst mode enabled
  - HRTIM_BURSTMODECTL_DISABLED: Burst mode disabled

Return values

- **HAL:** status

Notes

- This function must be called after starting the timer(s)

HAL_HRTIM_BurstModeSoftwareTrigger

Function name

HAL_StatusTypeDef HAL_HRTIM_BurstModeSoftwareTrigger (HRTIM_HandleTypeDef * hhrtim)

Function description

Trig the burst mode operation.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle

Return values

- **HAL:** status

HAL_HRTIM_SoftwareCapture

Function name

HAL_StatusTypeDef HAL_HRTIM_SoftwareCapture (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t CaptureUnit)

Function description

Trig a software capture on the designed capture unit.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **CaptureUnit:** Capture unit to trig This parameter can be one of the following values:
  - HRTIM_CAPTUREUNIT_1: Capture unit 1
  - HRTIM_CAPTUREUNIT_2: Capture unit 2

Return values

- **HAL:** status

Notes

- The 'software capture' bit in the capure configuration register is automatically reset by hardware

HAL_HRTIM_SoftwareUpdate

Function name

HAL_StatusTypeDef HAL_HRTIM_SoftwareUpdate (HRTIM_HandleTypeDef * hhrtim, uint32_t Timers)

Function description

Trig the update of the registers of one or several timers.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Timers:** timers concerned with the software register update This parameter can be any combination of the following values:
  - HRTIM_TIMERUPDATE_MASTER
  - HRTIM_TIMERUPDATE_A
  - HRTIM_TIMERUPDATE_B
  - HRTIM_TIMERUPDATE_C
  - HRTIM_TIMERUPDATE_D
  - HRTIM_TIMERUPDATE_E

Return values

- **HAL:** status

Notes

- The 'software update' bits in the HRTIM control register 2 register are automatically reset by hardware

HAL_HRTIM_SoftwareReset

Function name

HAL_StatusTypeDef HAL_HRTIM_SoftwareReset (HRTIM_HandleTypeDef * hhrtim, uint32_t Timers)

Function description

Trig the reset of one or several timers.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Timers:** timers concerned with the software counter reset This parameter can be any combination of the following values:
  - HRTIM_TIMERRESET_MASTER
  - HRTIM_TIMERRESET_TIMER_A
  - HRTIM_TIMERRESET_TIMER_B
  - HRTIM_TIMERRESET_TIMER_C
  - HRTIM_TIMERRESET_TIMER_D
  - HRTIM_TIMERRESET_TIMER_E

Return values

- **HAL:** status

Notes

- The 'software reset' bits in the HRTIM control register 2 are automatically reset by hardware

HAL_HRTIM_BurstDMATransfer

Function name

HAL_StatusTypeDef HAL_HRTIM_BurstDMATransfer (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t BurstBufferAddress, uint32_t BurstBufferLength)

Function description

Start a burst DMA operation to update HRTIM control registers content.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **BurstBufferAddress:** address of the buffer the HRTIM control registers content will be updated from.
- **BurstBufferLength:** size (in WORDS) of the burst buffer.

Return values

- **HAL:** status

Notes

- The TimerIdx parameter determines the dma channel to be used by the DMA burst controller (see below) HRTIM_TIMERINDEX_MASTER: DMA channel 2 is used by the DMA burst controller HRTIM_TIMERINDEX_TIMER_A: DMA channel 3 is used by the DMA burst controller HRTIM_TIMERINDEX_TIMER_B: DMA channel 4 is used by the DMA burst controller HRTIM_TIMERINDEX_TIMER_C: DMA channel 5 is used by the DMA burst controller HRTIM_TIMERINDEX_TIMER_D: DMA channel 6 is used by the DMA burst controller HRTIM_TIMERINDEX_TIMER_E: DMA channel 7 is used by the DMA burst controller

HAL_HRTIM_UpdateEnable

Function name

HAL_StatusTypeDef HAL_HRTIM_UpdateEnable (HRTIM_HandleTypeDef * hhrtim, uint32_t Timers)

Function description

Enable the transfer from preload to active registers for one or several timing units (including master timer).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Timers:** Timer(s) concerned by the register preload enabling command This parameter can be any combination of the following values:
  - HRTIM_TIMERUPDATE_MASTER
  - HRTIM_TIMERUPDATE_A
  - HRTIM_TIMERUPDATE_B
  - HRTIM_TIMERUPDATE_C
  - HRTIM_TIMERUPDATE_D
  - HRTIM_TIMERUPDATE_E

Return values

- **HAL:** status

HAL_HRTIM_UpdateDisable

Function name

HAL_StatusTypeDef HAL_HRTIM_UpdateDisable (HRTIM_HandleTypeDef * hhrtim, uint32_t Timers)

Function description

Disable the transfer from preload to active registers for one or several timing units (including master timer).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **Timers:** Timer(s) concerned by the register preload disabling command This parameter can be any combination of the following values:
  - HRTIM_TIMERUPDATE_MASTER
  - HRTIM_TIMERUPDATE_A
  - HRTIM_TIMERUPDATE_B
  - HRTIM_TIMERUPDATE_C
  - HRTIM_TIMERUPDATE_D
  - HRTIM_TIMERUPDATE_E

Return values

- **HAL:** status

HAL_HRTIM_GetState

Function name

HAL_HRTIM_StateTypeDef HAL_HRTIM_GetState (const HRTIM_HandleTypeDef * hhrtim)

Function description

Return the HRTIM HAL state.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle

Return values

- **HAL:** state

HAL_HRTIM_GetCapturedValue

Function name

uint32_t HAL_HRTIM_GetCapturedValue (const HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t CaptureUnit)

Function description

Return actual value of the capture register of the designated capture unit.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **CaptureUnit:** Capture unit to trig This parameter can be one of the following values:
  - HRTIM_CAPTUREUNIT_1: Capture unit 1
  - HRTIM_CAPTUREUNIT_2: Capture unit 2

Return values

- **Captured:** value

HAL_HRTIM_WaveformGetOutputLevel

Function name

uint32_t HAL_HRTIM_WaveformGetOutputLevel (const HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t Output)

Function description

Return actual level (active or inactive) of the designated output.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **Output:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **Output:** level

Notes

- Returned output level is taken before the output stage (chopper, polarity).

HAL_HRTIM_WaveformGetOutputState

Function name

uint32_t HAL_HRTIM_WaveformGetOutputState (const HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t Output)

Function description

Return actual state (RUN, IDLE, FAULT) of the designated output.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **Output:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **Output:** state

HAL_HRTIM_GetDelayedProtectionStatus

Function name

uint32_t HAL_HRTIM_GetDelayedProtectionStatus (const HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx, uint32_t Output)

Function description

Return the level (active or inactive) of the designated output when the delayed protection was triggered.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E
- **Output:** Timer output This parameter can be one of the following values:
  - HRTIM_OUTPUT_TA1: Timer A - Output 1
  - HRTIM_OUTPUT_TA2: Timer A - Output 2
  - HRTIM_OUTPUT_TB1: Timer B - Output 1
  - HRTIM_OUTPUT_TB2: Timer B - Output 2
  - HRTIM_OUTPUT_TC1: Timer C - Output 1
  - HRTIM_OUTPUT_TC2: Timer C - Output 2
  - HRTIM_OUTPUT_TD1: Timer D - Output 1
  - HRTIM_OUTPUT_TD2: Timer D - Output 2
  - HRTIM_OUTPUT_TE1: Timer E - Output 1
  - HRTIM_OUTPUT_TE2: Timer E - Output 2

Return values

- **Delayed:** protection status

HAL_HRTIM_GetBurstStatus

Function name

uint32_t HAL_HRTIM_GetBurstStatus (const HRTIM_HandleTypeDef * hhrtim)

Function description

Return the actual status (active or inactive) of the burst mode controller.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle

Return values

- **Burst:** mode controller status

HAL_HRTIM_GetCurrentPushPullStatus

Function name

uint32_t HAL_HRTIM_GetCurrentPushPullStatus (const HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Indicate on which output the signal is currently active (when the push pull mode is enabled).

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **Burst:** mode controller status

HAL_HRTIM_GetIdlePushPullStatus

Function name

uint32_t HAL_HRTIM_GetIdlePushPullStatus (const HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Indicate on which output the signal was applied, in push-pull mode, balanced fault mode or delayed idle mode, when the protection was triggered.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **Idle:** Push Pull Status

HAL_HRTIM_IRQHandler

Function name

void HAL_HRTIM_IRQHandler (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

This function handles HRTIM interrupt request.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be any value of HRTIM_Timer_Index

Return values

- **None:**

HAL_HRTIM_Fault1Callback

Function name

void HAL_HRTIM_Fault1Callback (HRTIM_HandleTypeDef * hhrtim)

Function description

Callback function invoked when a fault 1 interrupt occurred.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle *

Return values

- **None:**
- **None:**

HAL_HRTIM_Fault2Callback

Function name

void HAL_HRTIM_Fault2Callback (HRTIM_HandleTypeDef * hhrtim)

Function description

Callback function invoked when a fault 2 interrupt occurred.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle

Return values

- **None:**

HAL_HRTIM_Fault3Callback

Function name

void HAL_HRTIM_Fault3Callback (HRTIM_HandleTypeDef * hhrtim)

Function description

Callback function invoked when a fault 3 interrupt occurred.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle

Return values

- **None:**

HAL_HRTIM_Fault4Callback

Function name

void HAL_HRTIM_Fault4Callback (HRTIM_HandleTypeDef * hhrtim)

Function description

Callback function invoked when a fault 4 interrupt occurred.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle

Return values

- **None:**

HAL_HRTIM_Fault5Callback

Function name

void HAL_HRTIM_Fault5Callback (HRTIM_HandleTypeDef * hhrtim)

Function description

Callback function invoked when a fault 5 interrupt occurred.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle

Return values

- **None:**

HAL_HRTIM_SystemFaultCallback

Function name

void HAL_HRTIM_SystemFaultCallback (HRTIM_HandleTypeDef * hhrtim)

Function description

Callback function invoked when a system fault interrupt occurred.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle

Return values

- **None:**

HAL_HRTIM_BurstModePeriodCallback

Function name

void HAL_HRTIM_BurstModePeriodCallback (HRTIM_HandleTypeDef * hhrtim)

Function description

Callback function invoked when the end of the burst mode period is reached.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle

Return values

- **None:**

HAL_HRTIM_SynchronizationEventCallback

Function name

void HAL_HRTIM_SynchronizationEventCallback (HRTIM_HandleTypeDef * hhrtim)

Function description

Callback function invoked when a synchronization input event is received.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle

Return values

- **None:**

HAL_HRTIM_RegistersUpdateCallback

Function name

void HAL_HRTIM_RegistersUpdateCallback (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Callback function invoked when timer registers are updated.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **None:**

HAL_HRTIM_RepetitionEventCallback

Function name

void HAL_HRTIM_RepetitionEventCallback (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Callback function invoked when timer repetition period has elapsed.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **None:**

HAL_HRTIM_Compare1EventCallback

Function name

void HAL_HRTIM_Compare1EventCallback (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Callback function invoked when the timer counter matches the value programmed in the compare 1 register.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **None:**

HAL_HRTIM_Compare2EventCallback

Function name

void HAL_HRTIM_Compare2EventCallback (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Callback function invoked when the timer counter matches the value programmed in the compare 2 register.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **None:**

HAL_HRTIM_Compare3EventCallback

Function name

void HAL_HRTIM_Compare3EventCallback (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Callback function invoked when the timer counter matches the value programmed in the compare 3 register.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **None:**

HAL_HRTIM_Compare4EventCallback

Function name

void HAL_HRTIM_Compare4EventCallback (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Callback function invoked when the timer counter matches the value programmed in the compare 4 register.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **None:**

HAL_HRTIM_Capture1EventCallback

Function name

void HAL_HRTIM_Capture1EventCallback (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Callback function invoked when the timer x capture 1 event occurs.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **None:**

HAL_HRTIM_Capture2EventCallback

Function name

void HAL_HRTIM_Capture2EventCallback (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Callback function invoked when the timer x capture 2 event occurs.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **None:**

HAL_HRTIM_DelayedProtectionCallback

Function name

void HAL_HRTIM_DelayedProtectionCallback (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Callback function invoked when the delayed idle or balanced idle mode is entered.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **None:**

HAL_HRTIM_CounterResetCallback

Function name

void HAL_HRTIM_CounterResetCallback (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Callback function invoked when the timer x counter reset/roll-over event occurs.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **None:**

HAL_HRTIM_Output1SetCallback

Function name

void HAL_HRTIM_Output1SetCallback (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Callback function invoked when the timer x output 1 is set.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **None:**

HAL_HRTIM_Output1ResetCallback

Function name

void HAL_HRTIM_Output1ResetCallback (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Callback function invoked when the timer x output 1 is reset.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **None:**

HAL_HRTIM_Output2SetCallback

Function name

void HAL_HRTIM_Output2SetCallback (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Callback function invoked when the timer x output 2 is set.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **None:**

HAL_HRTIM_Output2ResetCallback

Function name

void HAL_HRTIM_Output2ResetCallback (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Callback function invoked when the timer x output 2 is reset.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **None:**

HAL_HRTIM_BurstDMATransferCallback

Function name

void HAL_HRTIM_BurstDMATransferCallback (HRTIM_HandleTypeDef * hhrtim, uint32_t TimerIdx)

Function description

Callback function invoked when a DMA burst transfer is completed.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **TimerIdx:** Timer index This parameter can be one of the following values:
  - HRTIM_TIMERINDEX_MASTER for master timer
  - HRTIM_TIMERINDEX_TIMER_A for timer A
  - HRTIM_TIMERINDEX_TIMER_B for timer B
  - HRTIM_TIMERINDEX_TIMER_C for timer C
  - HRTIM_TIMERINDEX_TIMER_D for timer D
  - HRTIM_TIMERINDEX_TIMER_E for timer E

Return values

- **None:**

HAL_HRTIM_ErrorCallback

Function name

void HAL_HRTIM_ErrorCallback (HRTIM_HandleTypeDef * hhrtim)

Function description

Callback function invoked when a DMA error occurs.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle

Return values

- **None:**

HAL_HRTIM_RegisterCallback

Function name

HAL_StatusTypeDef HAL_HRTIM_RegisterCallback (HRTIM_HandleTypeDef * hhrtim, HAL_HRTIM_CallbackIDTypeDef CallbackID, pHRTIM_CallbackTypeDef pCallback)

Function description

HRTIM callback function registration.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **CallbackID:** ID of the HRTIM callback function to register This parameter can be one of the following values:
  - HAL_HRTIM_FAULT1CALLBACK_CB_ID
  - HAL_HRTIM_FAULT2CALLBACK_CB_ID
  - HAL_HRTIM_FAULT3CALLBACK_CB_ID
  - HAL_HRTIM_FAULT4CALLBACK_CB_ID
  - HAL_HRTIM_FAULT5CALLBACK_CB_ID
  - HAL_HRTIM_SYSTEMFAULTCALLBACK_CB_ID
  - HAL_HRTIM_BURSTMODEPERIODCALLBACK_CB_ID
  - HAL_HRTIM_SYNCHRONIZATIONEVENTCALLBACK_CB_ID
  - HAL_HRTIM_ERRORCALLBACK_CB_ID
  - HAL_HRTIM_MSPINIT_CB_ID
  - HAL_HRTIM_MSPDEINIT_CB_ID
- **pCallback:** Callback function pointer

Return values

- **HAL:** status

HAL_HRTIM_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_HRTIM_UnRegisterCallback (HRTIM_HandleTypeDef * hhrtim, HAL_HRTIM_CallbackIDTypeDef CallbackID)

Function description

HRTIM callback function un-registration.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **CallbackID:** ID of the HRTIM callback function to unregister This parameter can be one of the following values:
  - HAL_HRTIM_FAULT1CALLBACK_CB_ID
  - HAL_HRTIM_FAULT2CALLBACK_CB_ID
  - HAL_HRTIM_FAULT3CALLBACK_CB_ID
  - HAL_HRTIM_FAULT4CALLBACK_CB_ID
  - HAL_HRTIM_FAULT5CALLBACK_CB_ID
  - HAL_HRTIM_SYSTEMFAULTCALLBACK_CB_ID
  - HAL_HRTIM_BURSTMODEPERIODCALLBACK_CB_ID
  - HAL_HRTIM_SYNCHRONIZATIONEVENTCALLBACK_CB_ID
  - HAL_HRTIM_ERRORCALLBACK_CB_ID
  - HAL_HRTIM_MSPINIT_CB_ID
  - HAL_HRTIM_MSPDEINIT_CB_ID

Return values

- **HAL:** status

HAL_HRTIM_TIMxRegisterCallback

Function name

HAL_StatusTypeDef HAL_HRTIM_TIMxRegisterCallback (HRTIM_HandleTypeDef * hhrtim, HAL_HRTIM_CallbackIDTypeDef CallbackID, pHRTIM_TIMxCallbackTypeDef pCallback)

Function description

HRTIM Timer x callback function registration.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **CallbackID:** ID of the HRTIM Timer x callback function to register This parameter can be one of the following values:
  - HAL_HRTIM_REGISTERSUPDATECALLBACK_CB_ID
  - HAL_HRTIM_REPETITIONEVENTCALLBACK_CB_ID
  - HAL_HRTIM_COMPARE1EVENTCALLBACK_CB_ID
  - HAL_HRTIM_COMPARE2EVENTCALLBACK_CB_ID
  - HAL_HRTIM_COMPARE3EVENTCALLBACK_CB_ID
  - HAL_HRTIM_COMPARE4EVENTCALLBACK_CB_ID
  - HAL_HRTIM_CAPTURE1EVENTCALLBACK_CB_ID
  - HAL_HRTIM_CAPTURE2EVENTCALLBACK_CB_ID
  - HAL_HRTIM_DELAYEDPROTECTIONCALLBACK_CB_ID
  - HAL_HRTIM_COUNTERRESETCALLBACK_CB_ID
  - HAL_HRTIM_OUTPUT1SETCALLBACK_CB_ID
  - HAL_HRTIM_OUTPUT1RESETCALLBACK_CB_ID
  - HAL_HRTIM_OUTPUT2SETCALLBACK_CB_ID
  - HAL_HRTIM_OUTPUT2RESETCALLBACK_CB_ID
  - HAL_HRTIM_BURSTDMATRANSFERCALLBACK_CB_ID
- **pCallback:** Callback function pointer

Return values

- **HAL:** status

HAL_HRTIM_TIMxUnRegisterCallback

Function name

HAL_StatusTypeDef HAL_HRTIM_TIMxUnRegisterCallback (HRTIM_HandleTypeDef * hhrtim, HAL_HRTIM_CallbackIDTypeDef CallbackID)

Function description

HRTIM Timer x callback function un-registration.

Parameters

- **hhrtim:** pointer to HAL HRTIM handle
- **CallbackID:** ID of the HRTIM callback Timer x function to unregister This parameter can be one of the following values:
  - HAL_HRTIM_REGISTERSUPDATECALLBACK_CB_ID
  - HAL_HRTIM_REPETITIONEVENTCALLBACK_CB_ID
  - HAL_HRTIM_COMPARE1EVENTCALLBACK_CB_ID
  - HAL_HRTIM_COMPARE2EVENTCALLBACK_CB_ID
  - HAL_HRTIM_COMPARE3EVENTCALLBACK_CB_ID
  - HAL_HRTIM_COMPARE4EVENTCALLBACK_CB_ID
  - HAL_HRTIM_CAPTURE1EVENTCALLBACK_CB_ID
  - HAL_HRTIM_CAPTURE2EVENTCALLBACK_CB_ID
  - HAL_HRTIM_DELAYEDPROTECTIONCALLBACK_CB_ID
  - HAL_HRTIM_COUNTERRESETCALLBACK_CB_ID
  - HAL_HRTIM_OUTPUT1SETCALLBACK_CB_ID
  - HAL_HRTIM_OUTPUT1RESETCALLBACK_CB_ID
  - HAL_HRTIM_OUTPUT2SETCALLBACK_CB_ID
  - HAL_HRTIM_OUTPUT2RESETCALLBACK_CB_ID
  - HAL_HRTIM_BURSTDMATRANSFERCALLBACK_CB_ID

Return values

- **HAL:** status

40.3 HRTIM Firmware driver defines

The following section lists the various define and macros of the module.

40.3.1 HRTIM

HRTIM

HRTIM ADC Trigger

HRTIM_ADCTRIGGER_1

ADC trigger 1 identifier

HRTIM_ADCTRIGGER_2

ADC trigger 2 identifier

HRTIM_ADCTRIGGER_3

ADC trigger 3 identifier

HRTIM_ADCTRIGGER_4

ADC trigger 4 identifier

IS_HRTIM_ADCTRIGGER

HRTIM ADC Trigger Event

HRTIM_ADCTRIGGEREVENT13_NONE

No ADC trigger event

HRTIM_ADCTRIGGEREVENT13_MASTER_CMP1

ADC Trigger on master compare 1U

HRTIM_ADCTRIGGEREVENT13_MASTER_CMP2

ADC Trigger on master compare 2U

HRTIM_ADCTRIGGEREVENT13_MASTER_CMP3

ADC Trigger on master compare 3U

HRTIM_ADCTRIGGEREVENT13_MASTER_CMP4

ADC Trigger on master compare 4U

HRTIM_ADCTRIGGEREVENT13_MASTER_PERIOD

ADC Trigger on master period

HRTIM_ADCTRIGGEREVENT13_EVENT_1

ADC Trigger on external event 1U

HRTIM_ADCTRIGGEREVENT13_EVENT_2

ADC Trigger on external event 2U

HRTIM_ADCTRIGGEREVENT13_EVENT_3

ADC Trigger on external event 3U

HRTIM_ADCTRIGGEREVENT13_EVENT_4

ADC Trigger on external event 4U

HRTIM_ADCTRIGGEREVENT13_EVENT_5

ADC Trigger on external event 5U

HRTIM_ADCTRIGGEREVENT13_TIMERA_CMP2

ADC Trigger on Timer A compare 2U

HRTIM_ADCTRIGGEREVENT13_TIMERA_CMP3

ADC Trigger on Timer A compare 3U

HRTIM_ADCTRIGGEREVENT13_TIMERA_CMP4

ADC Trigger on Timer A compare 4U

HRTIM_ADCTRIGGEREVENT13_TIMERA_PERIOD

ADC Trigger on Timer A period

HRTIM_ADCTRIGGEREVENT13_TIMERA_RESET

ADC Trigger on Timer A reset

HRTIM_ADCTRIGGEREVENT13_TIMERB_CMP2

ADC Trigger on Timer B compare 2U

HRTIM_ADCTRIGGEREVENT13_TIMERB_CMP3

ADC Trigger on Timer B compare 3U

HRTIM_ADCTRIGGEREVENT13_TIMERB_CMP4

ADC Trigger on Timer B compare 4U

HRTIM_ADCTRIGGEREVENT13_TIMERB_PERIOD

ADC Trigger on Timer B period

HRTIM_ADCTRIGGEREVENT13_TIMERB_RESET

ADC Trigger on Timer B reset

HRTIM_ADCTRIGGEREVENT13_TIMERC_CMP2

ADC Trigger on Timer C compare 2U

HRTIM_ADCTRIGGEREVENT13_TIMERC_CMP3

ADC Trigger on Timer C compare 3U

HRTIM_ADCTRIGGEREVENT13_TIMERC_CMP4

ADC Trigger on Timer C compare 4U

HRTIM_ADCTRIGGEREVENT13_TIMERC_PERIOD

ADC Trigger on Timer C period

HRTIM_ADCTRIGGEREVENT13_TIMERD_CMP2

ADC Trigger on Timer D compare 2U

HRTIM_ADCTRIGGEREVENT13_TIMERD_CMP3

ADC Trigger on Timer D compare 3U

HRTIM Compare Unit

HRTIM_COMPAREUNIT_1

Compare unit 1 identifier

HRTIM_COMPAREUNIT_2

Compare unit 2 identifier

HRTIM_COMPAREUNIT_3

Compare unit 3 identifier

HRTIM_COMPAREUNIT_4

Compare unit 4 identifier

HRTIM Compare Unit Auto Delayed Mode

HRTIM_AUTODELAYEDMODE_REGULAR

standard compare mode

HRTIM_AUTODELAYEDMODE_AUTODELAYED_NOTIMEOUT

Compare event generated only if a capture has occurred

HRTIM_AUTODELAYEDMODE_AUTODELAYED_TIMEOUTCMP1

Compare event generated if a capture has occurred or after a Compare 1 match (timeout if capture event is missing)

HRTIM_AUTODELAYEDMODE_AUTODELAYED_TIMEOUTCMP3

Compare event generated if a capture has occurred or after a Compare 3 match (timeout if capture event is missing)

HRTIM Counter Operating Mode

HRTIM_MODE_CONTINUOUS

The timer operates in continuous (free-running) mode

HRTIM_MODE_SINGLESHOT

The timer operates in non retriggerable single-shot mode

HRTIM_MODE_SINGLESHOT_RETRIGGERABLE

The timer operates in retriggerable single-shot mode

HRTIM Current Push Pull Status

HRTIM_PUSHPULL_CURRENTSTATUS_OUTPUT1

Signal applied on output 1 and output 2 forced inactive

HRTIM_PUSHPULL_CURRENTSTATUS_OUTPUT2

Signal applied on output 2 and output 1 forced inactive

HRTIM DAC Synchronization

HRTIM_DACSYNC_NONE

No DAC synchronization event generated

HRTIM_DACSYNC_DACTRIGOUT_1

DAC synchronization event generated on DACTrigOut1 output upon timer update

HRTIM_DACSYNC_DACTRIGOUT_2

DAC synchronization event generated on DACTrigOut2 output upon timer update

HRTIM_DACSYNC_DACTRIGOUT_3

DAC update generated on DACTrigOut3 output upon timer update

HRTIM Dead-time Falling Lock

HRTIM_TIMDEADTIME_FALLINGLOCK_WRITE

Dead-time falling value and sign is writeable

HRTIM_TIMDEADTIME_FALLINGLOCK_READONLY

Dead-time falling value and sign is read-only

HRTIM Dead-time Falling Sign

HRTIM_TIMDEADTIME_FALLINGSIGN_POSITIVE

Positive dead-time on falling edge

HRTIM_TIMDEADTIME_FALLINGSIGN_NEGATIVE

Negative dead-time on falling edge

HRTIM Dead-time Falling Sign Lock

HRTIM_TIMDEADTIME_FALLINGSIGNLOCK_WRITE

Dead-time falling sign is writeable

HRTIM_TIMDEADTIME_FALLINGSIGNLOCK_READONLY

Dead-time falling sign is read-only

HRTIM Dead-time Prescaler Ratio

HRTIM_TIMDEADTIME_PRESCALERRATIO_DIV1

fDTG = fHRTIM

HRTIM_TIMDEADTIME_PRESCALERRATIO_DIV2

fDTG = fHRTIM / 16U

HRTIM Dead-time Rising Lock

HRTIM_TIMDEADTIME_RISINGLOCK_WRITE

Dead-time rising value and sign is writeable

HRTIM_TIMDEADTIME_RISINGLOCK_READONLY

Dead-time rising value and sign is read-only

HRTIM Dead-time Rising Sign

HRTIM_TIMDEADTIME_RISINGSIGN_POSITIVE

Positive dead-time on rising edge

HRTIM_TIMDEADTIME_RISINGSIGN_NEGATIVE

Negative dead-time on rising edge

HRTIM Dead-time Rising Sign Lock

HRTIM_TIMDEADTIME_RISINGSIGNLOCK_WRITE

Dead-time rising sign is writeable

HRTIM_TIMDEADTIME_RISINGSIGNLOCK_READONLY

Dead-time rising sign is read-only

HRTIM Exported Macros

__HAL_HRTIM_RESET_HANDLE_STATE

Description:

- Reset HRTIM handle state.

Parameters:

- __HANDLE__: HRTIM handle.

Return value:

- None

__HAL_HRTIM_ENABLE

Description:

- Enables or disables the timer counter(s)

Parameters:

- __HANDLE__: specifies the HRTIM Handle.
- __TIMERS__: timers to enable/disable This parameter can be any combinations of the following values:
  - HRTIM_TIMERID_MASTER: Master timer identifier
  - HRTIM_TIMERID_TIMER_A: Timer A identifier
  - HRTIM_TIMERID_TIMER_B: Timer B identifier
  - HRTIM_TIMERID_TIMER_C: Timer C identifier
  - HRTIM_TIMERID_TIMER_D: Timer D identifier
  - HRTIM_TIMERID_TIMER_E: Timer E identifier

Return value:

- None

HRTIM_TAOEN_MASK

HRTIM_TBOEN_MASK

HRTIM_TCOEN_MASK

HRTIM_TDOEN_MASK

HRTIM_TEOEN_MASK

__HAL_HRTIM_DISABLE

__HAL_HRTIM_ENABLE_IT

Description:

- Enables or disables the specified HRTIM common interrupts.

Parameters:

- __HANDLE__: specifies the HRTIM Handle.
- __INTERRUPT__: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - HRTIM_IT_FLT1: Fault 1 interrupt enable
  - HRTIM_IT_FLT2: Fault 2 interrupt enable
  - HRTIM_IT_FLT3: Fault 3 interrupt enable
  - HRTIM_IT_FLT4: Fault 4 interrupt enable
  - HRTIM_IT_FLT5: Fault 5 interrupt enable
  - HRTIM_IT_SYSFLT: System Fault interrupt enable
  - HRTIM_IT_BMPER: Burst mode period interrupt enable

Return value:

- None

__HAL_HRTIM_DISABLE_IT

__HAL_HRTIM_MASTER_ENABLE_IT

Description:

- Enables or disables the specified HRTIM Master timer interrupts.

Parameters:

- __HANDLE__: specifies the HRTIM Handle.
- __INTERRUPT__: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - HRTIM_MASTER_IT_MCMP1: Master compare 1 interrupt enable
  - HRTIM_MASTER_IT_MCMP2: Master compare 2 interrupt enable
  - HRTIM_MASTER_IT_MCMP3: Master compare 3 interrupt enable
  - HRTIM_MASTER_IT_MCMP4: Master compare 4 interrupt enable
  - HRTIM_MASTER_IT_MREP: Master Repetition interrupt enable
  - HRTIM_MASTER_IT_SYNC: Synchronization input interrupt enable
  - HRTIM_MASTER_IT_MUPD: Master update interrupt enable

Return value:

- None

__HAL_HRTIM_MASTER_DISABLE_IT

__HAL_HRTIM_TIMER_ENABLE_IT

Description:

- Enables or disables the specified HRTIM Timerx interrupts.

Parameters:

- __HANDLE__: specifies the HRTIM Handle.
- __TIMER__: specified the timing unit (Timer A to E)
- __INTERRUPT__: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - HRTIM_TIM_IT_CMP1: Timer compare 1 interrupt enable
  - HRTIM_TIM_IT_CMP2: Timer compare 2 interrupt enable
  - HRTIM_TIM_IT_CMP3: Timer compare 3 interrupt enable
  - HRTIM_TIM_IT_CMP4: Timer compare 4 interrupt enable
  - HRTIM_TIM_IT_REP: Timer repetition interrupt enable
  - HRTIM_TIM_IT_UPD: Timer update interrupt enable
  - HRTIM_TIM_IT_CPT1: Timer capture 1 interrupt enable
  - HRTIM_TIM_IT_CPT2: Timer capture 2 interrupt enable
  - HRTIM_TIM_IT_SET1: Timer output 1 set interrupt enable
  - HRTIM_TIM_IT_RST1: Timer output 1 reset interrupt enable
  - HRTIM_TIM_IT_SET2: Timer output 2 set interrupt enable
  - HRTIM_TIM_IT_RST2: Timer output 2 reset interrupt enable
  - HRTIM_TIM_IT_RST: Timer reset interrupt enable
  - HRTIM_TIM_IT_DLYPRT: Timer delay protection interrupt enable

Return value:

- None

__HAL_HRTIM_TIMER_DISABLE_IT

__HAL_HRTIM_GET_ITSTATUS

Description:

- Checks if the specified HRTIM common interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: specifies the HRTIM Handle.
- __INTERRUPT__: specifies the interrupt source to check. This parameter can be one of the following values:
  - HRTIM_IT_FLT1: Fault 1 interrupt enable
  - HRTIM_IT_FLT2: Fault 2 interrupt enable
  - HRTIM_IT_FLT3: Fault 3 enable
  - HRTIM_IT_FLT4: Fault 4 enable
  - HRTIM_IT_FLT5: Fault 5 enable
  - HRTIM_IT_SYSFLT: System Fault interrupt enable
  - HRTIM_IT_BMPER: Burst mode period interrupt enable

Return value:

- The: new state of __INTERRUPT__ (TRUE or FALSE).

__HAL_HRTIM_MASTER_GET_ITSTATUS

Description:

- Checks if the specified HRTIM Master interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: specifies the HRTIM Handle.
- __INTERRUPT__: specifies the interrupt source to check. This parameter can be one of the following values:
  - HRTIM_MASTER_IT_MCMP1: Master compare 1 interrupt enable
  - HRTIM_MASTER_IT_MCMP2: Master compare 2 interrupt enable
  - HRTIM_MASTER_IT_MCMP3: Master compare 3 interrupt enable
  - HRTIM_MASTER_IT_MCMP4: Master compare 4 interrupt enable
  - HRTIM_MASTER_IT_MREP: Master Repetition interrupt enable
  - HRTIM_MASTER_IT_SYNC: Synchronization input interrupt enable
  - HRTIM_MASTER_IT_MUPD: Master update interrupt enable

Return value:

- The: new state of __INTERRUPT__ (TRUE or FALSE).

__HAL_HRTIM_TIMER_GET_ITSTATUS

Description:

- Checks if the specified HRTIM Timerx interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: specifies the HRTIM Handle.
- __TIMER__: specified the timing unit (Timer A to E)
- __INTERRUPT__: specifies the interrupt source to check. This parameter can be one of the following values:
  - HRTIM_MASTER_IT_MCMP1: Master compare 1 interrupt enable
  - HRTIM_MASTER_IT_MCMP2: Master compare 2 interrupt enable
  - HRTIM_MASTER_IT_MCMP3: Master compare 3 interrupt enable
  - HRTIM_MASTER_IT_MCMP4: Master compare 4 interrupt enable
  - HRTIM_MASTER_IT_MREP: Master Repetition interrupt enable
  - HRTIM_MASTER_IT_SYNC: Synchronization input interrupt enable
  - HRTIM_MASTER_IT_MUPD: Master update interrupt enable
  - HRTIM_TIM_IT_CMP1: Timer compare 1 interrupt enable
  - HRTIM_TIM_IT_CMP2: Timer compare 2 interrupt enable
  - HRTIM_TIM_IT_CMP3: Timer compare 3 interrupt enable
  - HRTIM_TIM_IT_CMP4: Timer compare 4 interrupt enable
  - HRTIM_TIM_IT_REP: Timer repetition interrupt enable
  - HRTIM_TIM_IT_UPD: Timer update interrupt enable
  - HRTIM_TIM_IT_CPT1: Timer capture 1 interrupt enable
  - HRTIM_TIM_IT_CPT2: Timer capture 2 interrupt enable
  - HRTIM_TIM_IT_SET1: Timer output 1 set interrupt enable
  - HRTIM_TIM_IT_RST1: Timer output 1 reset interrupt enable
  - HRTIM_TIM_IT_SET2: Timer output 2 set interrupt enable
  - HRTIM_TIM_IT_RST2: Timer output 2 reset interrupt enable
  - HRTIM_TIM_IT_RST: Timer reset interrupt enable
  - HRTIM_TIM_IT_DLYPRT: Timer delay protection interrupt enable

Return value:

- The: new state of __INTERRUPT__ (TRUE or FALSE).

__HAL_HRTIM_CLEAR_IT

Description:

- Clears the specified HRTIM common pending flag.

Parameters:

- __HANDLE__: specifies the HRTIM Handle.
- __INTERRUPT__: specifies the interrupt pending bit to clear. This parameter can be one of the following values:
  - HRTIM_IT_FLT1: Fault 1 interrupt clear flag
  - HRTIM_IT_FLT2: Fault 2 interrupt clear flag
  - HRTIM_IT_FLT3: Fault 3 clear flag
  - HRTIM_IT_FLT4: Fault 4 clear flag
  - HRTIM_IT_FLT5: Fault 5 clear flag
  - HRTIM_IT_SYSFLT: System Fault interrupt clear flag
  - HRTIM_IT_BMPER: Burst mode period interrupt clear flag

Return value:

- None

__HAL_HRTIM_MASTER_CLEAR_IT

Description:

- Clears the specified HRTIM Master pending flag.

Parameters:

- __HANDLE__: specifies the HRTIM Handle.
- __INTERRUPT__: specifies the interrupt pending bit to clear. This parameter can be one of the following values:
  - HRTIM_MASTER_IT_MCMP1: Master compare 1 interrupt clear flag
  - HRTIM_MASTER_IT_MCMP2: Master compare 2 interrupt clear flag
  - HRTIM_MASTER_IT_MCMP3: Master compare 3 interrupt clear flag
  - HRTIM_MASTER_IT_MCMP4: Master compare 4 interrupt clear flag
  - HRTIM_MASTER_IT_MREP: Master Repetition interrupt clear flag
  - HRTIM_MASTER_IT_SYNC: Synchronization input interrupt clear flag
  - HRTIM_MASTER_IT_MUPD: Master update interrupt clear flag

Return value:

- None

__HAL_HRTIM_TIMER_CLEAR_IT

Description:

- Clears the specified HRTIM Timerx pending flag.

Parameters:

- __HANDLE__: specifies the HRTIM Handle.
- __TIMER__: specified the timing unit (Timer A to E)
- __INTERRUPT__: specifies the interrupt pending bit to clear. This parameter can be one of the following values:
  - HRTIM_TIM_IT_CMP1: Timer compare 1 interrupt clear flag
  - HRTIM_TIM_IT_CMP2: Timer compare 2 interrupt clear flag
  - HRTIM_TIM_IT_CMP3: Timer compare 3 interrupt clear flag
  - HRTIM_TIM_IT_CMP4: Timer compare 4 interrupt clear flag
  - HRTIM_TIM_IT_REP: Timer repetition interrupt clear flag
  - HRTIM_TIM_IT_UPD: Timer update interrupt clear flag
  - HRTIM_TIM_IT_CPT1: Timer capture 1 interrupt clear flag
  - HRTIM_TIM_IT_CPT2: Timer capture 2 interrupt clear flag
  - HRTIM_TIM_IT_SET1: Timer output 1 set interrupt clear flag
  - HRTIM_TIM_IT_RST1: Timer output 1 reset interrupt clear flag
  - HRTIM_TIM_IT_SET2: Timer output 2 set interrupt clear flag
  - HRTIM_TIM_IT_RST2: Timer output 2 reset interrupt clear flag
  - HRTIM_TIM_IT_RST: Timer reset interrupt clear flag
  - HRTIM_TIM_IT_DLYPRT: Timer output 1 delay protection interrupt clear flag

Return value:

- None

__HAL_HRTIM_MASTER_ENABLE_DMA

Description:

- Enables or disables the specified HRTIM Master timer DMA requests.

Parameters:

- __HANDLE__: specifies the HRTIM Handle.
- __DMA__: specifies the DMA request to enable or disable. This parameter can be one of the following values:
  - HRTIM_MASTER_DMA_MCMP1: Master compare 1 DMA request enable
  - HRTIM_MASTER_DMA_MCMP2: Master compare 2 DMA request enable
  - HRTIM_MASTER_DMA_MCMP3: Master compare 3 DMA request enable
  - HRTIM_MASTER_DMA_MCMP4: Master compare 4 DMA request enable
  - HRTIM_MASTER_DMA_MREP: Master Repetition DMA request enable
  - HRTIM_MASTER_DMA_SYNC: Synchronization input DMA request enable
  - HRTIM_MASTER_DMA_MUPD: Master update DMA request enable

Return value:

- None

__HAL_HRTIM_MASTER_DISABLE_DMA

__HAL_HRTIM_TIMER_ENABLE_DMA

Description:

- Enables or disables the specified HRTIM Timerx DMA requests.

Parameters:

- __HANDLE__: specifies the HRTIM Handle.
- __TIMER__: specified the timing unit (Timer A to E)
- __DMA__: specifies the DMA request to enable or disable. This parameter can be one of the following values:
  - HRTIM_TIM_DMA_CMP1: Timer compare 1 DMA request enable
  - HRTIM_TIM_DMA_CMP2: Timer compare 2 DMA request enable
  - HRTIM_TIM_DMA_CMP3: Timer compare 3 DMA request enable
  - HRTIM_TIM_DMA_CMP4: Timer compare 4 DMA request enable
  - HRTIM_TIM_DMA_REP: Timer repetition DMA request enable
  - HRTIM_TIM_DMA_UPD: Timer update DMA request enable
  - HRTIM_TIM_DMA_CPT1: Timer capture 1 DMA request enable
  - HRTIM_TIM_DMA_CPT2: Timer capture 2 DMA request enable
  - HRTIM_TIM_DMA_SET1: Timer output 1 set DMA request enable
  - HRTIM_TIM_DMA_RST1: Timer output 1 reset DMA request enable
  - HRTIM_TIM_DMA_SET2: Timer output 2 set DMA request enable
  - HRTIM_TIM_DMA_RST2: Timer output 2 reset DMA request enable
  - HRTIM_TIM_DMA_RST: Timer reset DMA request enable
  - HRTIM_TIM_DMA_DLYPRT: Timer delay protection DMA request enable

Return value:

- None

__HAL_HRTIM_TIMER_DISABLE_DMA

__HAL_HRTIM_GET_FLAG

__HAL_HRTIM_CLEAR_FLAG

__HAL_HRTIM_MASTER_GET_FLAG

__HAL_HRTIM_MASTER_CLEAR_FLAG

__HAL_HRTIM_TIMER_GET_FLAG

__HAL_HRTIM_TIMER_CLEAR_FLAG

__HAL_HRTIM_SETCOUNTER

Description:

- Sets the HRTIM timer Counter Register value on runtime.

Parameters:

- __HANDLE__: HRTIM Handle.
- __TIMER__: HRTIM timer This parameter can be one of the following values:
  - 0x5 for master timer
  - 0x0 to 0x4 for timers A to E
- __COUNTER__: specifies the Counter Register new value.

Return value:

- None

__HAL_HRTIM_GETCOUNTER

Description:

- Gets the HRTIM timer Counter Register value on runtime.

Parameters:

- __HANDLE__: HRTIM Handle.
- __TIMER__: HRTIM timer This parameter can be one of the following values:
  - 0x5 for master timer
  - 0x0 to 0x4 for timers A to E

Return value:

- HRTIM: timer Counter Register value

__HAL_HRTIM_SETPERIOD

Description:

- Sets the HRTIM timer Period value on runtime.

Parameters:

- __HANDLE__: HRTIM Handle.
- __TIMER__: HRTIM timer This parameter can be one of the following values:
  - 0x5 for master timer
  - 0x0 to 0x4 for timers A to E
- __PERIOD__: specifies the Period Register new value.

Return value:

- None

__HAL_HRTIM_GETPERIOD

Description:

- Gets the HRTIM timer Period Register value on runtime.

Parameters:

- __HANDLE__: HRTIM Handle.
- __TIMER__: HRTIM timer This parameter can be one of the following values:
  - 0x5 for master timer
  - 0x0 to 0x4 for timers A to E

Return value:

- timer: Period Register

__HAL_HRTIM_SETCLOCKPRESCALER

Description:

- Sets the HRTIM timer clock prescaler value on runtime.

Parameters:

- __HANDLE__: HRTIM Handle.
- __TIMER__: HRTIM timer This parameter can be one of the following values:
  - 0x5 for master timer
  - 0x0 to 0x4 for timers A to E
- __PRESCALER__: specifies the clock prescaler new value. This parameter can be one of the following values:
  - HRTIM_PRESCALERRATIO_DIV1: fHRCK: 144 MHz - Resolution: 6.95 ns - Min PWM frequency: 2.2 kHz (fHRTIM=144MHz)
  - HRTIM_PRESCALERRATIO_DIV2: fHRCK: 72 MHz - Resolution: 13.88 ns- Min PWM frequency: 1.1 kHz (fHRTIM=144MHz)
  - HRTIM_PRESCALERRATIO_DIV4: fHRCK: 36 MHz - Resolution: 27.7 ns- Min PWM frequency: 550Hz (fHRTIM=144MHz)

Return value:

- None

__HAL_HRTIM_GETCLOCKPRESCALER

Description:

- Gets the HRTIM timer clock prescaler value on runtime.

Parameters:

- __HANDLE__: HRTIM Handle.
- __TIMER__: HRTIM timer This parameter can be one of the following values:
  - 0x5 for master timer
  - 0x0 to 0x4 for timers A to E

Return value:

- timer: clock prescaler value

__HAL_HRTIM_SETCOMPARE

Description:

- Sets the HRTIM timer Compare Register value on runtime.

Parameters:

- __HANDLE__: HRTIM Handle.
- __TIMER__: HRTIM timer This parameter can be one of the following values:
  - 0x0 to 0x4 for timers A to E
- __COMPAREUNIT__: timer compare unit This parameter can be one of the following values:
  - HRTIM_COMPAREUNIT_1: Compare unit 1
  - HRTIM_COMPAREUNIT_2: Compare unit 2
  - HRTIM_COMPAREUNIT_3: Compare unit 3
  - HRTIM_COMPAREUNIT_4: Compare unit 4
- __COMPARE__: specifies the Compare new value.

Return value:

- None

__HAL_HRTIM_GETCOMPARE

Description:

- Gets the HRTIM timer Compare Register value on runtime.

Parameters:

- __HANDLE__: HRTIM Handle.
- __TIMER__: HRTIM timer This parameter can be one of the following values:
  - 0x0 to 0x4 for timers A to E
- __COMPAREUNIT__: timer compare unit This parameter can be one of the following values:
  - HRTIM_COMPAREUNIT_1: Compare unit 1
  - HRTIM_COMPAREUNIT_2: Compare unit 2
  - HRTIM_COMPAREUNIT_3: Compare unit 3
  - HRTIM_COMPAREUNIT_4: Compare unit 4

Return value:

- Compare: value

HRTIM External Event Channels

HRTIM_EVENT_NONE

Undefined event channel

HRTIM_EVENT_1

External event channel 1 identifier

HRTIM_EVENT_2

External event channel 2 identifier

HRTIM_EVENT_3

External event channel 3 identifier

HRTIM_EVENT_4

External event channel 4 identifier

fSAMPLING= fFLTS/32U, N=8U

HRTIM Fault Lock

HRTIM_FAULTLOCK_READWRITE

Fault settings bits are read/write

HRTIM_FAULTLOCK_READONLY

Fault settings bits are read only

HRTIM Fault Mode Control

HRTIM_FAULTMODECTL_DISABLED

Fault channel is disabled

HRTIM_FAULTMODECTL_ENABLED

Fault channel is enabled

HRTIM Fault Polarity

HRTIM_FAULTPOLARITY_LOW

Fault input is active low

HRTIM_FAULTPOLARITY_HIGH

Fault input is active high

HRTIM Fault Sources

HRTIM_FAULTSOURCE_DIGITALINPUT

Fault input is FLT input pin

HRTIM_FAULTSOURCE_INTERNAL

Fault input is FLT_Int signal (e.g. internal comparator)

HRTIM Half Mode Enable

HRTIM_HALFMODE_DISABLED

Half mode is disabled

HRTIM_HALFMODE_ENABLED

Half mode is enabled

HRTIM Idle Push Pull Status

HRTIM_PUSHPULL_IDLESTATUS_OUTPUT1

Protection occurred when the output 1 was active and output 2 forced inactive

HRTIM_PUSHPULL_IDLESTATUS_OUTPUT2

Protection occurred when the output 2 was active and output 1 forced inactive

HRTIM Master DMA Request Enable

HRTIM_MASTER_DMA_NONE

No DMA request enable

HRTIM_MASTER_DMA_MCMP1

Master compare 1 DMA request enable

HRTIM_MASTER_DMA_MCMP2

Master compare 2 DMA request enable

HRTIM_MASTER_DMA_MCMP3

Master compare 3 DMA request enable

HRTIM_MASTER_DMA_MCMP4

Master compare 4 DMA request enable

HRTIM_MASTER_DMA_MREP

Master Repetition DMA request enable

HRTIM_MASTER_DMA_SYNC

Synchronization input DMA request enable

HRTIM_MASTER_DMA_MUPD

Master update DMA request enable

HRTIM Master Interrupt Enable

HRTIM_MASTER_IT_NONE

No interrupt enabled

HRTIM_MASTER_IT_MCMP1

Master compare 1 interrupt enable

HRTIM_MASTER_IT_MCMP2

Master compare 2 interrupt enable

HRTIM_MASTER_IT_MCMP3

Master compare 3 interrupt enable

HRTIM_MASTER_IT_MCMP4

Master compare 4 interrupt enable

HRTIM_MASTER_IT_MREP

Master Repetition interrupt enable

HRTIM_MASTER_IT_SYNC

Synchronization input interrupt enable

HRTIM_MASTER_IT_MUPD

Master update interrupt enable

HRTIM Master Interrupt Flag

HRTIM_MASTER_FLAG_MCMP1

Master compare 1 interrupt flag

HRTIM_MASTER_FLAG_MCMP2

Master compare 2 interrupt flag

HRTIM_MASTER_FLAG_MCMP3

Master compare 3 interrupt flag

HRTIM_MASTER_FLAG_MCMP4

Master compare 4 interrupt flag

HRTIM_MASTER_FLAG_MREP

Master Repetition interrupt flag

HRTIM_MASTER_FLAG_SYNC

Synchronization input interrupt flag

HRTIM_MASTER_FLAG_MUPD

Master update interrupt flag

HRTIM Max Timer

MAX_HRTIM_TIMER

HRTIM Output Burst Mode Entry Delayed

HRTIM_OUTPUTBURSTMODEENTRY_REGULAR

The programmed Idle state is applied immediately to the Output

HRTIM_OUTPUTBURSTMODEENTRY_DELAYED

Dead-time is inserted on output before entering the idle mode

HRTIM Output Chopper Mode Enable

HRTIM_OUTPUTCHOPPERMODE_DISABLED

Output signal is not altered

HRTIM_OUTPUTCHOPPERMODE_ENABLED

Output signal is chopped by a carrier signal

HRTIM Output FAULT Level

HRTIM_OUTPUTFAULTLEVEL_NONE

The output is not affected by the fault input

HRTIM_OUTPUTFAULTLEVEL_ACTIVE

Output at active level when in FAULT state

HRTIM_OUTPUTFAULTLEVEL_INACTIVE

Output at inactive level when in FAULT state

HRTIM_OUTPUTFAULTLEVEL_HIGHZ

Output is tri-stated when in FAULT state

HRTIM Output IDLE Level

HRTIM_OUTPUTIDLELEVEL_INACTIVE

Output at inactive level when in IDLE state

HRTIM_OUTPUTIDLELEVEL_ACTIVE

Output at active level when in IDLE state

HRTIM Output Idle Mode

HRTIM_OUTPUTIDLEMODE_NONE

The output is not affected by the burst mode operation

HRTIM_OUTPUTIDLEMODE_IDLE

The output is in idle state when requested by the burst mode controller

HRTIM Output Level

HRTIM_OUTPUTLEVEL_ACTIVE

Force the output to its active state

HRTIM_OUTPUTLEVEL_INACTIVE

Force the output to its inactive state

IS_HRTIM_OUTPUTLEVEL

HRTIM Output Polarity

HRTIM_OUTPUTPOLARITY_HIGH

Output is active HIGH

HRTIM_OUTPUTPOLARITY_LOW

Output is active LOW

HRTIM Output Reset Source

HRTIM_OUTPUTRESET_NONE

Reset the output reset crossbar

HRTIM_OUTPUTRESET_RESYNC

Timer reset event coming solely from software or SYNC input forces the output to its inactive state

HRTIM_OUTPUTRESET_TIMPER

Timer period event forces the output to its inactive state

HRTIM_OUTPUTRESET_TIMCMP1

Timer compare 1 event forces the output to its inactive state

HRTIM_OUTPUTRESET_TIMCMP2

Timer compare 2 event forces the output to its inactive state

HRTIM_OUTPUTRESET_TIMCMP3

Timer compare 3 event forces the output to its inactive state

HRTIM_OUTPUTRESET_TIMCMP4

Timer compare 4 event forces the output to its inactive state

HRTIM_OUTPUTRESET_MASTERPER

The master timer period event forces the output to its inactive state

HRTIM_OUTPUTRESET_MASTERCMP1

Master Timer compare 1 event forces the output to its inactive state

HRTIM_OUTPUTRESET_MASTERCMP2

Master Timer compare 2 event forces the output to its inactive state

HRTIM_OUTPUTRESET_MASTERCMP3

Master Timer compare 3 event forces the output to its inactive state

HRTIM_OUTPUTRESET_MASTERCMP4

Master Timer compare 4 event forces the output to its inactive state

HRTIM_OUTPUTRESET_TIMEV_1

Timer event 1 forces the output to its active state

HRTIM_OUTPUTRESET_TIMEV_2

Timer event 2 forces the output to its active state

HRTIM_OUTPUTRESET_TIMEV_3

Timer event 3 forces the output to its active state

HRTIM_OUTPUTRESET_TIMEV_4

Timer event 4 forces the output to its active state

HRTIM_OUTPUTRESET_TIMEV_5

Timer event 5 forces the output to its active state

HRTIM_OUTPUTRESET_TIMEV_6

Timer event 6 forces the output to its active state

HRTIM_OUTPUTRESET_TIMEV_7

Timer event 7 forces the output to its active state

HRTIM_OUTPUTRESET_TIMEV_8

Timer event 8 forces the output to its active state

HRTIM_OUTPUTRESET_TIMEV_9

Timer event 9 forces the output to its active state

HRTIM_OUTPUTRESET_EEV_1

External event 1 forces the output to its inactive state

HRTIM_OUTPUTRESET_EEV_2

External event 2 forces the output to its inactive state

HRTIM_OUTPUTRESET_EEV_3

External event 3 forces the output to its inactive state

HRTIM_OUTPUTRESET_EEV_4

External event 4 forces the output to its inactive state

HRTIM_OUTPUTRESET_EEV_5

External event 5 forces the output to its inactive state

HRTIM_OUTPUTRESET_EEV_6

External event 6 forces the output to its inactive state

HRTIM_OUTPUTRESET_EEV_7

External event 7 forces the output to its inactive state

HRTIM_OUTPUTRESET_EEV_8

External event 8 forces the output to its inactive state

HRTIM_OUTPUTRESET_EEV_9

External event 9 forces the output to its inactive state

HRTIM_OUTPUTRESET_EEV_10

External event 10 forces the output to its inactive state

HRTIM_OUTPUTRESET_UPDATE

Timer register update event forces the output to its inactive state

HRTIM Output Set Source

HRTIM_OUTPUTSET_NONE

Reset the output set crossbar

HRTIM_OUTPUTSET_RESYNC

Timer reset event coming solely from software or SYNC input forces the output to its active state

HRTIM_OUTPUTSET_TIMPER

Timer period event forces the output to its active state

HRTIM_OUTPUTSET_TIMCMP1

Timer compare 1 event forces the output to its active state

HRTIM_OUTPUTSET_TIMCMP2

Timer compare 2 event forces the output to its active state

HRTIM_OUTPUTSET_TIMCMP3

Timer compare 3 event forces the output to its active state

HRTIM_OUTPUTSET_TIMCMP4

Timer compare 4 event forces the output to its active state

HRTIM_OUTPUTSET_MASTERPER

The master timer period event forces the output to its active state

HRTIM_OUTPUTSET_MASTERCMP1

Master Timer compare 1 event forces the output to its active state

HRTIM_OUTPUTSET_MASTERCMP2

Master Timer compare 2 event forces the output to its active state

HRTIM_OUTPUTSET_MASTERCMP3

Master Timer compare 3 event forces the output to its active state

HRTIM_OUTPUTSET_MASTERCMP4

Master Timer compare 4 event forces the output to its active state

HRTIM_OUTPUTSET_TIMEV_1

Timer event 1 forces the output to its active state

HRTIM_OUTPUTSET_TIMEV_2

Timer event 2 forces the output to its active state

HRTIM_OUTPUTSET_TIMEV_3

Timer event 3 forces the output to its active state

HRTIM_OUTPUTSET_TIMEV_4

Timer event 4 forces the output to its active state

HRTIM_OUTPUTSET_TIMEV_5

Timer event 5 forces the output to its active state

HRTIM_OUTPUTSET_TIMEV_6

Timer event 6 forces the output to its active state

HRTIM_OUTPUTSET_TIMEV_7

Timer event 7 forces the output to its active state

HRTIM_OUTPUTSET_TIMEV_8

Timer event 8 forces the output to its active state

HRTIM_OUTPUTSET_TIMEV_9

Timer event 9 forces the output to its active state

HRTIM_OUTPUTSET_EEV_1

External event 1 forces the output to its active state

HRTIM_OUTPUTSET_EEV_2

External event 2 forces the output to its active state

HRTIM_OUTPUTSET_EEV_3

External event 3 forces the output to its active state

HRTIM_OUTPUTSET_EEV_4

External event 4 forces the output to its active state

HRTIM_OUTPUTSET_EEV_5

External event 5 forces the output to its active state

HRTIM_OUTPUTSET_EEV_6

External event 6 forces the output to its active state

HRTIM_OUTPUTSET_EEV_7

External event 7 forces the output to its active state

HRTIM_OUTPUTSET_EEV_8

External event 8 forces the output to its active state

HRTIM_OUTPUTSET_EEV_9

External event 9 forces the output to its active state

HRTIM_OUTPUTSET_EEV_10

External event 10 forces the output to its active state

HRTIM_OUTPUTSET_UPDATE

Timer register update event forces the output to its active state

HRTIM Output State

HRTIM_OUTPUTSTATE_IDLE

Main operating mode, where the output can take the active or inactive level as programmed in the crossbar unit

HRTIM_OUTPUTSTATE_RUN

Default operating state (e.g. after an HRTIM reset, when the outputs are disabled by software or during a burst mode operation

HRTIM_OUTPUTSTATE_FAULT

Safety state, entered in case of a shut-down request on FAULTx inputs

HRTIM Prescaler Ratio

HRTIM_PRESCALERRATIO_DIV1

fHRCK: fHRTIM = 144 MHz - Resolution: 6.95 ns - Min PWM frequency: 2.2 kHz (fHRTIM=144MHz)

HRTIM_PRESCALERRATIO_DIV2

fHRCK: fHRTIM / 2U = 72 MHz - Resolution: 13.88 ns- Min PWM frequency: 1.1 kHz (fHRTIM=144MHz)

HRTIM_PRESCALERRATIO_DIV4

fHRCK: fHRTIM / 4U = 36 MHz - Resolution: 27.7 ns- Min PWM frequency: 550Hz (fHRTIM=144MHz)

HRTIM Register Preload Enable

HRTIM_PRELOAD_DISABLED

Preload disabled: the write access is directly done into the active register

HRTIM_PRELOAD_ENABLED

Preload enabled: the write access is done into the preload register

HRTIM Reset On Sync Input Event

HRTIM_SYNCRESET_DISABLED

Synchronization input event has effect on the timer

HRTIM_SYNCRESET_ENABLED

Synchronization input event resets the timer

HRTIM Simple OC Mode

HRTIM_BASICOCMODE_TOGGLE

Output toggles when the timer counter reaches the compare value

HRTIM_BASICOCMODE_INACTIVE

Output forced to active level when the timer counter reaches the compare value

HRTIM_BASICOCMODE_ACTIVE

Output forced to inactive level when the timer counter reaches the compare value

IS_HRTIM_BASICOCMODE

HRTIM Software Timer Reset

HRTIM_TIMERRESET_MASTER

Reset the master timer counter

HRTIM_TIMERRESET_TIMER_A

Reset the timer A counter

HRTIM_TIMERRESET_TIMER_B

Reset the timer B counter

HRTIM_TIMERRESET_TIMER_C

Reset the timer C counter

HRTIM_TIMERRESET_TIMER_D

Reset the timer D counter

HRTIM_TIMERRESET_TIMER_E

Reset the timer E counter

HRTIM Software Timer Update

HRTIM_TIMERUPDATE_MASTER

Force an immediate transfer from the preload to the active register in the master timer

HRTIM_TIMERUPDATE_A

Force an immediate transfer from the preload to the active register in the timer A

HRTIM_TIMERUPDATE_B

Force an immediate transfer from the preload to the active register in the timer B

HRTIM_TIMERUPDATE_C

Force an immediate transfer from the preload to the active register in the timer C

HRTIM_TIMERUPDATE_D

Force an immediate transfer from the preload to the active register in the timer D

HRTIM_TIMERUPDATE_E

Force an immediate transfer from the preload to the active register in the timer E

HRTIM Start On Sync Input Event

HRTIM_SYNCSTART_DISABLED

Synchronization input event has effect on the timer

HRTIM_SYNCSTART_ENABLED

Synchronization input event starts the timer

HRTIM Synchronization Input Source

HRTIM_SYNCINPUTSOURCE_NONE

disabled. HRTIM is not synchronized and runs in standalone mode

HRTIM_SYNCINPUTSOURCE_INTERNALEVENT

The HRTIM is synchronized with the on-chip timer

HRTIM_SYNCINPUTSOURCE_EXTERNALEVENT

A positive pulse on SYNCIN input triggers the HRTIM

HRTIM Synchronization Options

HRTIM_SYNCOPTION_NONE

HRTIM instance doesn't handle external synchronization signals (SYNCIN, SYNCOUT)

HRTIM_SYNCOPTION_MASTER

HRTIM instance acts as a MASTER, i.e. generates external synchronization output (SYNCOUT)

HRTIM_SYNCOPTION_SLAVE

HRTIM instance acts as a SLAVE, i.e. it is synchronized by external sources (SYNCIN)

HRTIM Synchronization Output Polarity

HRTIM_SYNCOUTPUTPOLARITY_NONE

Synchronization output event is disabled

HRTIM_SYNCOUTPUTPOLARITY_POSITIVE

SCOUT pin has a low idle level and issues a positive pulse of 16 fHRTIM clock cycles length for the synchronization

HRTIM_SYNCOUTPUTPOLARITY_NEGATIVE

SCOUT pin has a high idle level and issues a negative pulse of 16 fHRTIM clock cycles length for the synchronization

HRTIM Synchronization Output Source

HRTIM_SYNCOUTPUTSOURCE_MASTER_START

A pulse is sent on HRTIM_SCOUT output and hrtim_out_sync2 upon master timer start event

HRTIM_SYNCOUTPUTSOURCE_MASTER_CMP1

A pulse is sent on HRTIM_SCOUT output and hrtim_out_sync2 upon master timer compare 1 event

HRTIM_SYNCOUTPUTSOURCE_TIMA_START

A pulse is sent on HRTIM_SCOUT output and hrtim_out_sync2 upon timer A start or reset events

HRTIM_SYNCOUTPUTSOURCE_TIMA_CMP1

A pulse is sent on HRTIM_SCOUT output and hrtim_out_sync2 upon timer A compare 1 event

HRTIM Timer Burst Mode

HRTIM_TIMERBURSTMODE_MAINTAINCLOCK

Timer counter clock is maintained and the timer operates normally

HRTIM_TIMERBURSTMODE_RESETCOUNTER

Timer counter clock is stopped and the counter is reset

HRTIM Timer Dead-time Insertion

HRTIM_TIMDEADTIMEINSERTION_DISABLED

Output 1 and output 2 signals are independent

HRTIM_TIMDEADTIMEINSERTION_ENABLED

Dead-time is inserted between output 1 and output 2U

HRTIM Timer Delayed Protection Mode

HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_DISABLED

No action

HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_DELAYEDOUT1_EEV6

Timers A, B, C: Output 1 delayed Idle on external Event 6U

HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_DELAYEDOUT2_EEV6

Timers A, B, C: Output 2 delayed Idle on external Event 6U

HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_DELAYEDBOTH_EEV6

Timers A, B, C: Output 1 and output 2 delayed Idle on external Event 6U

HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_BALANCED_EEV6

Timers A, B, C: Balanced Idle on external Event 6U

HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_DELAYEDOUT1_DEEV7

Timers A, B, C: Output 1 delayed Idle on external Event 7U

HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_DELAYEDOUT2_DEEV7

Timers A, B, C: Output 2 delayed Idle on external Event 7U

HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_DELAYEDBOTH_EEV7

Timers A, B, C: Output 1 and output2 delayed Idle on external Event 7U

HRTIM_TIMER_A_B_C_DELAYEDPROTECTION_BALANCED_EEV7

Timers A, B, C: Balanced Idle on external Event 7U

HRTIM_TIMER_D_E_DELAYEDPROTECTION_DISABLED

No action

HRTIM_TIMER_D_E_DELAYEDPROTECTION_DELAYEDOUT1_EEV8

Timers D, E: Output 1 delayed Idle on external Event 6U

HRTIM_TIMER_D_E_DELAYEDPROTECTION_DELAYEDOUT2_EEV8

Timers D, E: Output 2 delayed Idle on external Event 6U

HRTIM_TIMER_D_E_DELAYEDPROTECTION_DELAYEDBOTH_EEV8

Timers D, E: Output 1 and output 2 delayed Idle on external Event 6U

HRTIM_TIMER_D_E_DELAYEDPROTECTION_BALANCED_EEV8

Timers D, E: Balanced Idle on external Event 6U

HRTIM_TIMER_D_E_DELAYEDPROTECTION_DELAYEDOUT1_DEEV9

Timers D, E: Output 1 delayed Idle on external Event 7U

HRTIM_TIMER_D_E_DELAYEDPROTECTION_DELAYEDOUT2_DEEV9

Timers D, E: Output 2 delayed Idle on external Event 7U

HRTIM_TIMER_D_E_DELAYEDPROTECTION_DELAYEDBOTH_EEV9

Timers D, E: Output 1 and output2 delayed Idle on external Event 7U

HRTIM_TIMER_D_E_DELAYEDPROTECTION_BALANCED_EEV9

Timers D, E: Balanced Idle on external Event 7U

HRTIM Timer External Event Filter

HRTIM_TIMEVENTFILTER_NONE

HRTIM_TIMEVENTFILTER_BLANKINGCMP1

Blanking from counter reset/roll-over to Compare 1U

HRTIM_TIMEVENTFILTER_BLANKINGCMP2

Blanking from counter reset/roll-over to Compare 2U

HRTIM_TIMEVENTFILTER_BLANKINGCMP3

Blanking from counter reset/roll-over to Compare 3U

HRTIM_TIMEVENTFILTER_BLANKINGCMP4

Blanking from counter reset/roll-over to Compare 4U

HRTIM_TIMEVENTFILTER_BLANKINGFLTR1

Blanking from another timing unit: TIMFLTR1 source

HRTIM_TIMEVENTFILTER_BLANKINGFLTR2

Blanking from another timing unit: TIMFLTR2 source

HRTIM_TIMEVENTFILTER_BLANKINGFLTR3

Blanking from another timing unit: TIMFLTR3 source

HRTIM_TIMEVENTFILTER_BLANKINGFLTR4

Blanking from another timing unit: TIMFLTR4 source

HRTIM_TIMEVENTFILTER_BLANKINGFLTR5

Blanking from another timing unit: TIMFLTR5 source

HRTIM_TIMEVENTFILTER_BLANKINGFLTR6

Blanking from another timing unit: TIMFLTR6 source

HRTIM_TIMEVENTFILTER_BLANKINGFLTR7

Blanking from another timing unit: TIMFLTR7 source

HRTIM_TIMEVENTFILTER_BLANKINGFLTR8

Blanking from another timing unit: TIMFLTR8 source

HRTIM_TIMEVENTFILTER_WINDOWINGCMP2

Windowing from counter reset/roll-over to Compare 2U

HRTIM_TIMEVENTFILTER_WINDOWINGCMP3

Windowing from counter reset/roll-over to Compare 3U

HRTIM_TIMEVENTFILTER_WINDOWINGTIM

Windowing from another timing unit: TIMWIN source

HRTIM Timer External Event Latch

HRTIM_TIMEVENTLATCH_DISABLED

Event is ignored if it happens during a blank, or passed through during a window

HRTIM_TIMEVENTLATCH_ENABLED

Event is latched and delayed till the end of the blanking or windowing period

HRTIM Timer Fault Enabling

HRTIM_TIMFAULTENABLE_NONE

No fault enabled

HRTIM_TIMFAULTENABLE_FAULT1

Fault 1 enabled

HRTIM_TIMFAULTENABLE_FAULT2

Fault 2 enabled

HRTIM_TIMFAULTENABLE_FAULT3

Fault 3 enabled

HRTIM_TIMFAULTENABLE_FAULT4

Fault 4 enabled

HRTIM_TIMFAULTENABLE_FAULT5

Fault 5 enabled

HRTIM Timer Fault Lock

HRTIM_TIMFAULTLOCK_READWRITE

Timer fault enabling bits are read/write

HRTIM_TIMFAULTLOCK_READONLY

Timer fault enabling bits are read only

HRTIM Timer identifier

HRTIM_TIMERID_MASTER

Master identifier

HRTIM_TIMERID_TIMER_A

Timer A identifier

HRTIM_TIMERID_TIMER_B

Timer B identifier

HRTIM_TIMERID_TIMER_C

Timer C identifier

HRTIM_TIMERID_TIMER_D

Timer D identifier

HRTIM_TIMERID_TIMER_E

Timer E identifier

HRTIM Timer Index

HRTIM_TIMERINDEX_TIMER_A

Index used to access timer A registers

HRTIM_TIMERINDEX_TIMER_B

Index used to access timer B registers

HRTIM_TIMERINDEX_TIMER_C

Index used to access timer C registers

HRTIM_TIMERINDEX_TIMER_D

Index used to access timer D registers

HRTIM_TIMERINDEX_TIMER_E

Index used to access timer E registers

HRTIM_TIMERINDEX_MASTER

Index used to access master registers

HRTIM_TIMERINDEX_COMMON

Index used to access HRTIM common registers

HRTIM Timer Output

HRTIM_OUTPUT_TA1

Timer A - Output 1 identifier

HRTIM_OUTPUT_TA2

Timer A - Output 2 identifier

HRTIM_OUTPUT_TB1

Timer B - Output 1 identifier

HRTIM_OUTPUT_TB2

Timer B - Output 2 identifier

HRTIM_OUTPUT_TC1

Timer C - Output 1 identifier

HRTIM_OUTPUT_TC2

Timer C - Output 2 identifier

HRTIM_OUTPUT_TD1

Timer D - Output 1 identifier

HRTIM_OUTPUT_TD2

Timer D - Output 2 identifier

HRTIM_OUTPUT_TE1

Timer E - Output 1 identifier

HRTIM_OUTPUT_TE2

Timer E - Output 2 identifier

HRTIM Timer Push Pull Mode

HRTIM_TIMPUSHPULLMODE_DISABLED

Push-Pull mode disabled

HRTIM_TIMPUSHPULLMODE_ENABLED

Push-Pull mode enabled

HRTIM Timer Repetition Update

HRTIM_UPDATEONREPETITION_DISABLED

Update on repetition disabled

HRTIM_UPDATEONREPETITION_ENABLED

Update on repetition enabled

HRTIM Timer Reset Trigger

HRTIM_TIMRESETTRIGGER_NONE

No counter reset trigger

HRTIM_TIMRESETTRIGGER_UPDATE

The timer counter is reset upon update event

HRTIM_TIMRESETTRIGGER_CMP2

The timer counter is reset upon Timer Compare 2 event

HRTIM_TIMRESETTRIGGER_CMP4

The timer counter is reset upon Timer Compare 4 event

HRTIM_TIMRESETTRIGGER_MASTER_PER

The timer counter is reset upon master timer period event

HRTIM_TIMRESETTRIGGER_MASTER_CMP1

The timer counter is reset upon master timer Compare 1 event

HRTIM_TIMRESETTRIGGER_MASTER_CMP2

The timer counter is reset upon master timer Compare 2 event

HRTIM_TIMRESETTRIGGER_MASTER_CMP3

The timer counter is reset upon master timer Compare 3 event

HRTIM_TIMRESETTRIGGER_MASTER_CMP4

The timer counter is reset upon master timer Compare 4 event

HRTIM_TIMRESETTRIGGER_EEV_1

The timer counter is reset upon external event 1U

HRTIM_TIMRESETTRIGGER_EEV_2

The timer counter is reset upon external event 2U

HRTIM_TIMRESETTRIGGER_EEV_3

The timer counter is reset upon external event 3U

HRTIM_TIMRESETTRIGGER_EEV_4

The timer counter is reset upon external event 4U

HRTIM_TIMRESETTRIGGER_EEV_5

The timer counter is reset upon external event 5U

HRTIM_TIMRESETTRIGGER_EEV_6

The timer counter is reset upon external event 6U

HRTIM_TIMRESETTRIGGER_EEV_7

The timer counter is reset upon external event 7U

HRTIM_TIMRESETTRIGGER_EEV_8

The timer counter is reset upon external event 8U

HRTIM_TIMRESETTRIGGER_EEV_9

The timer counter is reset upon external event 9U

HRTIM_TIMRESETTRIGGER_EEV_10

The timer counter is reset upon external event 10U

HRTIM_TIMRESETTRIGGER_OTHER1_CMP1

The timer counter is reset upon other timer Compare 1 event

HRTIM_TIMRESETTRIGGER_OTHER1_CMP2

The timer counter is reset upon other timer Compare 2 event

HRTIM_TIMRESETTRIGGER_OTHER1_CMP4

The timer counter is reset upon other timer Compare 4 event

HRTIM_TIMRESETTRIGGER_OTHER2_CMP1

The timer counter is reset upon other timer Compare 1 event

HRTIM_TIMRESETTRIGGER_OTHER2_CMP2

The timer counter is reset upon other timer Compare 2 event

HRTIM_TIMRESETTRIGGER_OTHER2_CMP4

The timer counter is reset upon other timer Compare 4 event

HRTIM_TIMRESETTRIGGER_OTHER3_CMP1

The timer counter is reset upon other timer Compare 1 event

HRTIM_TIMRESETTRIGGER_OTHER3_CMP2

The timer counter is reset upon other timer Compare 2 event

HRTIM_TIMRESETTRIGGER_OTHER3_CMP4

The timer counter is reset upon other timer Compare 4 event

HRTIM_TIMRESETTRIGGER_OTHER4_CMP1

The timer counter is reset upon other timer Compare 1 event

HRTIM_TIMRESETTRIGGER_OTHER4_CMP2

The timer counter is reset upon other timer Compare 2 event

HRTIM_TIMRESETTRIGGER_OTHER4_CMP4

The timer counter is reset upon other timer Compare 4 event

HRTIM Timer Reset Update

HRTIM_TIMUPDATEONRESET_DISABLED

Update by timer x reset / roll-over disabled

HRTIM_TIMUPDATEONRESET_ENABLED

Update by timer x reset / roll-over enabled

HRTIM Timer Update Trigger

HRTIM_TIMUPDATETRIGGER_NONE

Register update is disabled

HRTIM_TIMUPDATETRIGGER_MASTER

Register update is triggered by the master timer update

HRTIM_TIMUPDATETRIGGER_TIMER_A

Register update is triggered by the timer A update

HRTIM_TIMUPDATETRIGGER_TIMER_B

Register update is triggered by the timer B update

HRTIM_TIMUPDATETRIGGER_TIMER_C

Register update is triggered by the timer C update

HRTIM_TIMUPDATETRIGGER_TIMER_D

Register update is triggered by the timer D update

HRTIM_TIMUPDATETRIGGER_TIMER_E

Register update is triggered by the timer E update

HRTIM Timing Unit DMA Request Enable

HRTIM_TIM_DMA_NONE

No DMA request enable

HRTIM_TIM_DMA_CMP1

Timer compare 1 DMA request enable

HRTIM_TIM_DMA_CMP2

Timer compare 2 DMA request enable

HRTIM_TIM_DMA_CMP3

Timer compare 3 DMA request enable

HRTIM_TIM_DMA_CMP4

Timer compare 4 DMA request enable

HRTIM_TIM_DMA_REP

Timer repetition DMA request enable

HRTIM_TIM_DMA_UPD

Timer update DMA request enable

HRTIM_TIM_DMA_CPT1

Timer capture 1 DMA request enable

HRTIM_TIM_DMA_CPT2

Timer capture 2 DMA request enable

HRTIM_TIM_DMA_SET1

Timer output 1 set DMA request enable

HRTIM_TIM_DMA_RST1

Timer output 1 reset DMA request enable

HRTIM_TIM_DMA_SET2

Timer output 2 set DMA request enable

HRTIM_TIM_DMA_RST2

Timer output 2 reset DMA request enable

HRTIM_TIM_DMA_RST

Timer reset DMA request enable

HRTIM_TIM_DMA_DLYPRT

Timer delay protection DMA request enable

HRTIM Timing Unit Interrupt Enable

HRTIM_TIM_IT_NONE

No interrupt enabled

HRTIM_TIM_IT_CMP1

Timer compare 1 interrupt enable

HRTIM_TIM_IT_CMP2

Timer compare 2 interrupt enable

HRTIM_TIM_IT_CMP3

Timer compare 3 interrupt enable

HRTIM_TIM_IT_CMP4

Timer compare 4 interrupt enable

HRTIM_TIM_IT_REP

Timer repetition interrupt enable

HRTIM_TIM_IT_UPD

Timer update interrupt enable

HRTIM_TIM_IT_CPT1

Timer capture 1 interrupt enable

HRTIM_TIM_IT_CPT2

Timer capture 2 interrupt enable

HRTIM_TIM_IT_SET1

Timer output 1 set interrupt enable

HRTIM_TIM_IT_RST1

Timer output 1 reset interrupt enable

HRTIM_TIM_IT_SET2

Timer output 2 set interrupt enable

HRTIM_TIM_IT_RST2

Timer output 2 reset interrupt enable

HRTIM_TIM_IT_RST

Timer reset interrupt enable

HRTIM_TIM_IT_DLYPRT

Timer delay protection interrupt enable

HRTIM Timing Unit Interrupt Flag

HRTIM_TIM_FLAG_CMP1

Timer compare 1 interrupt flag

HRTIM_TIM_FLAG_CMP2

Timer compare 2 interrupt flag

HRTIM_TIM_FLAG_CMP3

Timer compare 3 interrupt flag

HRTIM_TIM_FLAG_CMP4

Timer compare 4 interrupt flag

HRTIM_TIM_FLAG_REP

Timer repetition interrupt flag

HRTIM_TIM_FLAG_UPD

Timer update interrupt flag

HRTIM_TIM_FLAG_CPT1

Timer capture 1 interrupt flag

HRTIM_TIM_FLAG_CPT2

Timer capture 2 interrupt flag

HRTIM_TIM_FLAG_SET1

Timer output 1 set interrupt flag

HRTIM_TIM_FLAG_RST1

Timer output 1 reset interrupt flag

HRTIM_TIM_FLAG_SET2

Timer output 2 set interrupt flag

HRTIM_TIM_FLAG_RST2

Timer output 2 reset interrupt flag

HRTIM_TIM_FLAG_RST

Timer reset interrupt flag

HRTIM_TIM_FLAG_DLYPRT

Timer delay protection interrupt flag

HRTIM Update Gating

HRTIM_UPDATEGATING_INDEPENDENT

Update done independently from the DMA burst transfer completion

HRTIM_UPDATEGATING_DMABURST

Update done when the DMA burst transfer is completed

HRTIM_UPDATEGATING_DMABURST_UPDATE

Update done on timer roll-over following a DMA burst transfer completion

HRTIM_UPDATEGATING_UPDEN1

Slave timer only - Update done on a rising edge of HRTIM update enable input 1U

HRTIM_UPDATEGATING_UPDEN2

Slave timer only - Update done on a rising edge of HRTIM update enable input 2U

HRTIM_UPDATEGATING_UPDEN3

Slave timer only - Update done on a rising edge of HRTIM update enable input 3U

HRTIM_UPDATEGATING_UPDEN1_UPDATE

Slave timer only - Update done on the update event following a rising edge of HRTIM update enable input 1U

HRTIM_UPDATEGATING_UPDEN2_UPDATE

Slave timer only - Update done on the update event following a rising edge of HRTIM update enable input 2U

HRTIM_UPDATEGATING_UPDEN3_UPDATE

Slave timer only - Update done on the update event following a rising edge of HRTIM update enable input 3U

41 HAL HSEM Generic Driver

41.1 HSEM Firmware driver API description

The following section lists the various functions of the HSEM library.

41.1.1 How to use this driver

1. Take a semaphore In 2-Step mode Using function HAL_HSEM_Take. This function takes as parameters :
   – the semaphore ID from 0 to 31
   – the process ID from 0 to 255
2. Fast Take semaphore In 1-Step mode Using function HAL_HSEM_FastTake. This function takes as parameter :
   – the semaphore ID from 0_ID to 31. Note that the process ID value is implicitly assumed as zero
3. Check if a semaphore is Taken using function HAL_HSEM_IsSemTaken. This function takes as parameter :
   – the semaphore ID from 0_ID to 31
   – It returns 1 if the given semaphore is taken otherwise (Free) zero
4. Release a semaphore using function with HAL_HSEM_Release. This function takes as parameters :
   – the semaphore ID from 0 to 31
   – the process ID from 0 to 255:
   – Note: If ProcessID and MasterID match, semaphore is freed, and an interrupt may be generated when enabled (notification activated). If ProcessID or MasterID does not match, semaphore remains taken (locked)
5. Release all semaphores at once taken by a given Master using function HAL_HSEM_Release_All This function takes as parameters :
   – the Release Key (value from 0 to 0xFFFF) can be Set or Get respectively by HAL_HSEM_SetClearKey() or HAL_HSEM_GetClearKey functions
   – the Master ID:
   – Note: If the Key and MasterID match, all semaphores taken by the given CPU that corresponds to MasterID will be freed, and an interrupt may be generated when enabled (notification activated). If the Key or the MasterID doesn't match, semaphores remains taken (locked)
6. Semaphores Release all key functions:
   – HAL_HSEM_SetClearKey() to set semaphore release all Key
   – HAL_HSEM_GetClearKey() to get release all Key
7. Semaphores notification functions :
   – HAL_HSEM_ActivateNotification to activate a notification callback on a given semaphores Mask (bitfield). When one or more semaphores defined by the mask are released the callback HAL_HSEM_FreeCallback will be asserted giving as parameters a mask of the released semaphores (bitfield).
   – HAL_HSEM_DeactivateNotification to deactivate the notification of a given semaphores Mask (bitfield).
   – See the description of the macro __HAL_HSEM_SEMID_TO_MASK to check how to calculate a semaphore mask Used by the notification functions

HSEM HAL driver macros list

Below the list of most used macros in HSEM HAL driver.

- __HAL_HSEM_SEMID_TO_MASK: Helper macro to convert a Semaphore ID to a Mask.

Example of use :

mask = __HAL_HSEM_SEMID_TO_MASK(8) | __HAL_HSEM_SEMID_TO_MASK(21) | __HAL_HSEM_SEMID_TO_MASK(25).

All next macros take as parameter a semaphore Mask (bitfiled) that can be constructed using __HAL_HSEM_SEMID_TO_MASK as the above example.

- __HAL_HSEM_ENABLE_IT: Enable the specified semaphores Mask interrupts.
- __HAL_HSEM_DISABLE_IT: Disable the specified semaphores Mask interrupts.
- __HAL_HSEM_GET_IT: Checks whether the specified semaphore interrupt has occurred or not.
- __HAL_HSEM_GET_FLAG: Get the semaphores status release flags.
- __HAL_HSEM_CLEAR_FLAG: Clear the semaphores status release flags.

41.1.2 HSEM Take and Release functions

This section provides functions allowing to:

- Take a semaphore with 2 Step method
- Fast Take a semaphore with 1 Step method
- Check semaphore state Taken or not
- Release a semaphore
- Release all semaphore at once

This section contains the following APIs:

- ***HAL_HSEM_Take()***
- ***HAL_HSEM_FastTake()***
- ***HAL_HSEM_IsSemTaken()***
- ***HAL_HSEM_Release()***
- ***HAL_HSEM_ReleaseAll()***

41.1.3 HSEM Set and Get Key functions

This section provides functions allowing to:

- Set semaphore Key
- Get semaphore Key

This section contains the following APIs:

- ***HAL_HSEM_SetClearKey()***
- ***HAL_HSEM_GetClearKey()***

41.1.4 HSEM IRQ handler management and Notification functions

This section provides HSEM IRQ handler and Notification function.

This section contains the following APIs:

- ***HAL_HSEM_ActivateNotification()***
- ***HAL_HSEM_DeactivateNotification()***
- ***HAL_HSEM_IRQHandler()***
- ***HAL_HSEM_FreeCallback()***

41.1.5 Detailed description of functions

HAL_HSEM_Take

Function name

HAL_StatusTypeDef HAL_HSEM_Take (uint32_t SemID, uint32_t ProcessID)

Function description

Take a semaphore in 2 Step mode.

Parameters

- **SemID:** semaphore ID from 0 to 31
- **ProcessID:** Process ID from 0 to 255

Return values

- **HAL:** status

HAL_HSEM_FastTake

Function name

HAL_StatusTypeDef HAL_HSEM_FastTake (uint32_t SemID)

Function description

Fast Take a semaphore with 1 Step mode.

Parameters

- **SemID:** semaphore ID from 0 to 31

Return values

- **HAL:** status

HAL_HSEM_Release

Function name

void HAL_HSEM_Release (uint32_t SemID, uint32_t ProcessID)

Function description

Release a semaphore.

Parameters

- **SemID:** semaphore ID from 0 to 31
- **ProcessID:** Process ID from 0 to 255

Return values

- **None:**

HAL_HSEM_ReleaseAll

Function name

void HAL_HSEM_ReleaseAll (uint32_t Key, uint32_t CoreID)

Function description

Release All semaphore used by a given Master .

Parameters

- **Key:** Semaphore Key , value from 0 to 0xFFFF
- **CoreID:** CoreID of the CPU that is using semaphores to be released

Return values

- **None:**

HAL_HSEM_IsSemTaken

Function name

uint32_t HAL_HSEM_IsSemTaken (uint32_t SemID)

Function description

Check semaphore state Taken or not.

Parameters

- **SemID:** semaphore ID

Return values

- **HAL:** HSEM state

HAL_HSEM_SetClearKey

Function name

void HAL_HSEM_SetClearKey (uint32_t Key)

Function description

Set semaphore Key .

Parameters

- **Key:** Semaphore Key , value from 0 to 0xFFFF

Return values

- **None:**

HAL_HSEM_GetClearKey

Function name

uint32_t HAL_HSEM_GetClearKey (void)

Function description

Get semaphore Key .

Return values

- **Semaphore:** Key , value from 0 to 0xFFFF

HAL_HSEM_ActivateNotification

Function name

void HAL_HSEM_ActivateNotification (uint32_t SemMask)

Function description

Activate Semaphore release Notification for a given Semaphores Mask .

Parameters

- **SemMask:** Mask of Released semaphores

Return values

- **Semaphore:** Key

HAL_HSEM_DeactivateNotification

Function name

void HAL_HSEM_DeactivateNotification (uint32_t SemMask)

Function description

Deactivate Semaphore release Notification for a given Semaphores Mask .

Parameters

- **SemMask:** Mask of Released semaphores

Return values

- **Semaphore:** Key

HAL_HSEM_FreeCallback

Function name

void HAL_HSEM_FreeCallback (uint32_t SemMask)

Function description

Semaphore Released Callback.

Parameters

- **SemMask:** Mask of Released semaphores

Return values

- **None:**

HAL_HSEM_IRQHandler

Function name

void HAL_HSEM_IRQHandler (void)

Function description

This function handles HSEM interrupt request.

Return values

- **None:**

41.2 HSEM Firmware driver defines

The following section lists the various define and macros of the module.

41.2.1 HSEM

HSEM

HSEM Exported Macros

__HAL_HSEM_SEMID_TO_MASK

Description:

- SemID to mask helper Macro.

Parameters:

- __SEMID__: semaphore ID from 0 to 31

Return value:

- Semaphore: Mask.

__HAL_HSEM_ENABLE_IT

Description:

- Enables the specified HSEM interrupts.

Parameters:

- __SEM_MASK__: semaphores Mask

Return value:

- None.

__HAL_HSEM_DISABLE_IT

Description:

- Disables the specified HSEM interrupts.

Parameters:

- __SEM_MASK__: semaphores Mask

Return value:

- None.

__HAL_HSEM_GET_IT

Description:

- Checks whether interrupt has occurred or not for semaphores specified by a mask.

Parameters:

- __SEM_MASK__: semaphores Mask

Return value:

- semaphores: Mask : Semaphores where an interrupt occurred.

__HAL_HSEM_GET_FLAG

Description:

- Get the semaphores release status flags.

Parameters:

- __SEM_MASK__: semaphores Mask

Return value:

- semaphores: Mask : Semaphores where Release flags rise.

__HAL_HSEM_CLEAR_FLAG

Description:

- Clears the HSEM Interrupt flags.

Parameters:

- __SEM_MASK__: semaphores Mask

Return value:

- None.

42 HAL I2C Generic Driver

42.1 I2C Firmware driver registers structures

42.1.1 I2C_InitTypeDef

I2C_InitTypeDef is defined in the stm32h7xx_hal_i2c.h

Data Fields

- ***uint32_t Timing***
- ***uint32_t OwnAddress1***
- ***uint32_t AddressingMode***
- ***uint32_t DualAddressMode***
- ***uint32_t OwnAddress2***
- ***uint32_t OwnAddress2Masks***
- ***uint32_t GeneralCallMode***
- ***uint32_t NoStretchMode***

Field Documentation

- ***uint32_t I2C_InitTypeDef::Timing***
  Specifies the I2C_TIMINGR_register value. This parameter calculated by referring to I2C initialization section in Reference manual
- ***uint32_t I2C_InitTypeDef::OwnAddress1***
  Specifies the first device own address. This parameter can be a 7-bit or 10-bit address.
- ***uint32_t I2C_InitTypeDef::AddressingMode***
  Specifies if 7-bit or 10-bit addressing mode is selected. This parameter can be a value of ***I2C_ADDRESSING_MODE***
- ***uint32_t I2C_InitTypeDef::DualAddressMode***
  Specifies if dual addressing mode is selected. This parameter can be a value of ***I2C_DUAL_ADDRESSING_MODE***
- ***uint32_t I2C_InitTypeDef::OwnAddress2***
  Specifies the second device own address if dual addressing mode is selected This parameter can be a 7-bit address.
- ***uint32_t I2C_InitTypeDef::OwnAddress2Masks***
  Specifies the acknowledge mask address second device own address if dual addressing mode is selected. This parameter can be a value of ***I2C_OWN_ADDRESS2_MASKS***
- ***uint32_t I2C_InitTypeDef::GeneralCallMode***
  Specifies if general call mode is selected. This parameter can be a value of ***I2C_GENERAL_CALL_ADDRESSING_MODE***
- ***uint32_t I2C_InitTypeDef::NoStretchMode***
  Specifies if nostretch mode is selected. This parameter can be a value of ***I2C_NOSTRETCH_MODE***

42.1.2 __I2C_HandleTypeDef

__I2C_HandleTypeDef is defined in the stm32h7xx_hal_i2c.h

42.2 I2C Firmware driver API description

The following section lists the various functions of the I2C library.

42.2.1 How to use this driver

The I2C HAL driver can be used as follows:

1. Declare a I2C_HandleTypeDef handle structure, for example: I2C_HandleTypeDef hi2c;

2. Initialize the I2C low level resources by implementing the HAL_I2C_MspInit() API:
   a. Enable the I2Cx interface clock
   b. I2C pins configuration
      - Enable the clock for the I2C GPIOs
      - Configure I2C pins as alternate function open-drain
   c. NVIC configuration if you need to use interrupt process
      - Configure the I2Cx interrupt priority
      - Enable the NVIC I2C IRQ Channel
   d. DMA Configuration if you need to use DMA process
      - Declare a DMA_HandleTypeDef handle structure for the transmit or receive stream or channel depends on Instance
      - Enable the DMAx interface clock using
      - Configure the DMA handle parameters
      - Configure the DMA Tx or Rx stream or channel depends on Instance
      - Associate the initialized DMA handle to the hi2c DMA Tx or Rx handle
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx or Rx stream or channel depends on Instance
3. Configure the Communication Clock Timing, Own Address1, Master Addressing mode, Dual Addressing mode, Own Address2, Own Address2 Mask, General call and Nostretch mode in the hi2c Init structure.
4. Initialize the I2C registers by calling the HAL_I2C_Init(), configures also the low level Hardware (GPIO, CLOCK, NVIC...etc) by calling the customized HAL_I2C_MspInit(&hi2c) API.
5. To check if target device is ready for communication, use the function HAL_I2C_IsDeviceReady()
6. For I2C IO and IO MEM operations, three operation modes are available within this driver :

Polling mode IO operation

- Transmit in master mode an amount of data in blocking mode using HAL_I2C_Master_Transmit()
- Receive in master mode an amount of data in blocking mode using HAL_I2C_Master_Receive()
- Transmit in slave mode an amount of data in blocking mode using HAL_I2C_Slave_Transmit()
- Receive in slave mode an amount of data in blocking mode using HAL_I2C_Slave_Receive()

Polling mode IO MEM operation

- Write an amount of data in blocking mode to a specific memory address using HAL_I2C_Mem_Write()
- Read an amount of data in blocking mode from a specific memory address using HAL_I2C_Mem_Read()

Interrupt mode IO operation

- Transmit in master mode an amount of data in non-blocking mode using HAL_I2C_Master_Transmit_IT()
- At transmission end of transfer, HAL_I2C_MasterTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterTxCpltCallback()
- Receive in master mode an amount of data in non-blocking mode using HAL_I2C_Master_Receive_IT()
- At reception end of transfer, HAL_I2C_MasterRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterRxCpltCallback()
- Transmit in slave mode an amount of data in non-blocking mode using HAL_I2C_Slave_Transmit_IT()
- At transmission end of transfer, HAL_I2C_SlaveTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveTxCpltCallback()
- Receive in slave mode an amount of data in non-blocking mode using HAL_I2C_Slave_Receive_IT()
- At reception end of transfer, HAL_I2C_SlaveRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveRxCpltCallback()
- In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()
- Abort a master I2C process communication with Interrupt using HAL_I2C_Master_Abort_IT()
- End of abort process, HAL_I2C_AbortCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_AbortCpltCallback()

- Discard a slave I2C process communication using __HAL_I2C_GENERATE_NACK() macro. This action will inform Master to generate a Stop condition to discard the communication.

Interrupt mode or DMA mode IO sequential operation

Note: These interfaces allow to manage a sequential transfer with a repeated start condition when a direction change during transfer

- A specific option field manage the different steps of a sequential transfer
- Option field values are defined through I2C_XFEROPTIONS and are listed below:
  - I2C_FIRST_AND_LAST_FRAME: No sequential usage, functional is same as associated interfaces in no sequential mode
  - I2C_FIRST_FRAME: Sequential usage, this option allow to manage a sequence with start condition, address and data to transfer without a final stop condition
  - I2C_FIRST_AND_NEXT_FRAME: Sequential usage (Master only), this option allow to manage a sequence with start condition, address and data to transfer without a final stop condition, an then permit a call the same master sequential interface several times (like HAL_I2C_Master_Seq_Transmit_IT() then HAL_I2C_Master_Seq_Transmit_IT() or HAL_I2C_Master_Seq_Transmit_DMA() then HAL_I2C_Master_Seq_Transmit_DMA())
  - I2C_NEXT_FRAME: Sequential usage, this option allow to manage a sequence with a restart condition, address and with new data to transfer if the direction change or manage only the new data to transfer if no direction change and without a final stop condition in both cases
  - I2C_LAST_FRAME: Sequential usage, this option allow to manage a sequance with a restart condition, address and with new data to transfer if the direction change or manage only the new data to transfer if no direction change and with a final stop condition in both cases
  - I2C_LAST_FRAME_NO_STOP: Sequential usage (Master only), this option allow to manage a restart condition after several call of the same master sequential interface several times (link with option I2C_FIRST_AND_NEXT_FRAME). Usage can, transfer several bytes one by one using HAL_I2C_Master_Seq_Transmit_IT or HAL_I2C_Master_Seq_Receive_IT or HAL_I2C_Master_Seq_Transmit_DMA or HAL_I2C_Master_Seq_Receive_DMA with option I2C_FIRST_AND_NEXT_FRAME then I2C_NEXT_FRAME. Then usage of this option I2C_LAST_FRAME_NO_STOP at the last Transmit or Receive sequence permit to call the opposite interface Receive or Transmit without stopping the communication and so generate a restart condition.
  - I2C_OTHER_FRAME: Sequential usage (Master only), this option allow to manage a restart condition after each call of the same master sequential interface. Usage can, transfer several bytes one by one with a restart with slave address between each bytes using HAL_I2C_Master_Seq_Transmit_IT or HAL_I2C_Master_Seq_Receive_IT or HAL_I2C_Master_Seq_Transmit_DMA or HAL_I2C_Master_Seq_Receive_DMA with option I2C_FIRST_FRAME then I2C_OTHER_FRAME. Then usage of this option I2C_OTHER_AND_LAST_FRAME at the last frame to help automatic generation of STOP condition.

- Different sequential I2C interfaces are listed below:
  - Sequential transmit in master I2C mode an amount of data in non-blocking mode using HAL_I2C_Master_Seq_Transmit_IT() or using HAL_I2C_Master_Seq_Transmit_DMA()
    - At transmission end of current frame transfer, HAL_I2C_MasterTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterTxCpltCallback()
  - Sequential receive in master I2C mode an amount of data in non-blocking mode using HAL_I2C_Master_Seq_Receive_IT() or using HAL_I2C_Master_Seq_Receive_DMA()
    - At reception end of current frame transfer, HAL_I2C_MasterRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterRxCpltCallback()
  - Abort a master IT or DMA I2C process communication with Interrupt using HAL_I2C_Master_Abort_IT()
    - End of abort process, HAL_I2C_AbortCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_AbortCpltCallback()
  - Enable/disable the Address listen mode in slave I2C mode using HAL_I2C_EnableListen_IT() HAL_I2C_DisableListen_IT()
    - When address slave I2C match, HAL_I2C_AddrCallback() is executed and users can add their own code to check the Address Match Code and the transmission direction request by master (Write/Read).
    - At Listen mode end HAL_I2C_ListenCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_ListenCpltCallback()
  - Sequential transmit in slave I2C mode an amount of data in non-blocking mode using HAL_I2C_Slave_Seq_Transmit_IT() or using HAL_I2C_Slave_Seq_Transmit_DMA()
    - At transmission end of current frame transfer, HAL_I2C_SlaveTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveTxCpltCallback()
  - Sequential receive in slave I2C mode an amount of data in non-blocking mode using HAL_I2C_Slave_Seq_Receive_IT() or using HAL_I2C_Slave_Seq_Receive_DMA()
    - At reception end of current frame transfer, HAL_I2C_SlaveRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveRxCpltCallback()
  - In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()
  - Discard a slave I2C process communication using __HAL_I2C_GENERATE_NACK() macro. This action will inform Master to generate a Stop condition to discard the communication.

Interrupt mode IO MEM operation

- Write an amount of data in non-blocking mode with Interrupt to a specific memory address using HAL_I2C_Mem_Write_IT()
- At Memory end of write transfer, HAL_I2C_MemTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MemTxCpltCallback()
- Read an amount of data in non-blocking mode with Interrupt from a specific memory address using HAL_I2C_Mem_Read_IT()
- At Memory end of read transfer, HAL_I2C_MemRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MemRxCpltCallback()
- In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()

DMA mode IO operation

- Transmit in master mode an amount of data in non-blocking mode (DMA) using HAL_I2C_Master_Transmit_DMA()
- At transmission end of transfer, HAL_I2C_MasterTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterTxCpltCallback()

- Receive in master mode an amount of data in non-blocking mode (DMA) using HAL_I2C_Master_Receive_DMA()
- At reception end of transfer, HAL_I2C_MasterRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterRxCpltCallback()
- Transmit in slave mode an amount of data in non-blocking mode (DMA) using HAL_I2C_Slave_Transmit_DMA()
- At transmission end of transfer, HAL_I2C_SlaveTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveTxCpltCallback()
- Receive in slave mode an amount of data in non-blocking mode (DMA) using HAL_I2C_Slave_Receive_DMA()
- At reception end of transfer, HAL_I2C_SlaveRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveRxCpltCallback()
- In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()
- Abort a master I2C process communication with Interrupt using HAL_I2C_Master_Abort_IT()
- End of abort process, HAL_I2C_AbortCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_AbortCpltCallback()
- Discard a slave I2C process communication using __HAL_I2C_GENERATE_NACK() macro. This action will inform Master to generate a Stop condition to discard the communication.

DMA mode IO MEM operation

- Write an amount of data in non-blocking mode with DMA to a specific memory address using HAL_I2C_Mem_Write_DMA()
- At Memory end of write transfer, HAL_I2C_MemTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MemTxCpltCallback()
- Read an amount of data in non-blocking mode with DMA from a specific memory address using HAL_I2C_Mem_Read_DMA()
- At Memory end of read transfer, HAL_I2C_MemRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MemRxCpltCallback()
- In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()

I2C HAL driver macros list

Below the list of most used macros in I2C HAL driver.

- __HAL_I2C_ENABLE: Enable the I2C peripheral
- __HAL_I2C_DISABLE: Disable the I2C peripheral
- __HAL_I2C_GENERATE_NACK: Generate a Non-Acknowledge I2C peripheral in Slave mode
- __HAL_I2C_GET_FLAG: Check whether the specified I2C flag is set or not
- __HAL_I2C_CLEAR_FLAG: Clear the specified I2C pending flag
- __HAL_I2C_ENABLE_IT: Enable the specified I2C interrupt
- __HAL_I2C_DISABLE_IT: Disable the specified I2C interrupt

Callback registration

The compilation flag USE_HAL_I2C_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_I2C_RegisterCallback() or HAL_I2C_RegisterAddrCallback() to register an interrupt callback.

Function HAL_I2C_RegisterCallback() allows to register following callbacks:

- MasterTxCpltCallback : callback for Master transmission end of transfer.
- MasterRxCpltCallback : callback for Master reception end of transfer.
- SlaveTxCpltCallback : callback for Slave transmission end of transfer.
- SlaveRxCpltCallback : callback for Slave reception end of transfer.
- ListenCpltCallback : callback for end of listen mode.
- MemTxCpltCallback : callback for Memory transmission end of transfer.

- MemRxCpltCallback : callback for Memory reception end of transfer.
- ErrorCallback : callback for error detection.
- AbortCpltCallback : callback for abort completion process.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

For specific callback AddrCallback use dedicated register callbacks : HAL_I2C_RegisterAddrCallback().

Use function HAL_I2C_UnRegisterCallback to reset a callback to the default weak function. HAL_I2C_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- MasterTxCpltCallback : callback for Master transmission end of transfer.
- MasterRxCpltCallback : callback for Master reception end of transfer.
- SlaveTxCpltCallback : callback for Slave transmission end of transfer.
- SlaveRxCpltCallback : callback for Slave reception end of transfer.
- ListenCpltCallback : callback for end of listen mode.
- MemTxCpltCallback : callback for Memory transmission end of transfer.
- MemRxCpltCallback : callback for Memory reception end of transfer.
- ErrorCallback : callback for error detection.
- AbortCpltCallback : callback for abort completion process.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit.

For callback AddrCallback use dedicated register callbacks : HAL_I2C_UnRegisterAddrCallback().

By default, after the HAL_I2C_Init() and when the state is HAL_I2C_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_I2C_MasterTxCpltCallback(), HAL_I2C_MasterRxCpltCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_I2C_Init()/ HAL_I2C_DeInit() only when these callbacks are null (not registered beforehand). If MspInit or MspDeInit are not null, the HAL_I2C_Init()/ HAL_I2C_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in HAL_I2C_STATE_READY state only. Exception done MspInit/MspDeInit functions that can be registered/unregistered in HAL_I2C_STATE_READY or HAL_I2C_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_I2C_RegisterCallback() before calling HAL_I2C_DeInit() or HAL_I2C_Init() function.

When the compilation flag USE_HAL_I2C_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

Note: You can refer to the I2C HAL driver header file for more useful macros

42.2.2 Initialization and de-initialization functions

This subsection provides a set of functions allowing to initialize and deinitialize the I2Cx peripheral:

- User must Implement HAL_I2C_MspInit() function in which he configures all related peripherals resources (CLOCK, GPIO, DMA, IT and NVIC).
- Call the function HAL_I2C_Init() to configure the selected device with the selected configuration:
  - Clock Timing
  - Own Address 1
  - Addressing mode (Master, Slave)
  - Dual Addressing mode
  - Own Address 2
  - Own Address 2 Mask
  - General call mode
  - Nostretch mode
- Call the function HAL_I2C_DeInit() to restore the default configuration of the selected I2Cx peripheral.

This section contains the following APIs:

- *HAL_I2C_Init()*
- *HAL_I2C_DeInit()*
- *HAL_I2C_MspInit()*
- *HAL_I2C_MspDeInit()*
- *HAL_I2C_RegisterCallback()*
- *HAL_I2C_UnRegisterCallback()*
- *HAL_I2C_RegisterAddrCallback()*
- *HAL_I2C_UnRegisterAddrCallback()*

42.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the I2C data transfers.

1. There are two modes of transfer:
   - Blocking mode : The communication is performed in the polling mode. The status of all data processing is returned by the same function after finishing transfer.
   - No-Blocking mode : The communication is performed using Interrupts or DMA. These functions return the status of the transfer startup. The end of the data processing will be indicated through the dedicated I2C IRQ when using Interrupt mode or the DMA IRQ when using DMA mode.
2. Blocking mode functions are :
   - HAL_I2C_Master_Transmit()
   - HAL_I2C_Master_Receive()
   - HAL_I2C_Slave_Transmit()
   - HAL_I2C_Slave_Receive()
   - HAL_I2C_Mem_Write()
   - HAL_I2C_Mem_Read()
   - HAL_I2C_IsDeviceReady()
3. No-Blocking mode functions with Interrupt are :
   - HAL_I2C_Master_Transmit_IT()
   - HAL_I2C_Master_Receive_IT()
   - HAL_I2C_Slave_Transmit_IT()
   - HAL_I2C_Slave_Receive_IT()
   - HAL_I2C_Mem_Write_IT()
   - HAL_I2C_Mem_Read_IT()
   - HAL_I2C_Master_Seq_Transmit_IT()
   - HAL_I2C_Master_Seq_Receive_IT()
   - HAL_I2C_Slave_Seq_Transmit_IT()
   - HAL_I2C_Slave_Seq_Receive_IT()
   - HAL_I2C_EnableListen_IT()
   - HAL_I2C_DisableListen_IT()
   - HAL_I2C_Master_Abort_IT()

4. No-Blocking mode functions with DMA are :
   - HAL_I2C_Master_Transmit_DMA()
   - HAL_I2C_Master_Receive_DMA()
   - HAL_I2C_Slave_Transmit_DMA()
   - HAL_I2C_Slave_Receive_DMA()
   - HAL_I2C_Mem_Write_DMA()
   - HAL_I2C_Mem_Read_DMA()
   - HAL_I2C_Master_Seq_Transmit_DMA()
   - HAL_I2C_Master_Seq_Receive_DMA()
   - HAL_I2C_Slave_Seq_Transmit_DMA()
   - HAL_I2C_Slave_Seq_Receive_DMA()
5. A set of Transfer Complete Callbacks are provided in non Blocking mode:
   - HAL_I2C_MasterTxCpltCallback()
   - HAL_I2C_MasterRxCpltCallback()
   - HAL_I2C_SlaveTxCpltCallback()
   - HAL_I2C_SlaveRxCpltCallback()
   - HAL_I2C_MemTxCpltCallback()
   - HAL_I2C_MemRxCpltCallback()
   - HAL_I2C_AddrCallback()
   - HAL_I2C_ListenCpltCallback()
   - HAL_I2C_ErrorCallback()
   - HAL_I2C_AbortCpltCallback()

This section contains the following APIs:

- ***HAL_I2C_Master_Transmit()***
- ***HAL_I2C_Master_Receive()***
- ***HAL_I2C_Slave_Transmit()***
- ***HAL_I2C_Slave_Receive()***
- ***HAL_I2C_Master_Transmit_IT()***
- ***HAL_I2C_Master_Receive_IT()***
- ***HAL_I2C_Slave_Transmit_IT()***
- ***HAL_I2C_Slave_Receive_IT()***
- ***HAL_I2C_Master_Transmit_DMA()***
- ***HAL_I2C_Master_Receive_DMA()***
- ***HAL_I2C_Slave_Transmit_DMA()***
- ***HAL_I2C_Slave_Receive_DMA()***
- ***HAL_I2C_Mem_Write()***
- ***HAL_I2C_Mem_Read()***
- ***HAL_I2C_Mem_Write_IT()***
- ***HAL_I2C_Mem_Read_IT()***
- ***HAL_I2C_Mem_Write_DMA()***
- ***HAL_I2C_Mem_Read_DMA()***
- ***HAL_I2C_IsDeviceReady()***
- ***HAL_I2C_Master_Seq_Transmit_IT()***
- ***HAL_I2C_Master_Seq_Transmit_DMA()***
- ***HAL_I2C_Master_Seq_Receive_IT()***
- ***HAL_I2C_Master_Seq_Receive_DMA()***
- ***HAL_I2C_Slave_Seq_Transmit_IT()***
- ***HAL_I2C_Slave_Seq_Transmit_DMA()***
- ***HAL_I2C_Slave_Seq_Receive_IT()***
- ***HAL_I2C_Slave_Seq_Receive_DMA()***

- *HAL_I2C_EnableListen_IT()*
- *HAL_I2C_DisableListen_IT()*
- *HAL_I2C_Master_Abort_IT()*

42.2.4 Peripheral State, Mode and Error functions

This subsection permit to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- *HAL_I2C_GetState()*
- *HAL_I2C_GetMode()*
- *HAL_I2C_GetError()*

42.2.5 Detailed description of functions

HAL_I2C_Init

Function name

HAL_StatusTypeDef HAL_I2C_Init (I2C_HandleTypeDef * hi2c)

Function description

Initializes the I2C according to the specified parameters in the I2C_InitTypeDef and initialize the associated handle.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **HAL:** status

HAL_I2C_DeInit

Function name

HAL_StatusTypeDef HAL_I2C_DeInit (I2C_HandleTypeDef * hi2c)

Function description

DeInitialize the I2C peripheral.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **HAL:** status

HAL_I2C_MspInit

Function name

void HAL_I2C_MspInit (I2C_HandleTypeDef * hi2c)

Function description

Initialize the I2C MSP.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_MspDeInit

Function name

void HAL_I2C_MspDeInit (I2C_HandleTypeDef * hi2c)

Function description

DeInitialize the I2C MSP.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_RegisterCallback

Function name

HAL_StatusTypeDef HAL_I2C_RegisterCallback (I2C_HandleTypeDef * hi2c, HAL_I2C_CallbackIDTypeDef CallbackID, pI2C_CallbackTypeDef pCallback)

Function description

Register a User I2C Callback To be used instead of the weak predefined callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_I2C_MASTER_TX_COMPLETE_CB_ID Master Tx Transfer completed callback ID
  - HAL_I2C_MASTER_RX_COMPLETE_CB_ID Master Rx Transfer completed callback ID
  - HAL_I2C_SLAVE_TX_COMPLETE_CB_ID Slave Tx Transfer completed callback ID
  - HAL_I2C_SLAVE_RX_COMPLETE_CB_ID Slave Rx Transfer completed callback ID
  - HAL_I2C_LISTEN_COMPLETE_CB_ID Listen Complete callback ID
  - HAL_I2C_MEM_TX_COMPLETE_CB_ID Memory Tx Transfer callback ID
  - HAL_I2C_MEM_RX_COMPLETE_CB_ID Memory Rx Transfer completed callback ID
  - HAL_I2C_ERROR_CB_ID Error callback ID
  - HAL_I2C_ABORT_CB_ID Abort callback ID
  - HAL_I2C_MSPINIT_CB_ID MspInit callback ID
  - HAL_I2C_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

Notes

- The HAL_I2C_RegisterCallback() may be called before HAL_I2C_Init() in HAL_I2C_STATE_RESET to register callbacks for HAL_I2C_MSPINIT_CB_ID and HAL_I2C_MSPDEINIT_CB_ID.

HAL_I2C_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_I2C_UnRegisterCallback (I2C_HandleTypeDef * hi2c, HAL_I2C_CallbackIDTypeDef CallbackID)

Function description

Unregister an I2C Callback I2C callback is redirected to the weak predefined callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values: This parameter can be one of the following values:
  - HAL_I2C_MASTER_TX_COMPLETE_CB_ID Master Tx Transfer completed callback ID
  - HAL_I2C_MASTER_RX_COMPLETE_CB_ID Master Rx Transfer completed callback ID
  - HAL_I2C_SLAVE_TX_COMPLETE_CB_ID Slave Tx Transfer completed callback ID
  - HAL_I2C_SLAVE_RX_COMPLETE_CB_ID Slave Rx Transfer completed callback ID
  - HAL_I2C_LISTEN_COMPLETE_CB_ID Listen Complete callback ID
  - HAL_I2C_MEM_TX_COMPLETE_CB_ID Memory Tx Transfer callback ID
  - HAL_I2C_MEM_RX_COMPLETE_CB_ID Memory Rx Transfer completed callback ID
  - HAL_I2C_ERROR_CB_ID Error callback ID
  - HAL_I2C_ABORT_CB_ID Abort callback ID
  - HAL_I2C_MSPINIT_CB_ID MspInit callback ID
  - HAL_I2C_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

Notes

- The HAL_I2C_UnRegisterCallback() may be called before HAL_I2C_Init() in HAL_I2C_STATE_RESET to un-register callbacks for HAL_I2C_MSPINIT_CB_ID and HAL_I2C_MSPDEINIT_CB_ID.

HAL_I2C_RegisterAddrCallback

Function name

HAL_StatusTypeDef HAL_I2C_RegisterAddrCallback (I2C_HandleTypeDef * hi2c, pI2C_AddrCallbackTypeDef pCallback)

Function description

Register the Slave Address Match I2C Callback To be used instead of the weak HAL_I2C_AddrCallback() predefined callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pCallback:** pointer to the Address Match Callback function

Return values

- **HAL:** status

HAL_I2C_UnRegisterAddrCallback

Function name

HAL_StatusTypeDef HAL_I2C_UnRegisterAddrCallback (I2C_HandleTypeDef * hi2c)

Function description

UnRegister the Slave Address Match I2C Callback Info Ready I2C Callback is redirected to the weak HAL_I2C_AddrCallback() predefined callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **HAL:** status

HAL_I2C_Master_Transmit

Function name

HAL_StatusTypeDef HAL_I2C_Master_Transmit (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Transmits in master mode an amount of data in blocking mode.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_Master_Receive

Function name

HAL_StatusTypeDef HAL_I2C_Master_Receive (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Receives in master mode an amount of data in blocking mode.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_Slave_Transmit

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Transmit (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Transmits in slave mode an amount of data in blocking mode.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_Slave_Receive

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Receive (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Receive in slave mode an amount of data in blocking mode.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_Mem_Write

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Write (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Write an amount of data in blocking mode to a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_Mem_Read

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Read (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Read an amount of data in blocking mode from a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_IsDeviceReady

Function name

HAL_StatusTypeDef HAL_I2C_IsDeviceReady (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint32_t Trials, uint32_t Timeout)

Function description

Checks if target device is ready for communication.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **Trials:** Number of trials
- **Timeout:** Timeout duration

Return values

- **HAL:** status

Notes

- This function is used with Memory devices

HAL_I2C_Master_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I2C_Master_Transmit_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size)

Function description

Transmit in master mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Master_Receive_IT

Function name

HAL_StatusTypeDef HAL_I2C_Master_Receive_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size)

Function description

Receive in master mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Slave_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Transmit_IT (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size)

Function description

Transmit in slave mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Slave_Receive_IT

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Receive_IT (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size)

Function description

Receive in slave mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Mem_Write_IT

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Write_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size)

Function description

Write an amount of data in non-blocking mode with Interrupt to a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Mem_Read_IT

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Read_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size)

Function description

Read an amount of data in non-blocking mode with Interrupt from a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Master_Seq_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I2C_Master_Seq_Transmit_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential transmit in master I2C mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Master_Seq_Receive_IT

Function name

HAL_StatusTypeDef HAL_I2C_Master_Seq_Receive_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential receive in master I2C mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Slave_Seq_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Seq_Transmit_IT (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential transmit in slave/device I2C mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Slave_Seq_Receive_IT

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Seq_Receive_IT (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential receive in slave/device I2C mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_EnableListen_IT

Function name

HAL_StatusTypeDef HAL_I2C_EnableListen_IT (I2C_HandleTypeDef * hi2c)

Function description

Enable the Address listen mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **HAL:** status

HAL_I2C_DisableListen_IT

Function name

HAL_StatusTypeDef HAL_I2C_DisableListen_IT (I2C_HandleTypeDef * hi2c)

Function description

Disable the Address listen mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C

Return values

- **HAL:** status

HAL_I2C_Master_Abort_IT

Function name

HAL_StatusTypeDef HAL_I2C_Master_Abort_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress)

Function description

Abort a master I2C IT or DMA process communication with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface

Return values

- **HAL:** status

HAL_I2C_Master_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Master_Transmit_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size)

Function description

Transmit in master mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Master_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Master_Receive_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size)

Function description

Receive in master mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Slave_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Transmit_DMA (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size)

Function description

Transmit in slave mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Slave_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Receive_DMA (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size)

Function description

Receive in slave mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Mem_Write_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Write_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size)

Function description

Write an amount of data in non-blocking mode with DMA to a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Mem_Read_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Read_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size)

Function description

Reads an amount of data in non-blocking mode with DMA from a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be read

Return values

- **HAL:** status

HAL_I2C_Master_Seq_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Master_Seq_Transmit_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential transmit in master I2C mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Master_Seq_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Master_Seq_Receive_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential receive in master I2C mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Slave_Seq_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Seq_Transmit_DMA (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential transmit in slave/device I2C mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Slave_Seq_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Seq_Receive_DMA (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential receive in slave/device I2C mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_EV_IRQHandler

Function name

void HAL_I2C_EV_IRQHandler (I2C_HandleTypeDef * hi2c)

Function description

This function handles I2C event interrupt request.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_ER_IRQHandler

Function name

void HAL_I2C_ER_IRQHandler (I2C_HandleTypeDef * hi2c)

Function description

This function handles I2C error interrupt request.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_MasterTxCpltCallback

Function name

void HAL_I2C_MasterTxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Master Tx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_MasterRxCpltCallback

Function name

void HAL_I2C_MasterRxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Master Rx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_SlaveTxCpltCallback

Function name

void HAL_I2C_SlaveTxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Slave Tx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_SlaveRxCpltCallback

Function name

void HAL_I2C_SlaveRxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Slave Rx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_AddrCallback

Function name

void HAL_I2C_AddrCallback (I2C_HandleTypeDef * hi2c, uint8_t TransferDirection, uint16_t AddrMatchCode)

Function description

Slave Address Match callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **TransferDirection:** Master request Transfer Direction (Write/Read), value of I2C Transfer Direction Master Point of View
- **AddrMatchCode:** Address Match Code

Return values

- **None:**

HAL_I2C_ListenCpltCallback

Function name

void HAL_I2C_ListenCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Listen Complete callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_MemTxCpltCallback

Function name

void HAL_I2C_MemTxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Memory Tx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_MemRxCpltCallback

Function name

void HAL_I2C_MemRxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Memory Rx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_ErrorCallback

Function name

void HAL_I2C_ErrorCallback (I2C_HandleTypeDef * hi2c)

Function description

I2C error callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_AbortCpltCallback

Function name

void HAL_I2C_AbortCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

I2C abort callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_GetState

Function name

HAL_I2C_StateTypeDef HAL_I2C_GetState (I2C_HandleTypeDef * hi2c)

Function description

Return the I2C handle state.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **HAL:** state

HAL_I2C_GetMode

Function name

HAL_I2C_ModeTypeDef HAL_I2C_GetMode (I2C_HandleTypeDef * hi2c)

Function description

Returns the I2C Master, Slave, Memory or no mode.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for I2C module

Return values

- **HAL:** mode

HAL_I2C_GetError

Function name

uint32_t HAL_I2C_GetError (I2C_HandleTypeDef * hi2c)

Function description

Return the I2C error code.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **I2C:** Error Code

42.3 I2C Firmware driver defines

The following section lists the various define and macros of the module.

42.3.1 I2C

I2C

I2C Addressing Mode

I2C_ADDRESSINGMODE_7BIT

I2C_ADDRESSINGMODE_10BIT

I2C Dual Addressing Mode

I2C_DUALADDRESS_DISABLE

I2C_DUALADDRESS_ENABLE

I2C Error Code definition

HAL_I2C_ERROR_NONE

No error

HAL_I2C_ERROR_BERR

BERR error

HAL_I2C_ERROR_ARLO

ARLO error

HAL_I2C_ERROR_AF

ACKF error

HAL_I2C_ERROR_OVR

OVR error

HAL_I2C_ERROR_DMA

DMA transfer error

HAL_I2C_ERROR_TIMEOUT

Timeout error

HAL_I2C_ERROR_SIZE

Size Management error

HAL_I2C_ERROR_DMA_PARAM

DMA Parameter Error

HAL_I2C_ERROR_INVALID_CALLBACK

Invalid Callback error

HAL_I2C_ERROR_INVALID_PARAM

Invalid Parameters error

I2C Exported Macros

__HAL_I2C_RESET_HANDLE_STATE

Description:

- Reset I2C handle state.

Parameters:

- __HANDLE__: specifies the I2C Handle.

Return value:

- None

__HAL_I2C_ENABLE_IT

Description:

- Enable the specified I2C interrupt.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __INTERRUPT__: specifies the interrupt source to enable. This parameter can be one of the following values:
  - I2C_IT_ERRI Errors interrupt enable
  - I2C_IT_TCI Transfer complete interrupt enable
  - I2C_IT_STOPI STOP detection interrupt enable
  - I2C_IT_NACKI NACK received interrupt enable
  - I2C_IT_ADDRI Address match interrupt enable
  - I2C_IT_RXI RX interrupt enable
  - I2C_IT_TXI TX interrupt enable

Return value:

- None

__HAL_I2C_DISABLE_IT

Description:

- Disable the specified I2C interrupt.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __INTERRUPT__: specifies the interrupt source to disable. This parameter can be one of the following values:
  - I2C_IT_ERRI Errors interrupt enable
  - I2C_IT_TCI Transfer complete interrupt enable
  - I2C_IT_STOPI STOP detection interrupt enable
  - I2C_IT_NACKI NACK received interrupt enable
  - I2C_IT_ADDRI Address match interrupt enable
  - I2C_IT_RXI RX interrupt enable
  - I2C_IT_TXI TX interrupt enable

Return value:

- None

__HAL_I2C_GET_IT_SOURCE

Description:

- Check whether the specified I2C interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __INTERRUPT__: specifies the I2C interrupt source to check. This parameter can be one of the following values:
  - I2C_IT_ERRI Errors interrupt enable
  - I2C_IT_TCI Transfer complete interrupt enable
  - I2C_IT_STOPI STOP detection interrupt enable
  - I2C_IT_NACKI NACK received interrupt enable
  - I2C_IT_ADDRI Address match interrupt enable
  - I2C_IT_RXI RX interrupt enable
  - I2C_IT_TXI TX interrupt enable

Return value:

- The: new state of __INTERRUPT__ (SET or RESET).

I2C_FLAG_MASK

Description:

- Check whether the specified I2C flag is set or not.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - I2C_FLAG_TXE Transmit data register empty
  - I2C_FLAG_TXIS Transmit interrupt status
  - I2C_FLAG_RXNE Receive data register not empty
  - I2C_FLAG_ADDR Address matched (slave mode)
  - I2C_FLAG_AF Acknowledge failure received flag
  - I2C_FLAG_STOPF STOP detection flag
  - I2C_FLAG_TC Transfer complete (master mode)
  - I2C_FLAG_TCR Transfer complete reload
  - I2C_FLAG_BERR Bus error
  - I2C_FLAG_ARLO Arbitration lost
  - I2C_FLAG_OVR Overrun/Underrun
  - I2C_FLAG_PECERR PEC error in reception
  - I2C_FLAG_TIMEOUT Timeout or Tlow detection flag
  - I2C_FLAG_ALERT SMBus alert
  - I2C_FLAG_BUSY Bus busy
  - I2C_FLAG_DIR Transfer direction (slave mode)

Return value:

- The: new state of __FLAG__ (SET or RESET).

__HAL_I2C_GET_FLAG

__HAL_I2C_CLEAR_FLAG

Description:

- Clear the I2C pending flags which are cleared by writing 1 in a specific bit.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - I2C_FLAG_TXE Transmit data register empty
  - I2C_FLAG_ADDR Address matched (slave mode)
  - I2C_FLAG_AF Acknowledge failure received flag
  - I2C_FLAG_STOPF STOP detection flag
  - I2C_FLAG_BERR Bus error
  - I2C_FLAG_ARLO Arbitration lost
  - I2C_FLAG_OVR Overrun/Underrun
  - I2C_FLAG_PECERR PEC error in reception
  - I2C_FLAG_TIMEOUT Timeout or Tlow detection flag
  - I2C_FLAG_ALERT SMBus alert

Return value:

- None

__HAL_I2C_ENABLE

Description:

- Enable the specified I2C peripheral.

Parameters:

- __HANDLE__: specifies the I2C Handle.

Return value:

- None

__HAL_I2C_DISABLE

Description:

- Disable the specified I2C peripheral.

Parameters:

- __HANDLE__: specifies the I2C Handle.

Return value:

- None

__HAL_I2C_GENERATE_NACK

Description:

- Generate a Non-Acknowledge I2C peripheral in Slave mode.

Parameters:

- __HANDLE__: specifies the I2C Handle.

Return value:

- None

43 HAL I2C Extension Driver

43.1 I2CEx Firmware driver API description

The following section lists the various functions of the I2CEx library.

43.1.1 I2C peripheral Extended features

Comparing to other previous devices, the I2C interface for STM32H7xx devices contains the following additional features

- Possibility to disable or enable Analog Noise Filter
- Use of a configured Digital Noise Filter
- Disable or enable wakeup from Stop mode(s)
- Disable or enable Fast Mode Plus

43.1.2 How to use this driver

This driver provides functions to configure Noise Filter and Wake Up Feature

1. Configure I2C Analog noise filter using the function HAL_I2CEx_ConfigAnalogFilter()
2. Configure I2C Digital noise filter using the function HAL_I2CEx_ConfigDigitalFilter()
3. Configure the enable or disable of I2C Wake Up Mode using the functions :
   - HAL_I2CEx_EnableWakeUp()
   - HAL_I2CEx_DisableWakeUp()
4. Configure the enable or disable of fast mode plus driving capability using the functions :
   - HAL_I2CEx_EnableFastModePlus()
   - HAL_I2CEx_DisableFastModePlus()

43.1.3 Filter Mode Functions

This section provides functions allowing to:

- Configure Noise Filters

This section contains the following APIs:

- ***HAL_I2CEx_ConfigAnalogFilter()***
- ***HAL_I2CEx_ConfigDigitalFilter()***

43.1.4 WakeUp Mode Functions

This section provides functions allowing to:

- Configure Wake Up Feature

This section contains the following APIs:

- ***HAL_I2CEx_EnableWakeUp()***
- ***HAL_I2CEx_DisableWakeUp()***

43.1.5 Fast Mode Plus Functions

This section provides functions allowing to:

- Configure Fast Mode Plus

This section contains the following APIs:

- ***HAL_I2CEx_EnableFastModePlus()***
- ***HAL_I2CEx_DisableFastModePlus()***

43.1.6 Detailed description of functions

HAL_I2CEx_ConfigAnalogFilter

Function name

HAL_StatusTypeDef HAL_I2CEx_ConfigAnalogFilter (I2C_HandleTypeDef * hi2c, uint32_t AnalogFilter)

Function description

Configure I2C Analog noise filter.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.
- **AnalogFilter:** New state of the Analog filter.

Return values

- **HAL:** status

HAL_I2CEx_ConfigDigitalFilter

Function name

HAL_StatusTypeDef HAL_I2CEx_ConfigDigitalFilter (I2C_HandleTypeDef * hi2c, uint32_t DigitalFilter)

Function description

Configure I2C Digital noise filter.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.
- **DigitalFilter:** Coefficient of digital noise filter between Min_Data=0x00 and Max_Data=0x0F.

Return values

- **HAL:** status

HAL_I2CEx_EnableWakeUp

Function name

HAL_StatusTypeDef HAL_I2CEx_EnableWakeUp (I2C_HandleTypeDef * hi2c)

Function description

Enable I2C wakeup from Stop mode(s).

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.

Return values

- **HAL:** status

HAL_I2CEx_DisableWakeUp

Function name

HAL_StatusTypeDef HAL_I2CEx_DisableWakeUp (I2C_HandleTypeDef * hi2c)

Function description

Disable I2C wakeup from Stop mode(s).

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.

Return values

- **HAL:** status

HAL_I2CEx_EnableFastModePlus

Function name

void HAL_I2CEx_EnableFastModePlus (uint32_t ConfigFastModePlus)

Function description

Enable the I2C fast mode plus driving capability.

Parameters

- **ConfigFastModePlus:** Selects the pin. This parameter can be one of the I2C Extended Fast Mode Plus values

Return values

- **None:**

Notes

- For I2C1, fast mode plus driving capability can be enabled on all selected I2C1 pins using I2C_FASTMODEPLUS_I2C1 parameter or independently on each one of the following pins PB6, PB7, PB8 and PB9.
- For remaining I2C1 pins (PA14, PA15...) fast mode plus driving capability can be enabled only by using I2C_FASTMODEPLUS_I2C1 parameter.
- For all I2C2 pins fast mode plus driving capability can be enabled only by using I2C_FASTMODEPLUS_I2C2 parameter.
- For all I2C3 pins fast mode plus driving capability can be enabled only by using I2C_FASTMODEPLUS_I2C3 parameter.
- For all I2C4 pins fast mode plus driving capability can be enabled only by using I2C_FASTMODEPLUS_I2C4 parameter.
- For all I2C5 pins fast mode plus driving capability can be enabled only by using I2C_FASTMODEPLUS_I2C5 parameter.

HAL_I2CEx_DisableFastModePlus

Function name

void HAL_I2CEx_DisableFastModePlus (uint32_t ConfigFastModePlus)

Function description

Disable the I2C fast mode plus driving capability.

Parameters

- **ConfigFastModePlus:** Selects the pin. This parameter can be one of the I2C Extended Fast Mode Plus values

Return values

- **None:**

Notes

- For I2C1, fast mode plus driving capability can be disabled on all selected I2C1 pins using I2C_FASTMODEPLUS_I2C1 parameter or independently on each one of the following pins PB6, PB7, PB8 and PB9.
- For remaining I2C1 pins (PA14, PA15...) fast mode plus driving capability can be disabled only by using I2C_FASTMODEPLUS_I2C1 parameter.
- For all I2C2 pins fast mode plus driving capability can be disabled only by using I2C_FASTMODEPLUS_I2C2 parameter.
- For all I2C3 pins fast mode plus driving capability can be disabled only by using I2C_FASTMODEPLUS_I2C3 parameter.
- For all I2C4 pins fast mode plus driving capability can be disabled only by using I2C_FASTMODEPLUS_I2C4 parameter.
- For all I2C5 pins fast mode plus driving capability can be disabled only by using I2C_FASTMODEPLUS_I2C5 parameter.

43.2 I2CEx Firmware driver defines

The following section lists the various define and macros of the module.

43.2.1 I2CEx

I2CEx

I2C Extended Analog Filter

I2C_ANALOGFILTER_ENABLE

I2C_ANALOGFILTER_DISABLE

I2C Extended Fast Mode Plus

I2C_FMP_NOT_SUPPORTED

Fast Mode Plus not supported

I2C_FASTMODEPLUS_PB6

Enable Fast Mode Plus on PB6

I2C_FASTMODEPLUS_PB7

Enable Fast Mode Plus on PB7

I2C_FASTMODEPLUS_PB8

Enable Fast Mode Plus on PB8

I2C_FASTMODEPLUS_PB9

Enable Fast Mode Plus on PB9

I2C_FASTMODEPLUS_I2C1

Enable Fast Mode Plus on I2C1 pins

I2C_FASTMODEPLUS_I2C2

Enable Fast Mode Plus on I2C2 pins

I2C_FASTMODEPLUS_I2C3

Enable Fast Mode Plus on I2C3 pins

I2C_FASTMODEPLUS_I2C4

Enable Fast Mode Plus on I2C4 pins

I2C_FASTMODEPLUS_I2C5

Fast Mode Plus I2C5 not supported

44 HAL I2S Generic Driver

44.1 I2S Firmware driver registers structures

44.1.1 I2S_InitTypeDef

I2S_InitTypeDef is defined in the stm32h7xx_hal_i2s.h

Data Fields

- ***uint32_t Mode***
- ***uint32_t Standard***
- ***uint32_t DataFormat***
- ***uint32_t MCLKOutput***
- ***uint32_t AudioFreq***
- ***uint32_t CPOL***
- ***uint32_t FirstBit***
- ***uint32_t WSInversion***
- ***uint32_t Data24BitAlignment***
- ***uint32_t MasterKeepIOState***

Field Documentation

- ***uint32_t I2S_InitTypeDef::Mode***
  Specifies the I2S operating mode. This parameter can be a value of ***I2S_Mode***
- ***uint32_t I2S_InitTypeDef::Standard***
  Specifies the standard used for the I2S communication. This parameter can be a value of ***I2S_Standard***
- ***uint32_t I2S_InitTypeDef::DataFormat***
  Specifies the data format for the I2S communication. This parameter can be a value of ***I2S_Data_Format***
- ***uint32_t I2S_InitTypeDef::MCLKOutput***
  Specifies whether the I2S MCLK output is enabled or not. This parameter can be a value of ***I2S_MCLK_Output***
- ***uint32_t I2S_InitTypeDef::AudioFreq***
  Specifies the frequency selected for the I2S communication. This parameter can be a value of ***I2S_Audio_Frequency***
- ***uint32_t I2S_InitTypeDef::CPOL***
  Specifies the idle state of the I2S clock. This parameter can be a value of ***I2S_Clock_Polarity***
- ***uint32_t I2S_InitTypeDef::FirstBit***
  Specifies whether data transfers start from MSB or LSB bit. This parameter can be a value of ***I2S_MSB_LSB_Transmission***
- ***uint32_t I2S_InitTypeDef::WSInversion***
  Control the Word Select Inversion. This parameter can be a value of ***I2S_WSInversion***
- ***uint32_t I2S_InitTypeDef::Data24BitAlignment***
  Specifies the Data Padding for 24 bits data length This parameter can be a value of ***I2S_Data_24Bit_Alignment***
- ***uint32_t I2S_InitTypeDef::MasterKeepIOState***
  Control of Alternate function GPIOs state This parameter can be a value of ***I2S_Master_Keep_IO_State***

44.1.2 __I2S_HandleTypeDef

__I2S_HandleTypeDef is defined in the stm32h7xx_hal_i2s.h

  I2S Error callback
- ***void(* __I2S_HandleTypeDef::MspInitCallback)(struct __I2S_HandleTypeDef *hi2s)***
  I2S Msp Init callback
- ***void(* __I2S_HandleTypeDef::MspDeInitCallback)(struct __I2S_HandleTypeDef *hi2s)***
  I2S Msp DeInit callback

44.2 I2S Firmware driver API description

The following section lists the various functions of the I2S library.

44.2.1 How to use this driver

The I2S HAL driver can be used as follow:

1. Declare a I2S_HandleTypeDef handle structure.
2. Initialize the I2S low level resources by implement the HAL_I2S_MspInit() API:
   a. Enable the SPIx interface clock.
   b. I2S pins configuration:
      - Enable the clock for the I2S GPIOs.
      - Configure these I2S pins as alternate function pull-up.
   c. NVIC configuration if you need to use interrupt process (HAL_I2S_Transmit_IT() and HAL_I2S_Receive_IT() APIs).
      - Configure the I2Sx interrupt priority.
      - Enable the NVIC I2S IRQ handle.
   d. DMA Configuration if you need to use DMA process (HAL_I2S_Transmit_DMA() and HAL_I2S_Receive_DMA() APIs:
      - Declare a DMA handle structure for the Tx/Rx Stream/Channel.
      - Enable the DMAx interface clock.
      - Configure the declared DMA handle structure with the required Tx/Rx parameters.
      - Configure the DMA Tx/Rx Stream/Channel.
      - Associate the initialized DMA handle to the I2S DMA Tx/Rx handle.
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx/Rx Stream/Channel.

3. Program the Mode, Standard, Data Format, MCLK Output, Audio frequency and Polarity using HAL_I2S_Init() function.

Note: The specific I2S interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros __HAL_I2S_ENABLE_IT() and __HAL_I2S_DISABLE_IT() inside the transmit and receive process.

– *External clock source is configured after setting correctly the define constant EXTERNAL_CLOCK_VALUE in the stm32h7xx_hal_conf.h file.*

4. Three mode of operations are available within this driver :

Polling mode IO operation

- Send an amount of data in blocking mode using HAL_I2S_Transmit()
- Receive an amount of data in blocking mode using HAL_I2S_Receive()

Interrupt mode IO operation

- Send an amount of data in non blocking mode using HAL_I2S_Transmit_IT()
- At transmission end of half transfer HAL_I2S_TxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_TxHalfCpltCallback
- At transmission end of transfer HAL_I2S_TxCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_TxCpltCallback
- Receive an amount of data in non blocking mode using HAL_I2S_Receive_IT()
- At reception end of half transfer HAL_I2S_RxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_RxHalfCpltCallback
- At reception end of transfer HAL_I2S_RxCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_RxCpltCallback
- In case of transfer Error, HAL_I2S_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_I2S_ErrorCallback

DMA mode IO operation

- Send an amount of data in non blocking mode (DMA) using HAL_I2S_Transmit_DMA()
- At transmission end of half transfer HAL_I2S_TxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_TxHalfCpltCallback
- At transmission end of transfer HAL_I2S_TxCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_TxCpltCallback
- Receive an amount of data in non blocking mode (DMA) using HAL_I2S_Receive_DMA()
- At reception end of half transfer HAL_I2S_RxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_RxHalfCpltCallback
- At reception end of transfer HAL_I2S_RxCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_RxCpltCallback
- In case of transfer Error, HAL_I2S_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_I2S_ErrorCallback
- Pause the DMA Transfer using HAL_I2S_DMAPause()
- Resume the DMA Transfer using HAL_I2S_DMAResume()
- Stop the DMA Transfer using HAL_I2S_DMAStop()

I2S HAL driver macros list

Below the list of most used macros in I2S HAL driver.

- __HAL_I2S_ENABLE: Enable the specified SPI peripheral (in I2S mode)
- __HAL_I2S_DISABLE: Disable the specified SPI peripheral (in I2S mode)
- __HAL_I2S_ENABLE_IT : Enable the specified I2S interrupts
- __HAL_I2S_DISABLE_IT : Disable the specified I2S interrupts
- __HAL_I2S_GET_FLAG: Check whether the specified I2S flag is set or not

Note: You can refer to the I2S HAL driver header file for more useful macros

I2S HAL driver macros list

Callback registration:

1. The compilation flag USE_HAL_I2S_REGISTER_CALLBACKS when set to 1UL allows the user to configure dynamically the driver callbacks. Use Functions HAL_I2S_RegisterCallback() to register an interrupt callback. Function HAL_I2S_RegisterCallback() allows to register following callbacks: (+) TxCpltCallback : I2S Tx Completed callback (+) RxCpltCallback : I2S Rx Completed callback (+) TxRxCpltCallback : I2S TxRx Completed callback (+) TxHalfCpltCallback : I2S Tx Half Completed callback (+) RxHalfCpltCallback : I2S Rx Half Completed callback (+) TxRxHalfCpltCallback : I2S TxRx Half Completed callback (+) ErrorCallback : I2S Error callback (+) MspInitCallback : I2S Msp Init callback (+) MspDeInitCallback : I2S Msp DeInit callback This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.
2. Use function HAL_I2S_UnRegisterCallback to reset a callback to the default weak function. HAL_I2S_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks: (+) TxCpltCallback : I2S Tx Completed callback (+) RxCpltCallback : I2S Rx Completed callback (+) TxRxCpltCallback : I2S TxRx Completed callback (+) TxHalfCpltCallback : I2S Tx Half Completed callback (+) RxHalfCpltCallback : I2S Rx Half Completed callback (+) TxRxHalfCpltCallback : I2S TxRx Half Completed callback (+) ErrorCallback : I2S Error callback (+) MspInitCallback : I2S Msp Init callback (+) MspDeInitCallback : I2S Msp DeInit callback By default, after the HAL_I2S_Init() and when the state is HAL_I2S_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_I2S_MasterTxCpltCallback(), HAL_I2S_MasterRxCpltCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_I2S_Init()/ HAL_I2S_DeInit() only when these callbacks are null (not registered beforehand). If MspInit or MspDeInit are not null, the HAL_I2S_Init()/ HAL_I2S_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state. Callbacks can be registered/unregistered in HAL_I2S_STATE_READY state only. Exception done MspInit/MspDeInit functions that can be registered/unregistered in HAL_I2S_STATE_READY or HAL_I2S_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_I2S_RegisterCallback() before calling HAL_I2S_DeInit() or HAL_I2S_Init() function. When The compilation define USE_HAL_I2S_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

Callback registration: (#) The compilation flag USE_HAL_I2S_REGISTER_CALLBACKS when set to 1UL allows the user to configure dynamically the driver callbacks. Use Functions HAL_I2S_RegisterCallback() to register an interrupt callback. Function HAL_I2S_RegisterCallback() allows to register following callbacks:

- TxCpltCallback : I2S Tx Completed callback
- RxCpltCallback : I2S Rx Completed callback
- TxRxCpltCallback : I2S TxRx Completed callback
- TxHalfCpltCallback : I2S Tx Half Completed callback
- RxHalfCpltCallback : I2S Rx Half Completed callback
- TxRxHalfCpltCallback : I2S TxRx Half Completed callback
- ErrorCallback : I2S Error callback
- MspInitCallback : I2S Msp Init callback
- MspDeInitCallback : I2S Msp DeInit callback This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. (#) Use function HAL_I2S_UnRegisterCallback to reset a callback to the default weak function. HAL_I2S_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:
- TxCpltCallback : I2S Tx Completed callback
- RxCpltCallback : I2S Rx Completed callback
- TxRxCpltCallback : I2S TxRx Completed callback
- TxHalfCpltCallback : I2S Tx Half Completed callback
- RxHalfCpltCallback : I2S Rx Half Completed callback
- TxRxHalfCpltCallback : I2S TxRx Half Completed callback
- ErrorCallback : I2S Error callback
- MspInitCallback : I2S Msp Init callback

- MspDeInitCallback : I2S Msp DeInit callback By default, after the HAL_I2S_Init() and when the state is HAL_I2S_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_I2S_MasterTxCpltCallback(), HAL_I2S_MasterRxCpltCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_I2S_Init()/ HAL_I2S_DeInit() only when these callbacks are null (not registered beforehand). If MspInit or MspDeInit are not null, the HAL_I2S_Init()/ HAL_I2S_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state. Callbacks can be registered/unregistered in HAL_I2S_STATE_READY state only. Exception done MspInit/MspDeInit functions that can be registered/unregistered in HAL_I2S_STATE_READY or HAL_I2S_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_I2S_RegisterCallback() before calling HAL_I2S_DeInit() or HAL_I2S_Init() function. When The compilation define USE_HAL_I2S_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

44.2.2 Initialization and de-initialization functions

This subsection provides a set of functions allowing to initialize and de-initialize the I2Sx peripheral in simplex mode:

- User must Implement HAL_I2S_MspInit() function in which he configures all related peripherals resources (CLOCK, GPIO, DMA, IT and NVIC).
- Call the function HAL_I2S_Init() to configure the selected device with the selected configuration:
  - Mode
  - Standard
  - Data Format
  - MCLK Output
  - Audio frequency
  - Polarity
- Call the function HAL_I2S_DeInit() to restore the default configuration of the selected I2Sx peripheral.

This section contains the following APIs:

- ***HAL_I2S_Init()***
- ***HAL_I2S_DeInit()***
- ***HAL_I2S_MspInit()***
- ***HAL_I2S_MspDeInit()***
- ***HAL_I2S_RegisterCallback()***
- ***HAL_I2S_UnRegisterCallback()***

44.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the I2S data transfers.

1. There are two modes of transfer:
   - Blocking mode : The communication is performed in the polling mode. The status of all data processing is returned by the same function after finishing transfer.
   - No-Blocking mode : The communication is performed using Interrupts or DMA. These functions return the status of the transfer startup. The end of the data processing will be indicated through the dedicated I2S IRQ when using Interrupt mode or the DMA IRQ when using DMA mode.
2. Blocking mode functions are :
   - HAL_I2S_Transmit()
   - HAL_I2S_Receive()
   - HAL_I2SEx_TransmitReceive()
3. No-Blocking mode functions with Interrupt are :
   - HAL_I2S_Transmit_IT()
   - HAL_I2S_Receive_IT()
   - HAL_I2SEx_TransmitReceive_IT()

4. No-Blocking mode functions with DMA are :
   – HAL_I2S_Transmit_DMA()
   – HAL_I2S_Receive_DMA()
   – HAL_I2SEx_TransmitReceive_DMA()
5. A set of Transfer Complete Callbacks are provided in non Blocking mode:
   – HAL_I2S_TxCpltCallback()
   – HAL_I2S_RxCpltCallback()
   – HAL_I2SEx_TxRxCpltCallback()
   – HAL_I2S_ErrorCallback()

This section contains the following APIs:

- ***HAL_I2S_Transmit()***
- ***HAL_I2S_Receive()***
- ***HAL_I2SEx_TransmitReceive()***
- ***HAL_I2S_Transmit_IT()***
- ***HAL_I2S_Receive_IT()***
- ***HAL_I2SEx_TransmitReceive_IT()***
- ***HAL_I2S_Transmit_DMA()***
- ***HAL_I2S_Receive_DMA()***
- ***HAL_I2SEx_TransmitReceive_DMA()***
- ***HAL_I2S_DMAPause()***
- ***HAL_I2S_DMAResume()***
- ***HAL_I2S_DMAStop()***
- ***HAL_I2S_IRQHandler()***
- ***HAL_I2S_TxHalfCpltCallback()***
- ***HAL_I2S_TxCpltCallback()***
- ***HAL_I2S_RxHalfCpltCallback()***
- ***HAL_I2S_RxCpltCallback()***
- ***HAL_I2SEx_TxRxHalfCpltCallback()***
- ***HAL_I2SEx_TxRxCpltCallback()***
- ***HAL_I2S_ErrorCallback()***

44.2.4 Peripheral State and Errors functions

This subsection permits to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- ***HAL_I2S_GetState()***
- ***HAL_I2S_GetError()***

44.2.5 Detailed description of functions

HAL_I2S_Init

Function name

HAL_StatusTypeDef HAL_I2S_Init (I2S_HandleTypeDef * hi2s)

Function description

Initializes the I2S according to the specified parameters in the I2S_InitTypeDef and create the associated handle.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **HAL:** status

HAL_I2S_DeInit

Function name

HAL_StatusTypeDef HAL_I2S_DeInit (I2S_HandleTypeDef * hi2s)

Function description

DeInitializes the I2S peripheral.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **HAL:** status

HAL_I2S_MspInit

Function name

void HAL_I2S_MspInit (I2S_HandleTypeDef * hi2s)

Function description

I2S MSP Init.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2S_MspDeInit

Function name

void HAL_I2S_MspDeInit (I2S_HandleTypeDef * hi2s)

Function description

I2S MSP DeInit.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2S_RegisterCallback

Function name

HAL_StatusTypeDef HAL_I2S_RegisterCallback (I2S_HandleTypeDef * hi2s, HAL_I2S_CallbackIDTypeDef CallbackID, pI2S_CallbackTypeDef pCallback)

Function description

Register a User I2S Callback To be used instead of the weak predefined callback.

Parameters

- **hi2s:** Pointer to a I2S_HandleTypeDef structure that contains the configuration information for the specified I2S.
- **CallbackID:** ID of the callback to be registered
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_I2S_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_I2S_UnRegisterCallback (I2S_HandleTypeDef * hi2s, HAL_I2S_CallbackIDTypeDef CallbackID)

Function description

Unregister an I2S Callback I2S callback is redirected to the weak predefined callback.

Parameters

- **hi2s:** Pointer to a I2S_HandleTypeDef structure that contains the configuration information for the specified I2S.
- **CallbackID:** ID of the callback to be unregistered

Return values

- **HAL:** status

HAL_I2S_Transmit

Function name

HAL_StatusTypeDef HAL_I2S_Transmit (I2S_HandleTypeDef * hi2s, const uint16_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Transmit an amount of data in blocking mode.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pData:** a 16-bit pointer to data buffer.
- **Size:** number of data sample to be sent:
- **Timeout:** Timeout duration

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).

HAL_I2S_Receive

Function name

HAL_StatusTypeDef HAL_I2S_Receive (I2S_HandleTypeDef * hi2s, uint16_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Receive an amount of data in blocking mode.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pData:** a 16-bit pointer to data buffer.
- **Size:** number of data sample to be sent:
- **Timeout:** Timeout duration

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).
- In I2S Master Receiver mode, just after enabling the peripheral the clock will be generate in continuous way and as the I2S is not disabled at the end of the I2S transaction.

HAL_I2SEx_TransmitReceive

Function name

HAL_StatusTypeDef HAL_I2SEx_TransmitReceive (I2S_HandleTypeDef * hi2s, const uint16_t * pTxData, uint16_t * pRxData, uint16_t Size, uint32_t Timeout)

Function description

Full-Duplex Transmit/Receive data in blocking mode.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pTxData:** a 16-bit pointer to the Transmit data buffer.
- **pRxData:** a 16-bit pointer to the Receive data buffer.
- **Size:** number of data sample to be sent:
- **Timeout:** Timeout duration

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).

HAL_I2S_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I2S_Transmit_IT (I2S_HandleTypeDef * hi2s, const uint16_t * pData, uint16_t Size)

Function description

Transmit an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pData:** a 16-bit pointer to data buffer.
- **Size:** number of data sample to be sent:

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).

HAL_I2S_Receive_IT

Function name

HAL_StatusTypeDef HAL_I2S_Receive_IT (I2S_HandleTypeDef * hi2s, uint16_t * pData, uint16_t Size)

Function description

Receive an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pData:** a 16-bit pointer to the Receive data buffer.
- **Size:** number of data sample to be sent:

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).
- It is recommended to use DMA for the I2S receiver to avoid de-synchronization between Master and Slave otherwise the I2S interrupt should be optimized.

HAL_I2SEx_TransmitReceive_IT

Function name

HAL_StatusTypeDef HAL_I2SEx_TransmitReceive_IT (I2S_HandleTypeDef * hi2s, const uint16_t * pTxData, uint16_t * pRxData, uint16_t Size)

Function description

Full-Duplex Transmit/Receive data in non-blocking mode using Interrupt.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pTxData:** a 16-bit pointer to the Transmit data buffer.
- **pRxData:** a 16-bit pointer to the Receive data buffer.
- **Size:** number of data sample to be sent:

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).

HAL_I2S_IRQHandler

Function name

void HAL_I2S_IRQHandler (I2S_HandleTypeDef * hi2s)

Function description

This function handles I2S interrupt request.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2S_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I2S_Transmit_DMA (I2S_HandleTypeDef * hi2s, const uint16_t * pData, uint16_t Size)

Function description

Transmit an amount of data in non-blocking mode with DMA.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pData:** a 16-bit pointer to the Transmit data buffer.
- **Size:** number of data sample to be sent:

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).

HAL_I2S_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I2S_Receive_DMA (I2S_HandleTypeDef * hi2s, uint16_t * pData, uint16_t Size)

Function description

Receive an amount of data in non-blocking mode with DMA.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pData:** a 16-bit pointer to the Receive data buffer.
- **Size:** number of data sample to be sent:

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).

HAL_I2SEx_TransmitReceive_DMA

Function name

HAL_StatusTypeDef HAL_I2SEx_TransmitReceive_DMA (I2S_HandleTypeDef * hi2s, const uint16_t * pTxData, uint16_t * pRxData, uint16_t Size)

Function description

Full-Duplex Transmit/Receive data in non-blocking mode using DMA.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pTxData:** a 16-bit pointer to the Transmit data buffer.
- **pRxData:** a 16-bit pointer to the Receive data buffer.
- **Size:** number of data sample to be sent:

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).

HAL_I2S_DMAPause

Function name

HAL_StatusTypeDef HAL_I2S_DMAPause (I2S_HandleTypeDef * hi2s)

Function description

Pauses the audio DMA Stream/Channel playing from the Media.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **HAL:** status

HAL_I2S_DMAResume

Function name

HAL_StatusTypeDef HAL_I2S_DMAResume (I2S_HandleTypeDef * hi2s)

Function description

Resumes the audio DMA Stream/Channel playing from the Media.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **HAL:** status

HAL_I2S_DMAStop

Function name

HAL_StatusTypeDef HAL_I2S_DMAStop (I2S_HandleTypeDef * hi2s)

Function description

Stops the audio DMA Stream/Channel playing from the Media.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **HAL:** status

HAL_I2S_TxHalfCpltCallback

Function name

void HAL_I2S_TxHalfCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

Tx Transfer Half completed callbacks.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2S_TxCpltCallback

Function name

void HAL_I2S_TxCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

Tx Transfer completed callbacks.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2S_RxHalfCpltCallback

Function name

void HAL_I2S_RxHalfCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

Rx Transfer half completed callbacks.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2S_RxCpltCallback

Function name

void HAL_I2S_RxCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

Rx Transfer completed callbacks.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2SEx_TxRxHalfCpltCallback

Function name

void HAL_I2SEx_TxRxHalfCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

Rx Transfer half completed callbacks.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2SEx_TxRxCpltCallback

Function name

void HAL_I2SEx_TxRxCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

Rx Transfer completed callbacks.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2S_ErrorCallback

Function name

void HAL_I2S_ErrorCallback (I2S_HandleTypeDef * hi2s)

Function description

I2S error callbacks.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2S_GetState

Function name

HAL_I2S_StateTypeDef HAL_I2S_GetState (const I2S_HandleTypeDef * hi2s)

Function description

Return the I2S state.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **HAL:** state

HAL_I2S_GetError

Function name

uint32_t HAL_I2S_GetError (const I2S_HandleTypeDef * hi2s)

Function description

Return the I2S error code.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **I2S:** Error Code

44.3 I2S Firmware driver defines

The following section lists the various define and macros of the module.

44.3.1 I2S

I2S

I2S Audio Frequency

I2S_AUDIOFREQ_192K

I2S_AUDIOFREQ_96K

I2S_AUDIOFREQ_48K

I2S_AUDIOFREQ_44K

I2S_AUDIOFREQ_32K

I2S_AUDIOFREQ_22K

I2S_AUDIOFREQ_16K

I2S_AUDIOFREQ_11K

I2S_AUDIOFREQ_8K

I2S_AUDIOFREQ_DEFAULT

I2S FullDuplex Mode

I2S_CPOL_LOW

I2S_CPOL_HIGH

Data Padding 24Bit

I2S_DATA_24BIT_ALIGNMENT_RIGHT

I2S_DATA_24BIT_ALIGNMENT_LEFT

I2S Data Format

I2S_DATAFORMAT_16B

I2S_DATAFORMAT_16B_EXTENDED

I2S_DATAFORMAT_24B

I2S_DATAFORMAT_32B

I2S Error

HAL_I2S_ERROR_NONE

No error

HAL_I2S_ERROR_TIMEOUT

Timeout error

HAL_I2S_ERROR_OVR

OVR error

HAL_I2S_ERROR_UDR

UDR error

HAL_I2S_ERROR_DMA

DMA transfer error

HAL_I2S_ERROR_PRESCALER

Prescaler Calculation error

HAL_I2S_ERROR_FRE

FRE error

HAL_I2S_ERROR_NO_OGT

No On Going Transfer error

HAL_I2S_ERROR_NOT_SUPPORTED

Requested operation not supported

HAL_I2S_ERROR_INVALID_CALLBACK

Invalid Callback error

I2S Exported Macros

__HAL_I2S_RESET_HANDLE_STATE

Description:

- Reset I2S handle state.

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

__HAL_I2S_ENABLE

Description:

- Enable the specified SPI peripheral (in I2S mode).

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

__HAL_I2S_DISABLE

Description:

- Disable the specified SPI peripheral (in I2S mode).

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

__HAL_I2S_ENABLE_IT

Description:

- Enable the specified I2S interrupts.

Parameters:

- __HANDLE__: specifies the I2S Handle. This parameter can be I2S where x: 1, 2 or 3 to select the I2S peripheral.
- __INTERRUPT__: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - I2S_IT_RXP : Rx-Packet available interrupt
  - I2S_IT_TXP : Tx-Packet space available interrupt
  - I2S_IT_UDR : Underrun interrupt
  - I2S_IT_OVR : Overrun interrupt
  - I2S_IT_FRE : TI mode frame format error interrupt
  - I2S_IT_ERR : Error interrupt enable

Return value:

- None

__HAL_I2S_DISABLE_IT

Description:

- Disable the specified I2S interrupts.

Parameters:

- __HANDLE__: specifies the I2S Handle. This parameter can be I2S where x: 1, 2 or 3 to select the I2S peripheral.
- __INTERRUPT__: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - I2S_IT_RXP : Rx-Packet available interrupt
  - I2S_IT_TXP : Tx-Packet space available interrupt
  - I2S_IT_UDR : Underrun interrupt
  - I2S_IT_OVR : Overrun interrupt
  - I2S_IT_FRE : TI mode frame format error interrupt
  - I2S_IT_ERR : Error interrupt enable

Return value:

- None

__HAL_I2S_GET_IT_SOURCE

Description:

- Check if the specified I2S interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: specifies the I2S Handle. This parameter can be I2S where x: 1, 2 or 3 to select the I2S peripheral.
- __INTERRUPT__: specifies the I2S interrupt source to check. This parameter can be one of the following values:
  - I2S_IT_RXP : Rx-Packet available interrupt
  - I2S_IT_TXP : Tx-Packet space available interrupt
  - I2S_IT_DXP : Tx-Packet space available interrupt
  - I2S_IT_UDR : Underrun interrupt
  - I2S_IT_OVR : Overrun interrupt
  - I2S_IT_FRE : TI mode frame format error interrupt
  - I2S_IT_ERR : Error interrupt enable

Return value:

- The: new state of __IT__ (TRUE or FALSE).

__HAL_I2S_GET_FLAG

Description:

- Check whether the specified I2S flag is set or not.

Parameters:

- __HANDLE__: specifies the I2S Handle. This parameter can be I2S where x: 1, 2 or 3 to select the I2S peripheral.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - I2S_FLAG_RXP : Rx-Packet available flag
  - I2S_FLAG_TXP : Tx-Packet space available flag
  - I2S_FLAG_UDR : Underrun flag
  - I2S_FLAG_OVR : Overrun flag
  - I2S_FLAG_FRE : TI mode frame format error flag

Return value:

- The: new state of __FLAG__ (TRUE or FALSE).

__HAL_I2S_CLEAR_OVRFLAG

Description:

- Clear the I2S OVR pending flag.

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

__HAL_I2S_CLEAR_UDRFLAG

Description:

- Clear the I2S UDR pending flag.

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

__HAL_I2S_CLEAR_TIFREFLAG

Description:

- Clear the I2S FRE pending flag.

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

45 HAL IRDA Generic Driver

45.1 IRDA Firmware driver registers structures

45.1.1 IRDA_InitTypeDef

IRDA_InitTypeDef is defined in the stm32h7xx_hal_irda.h

Data Fields

- ***uint32_t BaudRate***
- ***uint32_t WordLength***
- ***uint32_t Parity***
- ***uint32_t Mode***
- ***uint8_t Prescaler***
- ***uint16_t PowerMode***
- ***uint32_t ClockPrescaler***

Field Documentation

- ***uint32_t IRDA_InitTypeDef::BaudRate***

  This member configures the IRDA communication baud rate. The baud rate register is computed using the following formula: Baud Rate Register = ((usart_ker_ckpres) / ((hirda->Init.BaudRate))) where usart_ker_ckpres is the IRDA input clock divided by a prescaler
- ***uint32_t IRDA_InitTypeDef::WordLength***

  Specifies the number of data bits transmitted or received in a frame. This parameter can be a value of ***IRDAEx_Word_Length***
- ***uint32_t IRDA_InitTypeDef::Parity***

  Specifies the parity mode. This parameter can be a value of ***IRDA_Parity***

  Note:

  – When parity is enabled, the computed parity is inserted at the MSB position of the transmitted data (9th bit when the word length is set to 9 data bits; 8th bit when the word length is set to 8 data bits).
- ***uint32_t IRDA_InitTypeDef::Mode***

  Specifies whether the Receive or Transmit mode is enabled or disabled. This parameter can be a value of ***IRDA_Transfer_Mode***
- ***uint8_t IRDA_InitTypeDef::Prescaler***

  Specifies the Prescaler value for dividing the UART/USART source clock to achieve low-power frequency.

  Note:

  – Prescaler value 0 is forbidden
- ***uint16_t IRDA_InitTypeDef::PowerMode***

  Specifies the IRDA power mode. This parameter can be a value of ***IRDA_Low_Power***
- ***uint32_t IRDA_InitTypeDef::ClockPrescaler***

  Specifies the prescaler value used to divide the IRDA clock source. This parameter can be a value of ***IRDA_ClockPrescaler***.

45.1.2 __IRDA_HandleTypeDef

__IRDA_HandleTypeDef is defined in the stm32h7xx_hal_irda.h

Data Fields

- ***USART_TypeDef * Instance***
- ***IRDA_InitTypeDef Init***
- ***const uint8_t * pTxBuffPtr***
- ***uint16_t TxXferSize***

- ***__IO uint16_t TxXferCount***
- ***uint8_t * pRxBuffPtr***
- ***uint16_t RxXferSize***
- ***__IO uint16_t RxXferCount***
- ***uint16_t Mask***
- ***DMA_HandleTypeDef * hdmatx***
- ***DMA_HandleTypeDef * hdmarx***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_IRDA_StateTypeDef gState***
- ***__IO HAL_IRDA_StateTypeDef RxState***
- ***__IO uint32_t ErrorCode***
- ***void(* TxHalfCpltCallback***
- ***void(* TxCpltCallback***
- ***void(* RxHalfCpltCallback***
- ***void(* RxCpltCallback***
- ***void(* ErrorCallback***
- ***void(* AbortCpltCallback***
- ***void(* AbortTransmitCpltCallback***
- ***void(* AbortReceiveCpltCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***USART_TypeDef* __IRDA_HandleTypeDef::Instance***
  USART registers base address
- ***IRDA_InitTypeDef __IRDA_HandleTypeDef::Init***
  IRDA communication parameters
- ***const uint8_t* __IRDA_HandleTypeDef::pTxBuffPtr***
  Pointer to IRDA Tx transfer Buffer
- ***uint16_t __IRDA_HandleTypeDef::TxXferSize***
  IRDA Tx Transfer size
- ***__IO uint16_t __IRDA_HandleTypeDef::TxXferCount***
  IRDA Tx Transfer Counter
- ***uint8_t* __IRDA_HandleTypeDef::pRxBuffPtr***
  Pointer to IRDA Rx transfer Buffer
- ***uint16_t __IRDA_HandleTypeDef::RxXferSize***
  IRDA Rx Transfer size
- ***__IO uint16_t __IRDA_HandleTypeDef::RxXferCount***
  IRDA Rx Transfer Counter
- ***uint16_t __IRDA_HandleTypeDef::Mask***
  USART RX RDR register mask
- ***DMA_HandleTypeDef* __IRDA_HandleTypeDef::hdmatx***
  IRDA Tx DMA Handle parameters
- ***DMA_HandleTypeDef* __IRDA_HandleTypeDef::hdmarx***
  IRDA Rx DMA Handle parameters
- ***HAL_LockTypeDef __IRDA_HandleTypeDef::Lock***
  Locking object
- ***__IO HAL_IRDA_StateTypeDef __IRDA_HandleTypeDef::gState***
  IRDA state information related to global Handle management and also related to Tx operations. This parameter can be a value of **HAL_IRDA_StateTypeDef**

- ***__IO HAL_IRDA_StateTypeDef __IRDA_HandleTypeDef::RxState***
  IRDA state information related to Rx operations. This parameter can be a value of **HAL_IRDA_StateTypeDef**
- ***__IO uint32_t __IRDA_HandleTypeDef::ErrorCode***
  IRDA Error code
- ***void(* __IRDA_HandleTypeDef::TxHalfCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Tx Half Complete Callback
- ***void(* __IRDA_HandleTypeDef::TxCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Tx Complete Callback
- ***void(* __IRDA_HandleTypeDef::RxHalfCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***

- ***void(* __IRDA_HandleTypeDef::RxCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Rx Complete Callback
- ***void(* __IRDA_HandleTypeDef::ErrorCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Error Callback
- ***void(* __IRDA_HandleTypeDef::AbortCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Abort Complete Callback
- ***void(* __IRDA_HandleTypeDef::AbortTransmitCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Abort Transmit Complete Callback
- ***void(* __IRDA_HandleTypeDef::AbortReceiveCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Abort Receive Complete Callback
- ***void(* __IRDA_HandleTypeDef::MspInitCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Msp Init callback
- ***void(* __IRDA_HandleTypeDef::MspDeInitCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Msp DeInit callback

45.2 IRDA Firmware driver API description

The following section lists the various functions of the IRDA library.

45.2.1 How to use this driver

The IRDA HAL driver can be used as follows:

1. Declare a IRDA_HandleTypeDef handle structure (eg. IRDA_HandleTypeDef hirda).

2. Initialize the IRDA low level resources by implementing the HAL_IRDA_MspInit() API in setting the associated USART or UART in IRDA mode:
   - Enable the USARTx/UARTx interface clock.
   - USARTx/UARTx pins configuration:
     - Enable the clock for the USARTx/UARTx GPIOs.
     - Configure these USARTx/UARTx pins (TX as alternate function pull-up, RX as alternate function Input).
   - NVIC configuration if you need to use interrupt process (HAL_IRDA_Transmit_IT() and HAL_IRDA_Receive_IT() APIs):
     - Configure the USARTx/UARTx interrupt priority.
     - Enable the NVIC USARTx/UARTx IRQ handle.
     - The specific IRDA interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros __HAL_IRDA_ENABLE_IT() and __HAL_IRDA_DISABLE_IT() inside the transmit and receive process.
   - DMA Configuration if you need to use DMA process (HAL_IRDA_Transmit_DMA() and HAL_IRDA_Receive_DMA() APIs):
     - Declare a DMA handle structure for the Tx/Rx channel.
     - Enable the DMAx interface clock.
     - Configure the declared DMA handle structure with the required Tx/Rx parameters.
     - Configure the DMA Tx/Rx channel.
     - Associate the initialized DMA handle to the IRDA DMA Tx/Rx handle.
     - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx/Rx channel.
3. Program the Baud Rate, Word Length and Parity and Mode(Receiver/Transmitter), the normal or low power mode and the clock prescaler in the hirda handle Init structure.
4. Initialize the IRDA registers by calling the HAL_IRDA_Init() API:
   - This API configures also the low level Hardware GPIO, CLOCK, CORTEX...etc) by calling the customized HAL_IRDA_MspInit() API.

Note: The specific IRDA interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros __HAL_IRDA_ENABLE_IT() and __HAL_IRDA_DISABLE_IT() inside the transmit and receive process.

5. Three operation modes are available within this driver :

Polling mode IO operation

- Send an amount of data in blocking mode using HAL_IRDA_Transmit()
- Receive an amount of data in blocking mode using HAL_IRDA_Receive()

Interrupt mode IO operation

- Send an amount of data in non-blocking mode using HAL_IRDA_Transmit_IT()
- At transmission end of transfer HAL_IRDA_TxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_TxCpltCallback()
- Receive an amount of data in non-blocking mode using HAL_IRDA_Receive_IT()
- At reception end of transfer HAL_IRDA_RxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_RxCpltCallback()
- In case of transfer Error, HAL_IRDA_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_IRDA_ErrorCallback()

DMA mode IO operation

- Send an amount of data in non-blocking mode (DMA) using HAL_IRDA_Transmit_DMA()
- At transmission half of transfer HAL_IRDA_TxHalfCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_TxHalfCpltCallback()
- At transmission end of transfer HAL_IRDA_TxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_TxCpltCallback()

- Receive an amount of data in non-blocking mode (DMA) using HAL_IRDA_Receive_DMA()
- At reception half of transfer HAL_IRDA_RxHalfCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_RxHalfCpltCallback()
- At reception end of transfer HAL_IRDA_RxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_RxCpltCallback()
- In case of transfer Error, HAL_IRDA_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_IRDA_ErrorCallback()

IRDA HAL driver macros list

Below the list of most used macros in IRDA HAL driver.

- __HAL_IRDA_ENABLE: Enable the IRDA peripheral
- __HAL_IRDA_DISABLE: Disable the IRDA peripheral
- __HAL_IRDA_GET_FLAG : Check whether the specified IRDA flag is set or not
- __HAL_IRDA_CLEAR_FLAG : Clear the specified IRDA pending flag
- __HAL_IRDA_ENABLE_IT: Enable the specified IRDA interrupt
- __HAL_IRDA_DISABLE_IT: Disable the specified IRDA interrupt
- __HAL_IRDA_GET_IT_SOURCE: Check whether or not the specified IRDA interrupt is enabled

Note: You can refer to the IRDA HAL driver header file for more useful macros

45.2.2 Callback registration

The compilation define USE_HAL_IRDA_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.

Use Function HAL_IRDA_RegisterCallback() to register a user callback. Function HAL_IRDA_RegisterCallback() allows to register following callbacks:

- TxHalfCpltCallback : Tx Half Complete Callback.
- TxCpltCallback : Tx Complete Callback.
- RxHalfCpltCallback : Rx Half Complete Callback.
- RxCpltCallback : Rx Complete Callback.
- ErrorCallback : Error Callback.
- AbortCpltCallback : Abort Complete Callback.
- AbortTransmitCpltCallback : Abort Transmit Complete Callback.
- AbortReceiveCpltCallback : Abort Receive Complete Callback.
- MspInitCallback : IRDA MspInit.
- MspDeInitCallback : IRDA MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_IRDA_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. HAL_IRDA_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- TxHalfCpltCallback : Tx Half Complete Callback.
- TxCpltCallback : Tx Complete Callback.
- RxHalfCpltCallback : Rx Half Complete Callback.
- RxCpltCallback : Rx Complete Callback.
- ErrorCallback : Error Callback.
- AbortCpltCallback : Abort Complete Callback.
- AbortTransmitCpltCallback : Abort Transmit Complete Callback.
- AbortReceiveCpltCallback : Abort Receive Complete Callback.
- MspInitCallback : IRDA MspInit.
- MspDeInitCallback : IRDA MspDeInit.

By default, after the HAL_IRDA_Init() and when the state is HAL_IRDA_STATE_RESET all callbacks are set to the corresponding weak (surcharged) functions: examples HAL_IRDA_TxCpltCallback(), HAL_IRDA_RxHalfCpltCallback(). Exception done for MspInit and MspDeInit functions that are respectively reset to the legacy weak (surcharged) functions in the HAL_IRDA_Init() and HAL_IRDA_DeInit() only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_IRDA_Init() and HAL_IRDA_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in HAL_IRDA_STATE_READY state only. Exception done MspInit/ MspDeInit that can be registered/unregistered in HAL_IRDA_STATE_READY or HAL_IRDA_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_IRDA_RegisterCallback() before calling HAL_IRDA_DeInit() or HAL_IRDA_Init() function.

When The compilation define USE_HAL_IRDA_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and weak (surcharged) callbacks are used.

45.2.3 Initialization and Configuration functions

This subsection provides a set of functions allowing to initialize the USARTx in asynchronous IRDA mode.

- For the asynchronous mode only these parameters can be configured:
  - Baud Rate
  - Word Length
  - Parity: If the parity is enabled, then the MSB bit of the data written in the data register is transmitted but is changed by the parity bit.
  - Power mode
  - Prescaler setting
  - Receiver/transmitter modes

The HAL_IRDA_Init() API follows the USART asynchronous configuration procedures (details for the procedures are available in reference manual).

This section contains the following APIs:

- ***HAL_IRDA_Init()***
- ***HAL_IRDA_DeInit()***
- ***HAL_IRDA_MspInit()***
- ***HAL_IRDA_MspDeInit()***
- ***HAL_IRDA_RegisterCallback()***
- ***HAL_IRDA_UnRegisterCallback()***

45.2.4 IO operation functions

This subsection provides a set of functions allowing to manage the IRDA data transfers.

IrDA is a half duplex communication protocol. If the Transmitter is busy, any data on the IrDA receive line will be ignored by the IrDA decoder and if the Receiver is busy, data on the TX from the USART to IrDA will not be encoded by IrDA. While receiving data, transmission should be avoided as the data to be transmitted could be corrupted.

1. There are two modes of transfer:
   - Blocking mode: the communication is performed in polling mode. The HAL status of all data processing is returned by the same function after finishing transfer.
   - Non-Blocking mode: the communication is performed using Interrupts or DMA, these API's return the HAL status. The end of the data processing will be indicated through the dedicated IRDA IRQ when using Interrupt mode or the DMA IRQ when using DMA mode. The HAL_IRDA_TxCpltCallback(), HAL_IRDA_RxCpltCallback() user callbacks will be executed respectively at the end of the Transmit or Receive process The HAL_IRDA_ErrorCallback() user callback will be executed when a communication error is detected
2. Blocking mode APIs are :
   - HAL_IRDA_Transmit()
   - HAL_IRDA_Receive()

3. Non Blocking mode APIs with Interrupt are :
   - HAL_IRDA_Transmit_IT()
   - HAL_IRDA_Receive_IT()
   - HAL_IRDA_IRQHandler()
4. Non Blocking mode functions with DMA are :
   - HAL_IRDA_Transmit_DMA()
   - HAL_IRDA_Receive_DMA()
   - HAL_IRDA_DMAPause()
   - HAL_IRDA_DMAResume()
   - HAL_IRDA_DMAStop()
5. A set of Transfer Complete Callbacks are provided in Non Blocking mode:
   - HAL_IRDA_TxHalfCpltCallback()
   - HAL_IRDA_TxCpltCallback()
   - HAL_IRDA_RxHalfCpltCallback()
   - HAL_IRDA_RxCpltCallback()
   - HAL_IRDA_ErrorCallback()
6. Non-Blocking mode transfers could be aborted using Abort API's :
   - HAL_IRDA_Abort()
   - HAL_IRDA_AbortTransmit()
   - HAL_IRDA_AbortReceive()
   - HAL_IRDA_Abort_IT()
   - HAL_IRDA_AbortTransmit_IT()
   - HAL_IRDA_AbortReceive_IT()
7. For Abort services based on interrupts (HAL_IRDA_Abortxxx_IT), a set of Abort Complete Callbacks are provided:
   - HAL_IRDA_AbortCpltCallback()
   - HAL_IRDA_AbortTransmitCpltCallback()
   - HAL_IRDA_AbortReceiveCpltCallback()
8. In Non-Blocking mode transfers, possible errors are split into 2 categories. Errors are handled as follows :
   - Error is considered as Recoverable and non blocking : Transfer could go till end, but error severity is to be evaluated by user : this concerns Frame Error, Parity Error or Noise Error in Interrupt mode reception . Received character is then retrieved and stored in Rx buffer, Error code is set to allow user to identify error type, and HAL_IRDA_ErrorCallback() user callback is executed. Transfer is kept ongoing on IRDA side. If user wants to abort it, Abort services should be called by user.
   - Error is considered as Blocking : Transfer could not be completed properly and is aborted. This concerns Overrun Error In Interrupt mode reception and all errors in DMA mode. Error code is set to allow user to identify error type, and HAL_IRDA_ErrorCallback() user callback is executed.

This section contains the following APIs:

- ***HAL_IRDA_Transmit()***
- ***HAL_IRDA_Receive()***
- ***HAL_IRDA_Transmit_IT()***
- ***HAL_IRDA_Receive_IT()***
- ***HAL_IRDA_Transmit_DMA()***
- ***HAL_IRDA_Receive_DMA()***
- ***HAL_IRDA_DMAPause()***
- ***HAL_IRDA_DMAResume()***
- ***HAL_IRDA_DMAStop()***
- ***HAL_IRDA_Abort()***
- ***HAL_IRDA_AbortTransmit()***
- ***HAL_IRDA_AbortReceive()***
- ***HAL_IRDA_Abort_IT()***

- *HAL_IRDA_AbortTransmit_IT()*
- *HAL_IRDA_AbortReceive_IT()*
- *HAL_IRDA_IRQHandler()*
- *HAL_IRDA_TxCpltCallback()*
- *HAL_IRDA_TxHalfCpltCallback()*
- *HAL_IRDA_RxCpltCallback()*
- *HAL_IRDA_RxHalfCpltCallback()*
- *HAL_IRDA_ErrorCallback()*
- *HAL_IRDA_AbortCpltCallback()*
- *HAL_IRDA_AbortTransmitCpltCallback()*
- *HAL_IRDA_AbortReceiveCpltCallback()*

45.2.5 Peripheral State and Error functions

This subsection provides a set of functions allowing to return the State of IrDA communication process and also return Peripheral Errors occurred during communication process

- HAL_IRDA_GetState() API can be helpful to check in run-time the state of the IRDA peripheral handle.
- HAL_IRDA_GetError() checks in run-time errors that could occur during communication.

This section contains the following APIs:

- *HAL_IRDA_GetState()*
- *HAL_IRDA_GetError()*

45.2.6 Detailed description of functions

HAL_IRDA_Init

Function name

HAL_StatusTypeDef HAL_IRDA_Init (IRDA_HandleTypeDef * hirda)

Function description

Initialize the IRDA mode according to the specified parameters in the IRDA_InitTypeDef and initialize the associated handle.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **HAL:** status

HAL_IRDA_DeInit

Function name

HAL_StatusTypeDef HAL_IRDA_DeInit (IRDA_HandleTypeDef * hirda)

Function description

DeInitialize the IRDA peripheral.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **HAL:** status

HAL_IRDA_MspInit

Function name

void HAL_IRDA_MspInit (IRDA_HandleTypeDef * hirda)

Function description

Initialize the IRDA MSP.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_MspDeInit

Function name

void HAL_IRDA_MspDeInit (IRDA_HandleTypeDef * hirda)

Function description

DeInitialize the IRDA MSP.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_RegisterCallback

Function name

HAL_StatusTypeDef HAL_IRDA_RegisterCallback (IRDA_HandleTypeDef * hirda, HAL_IRDA_CallbackIDTypeDef CallbackID, pIRDA_CallbackTypeDef pCallback)

Function description

Register a User IRDA Callback To be used instead of the weak predefined callback.

Parameters

- **hirda:** irda handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_IRDA_TX_HALFCOMPLETE_CB_ID Tx Half Complete Callback ID
  - HAL_IRDA_TX_COMPLETE_CB_ID Tx Complete Callback ID
  - HAL_IRDA_RX_HALFCOMPLETE_CB_ID Rx Half Complete Callback ID
  - HAL_IRDA_RX_COMPLETE_CB_ID Rx Complete Callback ID
  - HAL_IRDA_ERROR_CB_ID Error Callback ID
  - HAL_IRDA_ABORT_COMPLETE_CB_ID Abort Complete Callback ID
  - HAL_IRDA_ABORT_TRANSMIT_COMPLETE_CB_ID Abort Transmit Complete Callback ID
  - HAL_IRDA_ABORT_RECEIVE_COMPLETE_CB_ID Abort Receive Complete Callback ID
  - HAL_IRDA_MSPINIT_CB_ID MspInit Callback ID
  - HAL_IRDA_MSPDEINIT_CB_ID MspDeInit Callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

Notes

- The HAL_IRDA_RegisterCallback() may be called before HAL_IRDA_Init() in HAL_IRDA_STATE_RESET to register callbacks for HAL_IRDA_MSPINIT_CB_ID and HAL_IRDA_MSPDEINIT_CB_ID

HAL_IRDA_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_IRDA_UnRegisterCallback (IRDA_HandleTypeDef * hirda, HAL_IRDA_CallbackIDTypeDef CallbackID)

Function description

Unregister an IRDA callback IRDA callback is redirected to the weak predefined callback.

Parameters

- **hirda:** irda handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_IRDA_TX_HALFCOMPLETE_CB_ID Tx Half Complete Callback ID
  - HAL_IRDA_TX_COMPLETE_CB_ID Tx Complete Callback ID
  - HAL_IRDA_RX_HALFCOMPLETE_CB_ID Rx Half Complete Callback ID
  - HAL_IRDA_RX_COMPLETE_CB_ID Rx Complete Callback ID
  - HAL_IRDA_ERROR_CB_ID Error Callback ID
  - HAL_IRDA_ABORT_COMPLETE_CB_ID Abort Complete Callback ID
  - HAL_IRDA_ABORT_TRANSMIT_COMPLETE_CB_ID Abort Transmit Complete Callback ID
  - HAL_IRDA_ABORT_RECEIVE_COMPLETE_CB_ID Abort Receive Complete Callback ID
  - HAL_IRDA_MSPINIT_CB_ID MspInit Callback ID
  - HAL_IRDA_MSPDEINIT_CB_ID MspDeInit Callback ID

Return values

- **HAL:** status

Notes

- The HAL_IRDA_UnRegisterCallback() may be called before HAL_IRDA_Init() in HAL_IRDA_STATE_RESET to un-register callbacks for HAL_IRDA_MSPINIT_CB_ID and HAL_IRDA_MSPDEINIT_CB_ID

HAL_IRDA_Transmit

Function name

HAL_StatusTypeDef HAL_IRDA_Transmit (IRDA_HandleTypeDef * hirda, const uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Send an amount of data in blocking mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** Pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be sent.
- **Timeout:** Specify timeout value.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the sent data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.

HAL_IRDA_Receive

Function name

HAL_StatusTypeDef HAL_IRDA_Receive (IRDA_HandleTypeDef * hirda, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Receive an amount of data in blocking mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** Pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be received.
- **Timeout:** Specify timeout value.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the received data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.

HAL_IRDA_Transmit_IT

Function name

HAL_StatusTypeDef HAL_IRDA_Transmit_IT (IRDA_HandleTypeDef * hirda, const uint8_t * pData, uint16_t Size)

Function description

Send an amount of data in interrupt mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** Pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be sent.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the sent data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.

HAL_IRDA_Receive_IT

Function name

HAL_StatusTypeDef HAL_IRDA_Receive_IT (IRDA_HandleTypeDef * hirda, uint8_t * pData, uint16_t Size)

Function description

Receive an amount of data in interrupt mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** Pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be received.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the received data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.

HAL_IRDA_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_IRDA_Transmit_DMA (IRDA_HandleTypeDef * hirda, const uint8_t * pData, uint16_t Size)

Function description

Send an amount of data in DMA mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be sent.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the sent data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.

HAL_IRDA_Receive_DMA

Function name

HAL_StatusTypeDef HAL_IRDA_Receive_DMA (IRDA_HandleTypeDef * hirda, uint8_t * pData, uint16_t Size)

Function description

Receive an amount of data in DMA mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** Pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be received.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the received data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.
- When the IRDA parity is enabled (PCE = 1), the received data contains the parity bit (MSB position).

HAL_IRDA_DMAPause

Function name

HAL_StatusTypeDef HAL_IRDA_DMAPause (IRDA_HandleTypeDef * hirda)

Function description

Pause the DMA Transfer.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **HAL:** status

HAL_IRDA_DMAResume

Function name

HAL_StatusTypeDef HAL_IRDA_DMAResume (IRDA_HandleTypeDef * hirda)

Function description

Resume the DMA Transfer.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

HAL_IRDA_DMAStop

Function name

HAL_StatusTypeDef HAL_IRDA_DMAStop (IRDA_HandleTypeDef * hirda)

Function description

Stop the DMA Transfer.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

HAL_IRDA_Abort

Function name

HAL_StatusTypeDef HAL_IRDA_Abort (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing transfers (blocking mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Tx and Rx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort (in case of transfer in DMA mode)Set handle State to READY
- This procedure is executed in blocking mode : when exiting function, Abort is considered as completed.

HAL_IRDA_AbortTransmit

Function name

HAL_StatusTypeDef HAL_IRDA_AbortTransmit (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing Transmit transfer (blocking mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing Tx transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Tx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort (in case of transfer in DMA mode)Set handle State to READY
- This procedure is executed in blocking mode : when exiting function, Abort is considered as completed.

HAL_IRDA_AbortReceive

Function name

HAL_StatusTypeDef HAL_IRDA_AbortReceive (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing Receive transfer (blocking mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing Rx transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Rx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort (in case of transfer in DMA mode)Set handle State to READY
- This procedure is executed in blocking mode : when exiting function, Abort is considered as completed.

HAL_IRDA_Abort_IT

Function name

HAL_StatusTypeDef HAL_IRDA_Abort_IT (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing transfers (Interrupt mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Tx and Rx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort_IT (in case of transfer in DMA mode)Set handle State to READYAt abort completion, call user abort complete callback
- This procedure is executed in Interrupt mode, meaning that abort procedure could be considered as completed only when user abort complete callback is executed (not when exiting function).

HAL_IRDA_AbortTransmit_IT

Function name

HAL_StatusTypeDef HAL_IRDA_AbortTransmit_IT (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing Transmit transfer (Interrupt mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing Tx transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Tx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort_IT (in case of transfer in DMA mode)Set handle State to READYAt abort completion, call user abort complete callback
- This procedure is executed in Interrupt mode, meaning that abort procedure could be considered as completed only when user abort complete callback is executed (not when exiting function).

HAL_IRDA_AbortReceive_IT

Function name

HAL_StatusTypeDef HAL_IRDA_AbortReceive_IT (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing Receive transfer (Interrupt mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing Rx transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Rx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort_IT (in case of transfer in DMA mode)Set handle State to READYAt abort completion, call user abort complete callback
- This procedure is executed in Interrupt mode, meaning that abort procedure could be considered as completed only when user abort complete callback is executed (not when exiting function).

HAL_IRDA_IRQHandler

Function name

void HAL_IRDA_IRQHandler (IRDA_HandleTypeDef * hirda)

Function description

Handle IRDA interrupt request.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_TxCpltCallback

Function name

void HAL_IRDA_TxCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

Tx Transfer completed callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_RxCpltCallback

Function name

void HAL_IRDA_RxCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

Rx Transfer completed callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_TxHalfCpltCallback

Function name

void HAL_IRDA_TxHalfCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

Tx Half Transfer completed callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified USART module.

Return values

- **None:**

HAL_IRDA_RxHalfCpltCallback

Function name

void HAL_IRDA_RxHalfCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

Rx Half Transfer complete callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_ErrorCallback

Function name

void HAL_IRDA_ErrorCallback (IRDA_HandleTypeDef * hirda)

Function description

IRDA error callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_AbortCpltCallback

Function name

void HAL_IRDA_AbortCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

IRDA Abort Complete callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_AbortTransmitCpltCallback

Function name

void HAL_IRDA_AbortTransmitCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

IRDA Abort Complete callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_AbortReceiveCpltCallback

Function name

void HAL_IRDA_AbortReceiveCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

IRDA Abort Receive Complete callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_GetState

Function name

HAL_IRDA_StateTypeDef HAL_IRDA_GetState (const IRDA_HandleTypeDef * hirda)

Function description

Return the IRDA handle state.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **HAL:** state

HAL_IRDA_GetError

Function name

uint32_t HAL_IRDA_GetError (const IRDA_HandleTypeDef * hirda)

Function description

Return the IRDA handle error code.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **IRDA:** Error Code

45.3 IRDA Firmware driver defines

The following section lists the various define and macros of the module.

IRDA Exported Macros

__HAL_IRDA_RESET_HANDLE_STATE

Description:

- Reset IRDA handle state.

Parameters:

- __HANDLE__: IRDA handle.

Return value:

- None

__HAL_IRDA_FLUSH_DRREGISTER

Description:

- Flush the IRDA DR register.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_CLEAR_FLAG

Description:

- Clear the specified IRDA pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __FLAG__: specifies the flag to check. This parameter can be any combination of the following values:
  - IRDA_CLEAR_PEF
  - IRDA_CLEAR_FEF
  - IRDA_CLEAR_NEF
  - IRDA_CLEAR_OREF
  - IRDA_CLEAR_TCF
  - IRDA_CLEAR_IDLEF

Return value:

- None

__HAL_IRDA_CLEAR_PEFLAG

Description:

- Clear the IRDA PE pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_CLEAR_FEFLAG

Description:

- Clear the IRDA FE pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_CLEAR_NEFLAG

Description:

- Clear the IRDA NE pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_CLEAR_OREFLAG

Description:

- Clear the IRDA ORE pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_CLEAR_IDLEFLAG

Description:

- Clear the IRDA IDLE pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_GET_FLAG

Description:

- Check whether the specified IRDA flag is set or not.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - IRDA_FLAG_REACK Receive enable acknowledge flag
  - IRDA_FLAG_TEACK Transmit enable acknowledge flag
  - IRDA_FLAG_BUSY Busy flag
  - IRDA_FLAG_ABRF Auto Baud rate detection flag
  - IRDA_FLAG_ABRE Auto Baud rate detection error flag
  - IRDA_FLAG_TXE Transmit data register empty flag
  - IRDA_FLAG_TC Transmission Complete flag
  - IRDA_FLAG_RXNE Receive data register not empty flag
  - IRDA_FLAG_ORE OverRun Error flag
  - IRDA_FLAG_NE Noise Error flag
  - IRDA_FLAG_FE Framing Error flag
  - IRDA_FLAG_PE Parity Error flag

Return value:

- The: new state of __FLAG__ (TRUE or FALSE).

__HAL_IRDA_ENABLE_IT

Description:

- Enable the specified IRDA interrupt.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __INTERRUPT__: specifies the IRDA interrupt source to enable. This parameter can be one of the following values:
  - IRDA_IT_TXE Transmit Data Register empty interrupt
  - IRDA_IT_TC Transmission complete interrupt
  - IRDA_IT_RXNE Receive Data register not empty interrupt
  - IRDA_IT_IDLE Idle line detection interrupt
  - IRDA_IT_PE Parity Error interrupt
  - IRDA_IT_ERR Error interrupt(Frame error, noise error, overrun error)

Return value:

- None

__HAL_IRDA_DISABLE_IT

Description:

- Disable the specified IRDA interrupt.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __INTERRUPT__: specifies the IRDA interrupt source to disable. This parameter can be one of the following values:
  - IRDA_IT_TXE Transmit Data Register empty interrupt
  - IRDA_IT_TC Transmission complete interrupt
  - IRDA_IT_RXNE Receive Data register not empty interrupt
  - IRDA_IT_IDLE Idle line detection interrupt
  - IRDA_IT_PE Parity Error interrupt
  - IRDA_IT_ERR Error interrupt(Frame error, noise error, overrun error)

Return value:

- None

__HAL_IRDA_GET_IT

Description:

- Check whether the specified IRDA interrupt has occurred or not.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __INTERRUPT__: specifies the IRDA interrupt source to check. This parameter can be one of the following values:
  - IRDA_IT_TXE Transmit Data Register empty interrupt
  - IRDA_IT_TC Transmission complete interrupt
  - IRDA_IT_RXNE Receive Data register not empty interrupt
  - IRDA_IT_IDLE Idle line detection interrupt
  - IRDA_IT_ORE OverRun Error interrupt
  - IRDA_IT_NE Noise Error interrupt
  - IRDA_IT_FE Framing Error interrupt
  - IRDA_IT_PE Parity Error interrupt

Return value:

- The: new state of __IT__ (SET or RESET).

__HAL_IRDA_GET_IT_SOURCE

Description:

- Check whether the specified IRDA interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __INTERRUPT__: specifies the IRDA interrupt source to check. This parameter can be one of the following values:
  - IRDA_IT_TXE Transmit Data Register empty interrupt
  - IRDA_IT_TC Transmission complete interrupt
  - IRDA_IT_RXNE Receive Data register not empty interrupt
  - IRDA_IT_IDLE Idle line detection interrupt
  - IRDA_IT_ERR Framing, overrun or noise error interrupt
  - IRDA_IT_PE Parity Error interrupt

Return value:

- The: new state of __IT__ (SET or RESET).

__HAL_IRDA_CLEAR_IT

Description:

- Clear the specified IRDA ISR flag, in setting the proper ICR register flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __IT_CLEAR__: specifies the interrupt clear register flag that needs to be set to clear the corresponding interrupt This parameter can be one of the following values:
  - IRDA_CLEAR_PEF Parity Error Clear Flag
  - IRDA_CLEAR_FEF Framing Error Clear Flag
  - IRDA_CLEAR_NEF Noise detected Clear Flag
  - IRDA_CLEAR_OREF OverRun Error Clear Flag
  - IRDA_CLEAR_TCF Transmission Complete Clear Flag

Return value:

- None

__HAL_IRDA_SEND_REQ

Description:

- Set a specific IRDA request flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __REQ__: specifies the request flag to set This parameter can be one of the following values:
  - IRDA_AUTOBAUD_REQUEST Auto-Baud Rate Request
  - IRDA_RXDATA_FLUSH_REQUEST Receive Data flush Request
  - IRDA_TXDATA_FLUSH_REQUEST Transmit data flush Request

Return value:

- None

__HAL_IRDA_ONE_BIT_SAMPLE_ENABLE

Description:

- Enable the IRDA one bit sample method.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_ONE_BIT_SAMPLE_DISABLE

Description:

- Disable the IRDA one bit sample method.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_ENABLE

Description:

- Enable UART/USART associated to IRDA Handle.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_DISABLE

Description:

- Disable UART/USART associated to IRDA Handle.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

47 HAL IWDG Generic Driver

47.1 IWDG Firmware driver registers structures

47.1.1 IWDG_InitTypeDef

IWDG_InitTypeDef is defined in the stm32h7xx_hal_iwdg.h

Data Fields

- ***uint32_t Prescaler***
- ***uint32_t Reload***
- ***uint32_t Window***

Field Documentation

- ***uint32_t IWDG_InitTypeDef::Prescaler***
  Select the prescaler of the IWDG. This parameter can be a value of ***IWDG_Prescaler***
- ***uint32_t IWDG_InitTypeDef::Reload***
  Specifies the IWDG down-counter reload value. This parameter must be a number between Min_Data = 0 and Max_Data = 0x0FFF
- ***uint32_t IWDG_InitTypeDef::Window***
  Specifies the window value to be compared to the down-counter. This parameter must be a number between Min_Data = 0 and Max_Data = 0x0FFF

47.1.2 IWDG_HandleTypeDef

IWDG_HandleTypeDef is defined in the stm32h7xx_hal_iwdg.h

Data Fields

- ***IWDG_TypeDef * Instance***
- ***IWDG_InitTypeDef Init***

Field Documentation

- ***IWDG_TypeDef* IWDG_HandleTypeDef::Instance***
  Register base address
- ***IWDG_InitTypeDef IWDG_HandleTypeDef::Init***
  IWDG required parameters

47.2 IWDG Firmware driver API description

The following section lists the various functions of the IWDG library.

47.2.1 IWDG Generic features

- The IWDG can be started by either software or hardware (configurable through option byte).
- The IWDG is clocked by the Low-Speed Internal clock (LSI) and thus stays active even if the main clock fails.
- Once the IWDG is started, the LSI is forced ON and both cannot be disabled. The counter starts counting down from the reset value (0xFFF). When it reaches the end of count value (0x000) a reset signal is generated (IWDG reset).
- Whenever the key value 0x0000 AAAA is written in the IWDG_KR register, the IWDG_RLR value is reloaded into the counter and the watchdog reset is prevented.
- The IWDG is implemented in the VDD voltage domain that is still functional in STOP and STANDBY mode (IWDG reset can wake up the CPU from STANDBY). IWDGRST flag in RCC_CSR register can be used to inform when an IWDG reset occurs.

- Debug mode: When the microcontroller enters debug mode (core halted), the IWDG counter either continues to work normally or stops, depending on DBG_IWDG_STOP configuration bit in DBG module, accessible through __HAL_DBGMCU_FREEZE_IWDG1() or __HAL_DBGMCU_FREEZE2_IWDG2() and __HAL_DBGMCU_UnFreeze_IWDG1 or __HAL_DBGMCU_UnFreeze2_IWDG2() macros.

Min-max timeout value @32KHz (LSI): ~125us / ~32.7s The IWDG timeout may vary due to LSI clock frequency dispersion. STM32H7xx devices provide the capability to measure the LSI clock frequency (LSI clock is internally connected to TIM16 CH1 input capture). The measured value can be used to have an IWDG timeout with an acceptable accuracy.

Default timeout value (necessary for IWDG_SR status register update): Constant LSI_VALUE is defined based on the nominal LSI clock frequency. This frequency being subject to variations as mentioned above, the default timeout value (defined through constant HAL_IWDG_DEFAULT_TIMEOUT below) may become too short or too long. In such cases, this default timeout value can be tuned by redefining the constant LSI_VALUE at user-application level (based, for instance, on the measured LSI clock frequency as explained above).

47.2.2 How to use this driver

1. Use IWDG using HAL_IWDG_Init() function to :
   - Enable instance by writing Start keyword in IWDG_KEY register. LSI clock is forced ON and IWDG counter starts counting down.
   - Enable write access to configuration registers: IWDG_PR, IWDG_RLR and IWDG_WINR.
   - Configure the IWDG prescaler and counter reload value. This reload value will be loaded in the IWDG counter each time the watchdog is reloaded, then the IWDG will start counting down from this value.
   - Depending on window parameter:
     - If Window Init parameter is same as Window register value, nothing more is done but reload counter value in order to exit function with exact time base.
     - Else modify Window register. This will automatically reload watchdog counter.
   - Wait for status flags to be reset.
2. Then the application program must refresh the IWDG counter at regular intervals during normal operation to prevent an MCU reset, using HAL_IWDG_Refresh() function.

IWDG HAL driver macros list

Below the list of most used macros in IWDG HAL driver:

- __HAL_IWDG_START: Enable the IWDG peripheral
- __HAL_IWDG_RELOAD_COUNTER: Reloads IWDG counter with value defined in the reload register

47.2.3 Initialization and Start functions

This section provides functions allowing to:

- Initialize the IWDG according to the specified parameters in the IWDG_InitTypeDef of associated handle.
- Manage Window option.
- Once initialization is performed in HAL_IWDG_Init function, Watchdog is reloaded in order to exit function with correct time base.

This section contains the following APIs:

- ***HAL_IWDG_Init()***

47.2.4 IO operation functions

This section provides functions allowing to:

- Refresh the IWDG.

This section contains the following APIs:

- ***HAL_IWDG_Refresh()***

47.2.5 Detailed description of functions

HAL_IWDG_Init

Function name

HAL_StatusTypeDef HAL_IWDG_Init (IWDG_HandleTypeDef * hiwdg)

Function description

Initialize the IWDG according to the specified parameters in the IWDG_InitTypeDef and start watchdog.

Parameters

- **hiwdg:** pointer to a IWDG_HandleTypeDef structure that contains the configuration information for the specified IWDG module.

Return values

- **HAL:** status

HAL_IWDG_Refresh

Function name

HAL_StatusTypeDef HAL_IWDG_Refresh (IWDG_HandleTypeDef * hiwdg)

Function description

Refresh the IWDG.

Parameters

- **hiwdg:** pointer to a IWDG_HandleTypeDef structure that contains the configuration information for the specified IWDG module.

Return values

- **HAL:** status

47.3 IWDG Firmware driver defines

The following section lists the various define and macros of the module.

47.3.1 IWDG

IWDG

IWDG Exported Macros

__HAL_IWDG_START

Description:

- Enable the IWDG peripheral.

Parameters:

- __HANDLE__: IWDG handle

Return value:

- None

__HAL_IWDG_RELOAD_COUNTER

Description:

- Reload IWDG counter with value defined in the reload register (write access to IWDG_PR, IWDG_RLR and IWDG_WINR registers disabled).

Parameters:

- __HANDLE__: IWDG handle

Return value:

- None

IWDG Prescaler

IWDG_PRESCALER_4

IWDG prescaler set to 4

IWDG_PRESCALER_8

IWDG prescaler set to 8

IWDG_PRESCALER_16

IWDG prescaler set to 16

IWDG_PRESCALER_32

IWDG prescaler set to 32

IWDG_PRESCALER_64

IWDG prescaler set to 64

IWDG_PRESCALER_128

IWDG prescaler set to 128

IWDG_PRESCALER_256

IWDG prescaler set to 256

IWDG Window option

IWDG_WINDOW_DISABLE

48 HAL JPEG Generic Driver

48.1 JPEG Firmware driver registers structures

48.1.1 JPEG_ConfTypeDef

JPEG_ConfTypeDef is defined in the stm32h7xx_hal_jpeg.h

Data Fields

- ***uint32_t ColorSpace***
- ***uint32_t ChromaSubsampling***
- ***uint32_t ImageHeight***
- ***uint32_t ImageWidth***
- ***uint32_t ImageQuality***

Field Documentation

- ***uint32_t JPEG_ConfTypeDef::ColorSpace***
  Image Color space : gray-scale, YCBCR, RGB or CMYK This parameter can be a value of ***JPEG_ColorSpace***
- ***uint32_t JPEG_ConfTypeDef::ChromaSubsampling***
  Chroma Subsampling in case of YCBCR or CMYK color space, 0-> 4:4:4 , 1-> 4:2:2, 2 -> 4:1:1, 3 -> 4:2:0 This parameter can be a value of ***JPEG_ChromaSubsampling***
- ***uint32_t JPEG_ConfTypeDef::ImageHeight***
  Image height : number of lines
- ***uint32_t JPEG_ConfTypeDef::ImageWidth***
  Image width : number of pixels per line
- ***uint32_t JPEG_ConfTypeDef::ImageQuality***
  Quality of the JPEG encoding : from 1 to 100

48.1.2 __JPEG_HandleTypeDef

__JPEG_HandleTypeDef is defined in the stm32h7xx_hal_jpeg.h

Data Fields

- ***JPEG_TypeDef * Instance***
- ***JPEG_ConfTypeDef Conf***
- ***uint8_t * pJpegInBuffPtr***
- ***uint8_t * pJpegOutBuffPtr***
- ***__IO uint32_t JpegInCount***
- ***__IO uint32_t JpegOutCount***
- ***uint32_t InDataLength***
- ***uint32_t OutDataLength***
- ***MDMA_HandleTypeDef * hdmain***
- ***MDMA_HandleTypeDef * hdmaout***
- ***uint8_t CustomQuanTable***
- ***uint8_t * QuantTable0***
- ***uint8_t * QuantTable1***
- ***uint8_t * QuantTable2***
- ***uint8_t * QuantTable3***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_JPEG_STATETypeDef State***
- ***__IO uint32_t ErrorCode***

- ***__IO uint32_t Context***
- ***void(* InfoReadyCallback***
- ***void(* EncodeCpltCallback***
- ***void(* DecodeCpltCallback***
- ***void(* ErrorCallback***
- ***void(* GetDataCallback***
- ***void(* DataReadyCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***JPEG_TypeDef* __JPEG_HandleTypeDef::Instance***
  JPEG peripheral register base address
- ***JPEG_ConfTypeDef __JPEG_HandleTypeDef::Conf***
  Current JPEG encoding/decoding parameters
- ***uint8_t* __JPEG_HandleTypeDef::pJpegInBuffPtr***
  Pointer to JPEG processing (encoding, decoding,...) input buffer
- ***uint8_t* __JPEG_HandleTypeDef::pJpegOutBuffPtr***
  Pointer to JPEG processing (encoding, decoding,...) output buffer
- ***__IO uint32_t __JPEG_HandleTypeDef::JpegInCount***
  Internal Counter of input data
- ***__IO uint32_t __JPEG_HandleTypeDef::JpegOutCount***
  Internal Counter of output data
- ***uint32_t __JPEG_HandleTypeDef::InDataLength***
  Input Buffer Length in Bytes
- ***uint32_t __JPEG_HandleTypeDef::OutDataLength***
  Output Buffer Length in Bytes
- ***MDMA_HandleTypeDef* __JPEG_HandleTypeDef::hdmain***
  JPEG In MDMA handle parameters
- ***MDMA_HandleTypeDef* __JPEG_HandleTypeDef::hdmaout***
  JPEG Out MDMA handle parameters
- ***uint8_t __JPEG_HandleTypeDef::CustomQuanTable***
  If set to 1 specify that user customized quantization tables are used
- ***uint8_t* __JPEG_HandleTypeDef::QuantTable0***
  Basic Quantization Table for component 0
- ***uint8_t* __JPEG_HandleTypeDef::QuantTable1***
  Basic Quantization Table for component 1
- ***uint8_t* __JPEG_HandleTypeDef::QuantTable2***
  Basic Quantization Table for component 2
- ***uint8_t* __JPEG_HandleTypeDef::QuantTable3***
  Basic Quantization Table for component 3
- ***HAL_LockTypeDef __JPEG_HandleTypeDef::Lock***
  JPEG locking object
- ***__IO HAL_JPEG_STATETypeDef __JPEG_HandleTypeDef::State***
  JPEG peripheral state
- ***__IO uint32_t __JPEG_HandleTypeDef::ErrorCode***
  JPEG Error code
- ***__IO uint32_t __JPEG_HandleTypeDef::Context***
  JPEG Internal context

- ***void(* __JPEG_HandleTypeDef::InfoReadyCallback)(struct __JPEG_HandleTypeDef *hjpeg, JPEG_ConfTypeDef *pInfo)***
  JPEG Info ready callback
- ***void(* __JPEG_HandleTypeDef::EncodeCpltCallback)(struct __JPEG_HandleTypeDef *hjpeg)***
  JPEG Encode complete callback
- ***void(* __JPEG_HandleTypeDef::DecodeCpltCallback)(struct __JPEG_HandleTypeDef *hjpeg)***
  JPEG Decode complete callback
- ***void(* __JPEG_HandleTypeDef::ErrorCallback)(struct __JPEG_HandleTypeDef *hjpeg)***
  JPEG Error callback
- ***void(* __JPEG_HandleTypeDef::GetDataCallback)(struct __JPEG_HandleTypeDef *hjpeg, uint32_t NbDecodedData)***
  JPEG Get Data callback
- ***void(* __JPEG_HandleTypeDef::DataReadyCallback)(struct __JPEG_HandleTypeDef *hjpeg, uint8_t *pDataOut, uint32_t OutDataLength)***
  JPEG Data ready callback
- ***void(* __JPEG_HandleTypeDef::MspInitCallback)(struct __JPEG_HandleTypeDef *hjpeg)***
  JPEG Msp Init callback
- ***void(* __JPEG_HandleTypeDef::MspDeInitCallback)(struct __JPEG_HandleTypeDef *hjpeg)***
  JPEG Msp DeInit callback

48.2 JPEG Firmware driver API description

The following section lists the various functions of the JPEG library.

48.2.1 How to use this driver

1. Initialize the JPEG peripheral using HAL_JPEG_Init : No initialization parameters are required. Only the call to HAL_JPEG_Init is necessary to initialize the JPEG peripheral.
2. If operation is JPEG encoding use function HAL_JPEG_ConfigEncoding to set the encoding parameters (mandatory before calling the encoding function). the application can change the encoding parameter ImageQuality from 1 to 100 to obtain a more or less quality (visual quality vs the original row image), and inversely more or less jpg file size.
3. Note that for decoding operation the JPEG peripheral output data are organized in YCbCr blocks called MCU (Minimum Coded Unit) as defioned in the JPEG specification ISO/IEC 10918-1 standard. It is up to the application to transform these YCbCr blocks to RGB data that can be display. Respectively, for Encoding operation the JPEG peripheral input should be organized in YCbCr MCU blocks. It is up to the application to perform the necessary RGB to YCbCr MCU blocks transformation before feeding the JPEG peripheral with data.
4. Use functions HAL_JPEG_Encode and HAL_JPEG_Decode to start respectively a JPEG encoding/decoding operation in polling method (blocking).
5. Use functions HAL_JPEG_Encode_IT and HAL_JPEG_Decode_IT to start respectively a JPEG encoding/ decoding operation with Interrupt method (not blocking).
6. Use functions HAL_JPEG_Encode_DMA and HAL_JPEG_Decode_DMA to start respectively a JPEG encoding/decoding operation with DMA method (not blocking).
7. Callback HAL_JPEG_InfoReadyCallback is asserted if the current operation is a JPEG decoding to provide the application with JPEG image parameters. This callback is asserted when the JPEG peripheral successfully parse the JPEG header.

8. Callback HAL_JPEG_GetDataCallback is asserted for both encoding and decoding operations to inform the application that the input buffer has been consumed by the peripheral and to ask for a new data chunk if the operation (encoding/decoding) has not been complete yet.
   - This CallBack should be implemented in the application side. It should call the function HAL_JPEG_ConfigInputBuffer if new input data are available, or call HAL_JPEG_Pause with parameter XferSelection set to JPEG_PAUSE_RESUME_INPUT to inform the JPEG HAL driver that the ongoing operation shall pause waiting for the application to provide a new input data chunk. Once the application succeed getting new data and if the input has been paused, the application can call the function HAL_JPEG_ConfigInputBuffer to set the new input buffer and size, then resume the JPEG HAL input by calling new function HAL_JPEG_Resume. If the application has ended feeding the HAL JPEG with input data (no more input data), the application Should call the function HAL_JPEG_ConfigInputBuffer (within the callback HAL_JPEG_GetDataCallback) with the parameter InDataLength set to zero.
   - The mechanism of HAL_JPEG_ConfigInputBuffer/HAL_JPEG_Pause/HAL_JPEG_Resume allows to the application to provide the input data (for encoding or decoding) by chunks. If the new input data chunk is not available (because data should be read from an input file for example) the application can pause the JPEG input (using function HAL_JPEG_Pause) Once the new input data chunk is available (read from a file for example), the application can call the function HAL_JPEG_ConfigInputBuffer to provide the HAL with the new chunk then resume the JPEG HAL input by calling function HAL_JPEG_Resume.
   - The application can call functions HAL_JPEG_ConfigInputBuffer then HAL_JPEG_Resume. any time (outside the HAL_JPEG_GetDataCallback) Once the new input chunk data available. However, to keep data coherency, the function HAL_JPEG_Pause must be imperatively called (if necessary) within the callback HAL_JPEG_GetDataCallback, i.e when the HAL JPEG has ended Transferring the previous chunk buffer to the JPEG peripheral.
9. Callback HAL_JPEG_DataReadyCallback is asserted when the HAL JPEG driver has filled the given output buffer with the given size.
   - This CallBack should be implemented in the application side. It should call the function HAL_JPEG_ConfigOutputBuffer to provide the HAL JPEG driver with the new output buffer location and size to be used to store next data chunk. if the application is not ready to provide the output chunk location then it can call the function HAL_JPEG_Pause with parameter XferSelection set to JPEG_PAUSE_RESUME_OUTPUT to inform the JPEG HAL driver that it shall pause output data. Once the application is ready to receive the new data chunk (output buffer location free or available) it should call the function HAL_JPEG_ConfigOutputBuffer to provide the HAL JPEG driver with the new output chunk buffer location and size, then call HAL_JPEG_Resume to inform the HAL that it shall resume outputting data in the given output buffer.
   - The mechanism of HAL_JPEG_ConfigOutputBuffer/HAL_JPEG_Pause/HAL_JPEG_Resume allows the application to receive data from the JPEG peripheral by chunks. when a chunk is received, the application can pause the HAL JPEG output data to be able to process these received data (YCbCr to RGB conversion in case of decoding or data storage in case of encoding).
   - The application can call functions HAL_JPEG_ ConfigOutputBuffer then HAL_JPEG_Resume. any time (outside the HAL_JPEG_DataReadyCallback) Once the output data buffer is free to use. However, to keep data coherency, the function HAL_JPEG_Pause must be imperatively called (if necessary) within the callback HAL_JPEG_ DataReadyCallback, i.e when the HAL JPEG has ended Transferring the previous chunk buffer from the JPEG peripheral to the application.
10. Callback HAL_JPEG_EncodeCpltCallback is asserted when the HAL JPEG driver has ended the current JPEG encoding operation, and all output data has been transmitted to the application.
11. Callback HAL_JPEG_DecodeCpltCallback is asserted when the HAL JPEG driver has ended the current JPEG decoding operation. and all output data has been transmitted to the application.
12. Callback HAL_JPEG_ErrorCallback is asserted when an error occurred during the current operation. the application can call the function HAL_JPEG_GetError() to retrieve the error codes.
13. By default the HAL JPEG driver uses the default quantization tables as provide in the JPEG specification (ISO/IEC 10918-1 standard) for encoding. User can change these default tables if necessary using the function HAL_JPEG_SetUserQuantTables Note that for decoding the quantization tables are automatically extracted from the JPEG header.
14. To control JPEG state you can use the following function: HAL_JPEG_GetState()

JPEG HAL driver macros list

Below the list of most used macros in JPEG HAL driver.

- __HAL_JPEG_RESET_HANDLE_STATE : Reset JPEG handle state.
- __HAL_JPEG_ENABLE : Enable the JPEG peripheral.
- __HAL_JPEG_DISABLE : Disable the JPEG peripheral.
- __HAL_JPEG_GET_FLAG : Check the specified JPEG status flag.
- __HAL_JPEG_CLEAR_FLAG : Clear the specified JPEG status flag.
- __HAL_JPEG_ENABLE_IT : Enable the specified JPEG Interrupt.
- __HAL_JPEG_DISABLE_IT : Disable the specified JPEG Interrupt.
- __HAL_JPEG_GET_IT_SOURCE : returns the state of the specified JPEG Interrupt (Enabled or disabled).

Callback registration

48.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the JPEG peripheral and creates the associated handle
- DeInitialize the JPEG peripheral

This section contains the following APIs:

- ***HAL_JPEG_Init()***
- ***HAL_JPEG_DeInit()***
- ***HAL_JPEG_MspInit()***
- ***HAL_JPEG_MspDeInit()***
- ***HAL_JPEG_RegisterCallback()***
- ***HAL_JPEG_UnRegisterCallback()***
- ***HAL_JPEG_RegisterInfoReadyCallback()***
- ***HAL_JPEG_UnRegisterInfoReadyCallback()***
- ***HAL_JPEG_RegisterGetDataCallback()***
- ***HAL_JPEG_UnRegisterGetDataCallback()***
- ***HAL_JPEG_RegisterDataReadyCallback()***
- ***HAL_JPEG_UnRegisterDataReadyCallback()***

48.2.3 Configuration functions

This section provides functions allowing to:

- HAL_JPEG_ConfigEncoding() : JPEG encoding configuration
- HAL_JPEG_GetInfo() : Extract the image configuration from the JPEG header during the decoding
- HAL_JPEG_EnableHeaderParsing() : Enable JPEG Header parsing for decoding
- HAL_JPEG_DisableHeaderParsing() : Disable JPEG Header parsing for decoding
- HAL_JPEG_SetUserQuantTables : Modify the default Quantization tables used for JPEG encoding.

This section contains the following APIs:

- ***HAL_JPEG_ConfigEncoding()***
- ***HAL_JPEG_GetInfo()***
- ***HAL_JPEG_EnableHeaderParsing()***
- ***HAL_JPEG_DisableHeaderParsing()***
- ***HAL_JPEG_SetUserQuantTables()***

48.2.4 JPEG processing functions

This section provides functions allowing to:

- HAL_JPEG_Encode() : JPEG encoding with polling process
- HAL_JPEG_Decode() : JPEG decoding with polling process
- HAL_JPEG_Encode_IT() : JPEG encoding with interrupt process
- HAL_JPEG_Decode_IT() : JPEG decoding with interrupt process
- HAL_JPEG_Encode_DMA() : JPEG encoding with DMA process
- HAL_JPEG_Decode_DMA() : JPEG decoding with DMA process
- HAL_JPEG_Pause() : Pause the Input/Output processing
- HAL_JPEG_Resume() : Resume the JPEG Input/Output processing
- HAL_JPEG_ConfigInputBuffer() : Config Encoding/Decoding Input Buffer
- HAL_JPEG_ConfigOutputBuffer() : Config Encoding/Decoding Output Buffer
- HAL_JPEG_Abort() : Aborts the JPEG Encoding/Decoding

This section contains the following APIs:

- ***HAL_JPEG_Encode()***
- ***HAL_JPEG_Decode()***
- ***HAL_JPEG_Encode_IT()***
- ***HAL_JPEG_Decode_IT()***
- ***HAL_JPEG_Encode_DMA()***
- ***HAL_JPEG_Decode_DMA()***
- ***HAL_JPEG_Pause()***
- ***HAL_JPEG_Resume()***
- ***HAL_JPEG_ConfigInputBuffer()***
- ***HAL_JPEG_ConfigOutputBuffer()***
- ***HAL_JPEG_Abort()***

48.2.5 JPEG Decode and Encode callback functions

This section provides callback functions:

- HAL_JPEG_InfoReadyCallback() : Decoding JPEG Info ready callback
- HAL_JPEG_EncodeCpltCallback() : Encoding complete callback.
- HAL_JPEG_DecodeCpltCallback() : Decoding complete callback.
- HAL_JPEG_ErrorCallback() : JPEG error callback.
- HAL_JPEG_GetDataCallback() : Get New Data chunk callback.
- HAL_JPEG_DataReadyCallback() : Decoded/Encoded Data ready callback.

This section contains the following APIs:

- ***HAL_JPEG_InfoReadyCallback()***
- ***HAL_JPEG_EncodeCpltCallback()***
- ***HAL_JPEG_DecodeCpltCallback()***
- ***HAL_JPEG_ErrorCallback()***
- ***HAL_JPEG_GetDataCallback()***
- ***HAL_JPEG_DataReadyCallback()***

48.2.6 JPEG IRQ handler management

This section provides JPEG IRQ handler function.

- HAL_JPEG_IRQHandler() : handles JPEG interrupt request

This section contains the following APIs:

- ***HAL_JPEG_IRQHandler()***

48.2.7 Peripheral State and Error functions

This section provides JPEG State and Errors function.

- HAL_JPEG_GetState() : permits to get in run-time the JPEG state.
- HAL_JPEG_GetError() : Returns the JPEG error code if any.

This section contains the following APIs:

- *HAL_JPEG_GetState()*
- *HAL_JPEG_GetError()*

48.2.8 Detailed description of functions

HAL_JPEG_Init

Function name

HAL_StatusTypeDef HAL_JPEG_Init (JPEG_HandleTypeDef * hjpeg)

Function description

Initializes the JPEG according to the specified parameters in the JPEG_InitTypeDef and creates the associated handle.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **HAL:** status

HAL_JPEG_DeInit

Function name

HAL_StatusTypeDef HAL_JPEG_DeInit (JPEG_HandleTypeDef * hjpeg)

Function description

DeInitializes the JPEG peripheral.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **HAL:** status

HAL_JPEG_MspInit

Function name

void HAL_JPEG_MspInit (JPEG_HandleTypeDef * hjpeg)

Function description

Initializes the JPEG MSP.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **None:**

HAL_JPEG_MspDeInit

Function name

void HAL_JPEG_MspDeInit (JPEG_HandleTypeDef * hjpeg)

Function description

DeInitializes JPEG MSP.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **None:**

HAL_JPEG_RegisterCallback

Function name

HAL_StatusTypeDef HAL_JPEG_RegisterCallback (JPEG_HandleTypeDef * hjpeg, HAL_JPEG_CallbackIDTypeDef CallbackID, pJPEG_CallbackTypeDef pCallback)

Function description

Register a User JPEG Callback To be used instead of the weak predefined callback.

Parameters

- **hjpeg:** JPEG handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_JPEG_ENCODE_CPLT_CB_ID Encode Complete callback ID
  - HAL_JPEG_DECODE_CPLT_CB_ID Decode Complete callback ID
  - HAL_JPEG_ERROR_CB_ID Error callback ID
  - HAL_JPEG_MSPINIT_CB_ID MspInit callback ID
  - HAL_JPEG_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_JPEG_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_JPEG_UnRegisterCallback (JPEG_HandleTypeDef * hjpeg, HAL_JPEG_CallbackIDTypeDef CallbackID)

Function description

Unregister a JPEG Callback JPEG callabck is redirected to the weak predefined callback.

Parameters

- **hjpeg:** JPEG handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values: This parameter can be one of the following values:
  - HAL_JPEG_ENCODE_CPLT_CB_ID Encode Complete callback ID
  - HAL_JPEG_DECODE_CPLT_CB_ID Decode Complete callback ID
  - HAL_JPEG_ERROR_CB_ID Error callback ID
  - HAL_JPEG_MSPINIT_CB_ID MspInit callback ID
  - HAL_JPEG_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_JPEG_RegisterInfoReadyCallback

Function name

HAL_StatusTypeDef HAL_JPEG_RegisterInfoReadyCallback (JPEG_HandleTypeDef * hjpeg, pJPEG_InfoReadyCallbackTypeDef pCallback)

Function description

Register Info Ready JPEG Callback To be used instead of the weak HAL_JPEG_InfoReadyCallback() predefined callback.

Parameters

- **hjpeg:** JPEG handle
- **pCallback:** pointer to the Info Ready Callback function

Return values

- **HAL:** status

HAL_JPEG_UnRegisterInfoReadyCallback

Function name

HAL_StatusTypeDef HAL_JPEG_UnRegisterInfoReadyCallback (JPEG_HandleTypeDef * hjpeg)

Function description

UnRegister the Info Ready JPEG Callback Info Ready JPEG Callback is redirected to the weak HAL_JPEG_InfoReadyCallback() predefined callback.

Parameters

- **hjpeg:** JPEG handle

Return values

- **HAL:** status

HAL_JPEG_RegisterGetDataCallback

Function name

HAL_StatusTypeDef HAL_JPEG_RegisterGetDataCallback (JPEG_HandleTypeDef * hjpeg, pJPEG_GetDataCallbackTypeDef pCallback)

Function description

Register Get Data JPEG Callback To be used instead of the weak HAL_JPEG_GetDataCallback() predefined callback.

Parameters

- **hjpeg:** JPEG handle
- **pCallback:** pointer to the Get Data Callback function

Return values

- **HAL:** status

HAL_JPEG_UnRegisterGetDataCallback

Function name

HAL_StatusTypeDef HAL_JPEG_UnRegisterGetDataCallback (JPEG_HandleTypeDef * hjpeg)

Function description

UnRegister the Get Data JPEG Callback Get Data JPEG Callback is redirected to the weak HAL_JPEG_GetDataCallback() predefined callback.

Parameters

- **hjpeg:** JPEG handle

Return values

- **HAL:** status

HAL_JPEG_RegisterDataReadyCallback

Function name

HAL_StatusTypeDef HAL_JPEG_RegisterDataReadyCallback (JPEG_HandleTypeDef * hjpeg, pJPEG_DataReadyCallbackTypeDef pCallback)

Function description

Register Data Ready JPEG Callback To be used instead of the weak HAL_JPEG_DataReadyCallback() predefined callback.

Parameters

- **hjpeg:** JPEG handle
- **pCallback:** pointer to the Get Data Callback function

Return values

- **HAL:** status

HAL_JPEG_UnRegisterDataReadyCallback

Function name

HAL_StatusTypeDef HAL_JPEG_UnRegisterDataReadyCallback (JPEG_HandleTypeDef * hjpeg)

Function description

UnRegister the Data Ready JPEG Callback Get Data Ready Callback is redirected to the weak HAL_JPEG_DataReadyCallback() predefined callback.

Parameters

- **hjpeg:** JPEG handle

Return values

- **HAL:** status

HAL_JPEG_ConfigEncoding

Function name

HAL_StatusTypeDef HAL_JPEG_ConfigEncoding (JPEG_HandleTypeDef * hjpeg, JPEG_ConfTypeDef * pConf)

Function description

Set the JPEG encoding configuration.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pConf:** pointer to a JPEG_ConfTypeDef structure that contains the encoding configuration

Return values

- **HAL:** status

HAL_JPEG_GetInfo

Function name

HAL_StatusTypeDef HAL_JPEG_GetInfo (JPEG_HandleTypeDef * hjpeg, JPEG_ConfTypeDef * pInfo)

Function description

Extract the image configuration from the JPEG header during the decoding.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pInfo:** pointer to a JPEG_ConfTypeDef structure that contains The JPEG decoded header information

Return values

- **HAL:** status

HAL_JPEG_EnableHeaderParsing

Function name

HAL_StatusTypeDef HAL_JPEG_EnableHeaderParsing (JPEG_HandleTypeDef * hjpeg)

Function description

Enable JPEG Header parsing for decoding.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for the JPEG.

Return values

- **HAL:** status

HAL_JPEG_DisableHeaderParsing

Function name

HAL_StatusTypeDef HAL_JPEG_DisableHeaderParsing (JPEG_HandleTypeDef * hjpeg)

Function description

Disable JPEG Header parsing for decoding.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for the JPEG.

Return values

- **HAL:** status

HAL_JPEG_SetUserQuantTables

Function name

HAL_StatusTypeDef HAL_JPEG_SetUserQuantTables (JPEG_HandleTypeDef * hjpeg, uint8_t * QTable0, uint8_t * QTable1, uint8_t * QTable2, uint8_t * QTable3)

Function description

Modify the default Quantization tables used for JPEG encoding.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **QTable0:** pointer to uint8_t , define the user quantification table for color component 1. If NULL assume no need to update the table and no error return
- **QTable1:** pointer to uint8_t , define the user quantification table for color component 2. If NULL assume no need to update the table and no error return.
- **QTable2:** pointer to uint8_t , define the user quantification table for color component 3, If NULL assume no need to update the table and no error return.
- **QTable3:** pointer to uint8_t , define the user quantification table for color component 4. If NULL assume no need to update the table and no error return.

Return values

- **HAL:** status

HAL_JPEG_Encode

Function name

HAL_StatusTypeDef HAL_JPEG_Encode (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataInMCU, uint32_t InDataLength, uint8_t * pDataOut, uint32_t OutDataLength, uint32_t Timeout)

Function description

Starts JPEG encoding with polling processing.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pDataInMCU:** Pointer to the Input buffer
- **InDataLength:** size in bytes Input buffer
- **pDataOut:** Pointer to the jpeg output data buffer
- **OutDataLength:** size in bytes of the Output buffer
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_JPEG_Decode

Function name

HAL_StatusTypeDef HAL_JPEG_Decode (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataIn, uint32_t InDataLength, uint8_t * pDataOutMCU, uint32_t OutDataLength, uint32_t Timeout)

Function description

Starts JPEG decoding with polling processing.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pDataIn:** Pointer to the input data buffer
- **InDataLength:** size in bytes Input buffer
- **pDataOutMCU:** Pointer to the Output data buffer
- **OutDataLength:** size in bytes of the Output buffer
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_JPEG_Encode_IT

Function name

HAL_StatusTypeDef HAL_JPEG_Encode_IT (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataInMCU, uint32_t InDataLength, uint8_t * pDataOut, uint32_t OutDataLength)

Function description

Starts JPEG encoding with interrupt processing.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pDataInMCU:** Pointer to the Input buffer
- **InDataLength:** size in bytes Input buffer
- **pDataOut:** Pointer to the jpeg output data buffer
- **OutDataLength:** size in bytes of the Output buffer

Return values

- **HAL:** status

HAL_JPEG_Decode_IT

Function name

HAL_StatusTypeDef HAL_JPEG_Decode_IT (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataIn, uint32_t InDataLength, uint8_t * pDataOutMCU, uint32_t OutDataLength)

Function description

Starts JPEG decoding with interrupt processing.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pDataIn:** Pointer to the input data buffer
- **InDataLength:** size in bytes Input buffer
- **pDataOutMCU:** Pointer to the Output data buffer
- **OutDataLength:** size in bytes of the Output buffer

Return values

- **HAL:** status

HAL_JPEG_Encode_DMA

Function name

HAL_StatusTypeDef HAL_JPEG_Encode_DMA (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataInMCU, uint32_t InDataLength, uint8_t * pDataOut, uint32_t OutDataLength)

Function description

Starts JPEG encoding with DMA processing.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pDataInMCU:** Pointer to the Input buffer
- **InDataLength:** size in bytes Input buffer
- **pDataOut:** Pointer to the jpeg output data buffer
- **OutDataLength:** size in bytes of the Output buffer

Return values

- **HAL:** status

HAL_JPEG_Decode_DMA

Function name

HAL_StatusTypeDef HAL_JPEG_Decode_DMA (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataIn, uint32_t InDataLength, uint8_t * pDataOutMCU, uint32_t OutDataLength)

Function description

Starts JPEG decoding with DMA processing.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pDataIn:** Pointer to the input data buffer
- **InDataLength:** size in bytes Input buffer
- **pDataOutMCU:** Pointer to the Output data buffer
- **OutDataLength:** size in bytes of the Output buffer

Return values

- **HAL:** status

HAL_JPEG_Pause

Function name

HAL_StatusTypeDef HAL_JPEG_Pause (JPEG_HandleTypeDef * hjpeg, uint32_t XferSelection)

Function description

Pause the JPEG Input/Output processing.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **XferSelection:** This parameter can be one of the following values : JPEG_PAUSE_RESUME_INPUT : Pause Input processing JPEG_PAUSE_RESUME_OUTPUT: Pause Output processing JPEG_PAUSE_RESUME_INPUT_OUTPUT: Pause Input and Output processing

Return values

- **HAL:** status

HAL_JPEG_Resume

Function name

HAL_StatusTypeDef HAL_JPEG_Resume (JPEG_HandleTypeDef * hjpeg, uint32_t XferSelection)

Function description

Resume the JPEG Input/Output processing.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **XferSelection:** This parameter can be one of the following values : JPEG_PAUSE_RESUME_INPUT : Resume Input processing JPEG_PAUSE_RESUME_OUTPUT: Resume Output processing JPEG_PAUSE_RESUME_INPUT_OUTPUT: Resume Input and Output processing

Return values

- **HAL:** status

HAL_JPEG_ConfigInputBuffer

Function name

void HAL_JPEG_ConfigInputBuffer (JPEG_HandleTypeDef * hjpeg, uint8_t * pNewInputBuffer, uint32_t InDataLength)

Function description

Config Encoding/Decoding Input Buffer.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module.
- **pNewInputBuffer:** Pointer to the new input data buffer
- **InDataLength:** Size in bytes of the new Input data buffer

Return values

- **HAL:** status

HAL_JPEG_ConfigOutputBuffer

Function name

void HAL_JPEG_ConfigOutputBuffer (JPEG_HandleTypeDef * hjpeg, uint8_t * pNewOutputBuffer, uint32_t OutDataLength)

Function description

Config Encoding/Decoding Output Buffer.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module.
- **pNewOutputBuffer:** Pointer to the new output data buffer
- **OutDataLength:** Size in bytes of the new Output data buffer

Return values

- **HAL:** status

HAL_JPEG_Abort

Function name

HAL_StatusTypeDef HAL_JPEG_Abort (JPEG_HandleTypeDef * hjpeg)

Function description

Aborts the JPEG Encoding/Decoding.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **HAL:** status

HAL_JPEG_InfoReadyCallback

Function name

void HAL_JPEG_InfoReadyCallback (JPEG_HandleTypeDef * hjpeg, JPEG_ConfTypeDef * pInfo)

Function description

Decoding JPEG Info ready callback.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pInfo:** pointer to a JPEG_ConfTypeDef structure that contains The JPEG decoded header information

Return values

- **None:**

HAL_JPEG_EncodeCpltCallback

Function name

void HAL_JPEG_EncodeCpltCallback (JPEG_HandleTypeDef * hjpeg)

Function description

Encoding complete callback.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **None:**

HAL_JPEG_DecodeCpltCallback

Function name

void HAL_JPEG_DecodeCpltCallback (JPEG_HandleTypeDef * hjpeg)

Function description

Decoding complete callback.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **None:**

HAL_JPEG_ErrorCallback

Function name

void HAL_JPEG_ErrorCallback (JPEG_HandleTypeDef * hjpeg)

Function description

JPEG error callback.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **None:**

HAL_JPEG_GetDataCallback

Function name

void HAL_JPEG_GetDataCallback (JPEG_HandleTypeDef * hjpeg, uint32_t NbDecodedData)

Function description

Get New Data chunk callback.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **NbDecodedData:** Number of consummed data in the previous chunk in bytes

Return values

- **None:**

HAL_JPEG_DataReadyCallback

Function name

void HAL_JPEG_DataReadyCallback (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataOut, uint32_t OutDataLength)

Function description

Decoded/Encoded Data ready callback.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pDataOut:** pointer to the output data buffer
- **OutDataLength:** number in bytes of data available in the specified output buffer

Return values

- **None:**

HAL_JPEG_IRQHandler

Function name

void HAL_JPEG_IRQHandler (JPEG_HandleTypeDef * hjpeg)

Function description

This function handles JPEG interrupt request.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **None:**

HAL_JPEG_GetState

Function name

HAL_JPEG_STATETypeDef HAL_JPEG_GetState (JPEG_HandleTypeDef * hjpeg)

Function description

Returns the JPEG state.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **JPEG:** state

HAL_JPEG_GetError

Function name

uint32_t HAL_JPEG_GetError (JPEG_HandleTypeDef * hjpeg)

Function description

Return the JPEG error code.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for the specified JPEG.

Return values

- **JPEG:** Error Code

48.3 JPEG Firmware driver defines

The following section lists the various define and macros of the module.

48.3.1 JPEG

JPEG

JPEG Chrominance Sampling

JPEG_444_SUBSAMPLING

Chroma Subsampling 4:4:4

JPEG_420_SUBSAMPLING

Chroma Subsampling 4:2:0

JPEG_422_SUBSAMPLING

Chroma Subsampling 4:2:2

JPEG ColorSpace

JPEG_GRAYSCALE_COLORSPACE

JPEG_YCBCR_COLORSPACE

JPEG_CMYK_COLORSPACE

JPEG Error Code definition

HAL_JPEG_ERROR_NONE

No error

HAL_JPEG_ERROR_HUFF_TABLE

HUffman Table programming error

HAL_JPEG_ERROR_QUANT_TABLE

Quantization Table programming error

HAL_JPEG_ERROR_DMA

DMA transfer error

HAL_JPEG_ERROR_TIMEOUT

Timeout error

HAL_JPEG_ERROR_INVALID_CALLBACK

Invalid Callback error

JPEG Exported Macros

__HAL_JPEG_RESET_HANDLE_STATE

Description:

- Reset JPEG handle state.

Parameters:

- __HANDLE__: specifies the JPEG handle.

Return value:

- None

__HAL_JPEG_ENABLE

Description:

- Enable the JPEG peripheral.

Parameters:

- __HANDLE__: specifies the JPEG handle.

Return value:

- None

__HAL_JPEG_DISABLE

Description:

- Disable the JPEG peripheral.

Parameters:

- __HANDLE__: specifies the JPEG handle.

Return value:

- None

__HAL_JPEG_GET_FLAG

Description:

- Check the specified JPEG status flag.

Parameters:

- __HANDLE__: specifies the JPEG handle.
- __FLAG__: specifies the flag to check This parameter can be one of the following values:
  - JPEG_FLAG_IFTF : The input FIFO is not full and is bellow its threshold flag
  - JPEG_FLAG_IFNFF : The input FIFO Not Full Flag, a data can be written
  - JPEG_FLAG_OFTF : The output FIFO is not empty and has reach its threshold
  - JPEG_FLAG_OFNEF : The output FIFO is not empty, a data is available
  - JPEG_FLAG_EOCF : JPEG Codec core has finished the encoding or the decoding process and than last data has been sent to the output FIFO
  - JPEG_FLAG_HPDF : JPEG Codec has finished the parsing of the headers and the internal registers have been updated
  - JPEG_FLAG_COF : JPEG Codec operation on going flag

Return value:

- __HAL_JPEG_GET_FLAG: : returns The new state of __FLAG__ (TRUE or FALSE)

__HAL_JPEG_CLEAR_FLAG

Description:

- Clear the specified JPEG status flag.

Parameters:

- __HANDLE__: specifies the JPEG handle.
- __FLAG__: specifies the flag to clear This parameter can be one of the following values:
  - JPEG_FLAG_EOCF : JPEG Codec core has finished the encoding or the decoding process and than last data has been sent to the output FIFO
  - JPEG_FLAG_HPDF : JPEG Codec has finished the parsing of the headers

Return value:

- None

__HAL_JPEG_ENABLE_IT

Description:

- Enable Interrupt.

Parameters:

- __HANDLE__: specifies the JPEG handle.
- __INTERRUPT__: specifies the interrupt to enable This parameter can be one of the following values:
  - JPEG_IT_IFT : Input FIFO Threshold Interrupt
  - JPEG_IT_IFNF : Input FIFO Not Full Interrupt
  - JPEG_IT_OFT : Output FIFO Threshold Interrupt
  - JPEG_IT_OFNE : Output FIFO Not empty Interrupt
  - JPEG_IT_EOC : End of Conversion Interrupt
  - JPEG_IT_HPD : Header Parsing Done Interrupt

Return value:

- No: return

__HAL_JPEG_DISABLE_IT

Description:

- Disable Interrupt.

Parameters:

- __HANDLE__: specifies the JPEG handle.
- __INTERRUPT__: specifies the interrupt to disable This parameter can be one of the following values:
  - JPEG_IT_IFT : Input FIFO Threshold Interrupt
  - JPEG_IT_IFNF : Input FIFO Not Full Interrupt
  - JPEG_IT_OFT : Output FIFO Threshold Interrupt
  - JPEG_IT_OFNE : Output FIFO Not empty Interrupt
  - JPEG_IT_EOC : End of Conversion Interrupt
  - JPEG_IT_HPD : Header Parsing Done Interrupt

Return value:

- No: return

Notes:

- To disable an IT we must use MODIFY_REG macro to avoid writing "1" to the FIFO flush bits located in the same IT enable register (CR register).

__HAL_JPEG_GET_IT_SOURCE

Description:

- Get Interrupt state.

Parameters:

- __HANDLE__: specifies the JPEG handle.
- __INTERRUPT__: specifies the interrupt to check This parameter can be one of the following values:
  - JPEG_IT_IFT : Input FIFO Threshold Interrupt
  - JPEG_IT_IFNF : Input FIFO Not Full Interrupt
  - JPEG_IT_OFT : Output FIFO Threshold Interrupt
  - JPEG_IT_OFNE : Output FIFO Not empty Interrupt
  - JPEG_IT_EOC : End of Conversion Interrupt
  - JPEG_IT_HPD : Header Parsing Done Interrupt

Return value:

- returns: The new state of __INTERRUPT__ (Enabled or disabled)

JPEG Flag definition

JPEG_FLAG_IFTF

Input FIFO is not full and is bellow its threshold flag

JPEG_FLAG_IFNFF

Input FIFO Not Full Flag, a data can be written

JPEG_FLAG_OFTF

Output FIFO is not empty and has reach its threshold

JPEG_FLAG_OFNEF

Output FIFO is not empty, a data is available

JPEG_FLAG_EOCF

JPEG Codec core has finished the encoding or the decoding process and than last data has been sent to the output FIFO

JPEG_FLAG_HPDF

JPEG Codec has finished the parsing of the headers and the internal registers have been updated

JPEG_FLAG_COF

JPEG Codec operation on going flag

JPEG_FLAG_ALL

JPEG Codec All previous flag

JPEG Image Quality

JPEG_IMAGE_QUALITY_MIN

Minimum JPEG quality

JPEG_IMAGE_QUALITY_MAX

Maximum JPEG quality

JPEG Interrupt configuration definition

JPEG_IT_IFT

Input FIFO Threshold Interrupt

JPEG_IT_IFNF

Input FIFO Not Full Interrupt

JPEG_IT_OFT

Output FIFO Threshold Interrupt

JPEG_IT_OFNE

Output FIFO Not Empty Interrupt

JPEG_IT_EOC

End of Conversion Interrupt

JPEG_IT_HPD

Header Parsing Done Interrupt

JPEG Process Pause Resume definition

JPEG_PAUSE_RESUME_INPUT

Pause/Resume Input FIFO Xfer

JPEG_PAUSE_RESUME_OUTPUT

Pause/Resume Output FIFO Xfer

JPEG_PAUSE_RESUME_INPUT_OUTPUT

Pause/Resume Input and Output FIFO Xfer

JPEG Quantization Table Size

JPEG_QUANT_TABLE_SIZE

JPEG Quantization Table Size in bytes

49 HAL LPTIM Generic Driver

49.1 LPTIM Firmware driver registers structures

49.1.1 LPTIM_ClockConfigTypeDef

LPTIM_ClockConfigTypeDef is defined in the stm32h7xx_hal_lptim.h

Data Fields

- ***uint32_t Source***
- ***uint32_t Prescaler***

Field Documentation

- ***uint32_t LPTIM_ClockConfigTypeDef::Source***
  Selects the clock source. This parameter can be a value of ***LPTIM_Clock_Source***
- ***uint32_t LPTIM_ClockConfigTypeDef::Prescaler***
  Specifies the counter clock Prescaler. This parameter can be a value of ***LPTIM_Clock_Prescaler***

49.1.2 LPTIM_ULPClockConfigTypeDef

LPTIM_ULPClockConfigTypeDef is defined in the stm32h7xx_hal_lptim.h

Data Fields

- ***uint32_t Polarity***
- ***uint32_t SampleTime***

Field Documentation

- ***uint32_t LPTIM_ULPClockConfigTypeDef::Polarity***
  Selects the polarity of the active edge for the counter unit if the ULPTIM input is selected. Note: This parameter is used only when Ultra low power clock source is used. Note: If the polarity is configured on 'both edges', an auxiliary clock (one of the Low power oscillator) must be active. This parameter can be a value of ***LPTIM_Clock_Polarity***
- ***uint32_t LPTIM_ULPClockConfigTypeDef::SampleTime***
  Selects the clock sampling time to configure the clock glitch filter. Note: This parameter is used only when Ultra low power clock source is used. This parameter can be a value of ***LPTIM_Clock_Sample_Time***

49.1.3 LPTIM_TriggerConfigTypeDef

LPTIM_TriggerConfigTypeDef is defined in the stm32h7xx_hal_lptim.h

Data Fields

- ***uint32_t Source***
- ***uint32_t ActiveEdge***
- ***uint32_t SampleTime***

Field Documentation

- ***uint32_t LPTIM_TriggerConfigTypeDef::Source***
  Selects the Trigger source. This parameter can be a value of ***LPTIM_Trigger_Source***
- ***uint32_t LPTIM_TriggerConfigTypeDef::ActiveEdge***
  Selects the Trigger active edge. Note: This parameter is used only when an external trigger is used. This parameter can be a value of ***LPTIM_External_Trigger_Polarity***
- ***uint32_t LPTIM_TriggerConfigTypeDef::SampleTime***
  Selects the trigger sampling time to configure the clock glitch filter. Note: This parameter is used only when an external trigger is used. This parameter can be a value of ***LPTIM_Trigger_Sample_Time***

49.1.4 LPTIM_InitTypeDef

LPTIM_InitTypeDef is defined in the stm32h7xx_hal_lptim.h

Data Fields

- ***LPTIM_ClockConfigTypeDef Clock***
- ***LPTIM_ULPClockConfigTypeDef UltraLowPowerClock***
- ***LPTIM_TriggerConfigTypeDef Trigger***
- ***uint32_t OutputPolarity***
- ***uint32_t UpdateMode***
- ***uint32_t CounterSource***
- ***uint32_t Input1Source***
- ***uint32_t Input2Source***

Field Documentation

- ***LPTIM_ClockConfigTypeDef LPTIM_InitTypeDef::Clock***
  Specifies the clock parameters
- ***LPTIM_ULPClockConfigTypeDef LPTIM_InitTypeDef::UltraLowPowerClock***
  Specifies the Ultra Low Power clock parameters
- ***LPTIM_TriggerConfigTypeDef LPTIM_InitTypeDef::Trigger***
  Specifies the Trigger parameters
- ***uint32_t LPTIM_InitTypeDef::OutputPolarity***
  Specifies the Output polarity. This parameter can be a value of ***LPTIM_Output_Polarity***
- ***uint32_t LPTIM_InitTypeDef::UpdateMode***
  Specifies whether the update of the autoreload and the compare values is done immediately or after the end of current period. This parameter can be a value of ***LPTIM_Updating_Mode***
- ***uint32_t LPTIM_InitTypeDef::CounterSource***
  Specifies whether the counter is incremented each internal event or each external event. This parameter can be a value of ***LPTIM_Counter_Source***
- ***uint32_t LPTIM_InitTypeDef::Input1Source***
  Specifies source selected for input1 (GPIO or comparator output). This parameter can be a value of ***LPTIM_Input1_Source***
- ***uint32_t LPTIM_InitTypeDef::Input2Source***
  Specifies source selected for input2 (GPIO or comparator output). Note: This parameter is used only for encoder feature so is used only for LPTIM1 instance. This parameter can be a value of ***LPTIM_Input2_Source***

49.1.5 __LPTIM_HandleTypeDef

__LPTIM_HandleTypeDef is defined in the stm32h7xx_hal_lptim.h

Data Fields

- ***LPTIM_TypeDef * Instance***
- ***LPTIM_InitTypeDef Init***
- ***HAL_StatusTypeDef Status***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_LPTIM_StateTypeDef State***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***
- ***void(* CompareMatchCallback***
- ***void(* AutoReloadMatchCallback***
- ***void(* TriggerCallback***
- ***void(* CompareWriteCallback***
- ***void(* AutoReloadWriteCallback***
- ***void(* DirectionUpCallback***

- ***void(* DirectionDownCallback***

Field Documentation

- ***LPTIM_TypeDef* __LPTIM_HandleTypeDef::Instance***
  Register base address
- ***LPTIM_InitTypeDef __LPTIM_HandleTypeDef::Init***
  LPTIM required parameters
- ***HAL_StatusTypeDef __LPTIM_HandleTypeDef::Status***
  LPTIM peripheral status
- ***HAL_LockTypeDef __LPTIM_HandleTypeDef::Lock***
  LPTIM locking object
- ***__IO HAL_LPTIM_StateTypeDef __LPTIM_HandleTypeDef::State***
  LPTIM peripheral state
- ***void(* __LPTIM_HandleTypeDef::MspInitCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  LPTIM Base Msp Init Callback
- ***void(* __LPTIM_HandleTypeDef::MspDeInitCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  LPTIM Base Msp DeInit Callback
- ***void(* __LPTIM_HandleTypeDef::CompareMatchCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Compare match Callback
- ***void(* __LPTIM_HandleTypeDef::AutoReloadMatchCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Auto-reload match Callback
- ***void(* __LPTIM_HandleTypeDef::TriggerCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  External trigger event detection Callback
- ***void(* __LPTIM_HandleTypeDef::CompareWriteCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Compare register write complete Callback
- ***void(* __LPTIM_HandleTypeDef::AutoReloadWriteCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Auto-reload register write complete Callback
- ***void(* __LPTIM_HandleTypeDef::DirectionUpCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Up-counting direction change Callback
- ***void(* __LPTIM_HandleTypeDef::DirectionDownCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Down-counting direction change Callback

49.2 LPTIM Firmware driver API description

The following section lists the various functions of the LPTIM library.

49.2.1 How to use this driver

The LPTIM HAL driver can be used as follows:

1. Initialize the LPTIM low level resources by implementing the HAL_LPTIM_MspInit():
   - Enable the LPTIM interface clock using __HAL_RCC_LPTIMx_CLK_ENABLE().
   - In case of using interrupts (e.g. HAL_LPTIM_PWM_Start_IT()):
     - Configure the LPTIM interrupt priority using HAL_NVIC_SetPriority().
     - Enable the LPTIM IRQ handler using HAL_NVIC_EnableIRQ().
     - In LPTIM IRQ handler, call HAL_LPTIM_IRQHandler().

2. Initialize the LPTIM HAL using HAL_LPTIM_Init(). This function configures mainly:
   - The instance: LPTIM1 or LPTIM2.
   - Clock: the counter clock.
     - Source : it can be either the ULPTIM input (IN1) or one of the internal clock; (APB, LSE, LSI or MSI).
     - Prescaler: select the clock divider.
   - UltraLowPowerClock : To be used only if the ULPTIM is selected as counter clock source.
     - Polarity: polarity of the active edge for the counter unit if the ULPTIM input is selected.
     - SampleTime: clock sampling time to configure the clock glitch filter.
   - Trigger: How the counter start.
     - Source: trigger can be software or one of the hardware triggers.
     - ActiveEdge : only for hardware trigger.
     - SampleTime : trigger sampling time to configure the trigger glitch filter.
   - OutputPolarity : 2 opposite polarities are possible.
   - UpdateMode: specifies whether the update of the autoreload and the compare values is done immediately or after the end of current period.
   - Input1Source: Source selected for input1 (GPIO or comparator output).
   - Input2Source: Source selected for input2 (GPIO or comparator output). Input2 is used only for encoder feature so is used only for LPTIM1 instance.
3. Six modes are available:
   - PWM Mode: To generate a PWM signal with specified period and pulse, call HAL_LPTIM_PWM_Start() or HAL_LPTIM_PWM_Start_IT() for interruption mode.
   - One Pulse Mode: To generate pulse with specified width in response to a stimulus, call HAL_LPTIM_OnePulse_Start() or HAL_LPTIM_OnePulse_Start_IT() for interruption mode.
   - Set once Mode: In this mode, the output changes the level (from low level to high level if the output polarity is configured high, else the opposite) when a compare match occurs. To start this mode, call HAL_LPTIM_SetOnce_Start() or HAL_LPTIM_SetOnce_Start_IT() for interruption mode.
   - Encoder Mode: To use the encoder interface call HAL_LPTIM_Encoder_Start() or HAL_LPTIM_Encoder_Start_IT() for interruption mode. Only available for LPTIM1 instance.
   - Time out Mode: an active edge on one selected trigger input rests the counter. The first trigger event will start the timer, any successive trigger event will reset the counter and the timer will restart. To start this mode call HAL_LPTIM_TimeOut_Start_IT() or HAL_LPTIM_TimeOut_Start_IT() for interruption mode.
   - Counter Mode: counter can be used to count external events on the LPTIM Input1 or it can be used to count internal clock cycles. To start this mode, call HAL_LPTIM_Counter_Start() or HAL_LPTIM_Counter_Start_IT() for interruption mode.
4. User can stop any process by calling the corresponding API: HAL_LPTIM_Xxx_Stop() or HAL_LPTIM_Xxx_Stop_IT() if the process is already started in interruption mode.
5. De-initialize the LPTIM peripheral using HAL_LPTIM_DeInit().

Callback registration

The compilation define USE_HAL_LPTIM_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.

Use Function HAL_LPTIM_RegisterCallback() to register a callback. HAL_LPTIM_RegisterCallback() takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_LPTIM_UnRegisterCallback() to reset a callback to the default weak function. HAL_LPTIM_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID.

These functions allow to register/unregister following callbacks:

- MspInitCallback : LPTIM Base Msp Init Callback.
- MspDeInitCallback : LPTIM Base Msp DeInit Callback.
- CompareMatchCallback : Compare match Callback.
- AutoReloadMatchCallback : Auto-reload match Callback.
- TriggerCallback : External trigger event detection Callback.

- CompareWriteCallback : Compare register write complete Callback.
- AutoReloadWriteCallback : Auto-reload register write complete Callback.
- DirectionUpCallback : Up-counting direction change Callback.
- DirectionDownCallback : Down-counting direction change Callback.

By default, after the Init and when the state is HAL_LPTIM_STATE_RESET all interrupt callbacks are set to the corresponding weak functions: examples HAL_LPTIM_TriggerCallback(), HAL_LPTIM_CompareMatchCallback().

Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functionalities in the Init/DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the Init/DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand)

Callbacks can be registered/unregistered in HAL_LPTIM_STATE_READY state only. Exception done MspInit/MspDeInit that can be registered/unregistered in HAL_LPTIM_STATE_READY or HAL_LPTIM_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_LPTIM_RegisterCallback() before calling DeInit or Init function.

When The compilation define USE_HAL_LPTIM_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

49.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the LPTIM according to the specified parameters in the LPTIM_InitTypeDef and initialize the associated handle.
- DeInitialize the LPTIM peripheral.
- Initialize the LPTIM MSP.
- DeInitialize the LPTIM MSP.

This section contains the following APIs:

- ***HAL_LPTIM_Init()***
- ***HAL_LPTIM_DeInit()***
- ***HAL_LPTIM_MspInit()***
- ***HAL_LPTIM_MspDeInit()***

49.2.3 LPTIM Start Stop operation functions

This section provides functions allowing to:

- Start the PWM mode.
- Stop the PWM mode.
- Start the One pulse mode.
- Stop the One pulse mode.
- Start the Set once mode.
- Stop the Set once mode.
- Start the Encoder mode.
- Stop the Encoder mode.
- Start the Timeout mode.
- Stop the Timeout mode.
- Start the Counter mode.
- Stop the Counter mode.

This section contains the following APIs:

- ***HAL_LPTIM_PWM_Start()***
- ***HAL_LPTIM_PWM_Stop()***
- ***HAL_LPTIM_PWM_Start_IT()***
- ***HAL_LPTIM_PWM_Stop_IT()***
- ***HAL_LPTIM_OnePulse_Start()***
- ***HAL_LPTIM_OnePulse_Stop()***

- *HAL_LPTIM_OnePulse_Start_IT()*
- *HAL_LPTIM_OnePulse_Stop_IT()*
- *HAL_LPTIM_SetOnce_Start()*
- *HAL_LPTIM_SetOnce_Stop()*
- *HAL_LPTIM_SetOnce_Start_IT()*
- *HAL_LPTIM_SetOnce_Stop_IT()*

49.2.4 LPTIM Read operation functions

This section provides LPTIM Reading functions.

- Read the counter value.
- Read the period (Auto-reload) value.
- Read the pulse (Compare)value.

This section contains the following APIs:

- *HAL_LPTIM_ReadCounter()*
- *HAL_LPTIM_ReadAutoReload()*
- *HAL_LPTIM_ReadCompare()*

49.2.5 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- *HAL_LPTIM_GetState()*

49.2.6 Detailed description of functions

HAL_LPTIM_Init

Function name

HAL_StatusTypeDef HAL_LPTIM_Init (LPTIM_HandleTypeDef * hlptim)

Function description

Initialize the LPTIM according to the specified parameters in the LPTIM_InitTypeDef and initialize the associated handle.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_DeInit

Function name

HAL_StatusTypeDef HAL_LPTIM_DeInit (LPTIM_HandleTypeDef * hlptim)

Function description

DeInitialize the LPTIM peripheral.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_MspInit

Function name

void HAL_LPTIM_MspInit (LPTIM_HandleTypeDef * hlptim)

Function description

Initialize the LPTIM MSP.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_MspDeInit

Function name

void HAL_LPTIM_MspDeInit (LPTIM_HandleTypeDef * hlptim)

Function description

DeInitialize LPTIM MSP.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_PWM_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Period, uint32_t Pulse)

Function description

Start the LPTIM PWM generation.

Parameters

- **hlptim:** LPTIM handle
- **Period:** Specifies the Autoreload value. This parameter must be a value between 0x0001 and 0xFFFF.
- **Pulse:** Specifies the compare value. This parameter must be a value between 0x0000 and 0xFFFF.

Return values

- **HAL:** status

HAL_LPTIM_PWM_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Stop (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the LPTIM PWM generation.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_PWM_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Period, uint32_t Pulse)

Function description

Start the LPTIM PWM generation in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Period:** Specifies the Autoreload value. This parameter must be a value between 0x0001 and 0xFFFF
- **Pulse:** Specifies the compare value. This parameter must be a value between 0x0000 and 0xFFFF

Return values

- **HAL:** status

HAL_LPTIM_PWM_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Stop_IT (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the LPTIM PWM generation in interrupt mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_OnePulse_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_OnePulse_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Period, uint32_t Pulse)

Function description

Start the LPTIM One pulse generation.

Parameters

- **hlptim:** LPTIM handle
- **Period:** Specifies the Autoreload value. This parameter must be a value between 0x0001 and 0xFFFF.
- **Pulse:** Specifies the compare value. This parameter must be a value between 0x0000 and 0xFFFF.

Return values

- **HAL:** status

HAL_LPTIM_OnePulse_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_OnePulse_Stop (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the LPTIM One pulse generation.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_OnePulse_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_OnePulse_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Period, uint32_t Pulse)

Function description

Start the LPTIM One pulse generation in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Period:** Specifies the Autoreload value. This parameter must be a value between 0x0001 and 0xFFFF.
- **Pulse:** Specifies the compare value. This parameter must be a value between 0x0000 and 0xFFFF.

Return values

- **HAL:** status

HAL_LPTIM_OnePulse_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_OnePulse_Stop_IT (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the LPTIM One pulse generation in interrupt mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_SetOnce_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_SetOnce_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Period, uint32_t Pulse)

Function description

Start the LPTIM in Set once mode.

Parameters

- **hlptim:** LPTIM handle
- **Period:** Specifies the Autoreload value. This parameter must be a value between 0x0001 and 0xFFFF.
- **Pulse:** Specifies the compare value. This parameter must be a value between 0x0000 and 0xFFFF.

Return values

- **HAL:** status

HAL_LPTIM_SetOnce_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_SetOnce_Stop (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the LPTIM Set once mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_SetOnce_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_SetOnce_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Period, uint32_t Pulse)

Function description

Start the LPTIM Set once mode in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Period:** Specifies the Autoreload value. This parameter must be a value between 0x0000 and 0xFFFF.
- **Pulse:** Specifies the compare value. This parameter must be a value between 0x0000 and 0xFFFF.

Return values

- **HAL:** status

HAL_LPTIM_SetOnce_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_SetOnce_Stop_IT (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the LPTIM Set once mode in interrupt mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Encoder_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_Encoder_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Period)

Function description

Start the Encoder interface.

Parameters

- **hlptim:** LPTIM handle
- **Period:** Specifies the Autoreload value. This parameter must be a value between 0x0001 and 0xFFFF.

Return values

- **HAL:** status

HAL_LPTIM_Encoder_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_Encoder_Stop (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Encoder interface.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Encoder_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_Encoder_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Period)

Function description

Start the Encoder interface in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Period:** Specifies the Autoreload value. This parameter must be a value between 0x0000 and 0xFFFF.

Return values

- **HAL:** status

HAL_LPTIM_Encoder_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_Encoder_Stop_IT (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Encoder interface in interrupt mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_TimeOut_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_TimeOut_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Period, uint32_t Timeout)

Function description

Start the Timeout function.

Parameters

- **hlptim:** LPTIM handle
- **Period:** Specifies the Autoreload value. This parameter must be a value between 0x0001 and 0xFFFF.
- **Timeout:** Specifies the TimeOut value to reset the counter. This parameter must be a value between 0x0000 and 0xFFFF.

Return values

- **HAL:** status

Notes

- The first trigger event will start the timer, any successive trigger event will reset the counter and the timer restarts.

HAL_LPTIM_TimeOut_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_TimeOut_Stop (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Timeout function.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_TimeOut_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_TimeOut_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Period, uint32_t Timeout)

Function description

Start the Timeout function in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Period:** Specifies the Autoreload value. This parameter must be a value between 0x0001 and 0xFFFF.
- **Timeout:** Specifies the TimeOut value to reset the counter. This parameter must be a value between 0x0000 and 0xFFFF.

Return values

- **HAL:** status

Notes

- The first trigger event will start the timer, any successive trigger event will reset the counter and the timer restarts.

HAL_LPTIM_TimeOut_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_TimeOut_Stop_IT (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Timeout function in interrupt mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Counter_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_Counter_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Period)

Function description

Start the Counter mode.

Parameters

- **hlptim:** LPTIM handle
- **Period:** Specifies the Autoreload value. This parameter must be a value between 0x0001 and 0xFFFF.

Return values

- **HAL:** status

HAL_LPTIM_Counter_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_Counter_Stop (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Counter mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Counter_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_Counter_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Period)

Function description

Start the Counter mode in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Period:** Specifies the Autoreload value. This parameter must be a value between 0x0001 and 0xFFFF.

Return values

- **HAL:** status

HAL_LPTIM_Counter_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_Counter_Stop_IT (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Counter mode in interrupt mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_ReadCounter

Function name

uint32_t HAL_LPTIM_ReadCounter (const LPTIM_HandleTypeDef * hlptim)

Function description

Return the current counter value.

Parameters

- **hlptim:** LPTIM handle

Return values

- **Counter:** value.

HAL_LPTIM_ReadAutoReload

Function name

uint32_t HAL_LPTIM_ReadAutoReload (const LPTIM_HandleTypeDef * hlptim)

Function description

Return the current Autoreload (Period) value.

Parameters

- **hlptim:** LPTIM handle

Return values

- **Autoreload:** value.

HAL_LPTIM_ReadCompare

Function name

uint32_t HAL_LPTIM_ReadCompare (const LPTIM_HandleTypeDef * hlptim)

Function description

Return the current Compare (Pulse) value.

Parameters

- **hlptim:** LPTIM handle

Return values

- **Compare:** value.

HAL_LPTIM_IRQHandler

Function name

void HAL_LPTIM_IRQHandler (LPTIM_HandleTypeDef * hlptim)

Function description

Handle LPTIM interrupt request.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_CompareMatchCallback

Function name

void HAL_LPTIM_CompareMatchCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Compare match callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_AutoReloadMatchCallback

Function name

void HAL_LPTIM_AutoReloadMatchCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Autoreload match callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_TriggerCallback

Function name

void HAL_LPTIM_TriggerCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Trigger detected callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_CompareWriteCallback

Function name

void HAL_LPTIM_CompareWriteCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Compare write callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_AutoReloadWriteCallback

Function name

void HAL_LPTIM_AutoReloadWriteCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Autoreload write callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_DirectionUpCallback

Function name

void HAL_LPTIM_DirectionUpCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Direction counter changed from Down to Up callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_DirectionDownCallback

Function name

void HAL_LPTIM_DirectionDownCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Direction counter changed from Up to Down callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_RegisterCallback

Function name

HAL_StatusTypeDef HAL_LPTIM_RegisterCallback (LPTIM_HandleTypeDef * hlptim, HAL_LPTIM_CallbackIDTypeDef CallbackID, pLPTIM_CallbackTypeDef pCallback)

Function description

Register a User LPTIM callback to be used instead of the weak predefined callback.

Parameters

- **hlptim:** LPTIM handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_LPTIM_MSPINIT_CB_ID LPTIM Base Msp Init Callback ID
  - HAL_LPTIM_MSPDEINIT_CB_ID LPTIM Base Msp DeInit Callback ID
  - HAL_LPTIM_COMPARE_MATCH_CB_ID Compare match Callback ID
  - HAL_LPTIM_AUTORELOAD_MATCH_CB_ID Auto-reload match Callback ID
  - HAL_LPTIM_TRIGGER_CB_ID External trigger event detection Callback ID
  - HAL_LPTIM_COMPARE_WRITE_CB_ID Compare register write complete Callback ID
  - HAL_LPTIM_AUTORELOAD_WRITE_CB_ID Auto-reload register write complete Callback ID
  - HAL_LPTIM_DIRECTION_UP_CB_ID Up-counting direction change Callback ID
  - HAL_LPTIM_DIRECTION_DOWN_CB_ID Down-counting direction change Callback ID
- **pCallback:** pointer to the callback function

Return values

- **status:**

HAL_LPTIM_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_LPTIM_UnRegisterCallback (LPTIM_HandleTypeDef * hlptim, HAL_LPTIM_CallbackIDTypeDef CallbackID)

Function description

Unregister a LPTIM callback LLPTIM callback is redirected to the weak predefined callback.

Parameters

- **hlptim:** LPTIM handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_LPTIM_MSPINIT_CB_ID LPTIM Base Msp Init Callback ID
  - HAL_LPTIM_MSPDEINIT_CB_ID LPTIM Base Msp DeInit Callback ID
  - HAL_LPTIM_COMPARE_MATCH_CB_ID Compare match Callback ID
  - HAL_LPTIM_AUTORELOAD_MATCH_CB_ID Auto-reload match Callback ID
  - HAL_LPTIM_TRIGGER_CB_ID External trigger event detection Callback ID
  - HAL_LPTIM_COMPARE_WRITE_CB_ID Compare register write complete Callback ID
  - HAL_LPTIM_AUTORELOAD_WRITE_CB_ID Auto-reload register write complete Callback ID
  - HAL_LPTIM_DIRECTION_UP_CB_ID Up-counting direction change Callback ID
  - HAL_LPTIM_DIRECTION_DOWN_CB_ID Down-counting direction change Callback ID

Return values

- **status:**

HAL_LPTIM_GetState

Function name

HAL_LPTIM_StateTypeDef HAL_LPTIM_GetState (LPTIM_HandleTypeDef * hlptim)

Function description

Return the LPTIM handle state.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** state

LPTIM_Disable

Function name

void LPTIM_Disable (LPTIM_HandleTypeDef * hlptim)

Function description

Disable LPTIM HW instance.

Parameters

- **hlptim:** pointer to a LPTIM_HandleTypeDef structure that contains the configuration information for LPTIM module.

Return values

- **None:**

Notes

- The following sequence is required to solve LPTIM disable HW limitation. Please check Errata Sheet ES0335 for more details under "MCU may remain stuck in LPTIM interrupt when entering Stop mode" section.

49.3 LPTIM Firmware driver defines

The following section lists the various define and macros of the module.

49.3.1 LPTIM

LPTIM

LPTIM Clock Polarity

LPTIM_CLOCKPOLARITY_RISING

LPTIM_CLOCKPOLARITY_FALLING

LPTIM_CLOCKPOLARITY_RISING_FALLING

LPTIM Clock Prescaler

LPTIM_PRESCALER_DIV1

LPTIM_PRESCALER_DIV2

LPTIM_PRESCALER_DIV4

LPTIM_PRESCALER_DIV8

LPTIM_PRESCALER_DIV16

LPTIM_PRESCALER_DIV32

LPTIM_PRESCALER_DIV64

LPTIM_PRESCALER_DIV128

LPTIM Clock Sample Time

LPTIM_CLOCKSAMPLETIME_DIRECTTRANSITION

LPTIM_CLOCKSAMPLETIME_2TRANSITIONS

LPTIM_CLOCKSAMPLETIME_4TRANSITIONS

LPTIM_CLOCKSAMPLETIME_8TRANSITIONS

LPTIM Clock Source

LPTIM_CLOCKSOURCE_APBCLOCK_LPOSC

LPTIM_CLOCKSOURCE_ULPTIM

LPTIM Counter Source

LPTIM_COUNTERSOURCE_INTERNAL

LPTIM_COUNTERSOURCE_EXTERNAL

LPTIM Exported Macros

__HAL_LPTIM_RESET_HANDLE_STATE

Description:

- Reset LPTIM handle state.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_ENABLE

Description:

- Enable the LPTIM peripheral.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_DISABLE

Description:

- Disable the LPTIM peripheral.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

Notes:

- The following sequence is required to solve LPTIM disable HW limitation. Please check Errata Sheet ES0335 for more details under "MCU may remain stuck in LPTIM interrupt when entering Stop mode" section. Please call HAL_LPTIM_GetState() after a call to __HAL_LPTIM_DISABLE to check for TIMEOUT.

__HAL_LPTIM_START_CONTINUOUS

Description:

- Start the LPTIM peripheral in Continuous mode.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_START_SINGLE

Description:

- Start the LPTIM peripheral in single mode.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_RESET_COUNTER

Description:

- Reset the LPTIM Counter register in synchronous mode.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_RESET_COUNTER_AFTERREAD

Description:

- Reset after read of the LPTIM Counter register in asynchronous mode.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_AUTORELOAD_SET

Description:

- Write the passed parameter in the Autoreload register.

Parameters:

- __HANDLE__: LPTIM handle
- __VALUE__: Autoreload value

Return value:

- None

Notes:

- The ARR register can only be modified when the LPTIM instance is enabled.

__HAL_LPTIM_COMPARE_SET

Description:

- Write the passed parameter in the Compare register.

Parameters:

- __HANDLE__: LPTIM handle
- __VALUE__: Compare value

Return value:

- None

Notes:

- The CMP register can only be modified when the LPTIM instance is enabled.

__HAL_LPTIM_GET_FLAG

Description:

- Check whether the specified LPTIM flag is set or not.

Parameters:

- __HANDLE__: LPTIM handle
- __FLAG__: LPTIM flag to check This parameter can be a value of:
  - LPTIM_FLAG_DOWN : Counter direction change up Flag.
  - LPTIM_FLAG_UP : Counter direction change down to up Flag.
  - LPTIM_FLAG_ARROK : Autoreload register update OK Flag.
  - LPTIM_FLAG_CMPOK : Compare register update OK Flag.
  - LPTIM_FLAG_EXTTRIG : External trigger edge event Flag.
  - LPTIM_FLAG_ARRM : Autoreload match Flag.
  - LPTIM_FLAG_CMPM : Compare match Flag.

Return value:

- The: state of the specified flag (SET or RESET).

__HAL_LPTIM_CLEAR_FLAG

Description:

- Clear the specified LPTIM flag.

Parameters:

- __HANDLE__: LPTIM handle.
- __FLAG__: LPTIM flag to clear. This parameter can be a value of:
  - LPTIM_FLAG_DOWN : Counter direction change up Flag.
  - LPTIM_FLAG_UP : Counter direction change down to up Flag.
  - LPTIM_FLAG_ARROK : Autoreload register update OK Flag.
  - LPTIM_FLAG_CMPOK : Compare register update OK Flag.
  - LPTIM_FLAG_EXTTRIG : External trigger edge event Flag.
  - LPTIM_FLAG_ARRM : Autoreload match Flag.
  - LPTIM_FLAG_CMPM : Compare match Flag.

Return value:

- None.

__HAL_LPTIM_ENABLE_IT

Description:

- Enable the specified LPTIM interrupt.

Parameters:

- __HANDLE__: LPTIM handle.
- __INTERRUPT__: LPTIM interrupt to set. This parameter can be a value of:
  - LPTIM_IT_DOWN : Counter direction change up Interrupt.
  - LPTIM_IT_UP : Counter direction change down to up Interrupt.
  - LPTIM_IT_ARROK : Autoreload register update OK Interrupt.
  - LPTIM_IT_CMPOK : Compare register update OK Interrupt.
  - LPTIM_IT_EXTTRIG : External trigger edge event Interrupt.
  - LPTIM_IT_ARRM : Autoreload match Interrupt.
  - LPTIM_IT_CMPM : Compare match Interrupt.

Return value:

- None.

Notes:

- The LPTIM interrupts can only be enabled when the LPTIM instance is disabled.

__HAL_LPTIM_DISABLE_IT

Description:

- Disable the specified LPTIM interrupt.

Parameters:

- __HANDLE__: LPTIM handle.
- __INTERRUPT__: LPTIM interrupt to set. This parameter can be a value of:
  - LPTIM_IT_DOWN : Counter direction change up Interrupt.
  - LPTIM_IT_UP : Counter direction change down to up Interrupt.
  - LPTIM_IT_ARROK : Autoreload register update OK Interrupt.
  - LPTIM_IT_CMPOK : Compare register update OK Interrupt.
  - LPTIM_IT_EXTTRIG : External trigger edge event Interrupt.
  - LPTIM_IT_ARRM : Autoreload match Interrupt.
  - LPTIM_IT_CMPM : Compare match Interrupt.

Return value:

- None.

Notes:

- The LPTIM interrupts can only be disabled when the LPTIM instance is disabled.

__HAL_LPTIM_GET_IT_SOURCE

Description:

- Check whether the specified LPTIM interrupt source is enabled or not.

Parameters:

- __HANDLE__: LPTIM handle.
- __INTERRUPT__: LPTIM interrupt to check. This parameter can be a value of:
  - LPTIM_IT_DOWN : Counter direction change up Interrupt.
  - LPTIM_IT_UP : Counter direction change down to up Interrupt.
  - LPTIM_IT_ARROK : Autoreload register update OK Interrupt.
  - LPTIM_IT_CMPOK : Compare register update OK Interrupt.
  - LPTIM_IT_EXTTRIG : External trigger edge event Interrupt.
  - LPTIM_IT_ARRM : Autoreload match Interrupt.
  - LPTIM_IT_CMPM : Compare match Interrupt.

Return value:

- Interrupt: status.

50 HAL LTDC Generic Driver

50.1 LTDC Firmware driver registers structures

50.1.1 LTDC_ColorTypeDef

LTDC_ColorTypeDef is defined in the stm32h7xx_hal_ltdc.h

Data Fields

- ***uint8_t Blue***
- ***uint8_t Green***
- ***uint8_t Red***
- ***uint8_t Reserved***

Field Documentation

- ***uint8_t LTDC_ColorTypeDef::Blue***
  Configures the blue value. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint8_t LTDC_ColorTypeDef::Green***
  Configures the green value. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint8_t LTDC_ColorTypeDef::Red***
  Configures the red value. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint8_t LTDC_ColorTypeDef::Reserved***
  Reserved 0xFF

50.1.2 LTDC_InitTypeDef

LTDC_InitTypeDef is defined in the stm32h7xx_hal_ltdc.h

Data Fields

- ***uint32_t HSPolarity***
- ***uint32_t VSPolarity***
- ***uint32_t DEPolarity***
- ***uint32_t PCPolarity***
- ***uint32_t HorizontalSync***
- ***uint32_t VerticalSync***
- ***uint32_t AccumulatedHBP***
- ***uint32_t AccumulatedVBP***
- ***uint32_t AccumulatedActiveW***
- ***uint32_t AccumulatedActiveH***
- ***uint32_t TotalWidth***
- ***uint32_t TotalHeigh***
- ***LTDC_ColorTypeDef Backcolor***

Field Documentation

- ***uint32_t LTDC_InitTypeDef::HSPolarity***
  configures the horizontal synchronization polarity. This parameter can be one value of ***LTDC_HS_POLARITY***
- ***uint32_t LTDC_InitTypeDef::VSPolarity***
  configures the vertical synchronization polarity. This parameter can be one value of ***LTDC_VS_POLARITY***

- ***uint32_t LTDC_InitTypeDef::DEPolarity***
  configures the data enable polarity. This parameter can be one of value of ***LTDC_DE_POLARITY***
- ***uint32_t LTDC_InitTypeDef::PCPolarity***
  configures the pixel clock polarity. This parameter can be one of value of ***LTDC_PC_POLARITY***
- ***uint32_t LTDC_InitTypeDef::HorizontalSync***
  configures the number of Horizontal synchronization width. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF.
- ***uint32_t LTDC_InitTypeDef::VerticalSync***
  configures the number of Vertical synchronization height. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0x7FF.
- ***uint32_t LTDC_InitTypeDef::AccumulatedHBP***
  configures the accumulated horizontal back porch width. This parameter must be a number between Min_Data = LTDC_HorizontalSync and Max_Data = 0xFFF.
- ***uint32_t LTDC_InitTypeDef::AccumulatedVBP***
  configures the accumulated vertical back porch height. This parameter must be a number between Min_Data = LTDC_VerticalSync and Max_Data = 0x7FF.
- ***uint32_t LTDC_InitTypeDef::AccumulatedActiveW***
  configures the accumulated active width. This parameter must be a number between Min_Data = LTDC_AccumulatedHBP and Max_Data = 0xFFF.
- ***uint32_t LTDC_InitTypeDef::AccumulatedActiveH***
  configures the accumulated active height. This parameter must be a number between Min_Data = LTDC_AccumulatedVBP and Max_Data = 0x7FF.
- ***uint32_t LTDC_InitTypeDef::TotalWidth***
  configures the total width. This parameter must be a number between Min_Data = LTDC_AccumulatedActiveW and Max_Data = 0xFFF.
- ***uint32_t LTDC_InitTypeDef::TotalHeigh***
  configures the total height. This parameter must be a number between Min_Data = LTDC_AccumulatedActiveH and Max_Data = 0x7FF.
- ***LTDC_ColorTypeDef LTDC_InitTypeDef::Backcolor***
  Configures the background color.

50.1.3 LTDC_LayerCfgTypeDef

LTDC_LayerCfgTypeDef is defined in the stm32h7xx_hal_ltdc.h

Data Fields

- ***uint32_t WindowX0***
- ***uint32_t WindowX1***
- ***uint32_t WindowY0***
- ***uint32_t WindowY1***
- ***uint32_t PixelFormat***
- ***uint32_t Alpha***
- ***uint32_t Alpha0***
- ***uint32_t BlendingFactor1***
- ***uint32_t BlendingFactor2***
- ***uint32_t FBStartAdress***
- ***uint32_t ImageWidth***
- ***uint32_t ImageHeight***
- ***LTDC_ColorTypeDef Backcolor***

Field Documentation

- ***uint32_t LTDC_LayerCfgTypeDef::WindowX0***
  Configures the Window Horizontal Start Position. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF.

- ***uint32_t LTDC_LayerCfgTypeDef::WindowX1***
  Configures the Window Horizontal Stop Position. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF.
- ***uint32_t LTDC_LayerCfgTypeDef::WindowY0***
  Configures the Window vertical Start Position. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0x7FF.
- ***uint32_t LTDC_LayerCfgTypeDef::WindowY1***
  Configures the Window vertical Stop Position. This parameter must be a number between Min_Data = 0x0000 and Max_Data = 0x7FF.
- ***uint32_t LTDC_LayerCfgTypeDef::PixelFormat***
  Specifies the pixel format. This parameter can be one of value of ***LTDC_Pixelformat***
- ***uint32_t LTDC_LayerCfgTypeDef::Alpha***
  Specifies the constant alpha used for blending. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint32_t LTDC_LayerCfgTypeDef::Alpha0***
  Configures the default alpha value. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint32_t LTDC_LayerCfgTypeDef::BlendingFactor1***
  Select the blending factor 1. This parameter can be one of value of ***LTDC_BlendingFactor1***
- ***uint32_t LTDC_LayerCfgTypeDef::BlendingFactor2***
  Select the blending factor 2. This parameter can be one of value of ***LTDC_BlendingFactor2***
- ***uint32_t LTDC_LayerCfgTypeDef::FBStartAdress***
  Configures the color frame buffer address
- ***uint32_t LTDC_LayerCfgTypeDef::ImageWidth***
  Configures the color frame buffer line length. This parameter must be a number between Min_Data = 0x0000 and Max_Data = 0x1FFF.
- ***uint32_t LTDC_LayerCfgTypeDef::ImageHeight***
  Specifies the number of line in frame buffer. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0x7FF.
- ***LTDC_ColorTypeDef LTDC_LayerCfgTypeDef::Backcolor***
  Configures the layer background color.

50.1.4 __LTDC_HandleTypeDef

__LTDC_HandleTypeDef is defined in the stm32h7xx_hal_ltdc.h

Data Fields

- ***LTDC_TypeDef * Instance***
- ***LTDC_InitTypeDef Init***
- ***LTDC_LayerCfgTypeDef LayerCfg***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_LTDC_StateTypeDef State***
- ***__IO uint32_t ErrorCode***

  LTDC parameters

- ***LTDC_LayerCfgTypeDef __LTDC_HandleTypeDef::LayerCfg[MAX_LAYER]***
  LTDC Layers parameters
- ***HAL_LockTypeDef __LTDC_HandleTypeDef::Lock***
  LTDC Lock
- ***__IO HAL_LTDC_StateTypeDef __LTDC_HandleTypeDef::State***
  LTDC state
- ***__IO uint32_t __LTDC_HandleTypeDef::ErrorCode***
  LTDC Error code
- ***void(* __LTDC_HandleTypeDef::LineEventCallback)(struct __LTDC_HandleTypeDef *hltdc)***
  LTDC Line Event Callback
- ***void(* __LTDC_HandleTypeDef::ReloadEventCallback)(struct __LTDC_HandleTypeDef *hltdc)***
  LTDC Reload Event Callback
- ***void(* __LTDC_HandleTypeDef::ErrorCallback)(struct __LTDC_HandleTypeDef *hltdc)***
  LTDC Error Callback
- ***void(* __LTDC_HandleTypeDef::MspInitCallback)(struct __LTDC_HandleTypeDef *hltdc)***
  LTDC Msp Init callback
- ***void(* __LTDC_HandleTypeDef::MspDeInitCallback)(struct __LTDC_HandleTypeDef *hltdc)***
  LTDC Msp DeInit callback

50.2 LTDC Firmware driver API description

The following section lists the various functions of the LTDC library.

50.2.1 How to use this driver

The LTDC HAL driver can be used as follows:

1. Declare a LTDC_HandleTypeDef handle structure, for example: LTDC_HandleTypeDef hltdc;
2. Initialize the LTDC low level resources by implementing the HAL_LTDC_MspInit() API:
   a. Enable the LTDC interface clock
   b. NVIC configuration if you need to use interrupt process
      - Configure the LTDC interrupt priority
      - Enable the NVIC LTDC IRQ Channel
3. Initialize the required configuration through the following parameters: the LTDC timing, the horizontal and vertical polarity, the pixel clock polarity, Data Enable polarity and the LTDC background color value using HAL_LTDC_Init() function

Configuration

1. Program the required configuration through the following parameters: the pixel format, the blending factors, input alpha value, the window size and the image size using HAL_LTDC_ConfigLayer() function for foreground or/and background layer.
2. Optionally, configure and enable the CLUT using HAL_LTDC_ConfigCLUT() and HAL_LTDC_EnableCLUT functions.
3. Optionally, enable the Dither using HAL_LTDC_EnableDither().
4. Optionally, configure and enable the Color keying using HAL_LTDC_ConfigColorKeying() and HAL_LTDC_EnableColorKeying functions.
5. Optionally, configure LineInterrupt using HAL_LTDC_ProgramLineEvent() function
6. If needed, reconfigure and change the pixel format value, the alpha value value, the window size, the window position and the layer start address for foreground or/and background layer using respectively the following functions: HAL_LTDC_SetPixelFormat(), HAL_LTDC_SetAlpha(), HAL_LTDC_SetWindowSize(), HAL_LTDC_SetWindowPosition() and HAL_LTDC_SetAddress().

7. Variant functions with _NoReload suffix allows to set the LTDC configuration/settings without immediate reload. This is useful in case when the program requires to modify serval LTDC settings (on one or both layers) then applying(reload) these settings in one shot by calling the function HAL_LTDC_Reload(). After calling the _NoReload functions to set different color/format/layer settings, the program shall call the function HAL_LTDC_Reload() to apply(reload) these settings. Function HAL_LTDC_Reload() can be called with the parameter ReloadType set to LTDC_RELOAD_IMMEDIATE if an immediate reload is required. Function HAL_LTDC_Reload() can be called with the parameter ReloadType set to LTDC_RELOAD_VERTICAL_BLANKING if the reload should be done in the next vertical blanking period, this option allows to avoid display flicker by applying the new settings during the vertical blanking period.
8. To control LTDC state you can use the following function: HAL_LTDC_GetState()

LTDC HAL driver macros list

Below the list of most used macros in LTDC HAL driver.

- __HAL_LTDC_ENABLE: Enable the LTDC.
- __HAL_LTDC_DISABLE: Disable the LTDC.
- __HAL_LTDC_LAYER_ENABLE: Enable an LTDC Layer.
- __HAL_LTDC_LAYER_DISABLE: Disable an LTDC Layer.
- __HAL_LTDC_RELOAD_IMMEDIATE_CONFIG: Reload Layer Configuration.
- __HAL_LTDC_GET_FLAG: Get the LTDC pending flags.
- __HAL_LTDC_CLEAR_FLAG: Clear the LTDC pending flags.
- __HAL_LTDC_ENABLE_IT: Enable the specified LTDC interrupts.
- __HAL_LTDC_DISABLE_IT: Disable the specified LTDC interrupts.
- __HAL_LTDC_GET_IT_SOURCE: Check whether the specified LTDC interrupt has occurred or not.

Note: You can refer to the LTDC HAL driver header file for more useful macros

Callback registration

The compilation define USE_HAL_LTDC_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use function HAL_LTDC_RegisterCallback() to register a callback.

Function HAL_LTDC_RegisterCallback() allows to register following callbacks:

- LineEventCallback : LTDC Line Event Callback.
- ReloadEventCallback : LTDC Reload Event Callback.
- ErrorCallback : LTDC Error Callback
- MspInitCallback : LTDC MspInit.
- MspDeInitCallback : LTDC MspDeInit.

This function takes as parameters the HAL peripheral handle, the callback ID and a pointer to the user callback function.

Use function HAL_LTDC_UnRegisterCallback() to reset a callback to the default weak function. HAL_LTDC_UnRegisterCallback() takes as parameters the HAL peripheral handle and the callback ID.

This function allows to reset following callbacks:

- LineEventCallback : LTDC Line Event Callback
- ReloadEventCallback : LTDC Reload Event Callback
- ErrorCallback : LTDC Error Callback
- MspInitCallback : LTDC MspInit
- MspDeInitCallback : LTDC MspDeInit.

By default, after the HAL_LTDC_Init and when the state is HAL_LTDC_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_LTDC_LineEventCallback(), HAL_LTDC_ErrorCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak (surcharged) functions in the HAL_LTDC_Init() and HAL_LTDC_DeInit() only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_LTDC_Init() and HAL_LTDC_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in HAL_LTDC_STATE_READY state only. Exception done MspInit/MspDeInit that can be registered/unregistered in HAL_LTDC_STATE_READY or HAL_LTDC_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_LTDC_RegisterCallback() before calling HAL_LTDC_DeInit() or HAL_LTDC_Init() function.

When the compilation define USE_HAL_LTDC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

50.2.2 Initialization and Configuration functions

This section provides functions allowing to:

- Initialize and configure the LTDC
- De-initialize the LTDC

This section contains the following APIs:

- ***HAL_LTDC_Init()***
- ***HAL_LTDC_DeInit()***
- ***HAL_LTDC_MspInit()***
- ***HAL_LTDC_MspDeInit()***
- ***HAL_LTDC_RegisterCallback()***
- ***HAL_LTDC_UnRegisterCallback()***
- ***HAL_LTDC_ErrorCallback()***
- ***HAL_LTDC_LineEventCallback()***
- ***HAL_LTDC_ReloadEventCallback()***

50.2.3 IO operation functions

This section provides function allowing to:

- Handle LTDC interrupt request

This section contains the following APIs:

- ***HAL_LTDC_IRQHandler()***
- ***HAL_LTDC_ErrorCallback()***
- ***HAL_LTDC_LineEventCallback()***
- ***HAL_LTDC_ReloadEventCallback()***

50.2.4 Peripheral Control functions

This section provides functions allowing to:

- Configure the LTDC foreground or/and background parameters.
- Set the active layer.
- Configure the color keying.
- Configure the C-LUT.
- Enable / Disable the color keying.
- Enable / Disable the C-LUT.
- Update the layer position.
- Update the layer size.
- Update pixel format on the fly.
- Update transparency on the fly.
- Update address on the fly.

This section contains the following APIs:

- ***HAL_LTDC_ConfigLayer()***
- ***HAL_LTDC_ConfigColorKeying()***
- ***HAL_LTDC_ConfigCLUT()***

- *HAL_LTDC_EnableColorKeying()*
- *HAL_LTDC_DisableColorKeying()*
- *HAL_LTDC_EnableCLUT()*
- *HAL_LTDC_DisableCLUT()*
- *HAL_LTDC_EnableDither()*
- *HAL_LTDC_DisableDither()*
- *HAL_LTDC_SetWindowSize()*
- *HAL_LTDC_SetWindowPosition()*
- *HAL_LTDC_SetPixelFormat()*
- *HAL_LTDC_SetAlpha()*
- *HAL_LTDC_SetAddress()*
- *HAL_LTDC_SetPitch()*
- *HAL_LTDC_ProgramLineEvent()*
- *HAL_LTDC_Reload()*
- *HAL_LTDC_ConfigLayer_NoReload()*
- *HAL_LTDC_SetWindowSize_NoReload()*
- *HAL_LTDC_SetWindowPosition_NoReload()*
- *HAL_LTDC_SetPixelFormat_NoReload()*
- *HAL_LTDC_SetAlpha_NoReload()*
- *HAL_LTDC_SetAddress_NoReload()*
- *HAL_LTDC_SetPitch_NoReload()*
- *HAL_LTDC_ConfigColorKeying_NoReload()*
- *HAL_LTDC_EnableColorKeying_NoReload()*
- *HAL_LTDC_DisableColorKeying_NoReload()*
- *HAL_LTDC_EnableCLUT_NoReload()*
- *HAL_LTDC_DisableCLUT_NoReload()*

50.2.5 Peripheral State and Errors functions

This subsection provides functions allowing to

- Check the LTDC handle state.
- Get the LTDC handle error code.

This section contains the following APIs:

- *HAL_LTDC_GetState()*
- *HAL_LTDC_GetError()*

50.2.6 Detailed description of functions

HAL_LTDC_Init

Function name

HAL_StatusTypeDef HAL_LTDC_Init (LTDC_HandleTypeDef * hltdc)

Function description

Initialize the LTDC according to the specified parameters in the LTDC_InitTypeDef.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **HAL:** status

HAL_LTDC_DeInit

Function name

HAL_StatusTypeDef HAL_LTDC_DeInit (LTDC_HandleTypeDef * hltdc)

Function description

De-initialize the LTDC peripheral.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **None:**

HAL_LTDC_MspInit

Function name

void HAL_LTDC_MspInit (LTDC_HandleTypeDef * hltdc)

Function description

Initialize the LTDC MSP.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **None:**

HAL_LTDC_MspDeInit

Function name

void HAL_LTDC_MspDeInit (LTDC_HandleTypeDef * hltdc)

Function description

De-initialize the LTDC MSP.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **None:**

HAL_LTDC_ErrorCallback

Function name

void HAL_LTDC_ErrorCallback (LTDC_HandleTypeDef * hltdc)

Function description

Error LTDC callback.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **None:**

HAL_LTDC_LineEventCallback

Function name

void HAL_LTDC_LineEventCallback (LTDC_HandleTypeDef * hltdc)

Function description

Line Event callback.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **None:**

HAL_LTDC_ReloadEventCallback

Function name

void HAL_LTDC_ReloadEventCallback (LTDC_HandleTypeDef * hltdc)

Function description

Reload Event callback.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **None:**

HAL_LTDC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_LTDC_RegisterCallback (LTDC_HandleTypeDef * hltdc, HAL_LTDC_CallbackIDTypeDef CallbackID, pLTDC_CallbackTypeDef pCallback)

Function description

Register a User LTDC Callback To be used instead of the weak predefined callback.

Parameters

- **hltdc:** ltdc handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_LTDC_LINE_EVENT_CB_ID Line Event Callback ID
  - HAL_LTDC_RELOAD_EVENT_CB_ID Reload Event Callback ID
  - HAL_LTDC_ERROR_CB_ID Error Callback ID
  - HAL_LTDC_MSPINIT_CB_ID MspInit callback ID
  - HAL_LTDC_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

HAL_LTDC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_LTDC_UnRegisterCallback (LTDC_HandleTypeDef * hltdc, HAL_LTDC_CallbackIDTypeDef CallbackID)

Function description

Unregister an LTDC Callback LTDC callback is redirected to the weak predefined callback.

Parameters

- **hltdc:** ltdc handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_LTDC_LINE_EVENT_CB_ID Line Event Callback ID
  - HAL_LTDC_RELOAD_EVENT_CB_ID Reload Event Callback ID
  - HAL_LTDC_ERROR_CB_ID Error Callback ID
  - HAL_LTDC_MSPINIT_CB_ID MspInit callback ID
  - HAL_LTDC_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **status:**

HAL_LTDC_IRQHandler

Function name

void HAL_LTDC_IRQHandler (LTDC_HandleTypeDef * hltdc)

Function description

Handle LTDC interrupt request.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **HAL:** status

HAL_LTDC_ConfigLayer

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigLayer (LTDC_HandleTypeDef * hltdc, LTDC_LayerCfgTypeDef * pLayerCfg, uint32_t LayerIdx)

Function description

Configure the LTDC Layer according to the specified parameters in the LTDC_InitTypeDef and create the associated handle.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **pLayerCfg:** pointer to a LTDC_LayerCfgTypeDef structure that contains the configuration information for the Layer.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_SetWindowSize

Function name

HAL_StatusTypeDef HAL_LTDC_SetWindowSize (LTDC_HandleTypeDef * hltdc, uint32_t XSize, uint32_t YSize, uint32_t LayerIdx)

Function description

Set the LTDC window size.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **XSize:** LTDC Pixel per line
- **YSize:** LTDC Line number
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_SetWindowPosition

Function name

HAL_StatusTypeDef HAL_LTDC_SetWindowPosition (LTDC_HandleTypeDef * hltdc, uint32_t X0, uint32_t Y0, uint32_t LayerIdx)

Function description

Set the LTDC window position.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **X0:** LTDC window X offset
- **Y0:** LTDC window Y offset
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_SetPixelFormat

Function name

HAL_StatusTypeDef HAL_LTDC_SetPixelFormat (LTDC_HandleTypeDef * hltdc, uint32_t Pixelformat, uint32_t LayerIdx)

Function description

Reconfigure the pixel format.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **Pixelformat:** new pixel format value.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1).

Return values

- **HAL:** status

HAL_LTDC_SetAlpha

Function name

HAL_StatusTypeDef HAL_LTDC_SetAlpha (LTDC_HandleTypeDef * hltdc, uint32_t Alpha, uint32_t LayerIdx)

Function description

Reconfigure the layer alpha value.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **Alpha:** new alpha value.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_SetAddress

Function name

HAL_StatusTypeDef HAL_LTDC_SetAddress (LTDC_HandleTypeDef * hltdc, uint32_t Address, uint32_t LayerIdx)

Function description

Reconfigure the frame buffer Address.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **Address:** new address value.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1).

Return values

- **HAL:** status

HAL_LTDC_SetPitch

Function name

HAL_StatusTypeDef HAL_LTDC_SetPitch (LTDC_HandleTypeDef * hltdc, uint32_t LinePitchInPixels, uint32_t LayerIdx)

Function description

Function used to reconfigure the pitch for specific cases where the attached LayerIdx buffer have a width that is larger than the one intended to be displayed on screen.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LinePitchInPixels:** New line pitch in pixels to configure for LTDC layer 'LayerIdx'.
- **LayerIdx:** LTDC layer index concerned by the modification of line pitch.

Return values

- **HAL:** status

Notes

- This function should be called only after a previous call to HAL_LTDC_ConfigLayer() to modify the default pitch configured by HAL_LTDC_ConfigLayer() when required (refer to example described just above).

HAL_LTDC_ConfigColorKeying

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigColorKeying (LTDC_HandleTypeDef * hltdc, uint32_t RGBValue, uint32_t LayerIdx)

Function description

Configure the color keying.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **RGBValue:** the color key value
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_ConfigCLUT

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigCLUT (LTDC_HandleTypeDef * hltdc, uint32_t * pCLUT, uint32_t CLUTSize, uint32_t LayerIdx)

Function description

Load the color lookup table.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **pCLUT:** pointer to the color lookup table address.
- **CLUTSize:** the color lookup table size.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_EnableColorKeying

Function name

HAL_StatusTypeDef HAL_LTDC_EnableColorKeying (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

Enable the color keying.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_DisableColorKeying

Function name

HAL_StatusTypeDef HAL_LTDC_DisableColorKeying (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

Disable the color keying.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_EnableCLUT

Function name

HAL_StatusTypeDef HAL_LTDC_EnableCLUT (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

Enable the color lookup table.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_DisableCLUT

Function name

HAL_StatusTypeDef HAL_LTDC_DisableCLUT (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

Disable the color lookup table.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_ProgramLineEvent

Function name

HAL_StatusTypeDef HAL_LTDC_ProgramLineEvent (LTDC_HandleTypeDef * hltdc, uint32_t Line)

Function description

Define the position of the line interrupt.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **Line:** Line Interrupt Position.

Return values

- **HAL:** status

Notes

- User application may resort to HAL_LTDC_LineEventCallback() at line interrupt generation.

HAL_LTDC_EnableDither

Function name

HAL_StatusTypeDef HAL_LTDC_EnableDither (LTDC_HandleTypeDef * hltdc)

Function description

Enable Dither.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **HAL:** status

HAL_LTDC_DisableDither

Function name

HAL_StatusTypeDef HAL_LTDC_DisableDither (LTDC_HandleTypeDef * hltdc)

Function description

Disable Dither.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **HAL:** status

HAL_LTDC_Reload

Function name

HAL_StatusTypeDef HAL_LTDC_Reload (LTDC_HandleTypeDef * hltdc, uint32_t ReloadType)

Function description

Reload LTDC Layers configuration.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **ReloadType:** This parameter can be one of the following values : LTDC_RELOAD_IMMEDIATE : Immediate Reload LTDC_RELOAD_VERTICAL_BLANKING : Reload in the next Vertical Blanking

Return values

- **HAL:** status

Notes

- User application may resort to HAL_LTDC_ReloadEventCallback() at reload interrupt generation.

HAL_LTDC_ConfigLayer_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigLayer_NoReload (LTDC_HandleTypeDef * hltdc, LTDC_LayerCfgTypeDef * pLayerCfg, uint32_t LayerIdx)

Function description

Configure the LTDC Layer according to the specified without reloading parameters in the LTDC_InitTypeDef and create the associated handle.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **pLayerCfg:** pointer to a LTDC_LayerCfgTypeDef structure that contains the configuration information for the Layer.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_SetWindowSize_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetWindowSize_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t XSize, uint32_t YSize, uint32_t LayerIdx)

Function description

Set the LTDC window size without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **XSize:** LTDC Pixel per line
- **YSize:** LTDC Line number
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_SetWindowPosition_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetWindowPosition_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t X0, uint32_t Y0, uint32_t LayerIdx)

Function description

Set the LTDC window position without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **X0:** LTDC window X offset
- **Y0:** LTDC window Y offset
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_SetPixelFormat_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetPixelFormat_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t Pixelformat, uint32_t LayerIdx)

Function description

Reconfigure the pixel format without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDfef structure that contains the configuration information for the LTDC.
- **Pixelformat:** new pixel format value.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1).

Return values

- **HAL:** status

HAL_LTDC_SetAlpha_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetAlpha_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t Alpha, uint32_t LayerIdx)

Function description

Reconfigure the layer alpha value without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **Alpha:** new alpha value.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_SetAddress_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetAddress_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t Address, uint32_t LayerIdx)

Function description

Reconfigure the frame buffer Address without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **Address:** new address value.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1).

Return values

- **HAL:** status

HAL_LTDC_SetPitch_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetPitch_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t LinePitchInPixels, uint32_t LayerIdx)

Function description

Function used to reconfigure the pitch for specific cases where the attached LayerIdx buffer have a width that is larger than the one intended to be displayed on screen.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LinePitchInPixels:** New line pitch in pixels to configure for LTDC layer 'LayerIdx'.
- **LayerIdx:** LTDC layer index concerned by the modification of line pitch.

Return values

- **HAL:** status

Notes

- This function should be called only after a previous call to HAL_LTDC_ConfigLayer() to modify the default pitch configured by HAL_LTDC_ConfigLayer() when required (refer to example described just above). Variant of the function HAL_LTDC_SetPitch without immediate reload.

HAL_LTDC_ConfigColorKeying_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigColorKeying_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t RGBValue, uint32_t LayerIdx)

Function description

Configure the color keying without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **RGBValue:** the color key value
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_EnableColorKeying_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_EnableColorKeying_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

Enable the color keying without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_DisableColorKeying_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_DisableColorKeying_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

Disable the color keying without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_EnableCLUT_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_EnableCLUT_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

Enable the color lookup table without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_DisableCLUT_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_DisableCLUT_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

Disable the color lookup table without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_GetState

Function name

HAL_LTDC_StateTypeDef HAL_LTDC_GetState (LTDC_HandleTypeDef * hltdc)

Function description

Return the LTDC handle state.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **HAL:** state

HAL_LTDC_GetError

Function name

uint32_t HAL_LTDC_GetError (LTDC_HandleTypeDef * hltdc)

Function description

Return the LTDC handle error code.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **LTDC:** Error Code

50.3 LTDC Firmware driver defines

The following section lists the various define and macros of the module.

50.3.1 LTDC

LTDC

LTDC Alpha

LTDC_ALPHA

LTDC Constant Alpha mask

LTDC BACK COLOR

LTDC_COLOR

Color mask

LTDC Blending Factor1

LTDC_BLENDING_FACTOR1_CA

Blending factor : Cte Alpha

LTDC_BLENDING_FACTOR1_PAxCA

Blending factor : Cte Alpha x Pixel Alpha

LTDC Blending Factor2

LTDC_BLENDING_FACTOR2_CA

Blending factor : Cte Alpha

LTDC_BLENDING_FACTOR2_PAxCA

Blending factor : Cte Alpha x Pixel Alpha

LTDC DE POLARITY

LTDC_DEPOLARITY_AL

Data Enable, is active low.

LTDC_DEPOLARITY_AH

Data Enable, is active high.

LTDC Error Code

HAL_LTDC_ERROR_NONE

LTDC No error

HAL_LTDC_ERROR_TE

LTDC Transfer error

HAL_LTDC_ERROR_FU

LTDC FIFO Underrun

HAL_LTDC_ERROR_TIMEOUT

LTDC Timeout error

HAL_LTDC_ERROR_INVALID_CALLBACK

LTDC Invalid Callback error

LTDC Exported Macros

__HAL_LTDC_RESET_HANDLE_STATE

Description:

- Reset LTDC handle state.

Parameters:

- __HANDLE__: LTDC handle

Return value:

- None

__HAL_LTDC_ENABLE

Description:

- Enable the LTDC.

Parameters:

- __HANDLE__: LTDC handle

Return value:

- None.

__HAL_LTDC_DISABLE

Description:

- Disable the LTDC.

Parameters:

- __HANDLE__: LTDC handle

Return value:

- None.

__HAL_LTDC_LAYER_ENABLE

Description:

- Enable the LTDC Layer.

Parameters:

- __HANDLE__: LTDC handle
- __LAYER__: Specify the layer to be enabled. This parameter can be LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1).

Return value:

- None.

__HAL_LTDC_LAYER_DISABLE

Description:

- Disable the LTDC Layer.

Parameters:

- __HANDLE__: LTDC handle
- __LAYER__: Specify the layer to be disabled. This parameter can be LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1).

Return value:

- None.

__HAL_LTDC_RELOAD_IMMEDIATE_CONFIG

Description:

- Reload immediately all LTDC Layers.

Parameters:

- __HANDLE__: LTDC handle

Return value:

- None.

__HAL_LTDC_VERTICAL_BLANKING_RELOAD_CONFIG

Description:

- Reload during vertical blanking period all LTDC Layers.

Parameters:

- __HANDLE__: LTDC handle

Return value:

- None.

__HAL_LTDC_GET_FLAG

Description:

- Get the LTDC pending flags.

Parameters:

- __HANDLE__: LTDC handle
- __FLAG__: Get the specified flag. This parameter can be any combination of the following values:
  - LTDC_FLAG_LI: Line Interrupt flag
  - LTDC_FLAG_FU: FIFO Underrun Interrupt flag
  - LTDC_FLAG_TE: Transfer Error interrupt flag
  - LTDC_FLAG_RR: Register Reload Interrupt Flag

Return value:

- The: state of FLAG (SET or RESET).

__HAL_LTDC_CLEAR_FLAG

Description:

- Clears the LTDC pending flags.

Parameters:

- __HANDLE__: LTDC handle
- __FLAG__: Specify the flag to clear. This parameter can be any combination of the following values:
  - LTDC_FLAG_LI: Line Interrupt flag
  - LTDC_FLAG_FU: FIFO Underrun Interrupt flag
  - LTDC_FLAG_TE: Transfer Error interrupt flag
  - LTDC_FLAG_RR: Register Reload Interrupt Flag

Return value:

- None

__HAL_LTDC_ENABLE_IT

Description:

- Enables the specified LTDC interrupts.

Parameters:

- __HANDLE__: LTDC handle
- __INTERRUPT__: Specify the LTDC interrupt sources to be enabled. This parameter can be any combination of the following values:
  - LTDC_IT_LI: Line Interrupt flag
  - LTDC_IT_FU: FIFO Underrun Interrupt flag
  - LTDC_IT_TE: Transfer Error interrupt flag
  - LTDC_IT_RR: Register Reload Interrupt Flag

Return value:

- None

__HAL_LTDC_DISABLE_IT

Description:

- Disables the specified LTDC interrupts.

Parameters:

- __HANDLE__: LTDC handle
- __INTERRUPT__: Specify the LTDC interrupt sources to be disabled. This parameter can be any combination of the following values:
  - LTDC_IT_LI: Line Interrupt flag
  - LTDC_IT_FU: FIFO Underrun Interrupt flag
  - LTDC_IT_TE: Transfer Error interrupt flag
  - LTDC_IT_RR: Register Reload Interrupt Flag

Return value:

- None

__HAL_LTDC_GET_IT_SOURCE

Description:

- Check whether the specified LTDC interrupt has occurred or not.

Parameters:

- __HANDLE__: LTDC handle
- __INTERRUPT__: Specify the LTDC interrupt source to check. This parameter can be one of the following values:
  - LTDC_IT_LI: Line Interrupt flag
  - LTDC_IT_FU: FIFO Underrun Interrupt flag
  - LTDC_IT_TE: Transfer Error interrupt flag
  - LTDC_IT_RR: Register Reload Interrupt Flag

Return value:

- The: state of INTERRUPT (SET or RESET).

LTDC_VERTICALSYNC

Vertical synchronization height.

LTDC VS POLARITY

LTDC_VSPOLARITY_AL

Vertical Synchronization is active low.

LTDC_VSPOLARITY_AH

Vertical Synchronization is active high.

51 HAL MDIOS Generic Driver

51.1 MDIOS Firmware driver registers structures

51.1.1 MDIOS_InitTypeDef

MDIOS_InitTypeDef is defined in the stm32h7xx_hal_mdios.h

Data Fields

- ***uint32_t PortAddress***
- ***uint32_t PreambleCheck***

Field Documentation

- ***uint32_t MDIOS_InitTypeDef::PortAddress***
  Specifies the MDIOS port address. This parameter can be a value from 0 to 31
- ***uint32_t MDIOS_InitTypeDef::PreambleCheck***
  Specifies whether the preamble check is enabled or disabled. This parameter can be a value of ***MDIOS_Preamble_Check***

51.1.2 __MDIOS_HandleTypeDef

__MDIOS_HandleTypeDef is defined in the stm32h7xx_hal_mdios.h

Data Fields

- ***MDIOS_TypeDef * Instance***
- ***MDIOS_InitTypeDef Init***
- ***__IO HAL_MDIOS_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***HAL_LockTypeDef Lock***
- ***void(* WriteCpltCallback***
- ***void(* ReadCpltCallback***
- ***void(* ErrorCallback***
- ***void(* WakeUpCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***MDIOS_TypeDef* __MDIOS_HandleTypeDef::Instance***
  Register base address
- ***MDIOS_InitTypeDef __MDIOS_HandleTypeDef::Init***
  MDIOS Init Structure
- ***__IO HAL_MDIOS_StateTypeDef __MDIOS_HandleTypeDef::State***
  MDIOS communication state This parameter can be a value of of **HAL_MDIOS_StateTypeDef**
- ***__IO uint32_t __MDIOS_HandleTypeDef::ErrorCode***
  Holds the global Error code of the MDIOS HAL status machine This parameter can be a value of of ***MDIOS_Error_Code***
- ***HAL_LockTypeDef __MDIOS_HandleTypeDef::Lock***
  MDIOS Lock
- ***void(* __MDIOS_HandleTypeDef::WriteCpltCallback)(struct __MDIOS_HandleTypeDef *hmdios)***
  MDIOS Write Complete Callback
- ***void(* __MDIOS_HandleTypeDef::ReadCpltCallback)(struct __MDIOS_HandleTypeDef *hmdios)***
  MDIOS Read Complete Callback

- ***void(* __MDIOS_HandleTypeDef::ErrorCallback)(struct __MDIOS_HandleTypeDef *hmdios)***
  MDIOS Error Callback
- ***void(* __MDIOS_HandleTypeDef::WakeUpCallback)(struct __MDIOS_HandleTypeDef *hmdios)***
  MDIOS Wake UP Callback
- ***void(* __MDIOS_HandleTypeDef::MspInitCallback)(struct __MDIOS_HandleTypeDef *hmdios)***
  MDIOS Msp Init callback
- ***void(* __MDIOS_HandleTypeDef::MspDeInitCallback)(struct __MDIOS_HandleTypeDef *hmdios)***
  MDIOS Msp DeInit callback

51.2 MDIOS Firmware driver API description

The following section lists the various functions of the MDIOS library.

51.2.1 How to use this driver

Note: A callback is executed for each genereted interrupt, so the driver provide the following HAL_MDIOS_WriteCpltCallback(), HAL_MDIOS_ReadCpltCallback() and HAL_MDIOS_ErrorCallback()

Note: HAL_MDIOS_IRQHandler() must be called from the MDIOS IRQ Handler, to handle the interrupt and execute the previous callbacks (#) Reset the MDIOS peripheral and all related resources by calling the HAL_MDIOS_DeInit() API. (##) HAL_MDIOS_MspDeInit() must be implemented to reset low level resources (GPIO, Clocks, NVIC configuration ...)

Callback registration

51.2.2 Initialization and Configuration functions

This subsection provides a set of functions allowing to initialize the MDIOS

- The following parameters can be configured:
  - Port Address
  - Preamble Check

This section contains the following APIs:

- ***HAL_MDIOS_Init()***
- ***HAL_MDIOS_DeInit()***
- ***HAL_MDIOS_MspInit()***
- ***HAL_MDIOS_MspDeInit()***
- ***HAL_MDIOS_RegisterCallback()***
- ***HAL_MDIOS_UnRegisterCallback()***

51.2.3 IO operation functions

This section contains the following APIs:

- ***HAL_MDIOS_WriteReg()***
- ***HAL_MDIOS_ReadReg()***
- ***HAL_MDIOS_GetWrittenRegAddress()***
- ***HAL_MDIOS_GetReadRegAddress()***
- ***HAL_MDIOS_ClearWriteRegAddress()***
- ***HAL_MDIOS_ClearReadRegAddress()***
- ***HAL_MDIOS_EnableEvents()***
- ***HAL_MDIOS_IRQHandler()***
- ***HAL_MDIOS_WriteCpltCallback()***
- ***HAL_MDIOS_ReadCpltCallback()***
- ***HAL_MDIOS_ErrorCallback()***
- ***HAL_MDIOS_WakeUpCallback()***

51.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the MDIOS.

- HAL_MDIOS_GetState() API, helpful to check in run-time the state.
- HAL_MDIOS_GetError() API, returns the errors code of the HAL state machine.

This section contains the following APIs:

- ***HAL_MDIOS_GetError()***
- ***HAL_MDIOS_GetState()***

51.2.5 Detailed description of functions

HAL_MDIOS_Init

Function name

HAL_StatusTypeDef HAL_MDIOS_Init (MDIOS_HandleTypeDef * hmdios)

Function description

Initializes the MDIOS according to the specified parameters in the MDIOS_InitTypeDef and creates the associated handle .

Parameters

- **hmdios:** pointer to a MDIOS_HandleTypeDef structure that contains the configuration information for MDIOS module

Return values

- **HAL:** status

HAL_MDIOS_DeInit

Function name

HAL_StatusTypeDef HAL_MDIOS_DeInit (MDIOS_HandleTypeDef * hmdios)

Function description

DeInitializes the MDIOS peripheral.

Parameters

- **hmdios:** MDIOS handle

Return values

- **HAL:** status

HAL_MDIOS_MspInit

Function name

void HAL_MDIOS_MspInit (MDIOS_HandleTypeDef * hmdios)

Function description

MDIOS MSP Init.

Parameters

- **hmdios:** mdios handle

Return values

- **None:**

HAL_MDIOS_MspDeInit

Function name

void HAL_MDIOS_MspDeInit (MDIOS_HandleTypeDef * hmdios)

Function description

MDIOS MSP DeInit.

Parameters

- **hmdios:** mdios handle

Return values

- **None:**

HAL_MDIOS_RegisterCallback

Function name

HAL_StatusTypeDef HAL_MDIOS_RegisterCallback (MDIOS_HandleTypeDef * hmdios, HAL_MDIOS_CallbackIDTypeDef CallbackID, pMDIOS_CallbackTypeDef pCallback)

Function description

Register a User MDIOS Callback To be used instead of the weak predefined callback.

Parameters

- **hmdios:** mdios handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_MDIOS_WRITE_COMPLETE_CB_ID Write Complete Callback ID
  - HAL_MDIOS_READ_COMPLETE_CB_ID Read Complete Callback ID
  - HAL_MDIOS_ERROR_CB_ID Error Callback ID
  - HAL_MDIOS_WAKEUP_CB_ID Wake Up Callback ID
  - HAL_MDIOS_MSPINIT_CB_ID MspInit callback ID
  - HAL_MDIOS_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

HAL_MDIOS_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_MDIOS_UnRegisterCallback (MDIOS_HandleTypeDef * hmdios, HAL_MDIOS_CallbackIDTypeDef CallbackID)

Function description

Unregister an MDIOS Callback MDIOS callback is redirected to the weak predefined callback.

Parameters

- **hmdios:** mdios handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_MDIOS_WRITE_COMPLETE_CB_ID Write Complete Callback ID
  - HAL_MDIOS_READ_COMPLETE_CB_ID Read Complete Callback ID
  - HAL_MDIOS_ERROR_CB_ID Error Callback ID
  - HAL_MDIOS_WAKEUP_CB_ID Wake Up Callback ID
  - HAL_MDIOS_MSPINIT_CB_ID MspInit callback ID
  - HAL_MDIOS_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **status:**

HAL_MDIOS_WriteReg

Function name

HAL_StatusTypeDef HAL_MDIOS_WriteReg (MDIOS_HandleTypeDef * hmdios, uint32_t RegNum, uint16_t Data)

Function description

Writes to an MDIOS output register.

Parameters

- **hmdios:** mdios handle
- **RegNum:** MDIOS output register address
- **Data:** Data to write

Return values

- **HAL:** status

HAL_MDIOS_ReadReg

Function name

HAL_StatusTypeDef HAL_MDIOS_ReadReg (MDIOS_HandleTypeDef * hmdios, uint32_t RegNum, uint16_t * pData)

Function description

Reads an MDIOS input register.

Parameters

- **hmdios:** mdios handle
- **RegNum:** MDIOS input register address
- **pData:** pointer to Data

Return values

- **HAL:** status

HAL_MDIOS_GetWrittenRegAddress

Function name

uint32_t HAL_MDIOS_GetWrittenRegAddress (MDIOS_HandleTypeDef * hmdios)

Function description

Gets Written registers by MDIO master.

Parameters

- **hmdios:** mdios handle

Return values

- **bit:** map of written registers addresses

HAL_MDIOS_GetReadRegAddress

Function name

uint32_t HAL_MDIOS_GetReadRegAddress (MDIOS_HandleTypeDef * hmdios)

Function description

Gets Read registers by MDIO master.

Parameters

- **hmdios:** mdios handle

Return values

- **bit:** map of read registers addresses

HAL_MDIOS_ClearWriteRegAddress

Function name

HAL_StatusTypeDef HAL_MDIOS_ClearWriteRegAddress (MDIOS_HandleTypeDef * hmdios, uint32_t RegNum)

Function description

Clears Write registers flag.

Parameters

- **hmdios:** mdios handle
- **RegNum:** registers addresses to be cleared

Return values

- **HAL:** status

HAL_MDIOS_ClearReadRegAddress

Function name

HAL_StatusTypeDef HAL_MDIOS_ClearReadRegAddress (MDIOS_HandleTypeDef * hmdios, uint32_t RegNum)

Function description

Clears Read register flag.

Parameters

- **hmdios:** mdios handle
- **RegNum:** registers addresses to be cleared

Return values

- **HAL:** status

HAL_MDIOS_EnableEvents

Function name

HAL_StatusTypeDef HAL_MDIOS_EnableEvents (MDIOS_HandleTypeDef * hmdios)

Function description

Enables Events for MDIOS peripheral.

Parameters

- **hmdios:** mdios handle

Return values

- **HAL:** status

HAL_MDIOS_IRQHandler

Function name

void HAL_MDIOS_IRQHandler (MDIOS_HandleTypeDef * hmdios)

Function description

This function handles MDIOS interrupt request.

Parameters

- **hmdios:** MDIOS handle

Return values

- **None:**

HAL_MDIOS_WriteCpltCallback

Function name

void HAL_MDIOS_WriteCpltCallback (MDIOS_HandleTypeDef * hmdios)

Function description

Write Complete Callback.

Parameters

- **hmdios:** mdios handle

Return values

- **None:**

HAL_MDIOS_ReadCpltCallback

Function name

void HAL_MDIOS_ReadCpltCallback (MDIOS_HandleTypeDef * hmdios)

Function description

Read Complete Callback.

Parameters

- **hmdios:** mdios handle

Return values

- **None:**

HAL_MDIOS_ErrorCallback

Function name

void HAL_MDIOS_ErrorCallback (MDIOS_HandleTypeDef * hmdios)

Function description

Error Callback.

Parameters

- **hmdios:** mdios handle

Return values

- **None:**

HAL_MDIOS_WakeUpCallback

Function name

void HAL_MDIOS_WakeUpCallback (MDIOS_HandleTypeDef * hmdios)

Function description

MDIOS WAKEUP interrupt callback.

Parameters

- **hmdios:** mdios handle

Return values

- **None:**

HAL_MDIOS_GetError

Function name

uint32_t HAL_MDIOS_GetError (MDIOS_HandleTypeDef * hmdios)

Function description

Gets MDIOS error code.

Parameters

- **hmdios:** mdios handle

Return values

- **mdios:** error code

HAL_MDIOS_GetState

Function name

HAL_MDIOS_StateTypeDef HAL_MDIOS_GetState (MDIOS_HandleTypeDef * hmdios)

Function description

Return the MDIOS HAL state.

Parameters

- **hmdios:** mdios handle

Return values

- **HAL:** state

51.3 MDIOS Firmware driver defines

The following section lists the various define and macros of the module.

51.3.1 MDIOS

MDIOS

MDIOS Error Code

HAL_MDIOS_ERROR_NONE

No error

HAL_MDIOS_ERROR_PARAM

Busy error

HAL_MDIOS_ERROR_BUSY

Parameter error

HAL_MDIOS_ERROR_TIMEOUT

Timeout error

HAL_MDIOS_ERROR_DATA

Data transfer error

HAL_MDIOS_ERROR_INVALID_CALLBACK

Invalid Callback error

MDIOS Exported Macros

__HAL_MDIOS_RESET_HANDLE_STATE

Description:

- Reset MDIOS handle state.

Parameters:

- __HANDLE__: MDIOS handle.

Return value:

- None

__HAL_MDIOS_ENABLE

Description:

- Enable/Disable the MDIOS peripheral.

Parameters:

- __HANDLE__: specifies the MDIOS handle.

Return value:

- None

__HAL_MDIOS_DISABLE

__HAL_MDIOS_ENABLE_IT

Description:

- Enable the MDIOS device interrupt.

Parameters:

- __HANDLE__: specifies the MDIOS handle.
- __INTERRUPT__: : specifies the MDIOS interrupt sources to be enabled. This parameter can be one or a combination of the following values:
  - MDIOS_IT_WRITE: Register write interrupt
  - MDIOS_IT_READ: Register read interrupt
  - MDIOS_IT_ERROR: Error interrupt

Return value:

- None

__HAL_MDIOS_DISABLE_IT

Description:

- Disable the MDIOS device interrupt.

Parameters:

- __HANDLE__: specifies the MDIOS handle.
- __INTERRUPT__: : specifies the MDIOS interrupt sources to be disabled. This parameter can be one or a combination of the following values:
  - MDIOS_IT_WRITE: Register write interrupt
  - MDIOS_IT_READ: Register read interrupt
  - MDIOS_IT_ERROR: Error interrupt

Return value:

- None

__HAL_MDIOS_GET_WRITE_FLAG

Description:

- Set MDIOS slave get write register flag.

Parameters:

- __HANDLE__: specifies the MDIOS handle.
- __FLAG__: specifies the write register flag

Return value:

- The: state of write flag

__HAL_MDIOS_GET_READ_FLAG

Description:

- MDIOS slave get read register flag.

Parameters:

- __HANDLE__: specifies the MDIOS handle.
- __FLAG__: specifies the read register flag

Return value:

- The: state of read flag

__HAL_MDIOS_GET_ERROR_FLAG

Description:

- MDIOS slave get interrupt.

Parameters:

- __HANDLE__: specifies the MDIOS handle.
- __FLAG__: : specifies the Error flag. This parameter can be one or a combination of the following values:
  - MDIOS_TURNARROUND_ERROR_FLAG: Register write interrupt
  - MDIOS_START_ERROR_FLAG: Register read interrupt
  - MDIOS_PREAMBLE_ERROR_FLAG: Error interrupt

Return value:

- The: state of the error flag

__HAL_MDIOS_CLEAR_ERROR_FLAG

Description:

- MDIOS slave clear interrupt.

Parameters:

- __HANDLE__: specifies the MDIOS handle.
- __FLAG__: : specifies the Error flag. This parameter can be one or a combination of the following values:
  - MDIOS_TURNARROUND_ERROR_FLAG: Register write interrupt
  - MDIOS_START_ERROR_FLAG: Register read interrupt
  - MDIOS_PREAMBLE_ERROR_FLAG: Error interrupt

Return value:

- none

__HAL_MDIOS_GET_IT_SOURCE

Description:

- Checks whether the specified MDIOS interrupt is set or not.

Parameters:

- __HANDLE__: specifies the MDIOS handle.
- __INTERRUPT__: : specifies the MDIOS interrupt sources This parameter can be one or a combination of the following values:
  - MDIOS_IT_WRITE: Register write interrupt
  - MDIOS_IT_READ: Register read interrupt
  - MDIOS_IT_ERROR: Error interrupt

Return value:

- The: state of the interrupt source

__HAL_MDIOS_WAKEUP_EXTI_ENABLE_IT

Description:

- Enable the MDIOS WAKEUP Exti Line.

Parameters:

- __EXTI_LINE__: specifies the MDIOS WAKEUP Exti sources to be enabled. This parameter can be:
  - MDIOS_WAKEUP_EXTI_LINE

Return value:

- None.

__HAL_MDIOS_WAKEUP_EXTID2_ENABLE_IT

Description:

- Enable the MDIOS WAKEUP Exti Line by Domain2.

Parameters:

- __EXTI_LINE__: specifies the MDIOS WAKEUP Exti sources to be enabled. This parameter can be:
  - MDIOS_WAKEUP_EXTI_LINE

Return value:

- None.

__HAL_MDIOS_WAKEUP_EXTI_GET_FLAG

Description:

- checks whether the specified MDIOS WAKEUP Exti interrupt flag is set or not.

Parameters:

- __EXTI_LINE__: specifies the MDIOS WAKEUP Exti sources to be cleared. This parameter can be:
  - MDIOS_WAKEUP_EXTI_LINE

Return value:

- EXTI: MDIOS WAKEUP Line Status.

__HAL_MDIOS_WAKEUP_EXTID2_GET_FLAG

Description:

- checks whether the specified MDIOS WAKEUP Exti interrupt flag is set or not.

Parameters:

- __EXTI_LINE__: specifies the MDIOS WAKEUP Exti sources to be cleared. This parameter can be:
  - MDIOS_WAKEUP_EXTI_LINE

Return value:

- EXTI: MDIOS WAKEUP Line Status.

__HAL_MDIOS_WAKEUP_EXTI_CLEAR_FLAG

Description:

- Clear the MDIOS WAKEUP Exti flag.

Parameters:

- __EXTI_LINE__: specifies the MDIOS WAKEUP Exti sources to be cleared. This parameter can be:
  - MDIOS_WAKEUP_EXTI_LINE

Return value:

- None.

__HAL_MDIOS_WAKEUP_EXTID2_CLEAR_FLAG

Description:

- Clear the MDIOS WAKEUP Exti flag.

Parameters:

- __EXTI_LINE__: specifies the MDIOS WAKEUP Exti sources to be cleared. This parameter can be:
  - MDIOS_WAKEUP_EXTI_LINE

Return value:

- None.

__HAL_MDIOS_WAKEUP_EXTI_ENABLE_RISING_EDGE

Description:

- enable rising edge interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the MDIOS WAKEUP EXTI sources to be disabled. This parameter can be:
  - MDIOS_WAKEUP_EXTI_LINE

Return value:

- None

__HAL_MDIOS_WAKEUP_EXTI_ENABLE_FALLING_EDGE

Description:

- enable falling edge interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the MDIOS WAKEUP EXTI sources to be disabled. This parameter can be:
  - MDIOS_WAKEUP_EXTI_LINE

Return value:

- None

__HAL_MDIOS_WAKEUP_EXTI_ENABLE_RISING_FALLING_EDGE

Description:

- enable falling edge interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the MDIOS WAKEUP EXTI sources to be disabled. This parameter can be:
  - MDIOS_WAKEUP_EXTI_LINE

Return value:

- None

__HAL_MDIOS_WAKEUP_EXTI_GENERATE_SWIT

Description:

- Generates a Software interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the MDIOS WAKEUP EXTI sources to be disabled. This parameter can be:
  - MDIOS_WAKEUP_EXTI_LINE

Return value:

- None

52 HAL MDMA Generic Driver

52.1 MDMA Firmware driver registers structures

52.1.1 MDMA_InitTypeDef

MDMA_InitTypeDef is defined in the stm32h7xx_hal_mdma.h

Data Fields

- ***uint32_t Request***
- ***uint32_t TransferTriggerMode***
- ***uint32_t Priority***
- ***uint32_t Endianness***
- ***uint32_t SourceInc***
- ***uint32_t DestinationInc***
- ***uint32_t SourceDataSize***
- ***uint32_t DestDataSize***
- ***uint32_t DataAlignment***
- ***uint32_t BufferTransferLength***
- ***uint32_t SourceBurst***
- ***uint32_t DestBurst***
- ***int32_t SourceBlockAddressOffset***
- ***int32_t DestBlockAddressOffset***

Field Documentation

- ***uint32_t MDMA_InitTypeDef::Request***

  Specifies the MDMA request. This parameter can be a value of ***MDMA_Request_selection***
- ***uint32_t MDMA_InitTypeDef::TransferTriggerMode***

  Specifies the Trigger Transfer mode : each request triggers a : a buffer transfer, a block transfer, a repeated block transfer or a linked list transfer This parameter can be a value of ***MDMA_Transfer_TriggerMode***
- ***uint32_t MDMA_InitTypeDef::Priority***

  Specifies the software priority for the MDMAy channelx. This parameter can be a value of ***MDMA_Priority_level***
- ***uint32_t MDMA_InitTypeDef::Endianness***

  Specifies if the MDMA transactions preserve the Little endianness. This parameter can be a value of ***MDMA_Endianness***
- ***uint32_t MDMA_InitTypeDef::SourceInc***

  Specifies if the Source increment mode . This parameter can be a value of ***MDMA_Source_increment_mode***
- ***uint32_t MDMA_InitTypeDef::DestinationInc***

  Specifies if the Destination increment mode . This parameter can be a value of ***MDMA_Destination_increment_mode***
- ***uint32_t MDMA_InitTypeDef::SourceDataSize***

  Specifies the source data size. This parameter can be a value of ***MDMA_Source_data_size***
- ***uint32_t MDMA_InitTypeDef::DestDataSize***

  Specifies the destination data size. This parameter can be a value of ***MDMA_Destination_data_size***
- ***uint32_t MDMA_InitTypeDef::DataAlignment***

  Specifies the source to destination Memory data packing/padding mode. This parameter can be a value of ***MDMA_data_Alignment***

- ***uint32_t MDMA_InitTypeDef::BufferTransferLength***

  Specifies the buffer Transfer Length (number of bytes), this is the number of bytes to be transferred in a single transfer (1 byte to 128 bytes)
- ***uint32_t MDMA_InitTypeDef::SourceBurst***

  Specifies the Burst transfer configuration for the source memory transfers. It specifies the amount of data to be transferred in a single non interruptible transaction. This parameter can be a value of ***MDMA_Source_burst***

  Note:

  – : the burst may be FIXED/INCR based on SourceInc value , the BURST must be programmed as to ensure that the burst size will be lower than than BufferTransferLength
- ***uint32_t MDMA_InitTypeDef::DestBurst***

  Specifies the Burst transfer configuration for the destination memory transfers. It specifies the amount of data to be transferred in a single non interruptible transaction. This parameter can be a value of ***MDMA_Destination_burst***

  Note:

  – : the burst may be FIXED/INCR based on DestinationInc value , the BURST must be programmed as to ensure that the burst size will be lower than than BufferTransferLength
- ***int32_t MDMA_InitTypeDef::SourceBlockAddressOffset***

  this field specifies the Next block source address offset signed value : if > 0 then increment the next block source Address by offset from where the last block ends if < 0 then decrement the next block source Address by offset from where the last block ends if == 0, the next block source address starts from where the last block ends
- ***int32_t MDMA_InitTypeDef::DestBlockAddressOffset***

  this field specifies the Next block destination address offset signed value : if > 0 then increment the next block destination Address by offset from where the last block ends if < 0 then decrement the next block destination Address by offset from where the last block ends if == 0, the next block destination address starts from where the last block ends

52.1.2 MDMA_LinkNodeTypeDef

MDMA_LinkNodeTypeDef is defined in the stm32h7xx_hal_mdma.h

Data Fields

- ***__IO uint32_t CTCR***
- ***__IO uint32_t CBNDTR***
- ***__IO uint32_t CSAR***
- ***__IO uint32_t CDAR***
- ***__IO uint32_t CBRUR***
- ***__IO uint32_t CLAR***
- ***__IO uint32_t CTBR***
- ***__IO uint32_t Reserved***
- ***__IO uint32_t CMAR***
- ***__IO uint32_t CMDR***

Field Documentation

- ***__IO uint32_t MDMA_LinkNodeTypeDef::CTCR***

  New CTCR register configuration for the given MDMA linked list node
- ***__IO uint32_t MDMA_LinkNodeTypeDef::CBNDTR***

  New CBNDTR register configuration for the given MDMA linked list node
- ***__IO uint32_t MDMA_LinkNodeTypeDef::CSAR***

  New CSAR register configuration for the given MDMA linked list node
- ***__IO uint32_t MDMA_LinkNodeTypeDef::CDAR***

  New CDAR register configuration for the given MDMA linked list node
- ***__IO uint32_t MDMA_LinkNodeTypeDef::CBRUR***

  New CBRUR register configuration for the given MDMA linked list node

- ***__IO uint32_t MDMA_LinkNodeTypeDef::CLAR***
  New CLAR register configuration for the given MDMA linked list node
- ***__IO uint32_t MDMA_LinkNodeTypeDef::CTBR***
  New CTBR register configuration for the given MDMA linked list node
- ***__IO uint32_t MDMA_LinkNodeTypeDef::Reserved***
  Reserved register
- ***__IO uint32_t MDMA_LinkNodeTypeDef::CMAR***
  New CMAR register configuration for the given MDMA linked list node
- ***__IO uint32_t MDMA_LinkNodeTypeDef::CMDR***
  New CMDR register configuration for the given MDMA linked list node

52.1.3 MDMA_LinkNodeConfTypeDef

MDMA_LinkNodeConfTypeDef is defined in the stm32h7xx_hal_mdma.h

Data Fields

- ***MDMA_InitTypeDef Init***
- ***uint32_t SrcAddress***
- ***uint32_t DstAddress***
- ***uint32_t BlockDataLength***
- ***uint32_t BlockCount***
- ***uint32_t PostRequestMaskAddress***
- ***uint32_t PostRequestMaskData***

Field Documentation

- ***MDMA_InitTypeDef MDMA_LinkNodeConfTypeDef::Init***
  configuration of the specified MDMA Linked List Node
- ***uint32_t MDMA_LinkNodeConfTypeDef::SrcAddress***
  The source memory address for the Linked list Node
- ***uint32_t MDMA_LinkNodeConfTypeDef::DstAddress***
  The destination memory address for the Linked list Node
- ***uint32_t MDMA_LinkNodeConfTypeDef::BlockDataLength***
  The data length of a block in bytes
- ***uint32_t MDMA_LinkNodeConfTypeDef::BlockCount***
  The number of blocks to be transferred
- ***uint32_t MDMA_LinkNodeConfTypeDef::PostRequestMaskAddress***
  specifies the address to be updated (written) with PostRequestMaskData after a request is served. PostRequestMaskAddress and PostRequestMaskData could be used to automatically clear a peripheral flag when the request is served
- ***uint32_t MDMA_LinkNodeConfTypeDef::PostRequestMaskData***
  specifies the value to be written to PostRequestMaskAddress after a request is served. PostRequestMaskAddress and PostRequestMaskData could be used to automatically clear a peripheral flag when the request is served

52.1.4 __MDMA_HandleTypeDef

__MDMA_HandleTypeDef is defined in the stm32h7xx_hal_mdma.h

Data Fields

- ***MDMA_Channel_TypeDef * Instance***
- ***MDMA_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_MDMA_StateTypeDef State***
- ***void * Parent***
- ***void(* XferCpltCallback***

- ***void(* XferBufferCpltCallback***
- ***void(* XferBlockCpltCallback***
- ***void(* XferRepeatBlockCpltCallback***
- ***void(* XferErrorCallback***
- ***void(* XferAbortCallback***
- ***MDMA_LinkNodeTypeDef * FirstLinkedListNodeAddress***
- ***MDMA_LinkNodeTypeDef * LastLinkedListNodeAddress***
- ***uint32_t LinkedListNodeCounter***
- ***__IO uint32_t ErrorCode***

Field Documentation

- ***MDMA_Channel_TypeDef* __MDMA_HandleTypeDef::Instance***
  Register base address
- ***MDMA_InitTypeDef __MDMA_HandleTypeDef::Init***
  MDMA communication parameters
- ***HAL_LockTypeDef __MDMA_HandleTypeDef::Lock***
  MDMA locking object
- ***__IO HAL_MDMA_StateTypeDef __MDMA_HandleTypeDef::State***
  MDMA transfer state
- ***void* __MDMA_HandleTypeDef::Parent***
  Parent object state
- ***void(* __MDMA_HandleTypeDef::XferCpltCallback)(struct __MDMA_HandleTypeDef *hmdma)***
  MDMA transfer complete callback
- ***void(* __MDMA_HandleTypeDef::XferBufferCpltCallback)(struct __MDMA_HandleTypeDef *hmdma)***
  MDMA buffer transfer complete callback
- ***void(* __MDMA_HandleTypeDef::XferBlockCpltCallback)(struct __MDMA_HandleTypeDef *hmdma)***
  MDMA block transfer complete callback
- ***void(* __MDMA_HandleTypeDef::XferRepeatBlockCpltCallback)(struct __MDMA_HandleTypeDef *hmdma)***
  MDMA block transfer repeat callback
- ***void(* __MDMA_HandleTypeDef::XferErrorCallback)(struct __MDMA_HandleTypeDef *hmdma)***
  MDMA transfer error callback
- ***void(* __MDMA_HandleTypeDef::XferAbortCallback)(struct __MDMA_HandleTypeDef *hmdma)***
  MDMA transfer Abort callback
- ***MDMA_LinkNodeTypeDef* __MDMA_HandleTypeDef::FirstLinkedListNodeAddress***
  specifies the first node address of the transfer list (after the initial node defined by the Init struct) this parameter is used internally by the MDMA driver to construct the linked list node
- ***MDMA_LinkNodeTypeDef* __MDMA_HandleTypeDef::LastLinkedListNodeAddress***
  specifies the last node address of the transfer list this parameter is used internally by the MDMA driver to construct the linked list node
- ***uint32_t __MDMA_HandleTypeDef::LinkedListNodeCounter***
  Number of nodes in the MDMA linked list
- ***__IO uint32_t __MDMA_HandleTypeDef::ErrorCode***
  MDMA Error code

52.2 MDMA Firmware driver API description

The following section lists the various functions of the MDMA library.

52.2.1 How to use this driver

1. Enable and configure the peripheral to be connected to the MDMA Channel (except for internal SRAM/ FLASH memories: no initialization is necessary) please refer to Reference manual for connection between peripherals and MDMA requests.
2. For a given Channel use HAL_MDMA_Init function to program the required configuration through the following parameters: transfer request , channel priority, data endianness, Source increment, destination increment , source data size, destination data size, data alignment, source Burst, destination Burst , buffer Transfer Length, Transfer Trigger Mode (buffer transfer, block transfer, repeated block transfer or full transfer) source and destination block address offset, mask address and data. If using the MDMA in linked list mode then use function HAL_MDMA_LinkedList_CreateNode to fill a transfer node. Note that parameters given to the function HAL_MDMA_Init corresponds always to the node zero. Use function HAL_MDMA_LinkedList_AddNode to connect the created node to the linked list at a given position. User can make a linked list circular using function HAL_MDMA_LinkedList_EnableCircularMode , this function will automatically connect the last node of the list to the first one in order to make the list circular. In this case the linked list will loop on node 1 : first node connected after the initial transfer defined by the HAL_MDMA_Init

Note: The initial transfer itself (node 0 corresponding to the Init). User can disable the circular mode using function HAL_MDMA_LinkedList_DisableCircularMode, this function will then remove the connection between last node and first one. Function HAL_MDMA_LinkedList_RemoveNode can be used to remove (disconnect) a node from the transfer linked list. When a linked list is circular (last node connected to first one), if removing node1 (node where the linked list loops), the linked list remains circular and node 2 becomes the first one. Note that if the linked list is made circular the transfer will loop infinitely (or until aborted by the user).

- User can select the transfer trigger mode (parameter TransferTriggerMode) to define the amount of data to be transfer upon a request :
  - MDMA_BUFFER_TRANSFER : each request triggers a transfer of BufferTransferLength data with BufferTransferLength defined within the HAL_MDMA_Init.
  - MDMA_BLOCK_TRANSFER : each request triggers a transfer of a block with block size defined within the function HAL_MDMA_Start/HAL_MDMA_Start_IT or within the current linked list node parameters.
  - MDMA_REPEAT_BLOCK_TRANSFER : each request triggers a transfer of a number of blocks with block size and number of blocks defined within the function HAL_MDMA_Start/HAL_MDMA_Start_IT or within the current linked list node parameters.
  - MDMA_FULL_TRANSFER : each request triggers a full transfer all blocks and all nodes(if a linked list has been created using HAL_MDMA_LinkedList_CreateNode \ HAL_MDMA_LinkedList_AddNode).

Polling mode IO operation

- Use HAL_MDMA_Start() to start MDMA transfer after the configuration of Source address and destination address and the Length of data to be transferred.
- Use HAL_MDMA_PollForTransfer() to poll for the end of current transfer or a transfer level In this case a fixed Timeout can be configured by User depending from his application.
- Use HAL_MDMA_Abort() function to abort the current transfer : blocking method this API returns when the abort ends or timeout (should not be called from an interrupt service routine).

Interrupt mode IO operation

- Configure the MDMA interrupt priority using HAL_NVIC_SetPriority()
- Enable the MDMA IRQ handler using HAL_NVIC_EnableIRQ()
- Use HAL_MDMA_Start_IT() to start MDMA transfer after the configuration of Source address and destination address and the Length of data to be transferred. In this case the MDMA interrupt is configured.
- Use HAL_MDMA_IRQHandler() called under MDMA_IRQHandler() Interrupt subroutine
- At the end of data transfer HAL_MDMA_IRQHandler() function is executed and user can add his own function by customization of function pointer XferCpltCallback and XferErrorCallback (i.e a member of MDMA handle structure).
- Use HAL_MDMA_Abort_IT() function to abort the current transfer : non-blocking method. This API will finish the execution immediately then the callback XferAbortCallback (if specified by the user) is asserted once the MDMA channel has effectively aborted. (could be called from an interrupt service routine).

- Use functions HAL_MDMA_RegisterCallback and HAL_MDMA_UnRegisterCallback respectevely to register unregister user callbacks from the following list :
  - XferCpltCallback : transfer complete callback.
  - XferBufferCpltCallback : buffer transfer complete callback.
  - XferBlockCpltCallback : block transfer complete callback.
  - XferRepeatBlockCpltCallback : repeated block transfer complete callback.
  - XferErrorCallback : transfer error callback.
  - XferAbortCallback : transfer abort complete callback.
- If the transfer Request corresponds to SW request (MDMA_REQUEST_SW) User can use function HAL_MDMA_GenerateSWRequest to trigger requests manually. Function HAL_MDMA_GenerateSWRequest must be used with the following precautions:
  - This function returns an error if used while the Transfer has ended or not started.
  - If used while the current request has not been served yet (current request transfer on going) this function returns an error and the new request is ignored. Generally this function should be used in conjunctions with the MDMA callbacks:
  - example 1:
    - Configure a transfer with request set to MDMA_REQUEST_SW and trigger mode set to MDMA_BUFFER_TRANSFER
    - Register a callback for buffer transfer complete (using callback ID set to HAL_MDMA_XFER_BUFFERCPLT_CB_ID)
    - After calling HAL_MDMA_Start_IT the MDMA will issue the transfer of a first BufferTransferLength data.
    - When the buffer transfer complete callback is asserted first buffer has been transferred and user can ask for a new buffer transfer request using HAL_MDMA_GenerateSWRequest.
  - example 2:
    - Configure a transfer with request set to MDMA_REQUEST_SW and trigger mode set to MDMA_BLOCK_TRANSFER
    - Register a callback for block transfer complete (using callback ID HAL_MDMA_XFER_BLOCKCPLT_CB_ID)
    - After calling HAL_MDMA_Start_IT the MDMA will issue the transfer of a first block of data.
    - When the block transfer complete callback is asserted the first block has been transferred and user can ask for a new block transfer request using HAL_MDMA_GenerateSWRequest.

Use HAL_MDMA_GetState() function to return the MDMA state and HAL_MDMA_GetError() in case of error detection.

MDMA HAL driver macros list

Below the list of most used macros in MDMA HAL driver.

- __HAL_MDMA_ENABLE: Enable the specified MDMA Channel.
- __HAL_MDMA_DISABLE: Disable the specified MDMA Channel.
- __HAL_MDMA_GET_FLAG: Get the MDMA Channel pending flags.
- __HAL_MDMA_CLEAR_FLAG: Clear the MDMA Channel pending flags.
- __HAL_MDMA_ENABLE_IT: Enable the specified MDMA Channel interrupts.
- __HAL_MDMA_DISABLE_IT: Disable the specified MDMA Channel interrupts.
- __HAL_MDMA_GET_IT_SOURCE: Check whether the specified MDMA Channel interrupt has occurred or not.

Note: You can refer to the header file of the MDMA HAL driver for more useful macros.

52.2.2 Initialization and de-initialization functions

This section provides functions allowing to : Initialize and de-initialize the MDMA channel. Register and Unregister MDMA callbacks

The HAL_MDMA_Init() function follows the MDMA channel configuration procedures as described in reference manual. The HAL_MDMA_DeInit function allows to deinitialize the MDMA channel. HAL_MDMA_RegisterCallback and HAL_MDMA_UnRegisterCallback functions allows respectevely to register/unregister an MDMA callback function.

This section contains the following APIs:

- ***HAL_MDMA_Init()***
- ***HAL_MDMA_DeInit()***
- ***HAL_MDMA_ConfigPostRequestMask()***
- ***HAL_MDMA_RegisterCallback()***
- ***HAL_MDMA_UnRegisterCallback()***

52.2.3 Linked list operation functions

This section provides functions allowing to:

- Create a linked list node
- Add a node to the MDMA linked list
- Remove a node from the MDMA linked list
- Enable/Disable linked list circular mode

This section contains the following APIs:

- ***HAL_MDMA_LinkedList_CreateNode()***
- ***HAL_MDMA_LinkedList_AddNode()***
- ***HAL_MDMA_LinkedList_RemoveNode()***
- ***HAL_MDMA_LinkedList_EnableCircularMode()***
- ***HAL_MDMA_LinkedList_DisableCircularMode()***

52.2.4 IO operation functions

This section provides functions allowing to:

- Configure the source, destination address and data length and Start MDMA transfer
- Configure the source, destination address and data length and Start MDMA transfer with interrupt
- Abort MDMA transfer
- Poll for transfer complete
- Generate a SW request (when Request is set to MDMA_REQUEST_SW)
- Handle MDMA interrupt request

This section contains the following APIs:

- ***HAL_MDMA_Start()***
- ***HAL_MDMA_Start_IT()***
- ***HAL_MDMA_Abort()***
- ***HAL_MDMA_Abort_IT()***
- ***HAL_MDMA_PollForTransfer()***
- ***HAL_MDMA_GenerateSWRequest()***
- ***HAL_MDMA_IRQHandler()***

52.2.5 State and Errors functions

This subsection provides functions allowing to

- Check the MDMA state
- Get error code

This section contains the following APIs:

- ***HAL_MDMA_GetState()***
- ***HAL_MDMA_GetError()***

52.2.6 Detailed description of functions

HAL_MDMA_Init

Function name

HAL_StatusTypeDef HAL_MDMA_Init (MDMA_HandleTypeDef * hmdma)

Function description

Initializes the MDMA according to the specified parameters in the MDMA_InitTypeDef and create the associated handle.

Parameters

- **hmdma:** Pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Channel.

Return values

- **HAL:** status

HAL_MDMA_DeInit

Function name

HAL_StatusTypeDef HAL_MDMA_DeInit (MDMA_HandleTypeDef * hmdma)

Function description

DeInitializes the MDMA peripheral.

Parameters

- **hmdma:** pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Channel.

Return values

- **HAL:** status

HAL_MDMA_ConfigPostRequestMask

Function name

HAL_StatusTypeDef HAL_MDMA_ConfigPostRequestMask (MDMA_HandleTypeDef * hmdma, uint32_t MaskAddress, uint32_t MaskData)

Function description

Config the Post request Mask address and Mask data.

Parameters

- **hmdma:** : pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Channel.
- **MaskAddress:** specifies the address to be updated (written) with MaskData after a request is served.
- **MaskData:** specifies the value to be written to MaskAddress after a request is served. MaskAddress and MaskData could be used to automatically clear a peripheral flag when the request is served.

Return values

- **HAL:** status

HAL_MDMA_RegisterCallback

Function name

HAL_StatusTypeDef HAL_MDMA_RegisterCallback (MDMA_HandleTypeDef * hmdma, HAL_MDMA_CallbackIDTypeDef CallbackID, void(*)(MDMA_HandleTypeDef *_hmdma) pCallback)

Function description

Register callbacks.

Parameters

- **hmdma:** pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Channel.
- **CallbackID:** User Callback identifier
- **pCallback:** pointer to callbacsk function.

Return values

- **HAL:** status

HAL_MDMA_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_MDMA_UnRegisterCallback (MDMA_HandleTypeDef * hmdma, HAL_MDMA_CallbackIDTypeDef CallbackID)

Function description

UnRegister callbacks.

Parameters

- **hmdma:** pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Channel.
- **CallbackID:** User Callback identifier a HAL_MDMA_CallbackIDTypeDef ENUM as parameter.

Return values

- **HAL:** status

HAL_MDMA_LinkedList_CreateNode

Function name

HAL_StatusTypeDef HAL_MDMA_LinkedList_CreateNode (MDMA_LinkNodeTypeDef * pNode, MDMA_LinkNodeConfTypeDef * pNodeConfig)

Function description

Initializes an MDMA Link Node according to the specified parameters in the pMDMA_LinkedListNodeConfig .

Parameters

- **pNode:** Pointer to a MDMA_LinkNodeTypeDef structure that contains Linked list node registers configurations.
- **pNodeConfig:** Pointer to a MDMA_LinkNodeConfTypeDef structure that contains the configuration information for the specified MDMA Linked List Node.

Return values

- **HAL:** status

HAL_MDMA_LinkedList_AddNode

Function name

HAL_StatusTypeDef HAL_MDMA_LinkedList_AddNode (MDMA_HandleTypeDef * hmdma, MDMA_LinkNodeTypeDef * pNewNode, MDMA_LinkNodeTypeDef * pPrevNode)

Function description

Connect a node to the linked list.

Parameters

- **hmdma:** : Pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Channel.
- **pNewNode:** : Pointer to a MDMA_LinkNodeTypeDef structure that contains Linked list node to be add to the list.
- **pPrevNode:** : Pointer to the new node position in the linked list or zero to insert the new node at the end of the list

Return values

- **HAL:** status

HAL_MDMA_LinkedList_RemoveNode

Function name

HAL_StatusTypeDef HAL_MDMA_LinkedList_RemoveNode (MDMA_HandleTypeDef * hmdma, MDMA_LinkNodeTypeDef * pNode)

Function description

Disconnect/Remove a node from the transfer linked list.

Parameters

- **hmdma:** : Pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Channel.
- **pNode:** : Pointer to a MDMA_LinkNodeTypeDef structure that contains Linked list node to be removed from the list.

Return values

- **HAL:** status

HAL_MDMA_LinkedList_EnableCircularMode

Function name

HAL_StatusTypeDef HAL_MDMA_LinkedList_EnableCircularMode (MDMA_HandleTypeDef * hmdma)

Function description

Make the linked list circular by connecting the last node to the first.

Parameters

- **hmdma:** : Pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Channel.

Return values

- **HAL:** status

HAL_MDMA_LinkedList_DisableCircularMode

Function name

HAL_StatusTypeDef HAL_MDMA_LinkedList_DisableCircularMode (MDMA_HandleTypeDef * hmdma)

Function description

Disable the linked list circular mode by setting the last node connection to null.

Parameters

- **hmdma:** : Pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Channel.

Return values

- **HAL:** status

HAL_MDMA_Start

Function name

HAL_StatusTypeDef HAL_MDMA_Start (MDMA_HandleTypeDef * hmdma, uint32_t SrcAddress, uint32_t DstAddress, uint32_t BlockDataLength, uint32_t BlockCount)

Function description

Starts the MDMA Transfer.

Parameters

- **hmdma:** : pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Channel.
- **SrcAddress:** : The source memory Buffer address
- **DstAddress:** : The destination memory Buffer address
- **BlockDataLength:** : The length of a block transfer in bytes
- **BlockCount:** : The number of a blocks to be transfer

Return values

- **HAL:** status

HAL_MDMA_Start_IT

Function name

HAL_StatusTypeDef HAL_MDMA_Start_IT (MDMA_HandleTypeDef * hmdma, uint32_t SrcAddress, uint32_t DstAddress, uint32_t BlockDataLength, uint32_t BlockCount)

Function description

Starts the MDMA Transfer with interrupts enabled.

Parameters

- **hmdma:** : pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Channel.
- **SrcAddress:** : The source memory Buffer address
- **DstAddress:** : The destination memory Buffer address
- **BlockDataLength:** : The length of a block transfer in bytes
- **BlockCount:** : The number of a blocks to be transfer

Return values

- **HAL:** status

HAL_MDMA_Abort

Function name

HAL_StatusTypeDef HAL_MDMA_Abort (MDMA_HandleTypeDef * hmdma)

Function description

Aborts the MDMA Transfer.

Parameters

- **hmdma:** : pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Channel.

Return values

- **HAL:** status

Notes

- After disabling a MDMA Channel, a check for wait until the MDMA Channel is effectively disabled is added. If a Channel is disabled while a data transfer is ongoing, the current data will be transferred and the Channel will be effectively disabled only after the transfer of this single data is finished.

HAL_MDMA_Abort_IT

Function name

HAL_StatusTypeDef HAL_MDMA_Abort_IT (MDMA_HandleTypeDef * hmdma)

Function description

Aborts the MDMA Transfer in Interrupt mode.

Parameters

- **hmdma:** : pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Channel.

Return values

- **HAL:** status

HAL_MDMA_PollForTransfer

Function name

HAL_StatusTypeDef HAL_MDMA_PollForTransfer (MDMA_HandleTypeDef * hmdma, HAL_MDMA_LevelCompleteTypeDef CompleteLevel, uint32_t Timeout)

Function description

Polling for transfer complete.

Parameters

- **hmdma:** pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Channel.
- **CompleteLevel:** Specifies the MDMA level complete.
- **Timeout:** Timeout duration.

Return values

- **HAL:** status

HAL_MDMA_GenerateSWRequest

Function name

HAL_StatusTypeDef HAL_MDMA_GenerateSWRequest (MDMA_HandleTypeDef * hmdma)

Function description

Generate an MDMA SW request trigger to activate the request on the given Channel.

Parameters

- **hmdma:** pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Stream.

Return values

- **HAL:** status

HAL_MDMA_IRQHandler

Function name

void HAL_MDMA_IRQHandler (MDMA_HandleTypeDef * hmdma)

Function description

Handles MDMA interrupt request.

Parameters

- **hmdma:** pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Channel.

Return values

- **None:**

HAL_MDMA_GetState

Function name

HAL_MDMA_StateTypeDef HAL_MDMA_GetState (MDMA_HandleTypeDef * hmdma)

Function description

Returns the MDMA state.

Parameters

- **hmdma:** pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Channel.

Return values

- **HAL:** state

HAL_MDMA_GetError

Function name

uint32_t HAL_MDMA_GetError (MDMA_HandleTypeDef * hmdma)

Function description

Return the MDMA error code.

Parameters

- **hmdma:** : pointer to a MDMA_HandleTypeDef structure that contains the configuration information for the specified MDMA Channel.

Return values

- **MDMA:** Error Code

52.3 MDMA Firmware driver defines

The following section lists the various define and macros of the module.

52.3.1 MDMA

MDMA

MDMA data alignment

MDMA_DATAALIGN_PACKENABLE

The source data is packed/un-packed into the destination data size All data are right aligned, in Little Endien mode.

MDMA_DATAALIGN_RIGHT

Right Aligned, padded w/ 0s (default)

MDMA_DATAALIGN_RIGHT_SIGNED

Right Aligned, Sign extended , Note : this mode is allowed only if the Source data size is smaller than Destination data size

MDMA_DATAALIGN_LEFT

Left Aligned (padded with 0s)

MDMA Destination burst

MDMA_DEST_BURST_SINGLE

single transfer

MDMA_DEST_BURST_2BEATS

Burst 2 beats

MDMA_DEST_BURST_4BEATS

Burst 4 beats

MDMA_DEST_BURST_8BEATS

Burst 8 beats

MDMA_DEST_BURST_16BEATS

Burst 16 beats

MDMA_DEST_BURST_32BEATS

Burst 32 beats

MDMA_DEST_BURST_64BEATS

Burst 64 beats

MDMA_DEST_BURST_128BEATS

Burst 128 beats

MDMA Destination data size

MDMA_DEST_DATASIZE_BYTE

Destination data size is Byte

MDMA_DEST_DATASIZE_HALFWORD

Destination data size is half word

MDMA_DEST_DATASIZE_WORD

Destination data size is word

MDMA_DEST_DATASIZE_DOUBLEWORD

Destination data size is double word

MDMA Destination increment mode

MDMA_DEST_INC_DISABLE

Source address pointer is fixed

MDMA_DEST_INC_BYTE

Source address pointer is incremented by a BYTE (8 bits)

MDMA_DEST_INC_HALFWORD

Source address pointer is incremented by a half Word (16 bits)

MDMA_DEST_INC_WORD

Source address pointer is incremented by a Word (32 bits)

MDMA_DEST_INC_DOUBLEWORD

Source address pointer is incremented by a double Word (64 bits))

MDMA_DEST_DEC_BYTE

Source address pointer is decremented by a BYTE (8 bits)

MDMA_DEST_DEC_HALFWORD

Source address pointer is decremented by a half Word (16 bits)

MDMA_DEST_DEC_WORD

Source address pointer is decremented by a Word (32 bits)

MDMA_DEST_DEC_DOUBLEWORD

Source address pointer is decremented by a double Word (64 bits))

MDMA Endianness

MDMA_LITTLE_ENDIANNESS_PRESERVE

little endianness preserve

MDMA_LITTLE_BYTE_ENDIANNESS_EXCHANGE

BYTEs endianness exchange when destination data size is > Byte

MDMA_LITTLE_HALFWORD_ENDIANNESS_EXCHANGE

HALF WORDs endianness exchange when destination data size is > HALF WORD

MDMA_LITTLE_WORD_ENDIANNESS_EXCHANGE

WORDs endianness exchange when destination data size is > DOUBLE WORD

MDMA Error Codes

HAL_MDMA_ERROR_NONE

No error

HAL_MDMA_ERROR_READ_XFER

Read Transfer error

HAL_MDMA_ERROR_WRITE_XFER

Write Transfer error

HAL_MDMA_ERROR_MASK_DATA

Error Mask Data error

HAL_MDMA_ERROR_LINKED_LIST

Linked list Data error

HAL_MDMA_ERROR_ALIGNMENT

Address/Size alignment error

HAL_MDMA_ERROR_BLOCK_SIZE

Block Size error

HAL_MDMA_ERROR_TIMEOUT

Timeout error

HAL_MDMA_ERROR_NO_XFER

Abort or SW trigger requested with no Xfer ongoing

HAL_MDMA_ERROR_BUSY

DeInit or SW trigger requested with Xfer ongoing

MDMA Exported Macros

__HAL_MDMA_ENABLE

Description:

- Enable the specified MDMA Channel.

Parameters:

- __HANDLE__: MDMA handle

Return value:

- None

__HAL_MDMA_DISABLE

Description:

- Disable the specified MDMA Channel.

Parameters:

- __HANDLE__: MDMA handle

Return value:

- None

__HAL_MDMA_GET_FLAG

Description:

- Get the MDMA Channel pending flags.

Parameters:

- __HANDLE__: MDMA handle
- __FLAG__: Get the specified flag. This parameter can be any combination of the following values:
  - MDMA_FLAG_TE : Transfer Error flag.
  - MDMA_FLAG_CTC : Channel Transfer Complete flag.
  - MDMA_FLAG_BRT : Block Repeat Transfer flag.
  - MDMA_FLAG_BT : Block Transfer complete flag.
  - MDMA_FLAG_BFTC : BuFfer Transfer Complete flag.
  - MDMA_FLAG_CRQA : Channel request Active flag.

Return value:

- The: state of FLAG (SET or RESET).

__HAL_MDMA_CLEAR_FLAG

Description:

- Clear the MDMA Stream pending flags.

Parameters:

- __HANDLE__: MDMA handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - MDMA_FLAG_TE : Transfer Error flag.
  - MDMA_FLAG_CTC : Channel Transfer Complete flag.
  - MDMA_FLAG_BRT : Block Repeat Transfer flag.
  - MDMA_FLAG_BT : Block Transfer complete flag.
  - MDMA_FLAG_BFTC : BuFfer Transfer Complete flag.

Return value:

- None

__HAL_MDMA_ENABLE_IT

Description:

- Enables the specified MDMA Channel interrupts.

Parameters:

- __HANDLE__: MDMA handle
- __INTERRUPT__: specifies the DMA interrupt sources to be enabled or disabled. This parameter can be any combination of the following values:
  - MDMA_IT_TE : Transfer Error interrupt mask
  - MDMA_IT_CTC : Channel Transfer Complete interrupt mask
  - MDMA_IT_BRT : Block Repeat Transfer interrupt mask
  - MDMA_IT_BT : Block Transfer interrupt mask
  - MDMA_IT_BFTC : BuFfer Transfer Complete interrupt mask

Return value:

- None

__HAL_MDMA_DISABLE_IT

Description:

- Disables the specified MDMA Channel interrupts.

Parameters:

- __HANDLE__: MDMA handle
- __INTERRUPT__: specifies the MDMA interrupt sources to be enabled or disabled. This parameter can be any combination of the following values:
  - MDMA_IT_TE : Transfer Error interrupt mask
  - MDMA_IT_CTC : Channel Transfer Complete interrupt mask
  - MDMA_IT_BRT : Block Repeat Transfer interrupt mask
  - MDMA_IT_BT : Block Transfer interrupt mask
  - MDMA_IT_BFTC : BuFfer Transfer Complete interrupt mask

Return value:

- None

__HAL_MDMA_GET_IT_SOURCE

Description:

- Checks whether the specified MDMA Channel interrupt is enabled or not.

Parameters:

- __HANDLE__: MDMA handle
- __INTERRUPT__: specifies the MDMA interrupt source to check.
  - MDMA_IT_TE : Transfer Error interrupt mask
  - MDMA_IT_CTC : Channel Transfer Complete interrupt mask
  - MDMA_IT_BRT : Block Repeat Transfer interrupt mask
  - MDMA_IT_BT : Block Transfer interrupt mask
  - MDMA_IT_BFTC : BuFfer Transfer Complete interrupt mask

Return value:

- The: state of MDMA_IT (SET or RESET).

__HAL_MDMA_SET_COUNTER

Description:

- Writes the number of data in bytes to be transferred on the MDMA Channelx.

Parameters:

- __HANDLE__: : MDMA handle
- __COUNTER__: Number of data in bytes to be transferred.

Return value:

- None

__HAL_MDMA_GET_COUNTER

Description:

- Returns the number of remaining data in bytes in the current MDMA Channelx transfer.

Parameters:

- __HANDLE__: : MDMA handle

Return value:

- The: number of remaining data in bytes in the current MDMA Channelx transfer.

MDMA flag definitions

MDMA_FLAG_TE

Transfer Error flag

MDMA_FLAG_CTC

Channel Transfer Complete flag

MDMA_FLAG_BRT

Block Repeat Transfer complete flag

MDMA_FLAG_BT

Block Transfer complete flag

MDMA_FLAG_BFTC

BuFfer Transfer complete flag

MDMA_FLAG_CRQA

Channel request Active flag

MDMA interrupt enable definitions

MDMA_IT_TE

Transfer Error interrupt

MDMA_IT_CTC

Channel Transfer Complete interrupt

MDMA_IT_BRT

Block Repeat Transfer interrupt

MDMA_IT_BT

Block Transfer interrupt

MDMA_IT_BFTC

Buffer Transfer Complete interrupt

MDMA Priority level

MDMA_PRIORITY_LOW

Priority level: Low

MDMA_PRIORITY_MEDIUM

Priority level: Medium

MDMA_PRIORITY_HIGH

Priority level: High

MDMA_PRIORITY_VERY_HIGH

Priority level: Very High

MDMA Request selection

MDMA_REQUEST_DMA1_Stream0_TC

MDMA HW request is DMA1 Stream 0 Transfer Complete Flag

MDMA_REQUEST_DMA1_Stream1_TC

MDMA HW request is DMA1 Stream 1 Transfer Complete Flag

MDMA_REQUEST_DMA1_Stream2_TC

MDMA HW request is DMA1 Stream 2 Transfer Complete Flag

MDMA_REQUEST_DMA1_Stream3_TC

MDMA HW request is DMA1 Stream 3 Transfer Complete Flag

MDMA_REQUEST_DMA1_Stream4_TC

MDMA HW request is DMA1 Stream 4 Transfer Complete Flag

MDMA_REQUEST_DMA1_Stream5_TC

MDMA HW request is DMA1 Stream 5 Transfer Complete Flag

MDMA_REQUEST_DMA1_Stream6_TC

MDMA HW request is DMA1 Stream 6 Transfer Complete Flag

MDMA_REQUEST_DMA1_Stream7_TC

MDMA HW request is DMA1 Stream 7 Transfer Complete Flag

MDMA_REQUEST_DMA2_Stream0_TC

MDMA HW request is DMA2 Stream 0 Transfer Complete Flag

MDMA_REQUEST_DMA2_Stream1_TC

MDMA HW request is DMA2 Stream 1 Transfer Complete Flag

MDMA_REQUEST_DMA2_Stream2_TC

MDMA HW request is DMA2 Stream 2 Transfer Complete Flag

MDMA_REQUEST_DMA2_Stream3_TC

MDMA HW request is DMA2 Stream 3 Transfer Complete Flag

MDMA_REQUEST_DMA2_Stream4_TC

MDMA HW request is DMA2 Stream 4 Transfer Complete Flag

MDMA_REQUEST_DMA2_Stream5_TC

MDMA HW request is DMA2 Stream 5 Transfer Complete Flag

MDMA_REQUEST_DMA2_Stream6_TC

MDMA HW request is DMA2 Stream 6 Transfer Complete Flag

MDMA_REQUEST_DMA2_Stream7_TC

MDMA HW request is DMA2 Stream 7 Transfer Complete Flag

MDMA_REQUEST_LTDC_LINE_IT

MDMA HW request is LTDC Line interrupt Flag

MDMA_REQUEST_JPEG_INFIFO_TH

MDMA HW request is JPEG Input FIFO threshold Flag

MDMA_REQUEST_JPEG_INFIFO_NF

MDMA HW request is JPEG Input FIFO not full Flag

MDMA_REQUEST_JPEG_OUTFIFO_TH

MDMA HW request is JPEG Output FIFO threshold Flag

MDMA_REQUEST_JPEG_OUTFIFO_NE

MDMA HW request is JPEG Output FIFO not empty Flag

MDMA_REQUEST_JPEG_END_CONVERSION

MDMA HW request is JPEG End of conversion Flag

MDMA_REQUEST_QUADSPI_FIFO_TH

MDMA HW request is QSPI FIFO threshold Flag

MDMA_REQUEST_QUADSPI_TC

MDMA HW request is QSPI Transfer complete Flag

MDMA_REQUEST_DMA2D_CLUT_TC

MDMA HW request is DMA2D CLUT Transfer Complete Flag

MDMA_REQUEST_DMA2D_TC

MDMA HW request is DMA2D Transfer Complete Flag

MDMA_REQUEST_DMA2D_TW

MDMA HW request is DMA2D Transfer Watermark Flag

MDMA_REQUEST_SDMMC1_END_DATA

MDMA HW request is SDMMC1 End of Data Flag

MDMA_REQUEST_SDMMC1_DMA_ENDBUFFER

MDMA HW request is SDMMC1 Internal DMA buffer End Flag

MDMA_REQUEST_SDMMC1_COMMAND_END

MDMA HW request is SDMMC1 Command End Flag

MDMA_REQUEST_SW

MDMA SW request

MDMA Source burst

MDMA_SOURCE_BURST_SINGLE

single transfer

MDMA_SOURCE_BURST_2BEATS

Burst 2 beats

MDMA_SOURCE_BURST_4BEATS

Burst 4 beats

MDMA_SOURCE_BURST_8BEATS

Burst 8 beats

MDMA_SOURCE_BURST_16BEATS

Burst 16 beats

MDMA_SOURCE_BURST_32BEATS

Burst 32 beats

MDMA_SOURCE_BURST_64BEATS

Burst 64 beats

MDMA_SOURCE_BURST_128BEATS

Burst 128 beats

MDMA Source data size

MDMA_SRC_DATASIZE_BYTE

Source data size is Byte

MDMA_SRC_DATASIZE_HALFWORD

Source data size is half word

MDMA_SRC_DATASIZE_WORD

Source data size is word

MDMA_SRC_DATASIZE_DOUBLEWORD

Source data size is double word

MDMA Source increment mode

MDMA_SRC_INC_DISABLE

Source address pointer is fixed

MDMA_SRC_INC_BYTE

Source address pointer is incremented by a BYTE (8 bits)

MDMA_SRC_INC_HALFWORD

Source address pointer is incremented by a half Word (16 bits)

MDMA_SRC_INC_WORD

Source address pointer is incremented by a Word (32 bits)

MDMA_SRC_INC_DOUBLEWORD

Source address pointer is incremented by a double Word (64 bits))

MDMA_SRC_DEC_BYTE

Source address pointer is decremented by a BYTE (8 bits)

MDMA_SRC_DEC_HALFWORD

Source address pointer is decremented by a half Word (16 bits)

MDMA_SRC_DEC_WORD

Source address pointer is decremented by a Word (32 bits)

MDMA_SRC_DEC_DOUBLEWORD

Source address pointer is decremented by a double Word (64 bits))

MDMA Transfer Trigger Mode

MDMA_BUFFER_TRANSFER

Each MDMA request (SW or HW) triggers a buffer transfer

MDMA_BLOCK_TRANSFER

Each MDMA request (SW or HW) triggers a block transfer

MDMA_REPEAT_BLOCK_TRANSFER

Each MDMA request (SW or HW) triggers a repeated block transfer

MDMA_FULL_TRANSFER

Each MDMA request (SW or HW) triggers a Full transfer or a linked list transfer if any

53 HAL MMC Generic Driver

53.1 MMC Firmware driver registers structures

53.1.1 HAL_MMC_CardInfoTypeDef

HAL_MMC_CardInfoTypeDef is defined in the stm32h7xx_hal_mmc.h

Data Fields

- ***uint32_t CardType***
- ***uint32_t Class***
- ***uint32_t RelCardAdd***
- ***uint32_t BlockNbr***
- ***uint32_t BlockSize***
- ***uint32_t LogBlockNbr***
- ***uint32_t LogBlockSize***

Field Documentation

- ***uint32_t HAL_MMC_CardInfoTypeDef::CardType***
  Specifies the card Type
- ***uint32_t HAL_MMC_CardInfoTypeDef::Class***
  Specifies the class of the card class
- ***uint32_t HAL_MMC_CardInfoTypeDef::RelCardAdd***
  Specifies the Relative Card Address
- ***uint32_t HAL_MMC_CardInfoTypeDef::BlockNbr***
  Specifies the Card Capacity in blocks
- ***uint32_t HAL_MMC_CardInfoTypeDef::BlockSize***
  Specifies one block size in bytes
- ***uint32_t HAL_MMC_CardInfoTypeDef::LogBlockNbr***
  Specifies the Card logical Capacity in blocks
- ***uint32_t HAL_MMC_CardInfoTypeDef::LogBlockSize***
  Specifies logical block size in bytes

53.1.2 __MMC_HandleTypeDef

__MMC_HandleTypeDef is defined in the stm32h7xx_hal_mmc.h

Data Fields

- ***MMC_TypeDef * Instance***
- ***MMC_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***const uint8_t * pTxBuffPtr***
- ***uint32_t TxXferSize***
- ***uint8_t * pRxBuffPtr***
- ***uint32_t RxXferSize***
- ***__IO uint32_t Context***
- ***__IO HAL_MMC_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***HAL_MMC_CardInfoTypeDef MmcCard***
- ***uint32_t CSD***
- ***uint32_t CID***

- ***uint32_t Ext_CSD***

- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::WrBlockMisalign***
  Write block misalignment
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::RdBlockMisalign***
  Read block misalignment
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::DSRImpl***
  DSR implemented
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::Reserved2***
  Reserved
- ***__IO uint32_t HAL_MMC_CardCSDTypeDef::DeviceSize***
  Device Size
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::MaxRdCurrentVDDMin***
  Max. read current @ VDD min
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::MaxRdCurrentVDDMax***
  Max. read current @ VDD max
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::MaxWrCurrentVDDMin***
  Max. write current @ VDD min
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::MaxWrCurrentVDDMax***
  Max. write current @ VDD max
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::DeviceSizeMul***
  Device size multiplier
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::EraseGrSize***
  Erase group size
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::EraseGrMul***
  Erase group size multiplier
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::WrProtectGrSize***
  Write protect group size
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::WrProtectGrEnable***
  Write protect group enable
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::ManDeflECC***
  Manufacturer default ECC
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::WrSpeedFact***
  Write speed factor

- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::MaxWrBlockLen***
  Max. write data block length
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::WriteBlockPaPartial***
  Partial blocks for write allowed
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::Reserved3***
  Reserved
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::ContentProtectAppli***
  Content protection application
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::FileFormatGroup***
  File format group
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::CopyFlag***
  Copy flag (OTP)
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::PermWrProtect***
  Permanent write protection
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::TempWrProtect***
  Temporary write protection
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::FileFormat***
  File format
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::ECC***
  ECC code
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::CSD_CRC***
  CSD CRC
- ***__IO uint8_t HAL_MMC_CardCSDTypeDef::Reserved4***
  Always 1

53.1.4 HAL_MMC_CardCIDTypeDef

HAL_MMC_CardCIDTypeDef is defined in the stm32h7xx_hal_mmc.h

Data Fields

- ***__IO uint8_t HAL_MMC_CardCIDTypeDef::CID_CRC***
  CID CRC
- ***__IO uint8_t HAL_MMC_CardCIDTypeDef::Reserved2***
  Always 1

53.2 MMC Firmware driver API description

The following section lists the various functions of the MMC library.

53.2.1 How to use this driver

This driver implements a high level communication layer for read and write from/to this memory. The needed STM32 hardware resources (SDMMC and GPIO) are performed by the user in HAL_MMC_MspInit() function (MSP layer). Basically, the MSP layer configuration should be the same as we provide in the examples. You can easily tailor this configuration according to hardware resources.

This driver is a generic layered driver for SDMMC memories which uses the HAL SDMMC driver functions to interface with MMC and eMMC cards devices. It is used as follows:

1. Initialize the SDMMC low level resources by implement the HAL_MMC_MspInit() API:
   a. Enable the SDMMC interface clock using __HAL_RCC_SDMMC_CLK_ENABLE();
   b. SDMMC pins configuration for MMC card
      - Enable the clock for the SDMMC GPIOs using the functions __HAL_RCC_GPIOx_CLK_ENABLE();
      - Configure these SDMMC pins as alternate function pull-up using HAL_GPIO_Init() and according to your pin assignment;
   c. NVIC configuration if you need to use interrupt process (HAL_MMC_ReadBlocks_IT() and HAL_MMC_WriteBlocks_IT() APIs).
      - Configure the SDMMC interrupt priorities using function HAL_NVIC_SetPriority();
      - Enable the NVIC SDMMC IRQs using function HAL_NVIC_EnableIRQ()
      - SDMMC interrupts are managed using the macros __HAL_MMC_ENABLE_IT() and __HAL_MMC_DISABLE_IT() inside the communication process.
      - SDMMC interrupts pending bits are managed using the macros __HAL_MMC_GET_IT() and __HAL_MMC_CLEAR_IT()
   d. No general propose DMA Configuration is needed, an Internal DMA for SDMMC Peripheral are used.
2. At this stage, you can perform MMC read/write/erase operations after MMC card initialization

MMC Card Initialization and configuration

To initialize the MMC Card, use the HAL_MMC_Init() function. It Initializes SDMMC Peripheral (STM32 side) and the MMC Card, and put it into StandBy State (Ready for data transfer). This function provide the following operations:

1. Initialize the SDMMC peripheral interface with default configuration. The initialization process is done at 400KHz. You can change or adapt this frequency by adjusting the "ClockDiv" field. The MMC Card frequency (SDMMC_CK) is computed as follows: SDMMC_CK = SDMMCCLK / (2 * ClockDiv) In initialization mode and according to the MMC Card standard, make sure that the SDMMC_CK frequency doesn't exceed 400KHz. This phase of initialization is done through SDMMC_Init() and SDMMC_PowerState_ON() SDMMC low level APIs.

2. Initialize the MMC card. The API used is HAL_MMC_InitCard(). This phase allows the card initialization and identification and check the MMC Card type (Standard Capacity or High Capacity) The initialization flow is compatible with MMC standard. This API (HAL_MMC_InitCard()) could be used also to reinitialize the card in case of plug-off plug-in.
3. Configure the MMC Card Data transfer frequency. By Default, the card transfer frequency by adjusting the "ClockDiv" field. In transfer mode and according to the MMC Card standard, make sure that the SDMMC_CK frequency doesn't exceed 25MHz and 100MHz in High-speed mode switch.
4. Select the corresponding MMC Card according to the address read with the step 2.
5. Configure the MMC Card in wide bus mode: 4-bits data.

MMC Card Read operation

- You can read from MMC card in polling mode by using function HAL_MMC_ReadBlocks(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state.
- You can read from MMC card in DMA mode by using function HAL_MMC_ReadBlocks_DMA(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state. You could also check the DMA transfer process through the MMC Rx interrupt event.
- You can read from MMC card in Interrupt mode by using function HAL_MMC_ReadBlocks_IT(). This function allows the read of 512 bytes blocks. You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state. You could also check the IT transfer process through the MMC Rx interrupt event.

MMC Card Write operation

- You can write to MMC card in polling mode by using function HAL_MMC_WriteBlocks(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state.
- You can write to MMC card in DMA mode by using function HAL_MMC_WriteBlocks_DMA(). This function support only 512-bytes block length (the block size should be chosen as 512 byte). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state. You could also check the DMA transfer process through the MMC Tx interrupt event.
- You can write to MMC card in Interrupt mode by using function HAL_MMC_WriteBlocks_IT(). This function allows the read of 512 bytes blocks. You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state. You could also check the IT transfer process through the MMC Tx interrupt event.

MMC card information

- To get MMC card information, you can use the function HAL_MMC_GetCardInfo(). It returns useful information about the MMC card such as block size, card type, block number ...

MMC card CSD register

- The HAL_MMC_GetCardCSD() API allows to get the parameters of the CSD register. Some of the CSD parameters are useful for card initialization and identification.

MMC card CID register

- The HAL_MMC_GetCardCID() API allows to get the parameters of the CID register. Some of the CID parameters are useful for card initialization and identification.

MMC HAL driver macros list

Below the list of most used macros in MMC HAL driver.

- __HAL_MMC_ENABLE_IT: Enable the MMC device interrupt
- __HAL_MMC_DISABLE_IT: Disable the MMC device interrupt
- __HAL_MMC_GET_FLAG:Check whether the specified MMC flag is set or not
- __HAL_MMC_CLEAR_FLAG: Clear the MMC's pending flags

Note: You can refer to the MMC HAL driver header file for more useful macros

Callback registration

The compilation define USE_HAL_MMC_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_MMC_RegisterCallback() to register a user callback, it allows to register following callbacks:

- TxCpltCallback : callback when a transmission transfer is completed.
- RxCpltCallback : callback when a reception transfer is completed.
- ErrorCallback : callback when error occurs.
- AbortCpltCallback : callback when abort is completed.
- Read_DMADblBuf0CpltCallback : callback when the DMA reception of first buffer is completed.
- Read_DMADblBuf1CpltCallback : callback when the DMA reception of second buffer is completed.
- Write_DMADblBuf0CpltCallback : callback when the DMA transmission of first buffer is completed.
- Write_DMADblBuf1CpltCallback : callback when the DMA transmission of second buffer is completed.
- MspInitCallback : MMC MspInit.
- MspDeInitCallback : MMC MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. Use function HAL_MMC_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. It allows to reset following callbacks:
- TxCpltCallback : callback when a transmission transfer is completed.
- RxCpltCallback : callback when a reception transfer is completed.
- ErrorCallback : callback when error occurs.
- AbortCpltCallback : callback when abort is completed.
- Read_DMADblBuf0CpltCallback : callback when the DMA reception of first buffer is completed.
- Read_DMADblBuf1CpltCallback : callback when the DMA reception of second buffer is completed.
- Write_DMADblBuf0CpltCallback : callback when the DMA transmission of first buffer is completed.
- Write_DMADblBuf1CpltCallback : callback when the DMA transmission of second buffer is completed.
- MspInitCallback : MMC MspInit.
- MspDeInitCallback : MMC MspDeInit. This function) takes as parameters the HAL peripheral handle and the Callback ID. By default, after the HAL_MMC_Init and if the state is HAL_MMC_STATE_RESET all callbacks are reset to the corresponding legacy weak (surcharged) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (surcharged) functions in the HAL_MMC_Init and HAL_MMC_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_MMC_Init and HAL_MMC_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/ unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_MMC_RegisterCallback before calling HAL_MMC_DeInit or HAL_MMC_Init function. When The compilation define USE_HAL_MMC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

53.2.2 Initialization and de-initialization functions

This section provides functions allowing to initialize/de-initialize the MMC card device to be ready for use.

This section contains the following APIs:

- *HAL_MMC_Init()*
- *HAL_MMC_InitCard()*
- *HAL_MMC_DeInit()*
- *HAL_MMC_MspInit()*
- *HAL_MMC_MspDeInit()*

53.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the data transfer from/to MMC card.

This section contains the following APIs:

- *HAL_MMC_ReadBlocks()*
- *HAL_MMC_WriteBlocks()*
- *HAL_MMC_ReadBlocks_IT()*
- *HAL_MMC_WriteBlocks_IT()*
- *HAL_MMC_ReadBlocks_DMA()*
- *HAL_MMC_WriteBlocks_DMA()*
- *HAL_MMC_Erase()*
- *HAL_MMC_IRQHandler()*
- *HAL_MMC_GetState()*
- *HAL_MMC_GetError()*
- *HAL_MMC_TxCpltCallback()*
- *HAL_MMC_RxCpltCallback()*
- *HAL_MMC_ErrorCallback()*
- *HAL_MMC_AbortCallback()*
- *HAL_MMC_RegisterCallback()*
- *HAL_MMC_UnRegisterCallback()*

53.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the MMC card operations and get the related information

This section contains the following APIs:

- *HAL_MMC_GetCardCID()*
- *HAL_MMC_GetCardCSD()*
- *HAL_MMC_GetCardInfo()*
- *HAL_MMC_GetCardExtCSD()*
- *HAL_MMC_ConfigWideBusOperation()*
- *HAL_MMC_ConfigSpeedBusOperation()*
- *HAL_MMC_GetCardState()*
- *HAL_MMC_Abort()*
- *HAL_MMC_Abort_IT()*
- *HAL_MMC_EraseSequence()*
- *HAL_MMC_Sanitize()*
- *HAL_MMC_ConfigSecRemovalType()*
- *HAL_MMC_GetSupportedSecRemovalType()*
- *HAL_MMC_SleepDevice()*
- *HAL_MMC_AwakeDevice()*

53.2.5 Detailed description of functions

HAL_MMC_Init

Function name

HAL_StatusTypeDef HAL_MMC_Init (MMC_HandleTypeDef * hmmc)

Function description

Initializes the MMC according to the specified parameters in the MMC_HandleTypeDef and create the associated handle.

Parameters

- **hmmc:** Pointer to the MMC handle

Return values

- **HAL:** status

HAL_MMC_InitCard

Function name

HAL_StatusTypeDef HAL_MMC_InitCard (MMC_HandleTypeDef * hmmc)

Function description

Initializes the MMC Card.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **HAL:** status

Notes

- This function initializes the MMC card. It could be used when a card re-initialization is needed.

HAL_MMC_DeInit

Function name

HAL_StatusTypeDef HAL_MMC_DeInit (MMC_HandleTypeDef * hmmc)

Function description

De-Initializes the MMC card.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **HAL:** status

HAL_MMC_MspInit

Function name

void HAL_MMC_MspInit (MMC_HandleTypeDef * hmmc)

Function description

Initializes the MMC MSP.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **None:**

HAL_MMC_MspDeInit

Function name

void HAL_MMC_MspDeInit (MMC_HandleTypeDef * hmmc)

Function description

De-Initialize MMC MSP.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **None:**

HAL_MMC_ReadBlocks

Function name

HAL_StatusTypeDef HAL_MMC_ReadBlocks (MMC_HandleTypeDef * hmmc, uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks, uint32_t Timeout)

Function description

Reads block(s) from a specified address in a card.

Parameters

- **hmmc:** Pointer to MMC handle
- **pData:** pointer to the buffer that will contain the received data
- **BlockAdd:** Block Address from where data is to be read
- **NumberOfBlocks:** Number of MMC blocks to read
- **Timeout:** Specify timeout value

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_WriteBlocks

Function name

HAL_StatusTypeDef HAL_MMC_WriteBlocks (MMC_HandleTypeDef * hmmc, const uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks, uint32_t Timeout)

Function description

Allows to write block(s) to a specified address in a card.

Parameters

- **hmmc:** Pointer to MMC handle
- **pData:** pointer to the buffer that will contain the data to transmit
- **BlockAdd:** Block Address where data will be written
- **NumberOfBlocks:** Number of MMC blocks to write
- **Timeout:** Specify timeout value

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_Erase

Function name

HAL_StatusTypeDef HAL_MMC_Erase (MMC_HandleTypeDef * hmmc, uint32_t BlockStartAdd, uint32_t BlockEndAdd)

Function description

Erases the specified memory area of the given MMC card.

Parameters

- **hmmc:** Pointer to MMC handle
- **BlockStartAdd:** Start Block address
- **BlockEndAdd:** End Block address

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_ReadBlocks_IT

Function name

HAL_StatusTypeDef HAL_MMC_ReadBlocks_IT (MMC_HandleTypeDef * hmmc, uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

Reads block(s) from a specified address in a card.

Parameters

- **hmmc:** Pointer to MMC handle
- **pData:** Pointer to the buffer that will contain the received data
- **BlockAdd:** Block Address from where data is to be read
- **NumberOfBlocks:** Number of blocks to read.

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().
- You could also check the IT transfer process through the MMC Rx interrupt event.

HAL_MMC_WriteBlocks_IT

Function name

HAL_StatusTypeDef HAL_MMC_WriteBlocks_IT (MMC_HandleTypeDef * hmmc, const uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

Writes block(s) to a specified address in a card.

Parameters

- **hmmc:** Pointer to MMC handle
- **pData:** Pointer to the buffer that will contain the data to transmit
- **BlockAdd:** Block Address where data will be written
- **NumberOfBlocks:** Number of blocks to write

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().
- You could also check the IT transfer process through the MMC Tx interrupt event.

HAL_MMC_ReadBlocks_DMA

Function name

HAL_StatusTypeDef HAL_MMC_ReadBlocks_DMA (MMC_HandleTypeDef * hmmc, uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

Reads block(s) from a specified address in a card.

Parameters

- **hmmc:** Pointer MMC handle
- **pData:** Pointer to the buffer that will contain the received data
- **BlockAdd:** Block Address from where data is to be read
- **NumberOfBlocks:** Number of blocks to read.

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().
- You could also check the DMA transfer process through the MMC Rx interrupt event.

HAL_MMC_WriteBlocks_DMA

Function name

HAL_StatusTypeDef HAL_MMC_WriteBlocks_DMA (MMC_HandleTypeDef * hmmc, const uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

Writes block(s) to a specified address in a card.

Parameters

- **hmmc:** Pointer to MMC handle
- **pData:** Pointer to the buffer that will contain the data to transmit
- **BlockAdd:** Block Address where data will be written
- **NumberOfBlocks:** Number of blocks to write

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().
- You could also check the DMA transfer process through the MMC Tx interrupt event.

HAL_MMC_IRQHandler

Function name

void HAL_MMC_IRQHandler (MMC_HandleTypeDef * hmmc)

Function description

This function handles MMC card interrupt request.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **None:**

HAL_MMC_TxCpltCallback

Function name

void HAL_MMC_TxCpltCallback (MMC_HandleTypeDef * hmmc)

Function description

Tx Transfer completed callbacks.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **None:**

HAL_MMC_RxCpltCallback

Function name

void HAL_MMC_RxCpltCallback (MMC_HandleTypeDef * hmmc)

Function description

Rx Transfer completed callbacks.

Parameters

- **hmmc:** Pointer MMC handle

Return values

- **None:**

HAL_MMC_ErrorCallback

Function name

void HAL_MMC_ErrorCallback (MMC_HandleTypeDef * hmmc)

Function description

MMC error callbacks.

Parameters

- **hmmc:** Pointer MMC handle

Return values

- **None:**

HAL_MMC_AbortCallback

Function name

void HAL_MMC_AbortCallback (MMC_HandleTypeDef * hmmc)

Function description

MMC Abort callbacks.

Parameters

- **hmmc:** Pointer MMC handle

Return values

- **None:**

HAL_MMC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_MMC_RegisterCallback (MMC_HandleTypeDef * hmmc, HAL_MMC_CallbackIDTypeDef CallbackId, pMMC_CallbackTypeDef pCallback)

Function description

Register a User MMC Callback To be used instead of the weak (surcharged) predefined callback.

Parameters

- **hmmc:** : MMC handle
- **CallbackId:** : ID of the callback to be registered This parameter can be one of the following values:
  - HAL_MMC_TX_CPLT_CB_ID MMC Tx Complete Callback ID
  - HAL_MMC_RX_CPLT_CB_ID MMC Rx Complete Callback ID
  - HAL_MMC_ERROR_CB_ID MMC Error Callback ID
  - HAL_MMC_ABORT_CB_ID MMC Abort Callback ID
  - HAL_MMC_READ_DMA_DBL_BUF0_CPLT_CB_ID MMC DMA Rx Double buffer 0 Callback ID
  - HAL_MMC_READ_DMA_DBL_BUF1_CPLT_CB_ID MMC DMA Rx Double buffer 1 Callback ID
  - HAL_MMC_WRITE_DMA_DBL_BUF0_CPLT_CB_ID MMC DMA Tx Double buffer 0 Callback ID
  - HAL_MMC_WRITE_DMA_DBL_BUF1_CPLT_CB_ID MMC DMA Tx Double buffer 1 Callback ID
  - HAL_MMC_MSP_INIT_CB_ID MMC MspInit Callback ID
  - HAL_MMC_MSP_DEINIT_CB_ID MMC MspDeInit Callback ID
- **pCallback:** : pointer to the Callback function

Return values

- **status:**

Notes

- The HAL_MMC_RegisterCallback() may be called before HAL_MMC_Init() in HAL_MMC_STATE_RESET to register callbacks for HAL_MMC_MSP_INIT_CB_ID and HAL_MMC_MSP_DEINIT_CB_ID.

HAL_MMC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_MMC_UnRegisterCallback (MMC_HandleTypeDef * hmmc, HAL_MMC_CallbackIDTypeDef CallbackId)

Function description

Unregister a User MMC Callback MMC Callback is redirected to the weak (surcharged) predefined callback.

Parameters

- **hmmc:** : MMC handle
- **CallbackId:** : ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_MMC_TX_CPLT_CB_ID MMC Tx Complete Callback ID
  - HAL_MMC_RX_CPLT_CB_ID MMC Rx Complete Callback ID
  - HAL_MMC_ERROR_CB_ID MMC Error Callback ID
  - HAL_MMC_ABORT_CB_ID MMC Abort Callback ID
  - HAL_MMC_READ_DMA_DBL_BUF0_CPLT_CB_ID MMC DMA Rx Double buffer 0 Callback ID
  - HAL_MMC_READ_DMA_DBL_BUF1_CPLT_CB_ID MMC DMA Rx Double buffer 1 Callback ID
  - HAL_MMC_WRITE_DMA_DBL_BUF0_CPLT_CB_ID MMC DMA Tx Double buffer 0 Callback ID
  - HAL_MMC_WRITE_DMA_DBL_BUF1_CPLT_CB_ID MMC DMA Tx Double buffer 1 Callback ID
  - HAL_MMC_MSP_INIT_CB_ID MMC MspInit Callback ID
  - HAL_MMC_MSP_DEINIT_CB_ID MMC MspDeInit Callback ID

Return values

- **status:**

Notes

- The HAL_MMC_UnRegisterCallback() may be called before HAL_MMC_Init() in HAL_MMC_STATE_RESET to register callbacks for HAL_MMC_MSP_INIT_CB_ID and HAL_MMC_MSP_DEINIT_CB_ID.

HAL_MMC_ConfigWideBusOperation

Function name

HAL_StatusTypeDef HAL_MMC_ConfigWideBusOperation (MMC_HandleTypeDef * hmmc, uint32_t WideMode)

Function description

Enables wide bus operation for the requested card if supported by card.

Parameters

- **hmmc:** Pointer to MMC handle
- **WideMode:** Specifies the MMC card wide bus mode This parameter can be one of the following values:
  - SDMMC_BUS_WIDE_8B: 8-bit data transfer
  - SDMMC_BUS_WIDE_4B: 4-bit data transfer
  - SDMMC_BUS_WIDE_1B: 1-bit data transfer

Return values

- **HAL:** status

HAL_MMC_ConfigSpeedBusOperation

Function name

HAL_StatusTypeDef HAL_MMC_ConfigSpeedBusOperation (MMC_HandleTypeDef * hmmc, uint32_t SpeedMode)

Function description

Configure the speed bus mode.

Parameters

- **hmmc:** Pointer to the MMC handle
- **SpeedMode:** Specifies the MMC card speed bus mode This parameter can be one of the following values:
  - SDMMC_SPEED_MODE_AUTO: Max speed mode supported by the card
  - SDMMC_SPEED_MODE_DEFAULT: Default Speed (MMC @ 26MHz)
  - SDMMC_SPEED_MODE_HIGH: High Speed (MMC @ 52 MHz)
  - SDMMC_SPEED_MODE_DDR: High Speed DDR (MMC DDR @ 52 MHz)

Return values

- **HAL:** status

HAL_MMC_GetCardState

Function name

HAL_MMC_CardStateTypeDef HAL_MMC_GetCardState (MMC_HandleTypeDef * hmmc)

Function description

Gets the current mmc card data state.

Parameters

- **hmmc:** pointer to MMC handle

Return values

- **Card:** state

HAL_MMC_GetCardCID

Function name

HAL_StatusTypeDef HAL_MMC_GetCardCID (MMC_HandleTypeDef * hmmc, HAL_MMC_CardCIDTypeDef * pCID)

Function description

Returns information the information of the card which are stored on the CID register.

Parameters

- **hmmc:** Pointer to MMC handle
- **pCID:** Pointer to a HAL_MMC_CIDTypedef structure that contains all CID register parameters

Return values

- **HAL:** status

HAL_MMC_GetCardCSD

Function name

HAL_StatusTypeDef HAL_MMC_GetCardCSD (MMC_HandleTypeDef * hmmc, HAL_MMC_CardCSDTypeDef * pCSD)

Function description

Returns information the information of the card which are stored on the CSD register.

Parameters

- **hmmc:** Pointer to MMC handle
- **pCSD:** Pointer to a HAL_MMC_CardCSDTypeDef structure that contains all CSD register parameters

Return values

- **HAL:** status

HAL_MMC_GetCardInfo

Function name

HAL_StatusTypeDef HAL_MMC_GetCardInfo (MMC_HandleTypeDef * hmmc, HAL_MMC_CardInfoTypeDef * pCardInfo)

Function description

Gets the MMC card info.

Parameters

- **hmmc:** Pointer to MMC handle
- **pCardInfo:** Pointer to the HAL_MMC_CardInfoTypeDef structure that will contain the MMC card status information

Return values

- **HAL:** status

HAL_MMC_GetCardExtCSD

Function name

HAL_StatusTypeDef HAL_MMC_GetCardExtCSD (MMC_HandleTypeDef * hmmc, uint32_t * pExtCSD, uint32_t Timeout)

Function description

Returns information the information of the card which are stored on the Extended CSD register.

Parameters

- **hmmc:** Pointer to MMC handle
- **pExtCSD:** Pointer to a memory area (512 bytes) that contains all Extended CSD register parameters
- **Timeout:** Specify timeout value

Return values

- **HAL:** status

HAL_MMC_GetState

Function name

HAL_MMC_StateTypeDef HAL_MMC_GetState (MMC_HandleTypeDef * hmmc)

Function description

return the MMC state

Parameters

- **hmmc:** Pointer to mmc handle

Return values

- **HAL:** state

HAL_MMC_GetError

Function name

uint32_t HAL_MMC_GetError (MMC_HandleTypeDef * hmmc)

Function description

Return the MMC error code.

Parameters

- **hmmc:** : Pointer to a MMC_HandleTypeDef structure that contains the configuration information.

Return values

- **MMC:** Error Code

HAL_MMC_Abort

Function name

HAL_StatusTypeDef HAL_MMC_Abort (MMC_HandleTypeDef * hmmc)

Function description

Abort the current transfer and disable the MMC.

Parameters

- **hmmc:** pointer to a MMC_HandleTypeDef structure that contains the configuration information for MMC module.

Return values

- **HAL:** status

HAL_MMC_Abort_IT

Function name

HAL_StatusTypeDef HAL_MMC_Abort_IT (MMC_HandleTypeDef * hmmc)

Function description

Abort the current transfer and disable the MMC (IT mode).

Parameters

- **hmmc:** pointer to a MMC_HandleTypeDef structure that contains the configuration information for MMC module.

Return values

- **HAL:** status

HAL_MMC_EraseSequence

Function name

HAL_StatusTypeDef HAL_MMC_EraseSequence (MMC_HandleTypeDef * hmmc, uint32_t EraseType, uint32_t BlockStartAdd, uint32_t BlockEndAdd)

Function description

Perform specific commands sequence for the different type of erase.

Parameters

- **hmmc:** Pointer to MMC handle
- **EraseType:** Specifies the type of erase to be performed This parameter can be one of the following values:
  - HAL_MMC_TRIM Erase the write blocks identified by CMD35 & 36
  - HAL_MMC_ERASE Erase the erase groups identified by CMD35 & 36
  - HAL_MMC_DISCARD Discard the write blocks identified by CMD35 & 36
  - HAL_MMC_SECURE_ERASE Perform a secure purge according SRT on the erase groups identified by CMD35 & 36
  - HAL_MMC_SECURE_TRIM_STEP1 Mark the write blocks identified by CMD35 & 36 for secure erase
  - HAL_MMC_SECURE_TRIM_STEP2 Perform a secure purge according SRT on the write blocks previously identified
- **BlockStartAdd:** Start Block address
- **BlockEndAdd:** End Block address

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_Sanitize

Function name

HAL_StatusTypeDef HAL_MMC_Sanitize (MMC_HandleTypeDef * hmmc)

Function description

Perform sanitize operation on the device.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_ConfigSecRemovalType

Function name

HAL_StatusTypeDef HAL_MMC_ConfigSecRemovalType (MMC_HandleTypeDef * hmmc, uint32_t SRTMode)

Function description

Configure the Secure Removal Type (SRT) in the Extended CSD register.

Parameters

- **hmmc:** Pointer to MMC handle
- **SRTMode:** Specifies the type of erase to be performed This parameter can be one of the following values:
  - HAL_MMC_SRT_ERASE Information removed by an erase
  - HAL_MMC_SRT_WRITE_CHAR_ERASE Information removed by an overwriting with a character followed by an erase
  - HAL_MMC_SRT_WRITE_CHAR_COMPL_RANDOM Information removed by an overwriting with a character, its complement then a random character
  - HAL_MMC_SRT_VENDOR_DEFINED Information removed using a vendor defined

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_GetSupportedSecRemovalType

Function name

HAL_StatusTypeDef HAL_MMC_GetSupportedSecRemovalType (MMC_HandleTypeDef * hmmc, uint32_t * SupportedSRT)

Function description

Gets the supported values of the the Secure Removal Type (SRT).

Parameters

- **hmmc:** pointer to MMC handle
- **SupportedSRT:** pointer for supported SRT value This parameter is a bit field of the following values:
  - HAL_MMC_SRT_ERASE Information removed by an erase
  - HAL_MMC_SRT_WRITE_CHAR_ERASE Information removed by an overwriting with a character followed by an erase
  - HAL_MMC_SRT_WRITE_CHAR_COMPL_RANDOM Information removed by an overwriting with a character, its complement then a random character
  - HAL_MMC_SRT_VENDOR_DEFINED Information removed using a vendor defined

Return values

- **HAL:** status

HAL_MMC_SleepDevice

Function name

HAL_StatusTypeDef HAL_MMC_SleepDevice (MMC_HandleTypeDef * hmmc)

Function description

Switch the device from Standby State to Sleep State.

Parameters

- **hmmc:** pointer to MMC handle

Return values

- **HAL:** status

HAL_MMC_AwakeDevice

Function name

HAL_StatusTypeDef HAL_MMC_AwakeDevice (MMC_HandleTypeDef * hmmc)

Function description

Switch the device from Sleep State to Standby State.

Parameters

- **hmmc:** pointer to MMC handle

Return values

- **HAL:** status

53.3 MMC Firmware driver defines

The following section lists the various define and macros of the module.

53.3.1 MMC

MMC

MMC Error status enumeration Structure definition

HAL_MMC_ERROR_NONE

No error

HAL_MMC_ERROR_CMD_CRC_FAIL

Command response received (but CRC check failed)

HAL_MMC_ERROR_DATA_CRC_FAIL

Data block sent/received (CRC check failed)

HAL_MMC_ERROR_CMD_RSP_TIMEOUT

Command response timeout

HAL_MMC_ERROR_DATA_TIMEOUT

Data timeout

HAL_MMC_ERROR_TX_UNDERRUN

Transmit FIFO underrun

HAL_MMC_ERROR_RX_OVERRUN

Receive FIFO overrun

HAL_MMC_ERROR_ADDR_MISALIGNED

Misaligned address

HAL_MMC_ERROR_BLOCK_LEN_ERR

Transferred block length is not allowed for the card or the number of transferred bytes does not match the block length

HAL_MMC_ERROR_ERASE_SEQ_ERR

An error in the sequence of erase command occurs

HAL_MMC_ERROR_BAD_ERASE_PARAM

An invalid selection for erase groups

HAL_MMC_ERROR_WRITE_PROT_VIOLATION

Attempt to program a write protect block

HAL_MMC_ERROR_LOCK_UNLOCK_FAILED

Sequence or password error has been detected in unlock command or if there was an attempt to access a locked card

HAL_MMC_ERROR_COM_CRC_FAILED

CRC check of the previous command failed

HAL_MMC_ERROR_ILLEGAL_CMD

Command is not legal for the card state

HAL_MMC_ERROR_CARD_ECC_FAILED

Card internal ECC was applied but failed to correct the data

HAL_MMC_ERROR_CC_ERR

Internal card controller error

HAL_MMC_ERROR_GENERAL_UNKNOWN_ERR

General or unknown error

HAL_MMC_ERROR_STREAM_READ_UNDERRUN

The card could not sustain data reading in stream rmode

HAL_MMC_ERROR_STREAM_WRITE_OVERRUN

The card could not sustain data programming in stream mode

HAL_MMC_ERROR_CID_CSD_OVERWRITE

CID/CSD overwrite error

HAL_MMC_ERROR_WP_ERASE_SKIP

Only partial address space was erased

HAL_MMC_ERROR_CARD_ECC_DISABLED

Command has been executed without using internal ECC

HAL_MMC_ERROR_ERASE_RESET

Erase sequence was cleared before executing because an out of erase sequence command was received

HAL_MMC_ERROR_AKE_SEQ_ERR

Error in sequence of authentication

HAL_MMC_ERROR_INVALID_VOLTRANGE

Error in case of invalid voltage range

HAL_MMC_ERROR_ADDR_OUT_OF_RANGE

Error when addressed block is out of range

HAL_MMC_ERROR_REQUEST_NOT_APPLICABLE

Error when command request is not applicable

HAL_MMC_ERROR_PARAM

the used parameter is not valid

HAL_MMC_ERROR_UNSUPPORTED_FEATURE

Error when feature is not insupported

HAL_MMC_ERROR_BUSY

Error when transfer process is busy

HAL_MMC_ERROR_DMA

Error while DMA transfer

HAL_MMC_ERROR_TIMEOUT

Timeout error

HAL_MMC_ERROR_INVALID_CALLBACK

Invalid callback error

MMC context enumeration

MMC_CONTEXT_NONE

None

MMC_CONTEXT_READ_SINGLE_BLOCK

Read single block operation

MMC_CONTEXT_READ_MULTIPLE_BLOCK

Read multiple blocks operation

MMC_CONTEXT_WRITE_SINGLE_BLOCK

Write single block operation

MMC_CONTEXT_WRITE_MULTIPLE_BLOCK

Write multiple blocks operation

MMC_CONTEXT_IT

Process in Interrupt mode

MMC_CONTEXT_DMA

Process in DMA mode

MMC Voltage mode

MMC_HIGH_VOLTAGE_RANGE

High voltage in byte mode

MMC_DUAL_VOLTAGE_RANGE

Dual voltage in byte mode

MMC_LOW_VOLTAGE_RANGE

Low voltage in byte mode

EMMC_HIGH_VOLTAGE_RANGE

High voltage in sector mode

EMMC_DUAL_VOLTAGE_RANGE

Dual voltage in sector mode

EMMC_LOW_VOLTAGE_RANGE

Low voltage in sector mode

MMC_INVALID_VOLTAGE_RANGE

MMC Memory Cards

MMC_LOW_CAPACITY_CARD

MMC Card Capacity <=2Gbytes

MMC_HIGH_CAPACITY_CARD

MMC Card Capacity >2Gbytes and <2Tbytes

MMC Erase Type

HAL_MMC_ERASE

Erase the erase groups identified by CMD35 & 36

HAL_MMC_TRIM

Erase the write blocks identified by CMD35 & 36

HAL_MMC_DISCARD

Discard the write blocks identified by CMD35 & 36

HAL_MMC_SECURE_ERASE

Perform a secure purge according SRT on the erase groups identified by CMD35 & 36

HAL_MMC_SECURE_TRIM_STEP1

Mark the write blocks identified by CMD35 & 36 for secure erase

HAL_MMC_SECURE_TRIM_STEP2

Perform a secure purge according SRT on the write blocks previously identified

IS_MMC_ERASE_TYPE

MMC Secure Removal Type

HAL_MMC_SRT_ERASE

Information removed by an erase

HAL_MMC_SRT_WRITE_CHAR_ERASE

Information removed by an overwriting with a character followed by an erase

HAL_MMC_SRT_WRITE_CHAR_COMPL_RANDOM

Information removed by an overwriting with a character, its complement then a random character

HAL_MMC_SRT_VENDOR_DEFINED

Information removed using a vendor defined

IS_MMC_SRT_TYPE

Exported Constants

MMC_BLOCKSIZE

Block size is 512 bytes

MMC Exported Macros

__HAL_MMC_RESET_HANDLE_STATE

Description:

- Reset MMC handle state.

Parameters:

- __HANDLE__: MMC Handle.

Return value:

- None

__HAL_MMC_ENABLE_IT

Description:

- Enable the MMC device interrupt.

Parameters:

- __HANDLE__: MMC Handle.
- __INTERRUPT__: specifies the SDMMC interrupt sources to be enabled. This parameter can be one or a combination of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SD I/O interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- None

__HAL_MMC_DISABLE_IT

Description:

- Disable the MMC device interrupt.

Parameters:

- __HANDLE__: MMC Handle.
- __INTERRUPT__: specifies the SDMMC interrupt sources to be disabled. This parameter can be one or a combination of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SD I/O interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- None

__HAL_MMC_GET_FLAG

Description:

- Check whether the specified MMC flag is set or not.

Parameters:

- __HANDLE__: MMC Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - SDMMC_FLAG_CCRCFAIL: Command response received (CRC check failed)
  - SDMMC_FLAG_DCRCFAIL: Data block sent/received (CRC check failed)
  - SDMMC_FLAG_CTIMEOUT: Command response timeout
  - SDMMC_FLAG_DTIMEOUT: Data timeout
  - SDMMC_FLAG_TXUNDERR: Transmit FIFO underrun error
  - SDMMC_FLAG_RXOVERR: Received FIFO overrun error
  - SDMMC_FLAG_CMDREND: Command response received (CRC check passed)
  - SDMMC_FLAG_CMDSENT: Command sent (no response required)
  - SDMMC_FLAG_DATAEND: Data end (data counter, DATACOUNT, is zero)
  - SDMMC_FLAG_DHOLD: Data transfer Hold
  - SDMMC_FLAG_DBCKEND: Data block sent/received (CRC check passed)
  - SDMMC_FLAG_DABORT: Data transfer aborted by CMD12
  - SDMMC_FLAG_DPSMACT: Data path state machine active
  - SDMMC_FLAG_CPSMACT: Command path state machine active
  - SDMMC_FLAG_TXFIFOHE: Transmit FIFO Half Empty
  - SDMMC_FLAG_RXFIFOHF: Receive FIFO Half Full
  - SDMMC_FLAG_TXFIFOF: Transmit FIFO full
  - SDMMC_FLAG_RXFIFOF: Receive FIFO full
  - SDMMC_FLAG_TXFIFOE: Transmit FIFO empty
  - SDMMC_FLAG_RXFIFOE: Receive FIFO empty
  - SDMMC_FLAG_BUSYD0: Inverted value of SDMMC_D0 line (Busy)
  - SDMMC_FLAG_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected
  - SDMMC_FLAG_SDIOIT: SD I/O interrupt received
  - SDMMC_FLAG_ACKFAIL: Boot Acknowledgment received
  - SDMMC_FLAG_ACKTIMEOUT: Boot Acknowledgment timeout
  - SDMMC_FLAG_VSWEND: Voltage switch critical timing section completion
  - SDMMC_FLAG_CKSTOP: SDMMC_CK stopped in Voltage switch procedure
  - SDMMC_FLAG_IDMATE: IDMA transfer error
  - SDMMC_FLAG_IDMABTC: IDMA buffer transfer complete

Return value:

- The: new state of MMC FLAG (SET or RESET).

__HAL_MMC_CLEAR_FLAG

Description:

- Clear the MMC's pending flags.

Parameters:

- __HANDLE__: MMC Handle.
- __FLAG__: specifies the flag to clear. This parameter can be one or a combination of the following values:
  - SDMMC_FLAG_CCRCFAIL: Command response received (CRC check failed)
  - SDMMC_FLAG_DCRCFAIL: Data block sent/received (CRC check failed)
  - SDMMC_FLAG_CTIMEOUT: Command response timeout
  - SDMMC_FLAG_DTIMEOUT: Data timeout
  - SDMMC_FLAG_TXUNDERR: Transmit FIFO underrun error
  - SDMMC_FLAG_RXOVERR: Received FIFO overrun error
  - SDMMC_FLAG_CMDREND: Command response received (CRC check passed)
  - SDMMC_FLAG_CMDSENT: Command sent (no response required)
  - SDMMC_FLAG_DATAEND: Data end (data counter, DATACOUNT, is zero)
  - SDMMC_FLAG_DHOLD: Data transfer Hold
  - SDMMC_FLAG_DBCKEND: Data block sent/received (CRC check passed)
  - SDMMC_FLAG_DABORT: Data transfer aborted by CMD12
  - SDMMC_FLAG_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected
  - SDMMC_FLAG_SDIOIT: SD I/O interrupt received
  - SDMMC_FLAG_ACKFAIL: Boot Acknowledgment received
  - SDMMC_FLAG_ACKTIMEOUT: Boot Acknowledgment timeout
  - SDMMC_FLAG_VSWEND: Voltage switch critical timing section completion
  - SDMMC_FLAG_CKSTOP: SDMMC_CK stopped in Voltage switch procedure
  - SDMMC_FLAG_IDMATE: IDMA transfer error
  - SDMMC_FLAG_IDMABTC: IDMA buffer transfer complete

Return value:

- None

__HAL_MMC_GET_IT

Description:

- Check whether the specified MMC interrupt has occurred or not.

Parameters:

- __HANDLE__: MMC Handle.
- __INTERRUPT__: specifies the SDMMC interrupt source to check. This parameter can be one of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SD I/O interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- The: new state of MMC IT (SET or RESET).

__HAL_MMC_CLEAR_IT

Description:

- Clear the MMC's interrupt pending bits.

Parameters:

- __HANDLE__: MMC Handle.
- __INTERRUPT__: specifies the interrupt pending bit to clear. This parameter can be one or a combination of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SD I/O interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- None

MMC Card State enumeration structure

HAL_MMC_CARD_IDLE

Card is in idle state (can't be checked by CMD13)

HAL_MMC_CARD_READY

Card state is ready (can't be checked by CMD13)

HAL_MMC_CARD_IDENTIFICATION

Card is in identification state (can't be checked by CMD13)

HAL_MMC_CARD_STANDBY

Card is in standby state

HAL_MMC_CARD_TRANSFER

Card is in transfer state

HAL_MMC_CARD_SENDING

Card is sending an operation

HAL_MMC_CARD_RECEIVING

Card is receiving operation information

HAL_MMC_CARD_PROGRAMMING

Card is in programming state

HAL_MMC_CARD_DISCONNECTED

Card is disconnected

HAL_MMC_CARD_BUSTEST

Card is in bus test state

HAL_MMC_CARD_SLEEP

Card is in sleep state (can't be checked by CMD13)

HAL_MMC_CARD_ERROR

Card response Error (can't be checked by CMD13)

54 HAL MMC Extension Driver

54.1 MMCEx Firmware driver API description

The following section lists the various functions of the MMCEx library.

54.1.1 How to use this driver

The MMC Extension HAL driver can be used as follows:

- Configure Buffer0 and Buffer1 start address and Buffer size using HAL_MMCEx_ConfigDMAMultiBuffer() function.
- Start Read and Write for multibuffer mode using HAL_MMCEx_ReadBlocksDMAMultiBuffer() and HAL_MMCEx_WriteBlocksDMAMultiBuffer() functions.

54.1.2 Multibuffer functions

This section provides functions allowing to configure the multibuffer mode and start read and write multibuffer mode for MMC HAL driver.

This section contains the following APIs:

- *HAL_MMCEx_ConfigDMAMultiBuffer()*
- *HAL_MMCEx_ReadBlocksDMAMultiBuffer()*
- *HAL_MMCEx_WriteBlocksDMAMultiBuffer()*
- *HAL_MMCEx_ChangeDMABuffer()*
- *HAL_MMCEx_Read_DMADoubleBuf0CpltCallback()*
- *HAL_MMCEx_Read_DMADoubleBuf1CpltCallback()*
- *HAL_MMCEx_Write_DMADoubleBuf0CpltCallback()*
- *HAL_MMCEx_Write_DMADoubleBuf1CpltCallback()*

54.1.3 Detailed description of functions

HAL_MMCEx_ConfigDMAMultiBuffer

Function name

HAL_StatusTypeDef HAL_MMCEx_ConfigDMAMultiBuffer (MMC_HandleTypeDef * hmmc, uint32_t * pDataBuffer0, uint32_t * pDataBuffer1, uint32_t BufferSize)

Function description

Configure DMA Dual Buffer mode.

Parameters

- **hmmc:** MMC handle
- **pDataBuffer0:** Pointer to the buffer0 that will contain/receive the transferred data
- **pDataBuffer1:** Pointer to the buffer1 that will contain/receive the transferred data
- **BufferSize:** Size of Buffer0 in Blocks. Buffer0 and Buffer1 must have the same size.

Return values

- **HAL:** status

HAL_MMCEx_ReadBlocksDMAMultiBuffer

Function name

HAL_StatusTypeDef HAL_MMCEx_ReadBlocksDMAMultiBuffer (MMC_HandleTypeDef * hmmc, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

Reads block(s) from a specified address in a card.

Parameters

- **hmmc:** MMC handle
- **BlockAdd:** Block Address from where data is to be read
- **NumberOfBlocks:** Total number of blocks to read

Return values

- **HAL:** status

HAL_MMCEx_WriteBlocksDMAMultiBuffer

Function name

HAL_StatusTypeDef HAL_MMCEx_WriteBlocksDMAMultiBuffer (MMC_HandleTypeDef * hmmc, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

Write block(s) to a specified address in a card.

Parameters

- **hmmc:** MMC handle
- **BlockAdd:** Block Address from where data is to be read
- **NumberOfBlocks:** Total number of blocks to read

Return values

- **HAL:** status

HAL_MMCEx_ChangeDMABuffer

Function name

HAL_StatusTypeDef HAL_MMCEx_ChangeDMABuffer (MMC_HandleTypeDef * hmmc, HAL_MMCEx_DMABuffer_MemoryTypeDef Buffer, uint32_t * pDataBuffer)

Function description

Change the DMA Buffer0 or Buffer1 address on the fly.

Parameters

- **hmmc:** pointer to a MMC_HandleTypeDef structure.
- **Buffer:** the buffer to be changed, This parameter can be one of the following values: MMC_DMA_BUFFER0 or MMC_DMA_BUFFER1
- **pDataBuffer:** The new address

Return values

- **HAL:** status

Notes

- The BUFFER0 address can be changed only when the current transfer use BUFFER1 and the BUFFER1 address can be changed only when the current transfer use BUFFER0.

HAL_MMCEx_Read_DMADoubleBuf0CpltCallback

Function name

void HAL_MMCEx_Read_DMADoubleBuf0CpltCallback (MMC_HandleTypeDef * hmmc)

Function description

Read DMA Buffer 0 Transfer completed callbacks.

Parameters

- **hmmc:** MMC handle

Return values

- **None:**

HAL_MMCEx_Read_DMADoubleBuf1CpltCallback

Function name

void HAL_MMCEx_Read_DMADoubleBuf1CpltCallback (MMC_HandleTypeDef * hmmc)

Function description

Read DMA Buffer 1 Transfer completed callbacks.

Parameters

- **hmmc:** MMC handle

Return values

- **None:**

HAL_MMCEx_Write_DMADoubleBuf0CpltCallback

Function name

void HAL_MMCEx_Write_DMADoubleBuf0CpltCallback (MMC_HandleTypeDef * hmmc)

Function description

Write DMA Buffer 0 Transfer completed callbacks.

Parameters

- **hmmc:** MMC handle

Return values

- **None:**

HAL_MMCEx_Write_DMADoubleBuf1CpltCallback

Function name

void HAL_MMCEx_Write_DMADoubleBuf1CpltCallback (MMC_HandleTypeDef * hmmc)

Function description

Write DMA Buffer 1 Transfer completed callbacks.

Parameters

- **hmmc:** MMC handle

Return values

- **None:**

55 HAL NAND Generic Driver

55.1 NAND Firmware driver registers structures

55.1.1 NAND_IDTypeDef

NAND_IDTypeDef is defined in the stm32h7xx_hal_nand.h

Data Fields

- ***uint8_t Maker_Id***
- ***uint8_t Device_Id***
- ***uint8_t Third_Id***
- ***uint8_t Fourth_Id***

Field Documentation

- ***uint8_t NAND_IDTypeDef::Maker_Id***
- ***uint8_t NAND_IDTypeDef::Device_Id***
- ***uint8_t NAND_IDTypeDef::Third_Id***
- ***uint8_t NAND_IDTypeDef::Fourth_Id***

55.1.2 NAND_AddressTypeDef

NAND_AddressTypeDef is defined in the stm32h7xx_hal_nand.h

Data Fields

- ***uint16_t Page***
- ***uint16_t Plane***
- ***uint16_t Block***

Field Documentation

- ***uint16_t NAND_AddressTypeDef::Page***
  NAND memory Page address
- ***uint16_t NAND_AddressTypeDef::Plane***
  NAND memory Zone address
- ***uint16_t NAND_AddressTypeDef::Block***
  NAND memory Block address

55.1.3 NAND_DeviceConfigTypeDef

NAND_DeviceConfigTypeDef is defined in the stm32h7xx_hal_nand.h

Data Fields

- ***uint32_t PageSize***
- ***uint32_t SpareAreaSize***
- ***uint32_t BlockSize***
- ***uint32_t BlockNbr***
- ***uint32_t PlaneNbr***
- ***uint32_t PlaneSize***
- ***FunctionalState ExtraCommandEnable***

Field Documentation

- ***uint32_t NAND_DeviceConfigTypeDef::PageSize***
  NAND memory page (without spare area) size measured in bytes for 8 bits addressing or words for 16 bits addressing

- ***uint32_t NAND_DeviceConfigTypeDef::SpareAreaSize***
  NAND memory spare area size measured in bytes for 8 bits addressing or words for 16 bits addressing
- ***uint32_t NAND_DeviceConfigTypeDef::BlockSize***
  NAND memory block size measured in number of pages
- ***uint32_t NAND_DeviceConfigTypeDef::BlockNbr***
  NAND memory number of total blocks
- ***uint32_t NAND_DeviceConfigTypeDef::PlaneNbr***
  NAND memory number of planes
- ***uint32_t NAND_DeviceConfigTypeDef::PlaneSize***
  NAND memory zone size measured in number of blocks
- ***FunctionalState NAND_DeviceConfigTypeDef::ExtraCommandEnable***
  NAND extra command needed for Page reading mode. This parameter is mandatory for some NAND parts after the read command (NAND_CMD_AREA_TRUE1) and before DATA reading sequence. Example: Toshiba THTH58BYG3S0HBAI6. This parameter could be ENABLE or DISABLE Please check the Read Mode sequnece in the NAND device datasheet

55.1.4 __NAND_HandleTypeDef

__NAND_HandleTypeDef is defined in the stm32h7xx_hal_nand.h

Data Fields

- ***FMC_NAND_TypeDef * Instance***
- ***FMC_NAND_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_NAND_StateTypeDef State***
- ***NAND_DeviceConfigTypeDef Config***

- ***void(* __NAND_HandleTypeDef::MspDeInitCallback)(struct __NAND_HandleTypeDef *hnand)***
  NAND Msp DeInit callback
- ***void(* __NAND_HandleTypeDef::ItCallback)(struct __NAND_HandleTypeDef *hnand)***
  NAND IT callback

55.2 NAND Firmware driver API description

The following section lists the various functions of the NAND library.

55.2.1 How to use this driver

This driver is a generic layered driver which contains a set of APIs used to control NAND flash memories. It uses the FMC layer functions to interface with NAND devices. This driver is used as follows:

- NAND flash memory configuration sequence using the function HAL_NAND_Init() with control and timing parameters for both common and attribute spaces.
- Read NAND flash memory maker and device IDs using the function HAL_NAND_Read_ID(). The read information is stored in the NAND_ID_TypeDef structure declared by the function caller.
- Access NAND flash memory by read/write operations using the functions HAL_NAND_Read_Page_8b()/ HAL_NAND_Read_SpareArea_8b(), HAL_NAND_Write_Page_8b()/HAL_NAND_Write_SpareArea_8b(), HAL_NAND_Read_Page_16b()/HAL_NAND_Read_SpareArea_16b(), HAL_NAND_Write_Page_16b()/ HAL_NAND_Write_SpareArea_16b() to read/write page(s)/spare area(s). These functions use specific device information (Block, page size..) predefined by the user in the NAND_DeviceConfigTypeDef structure. The read/write address information is contained by the Nand_Address_Typedef structure passed as parameter.
- Perform NAND flash Reset chip operation using the function HAL_NAND_Reset().
- Perform NAND flash erase block operation using the function HAL_NAND_Erase_Block(). The erase block address information is contained in the Nand_Address_Typedef structure passed as parameter.
- Read the NAND flash status operation using the function HAL_NAND_Read_Status().
- You can also control the NAND device by calling the control APIs HAL_NAND_ECC_Enable()/ HAL_NAND_ECC_Disable() to respectively enable/disable the ECC code correction feature or the function HAL_NAND_GetECC() to get the ECC correction code.
- You can monitor the NAND device HAL state by calling the function HAL_NAND_GetState()

Note: This driver is a set of generic APIs which handle standard NAND flash operations. If a NAND flash device contains different operations and/or implementations, it should be implemented separately.

Callback registration

The compilation define USE_HAL_NAND_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_NAND_RegisterCallback() to register a user callback, it allows to register following callbacks:

- MspInitCallback : NAND MspInit.
- MspDeInitCallback : NAND MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. Use function HAL_NAND_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. It allows to reset following callbacks:
- MspInitCallback : NAND MspInit.
- MspDeInitCallback : NAND MspDeInit. This function) takes as parameters the HAL peripheral handle and the Callback ID. By default, after the HAL_NAND_Init and if the state is HAL_NAND_STATE_RESET all callbacks are reset to the corresponding legacy weak (surcharged) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (surcharged) functions in the HAL_NAND_Init and HAL_NAND_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_NAND_Init and HAL_NAND_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/ unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_NAND_RegisterCallback before calling HAL_NAND_DeInit or HAL_NAND_Init function. When The compilation define USE_HAL_NAND_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

55.2.2 NAND Initialization and de-initialization functions

This section provides functions allowing to initialize/de-initialize the NAND memory

This section contains the following APIs:

- ***HAL_NAND_Init()***
- ***HAL_NAND_DeInit()***
- ***HAL_NAND_MspInit()***
- ***HAL_NAND_MspDeInit()***
- ***HAL_NAND_IRQHandler()***

- *HAL_NAND_ITCallback()*
- *HAL_NAND_ConfigDevice()*
- *HAL_NAND_Read_ID()*

55.2.3 NAND Input and Output functions

This section provides functions allowing to use and control the NAND memory

This section contains the following APIs:

- *HAL_NAND_Read_ID()*
- *HAL_NAND_Reset()*
- *HAL_NAND_ConfigDevice()*
- *HAL_NAND_Read_Page_8b()*
- *HAL_NAND_Read_Page_16b()*
- *HAL_NAND_Write_Page_8b()*
- *HAL_NAND_Write_Page_16b()*
- *HAL_NAND_Read_SpareArea_8b()*
- *HAL_NAND_Read_SpareArea_16b()*
- *HAL_NAND_Write_SpareArea_8b()*
- *HAL_NAND_Write_SpareArea_16b()*
- *HAL_NAND_Erase_Block()*
- *HAL_NAND_Address_Inc()*
- *HAL_NAND_RegisterCallback()*
- *HAL_NAND_UnRegisterCallback()*

55.2.4 NAND Control functions

This subsection provides a set of functions allowing to control dynamically the NAND interface.

This section contains the following APIs:

- *HAL_NAND_ECC_Enable()*
- *HAL_NAND_ECC_Disable()*
- *HAL_NAND_GetECC()*

55.2.5 NAND State functions

This subsection permits to get in run-time the status of the NAND controller and the data flow.

This section contains the following APIs:

- *HAL_NAND_GetState()*
- *HAL_NAND_Read_Status()*

55.2.6 Detailed description of functions

HAL_NAND_Init

Function name

HAL_StatusTypeDef HAL_NAND_Init (NAND_HandleTypeDef * hnand, FMC_NAND_PCC_TimingTypeDef * ComSpace_Timing, FMC_NAND_PCC_TimingTypeDef * AttSpace_Timing)

Function description

Perform NAND memory Initialization sequence.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **ComSpace_Timing:** pointer to Common space timing structure
- **AttSpace_Timing:** pointer to Attribute space timing structure

Return values

- **HAL:** status

HAL_NAND_DeInit

Function name

HAL_StatusTypeDef HAL_NAND_DeInit (NAND_HandleTypeDef * hnand)

Function description

Perform NAND memory De-Initialization sequence.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** status

HAL_NAND_ConfigDevice

Function name

HAL_StatusTypeDef HAL_NAND_ConfigDevice (NAND_HandleTypeDef * hnand, NAND_DeviceConfigTypeDef * pDeviceConfig)

Function description

Configure the device: Enter the physical parameters of the device.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pDeviceConfig:** pointer to NAND_DeviceConfigTypeDef structure

Return values

- **HAL:** status

HAL_NAND_Read_ID

Function name

HAL_StatusTypeDef HAL_NAND_Read_ID (NAND_HandleTypeDef * hnand, NAND_IDTypeDef * pNAND_ID)

Function description

Read the NAND memory electronic signature.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pNAND_ID:** NAND ID structure

Return values

- **HAL:** status

HAL_NAND_MspInit

Function name

void HAL_NAND_MspInit (NAND_HandleTypeDef * hnand)

Function description

NAND MSP Init.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **None:**

HAL_NAND_MspDeInit

Function name

void HAL_NAND_MspDeInit (NAND_HandleTypeDef * hnand)

Function description

NAND MSP DeInit.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **None:**

HAL_NAND_IRQHandler

Function name

void HAL_NAND_IRQHandler (NAND_HandleTypeDef * hnand)

Function description

This function handles NAND device interrupt request.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** status

HAL_NAND_ITCallback

Function name

void HAL_NAND_ITCallback (NAND_HandleTypeDef * hnand)

Function description

NAND interrupt feature callback.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **None:**

HAL_NAND_Reset

Function name

HAL_StatusTypeDef HAL_NAND_Reset (NAND_HandleTypeDef * hnand)

Function description

NAND memory reset.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** status

HAL_NAND_Read_Page_8b

Function name

HAL_StatusTypeDef HAL_NAND_Read_Page_8b (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress, uint8_t * pBuffer, uint32_t NumPageToRead)

Function description

Read Page(s) from NAND memory block (8-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to destination read buffer
- **NumPageToRead:** number of pages to read from block

Return values

- **HAL:** status

HAL_NAND_Write_Page_8b

Function name

HAL_StatusTypeDef HAL_NAND_Write_Page_8b (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress, uint8_t * pBuffer, uint32_t NumPageToWrite)

Function description

Write Page(s) to NAND memory block (8-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write
- **NumPageToWrite:** number of pages to write to block

Return values

- **HAL:** status

HAL_NAND_Read_SpareArea_8b

Function name

HAL_StatusTypeDef HAL_NAND_Read_SpareArea_8b (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress, uint8_t * pBuffer, uint32_t NumSpareAreaToRead)

Function description

Read Spare area(s) from NAND memory (8-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write
- **NumSpareAreaToRead:** Number of spare area to read

Return values

- **HAL:** status

HAL_NAND_Write_SpareArea_8b

Function name

HAL_StatusTypeDef HAL_NAND_Write_SpareArea_8b (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress, uint8_t * pBuffer, uint32_t NumSpareAreaTowrite)

Function description

Write Spare area(s) to NAND memory (8-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write
- **NumSpareAreaTowrite:** number of spare areas to write to block

Return values

- **HAL:** status

HAL_NAND_Read_Page_16b

Function name

HAL_StatusTypeDef HAL_NAND_Read_Page_16b (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress, uint16_t * pBuffer, uint32_t NumPageToRead)

Function description

Read Page(s) from NAND memory block (16-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to destination read buffer. pBuffer should be 16bits aligned
- **NumPageToRead:** number of pages to read from block

Return values

- **HAL:** status

HAL_NAND_Write_Page_16b

Function name

HAL_StatusTypeDef HAL_NAND_Write_Page_16b (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress, uint16_t * pBuffer, uint32_t NumPageToWrite)

Function description

Write Page(s) to NAND memory block (16-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write. pBuffer should be 16bits aligned
- **NumPageToWrite:** number of pages to write to block

Return values

- **HAL:** status

HAL_NAND_Read_SpareArea_16b

Function name

HAL_StatusTypeDef HAL_NAND_Read_SpareArea_16b (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress, uint16_t * pBuffer, uint32_t NumSpareAreaToRead)

Function description

Read Spare area(s) from NAND memory (16-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write. pBuffer should be 16bits aligned.
- **NumSpareAreaToRead:** Number of spare area to read

Return values

- **HAL:** status

HAL_NAND_Write_SpareArea_16b

Function name

HAL_StatusTypeDef HAL_NAND_Write_SpareArea_16b (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress, uint16_t * pBuffer, uint32_t NumSpareAreaTowrite)

Function description

Write Spare area(s) to NAND memory (16-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write. pBuffer should be 16bits aligned.
- **NumSpareAreaTowrite:** number of spare areas to write to block

Return values

- **HAL:** status

HAL_NAND_Erase_Block

Function name

HAL_StatusTypeDef HAL_NAND_Erase_Block (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress)

Function description

NAND memory Block erase.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure

Return values

- **HAL:** status

HAL_NAND_Address_Inc

Function name

uint32_t HAL_NAND_Address_Inc (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress)

Function description

Increment the NAND memory address.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure

Return values

- **The:** new status of the increment address operation. It can be:
  - NAND_VALID_ADDRESS: When the new address is valid address
  - NAND_INVALID_ADDRESS: When the new address is invalid address

HAL_NAND_RegisterCallback

Function name

HAL_StatusTypeDef HAL_NAND_RegisterCallback (NAND_HandleTypeDef * hnand, HAL_NAND_CallbackIDTypeDef CallbackId, pNAND_CallbackTypeDef pCallback)

Function description

Register a User NAND Callback To be used instead of the weak (surcharged) predefined callback.

Parameters

- **hnand:** : NAND handle
- **CallbackId:** : ID of the callback to be registered This parameter can be one of the following values:
  - HAL_NAND_MSP_INIT_CB_ID NAND MspInit callback ID
  - HAL_NAND_MSP_DEINIT_CB_ID NAND MspDeInit callback ID
  - HAL_NAND_IT_CB_ID NAND IT callback ID
- **pCallback:** : pointer to the Callback function

Return values

- **status:**

HAL_NAND_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_NAND_UnRegisterCallback (NAND_HandleTypeDef * hnand, HAL_NAND_CallbackIDTypeDef CallbackId)

Function description

Unregister a User NAND Callback NAND Callback is redirected to the weak (surcharged) predefined callback.

Parameters

- **hnand:** : NAND handle
- **CallbackId:** : ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_NAND_MSP_INIT_CB_ID NAND MspInit callback ID
  - HAL_NAND_MSP_DEINIT_CB_ID NAND MspDeInit callback ID
  - HAL_NAND_IT_CB_ID NAND IT callback ID

Return values

- **status:**

HAL_NAND_ECC_Enable

Function name

HAL_StatusTypeDef HAL_NAND_ECC_Enable (NAND_HandleTypeDef * hnand)

Function description

Enables dynamically NAND ECC feature.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** status

HAL_NAND_ECC_Disable

Function name

HAL_StatusTypeDef HAL_NAND_ECC_Disable (NAND_HandleTypeDef * hnand)

Function description

Disables dynamically FMC_NAND ECC feature.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** status

HAL_NAND_GetECC

Function name

HAL_StatusTypeDef HAL_NAND_GetECC (NAND_HandleTypeDef * hnand, uint32_t * ECCval, uint32_t Timeout)

Function description

Disables dynamically NAND ECC feature.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **ECCval:** pointer to ECC value
- **Timeout:** maximum timeout to wait

Return values

- **HAL:** status

HAL_NAND_GetState

Function name

HAL_NAND_StateTypeDef HAL_NAND_GetState (NAND_HandleTypeDef * hnand)

Function description

return the NAND state

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** state

HAL_NAND_Read_Status

Function name

uint32_t HAL_NAND_Read_Status (NAND_HandleTypeDef * hnand)

Function description

NAND memory read status.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **NAND:** status

55.3 NAND Firmware driver defines

The following section lists the various define and macros of the module.

55.3.1 NAND

NAND

NAND Exported Macros

__HAL_NAND_RESET_HANDLE_STATE

Description:

- Reset NAND handle state.

Parameters:

- __HANDLE__: specifies the NAND handle.

Return value:

- None

56 HAL NOR Generic Driver

56.1 NOR Firmware driver registers structures

56.1.1 NOR_IDTypeDef

NOR_IDTypeDef is defined in the stm32h7xx_hal_nor.h

Data Fields

- ***uint16_t Manufacturer_Code***
- ***uint16_t Device_Code1***
- ***uint16_t Device_Code2***
- ***uint16_t Device_Code3***

Field Documentation

- ***uint16_t NOR_IDTypeDef::Manufacturer_Code***
  Defines the device's manufacturer code used to identify the memory
- ***uint16_t NOR_IDTypeDef::Device_Code1***
- ***uint16_t NOR_IDTypeDef::Device_Code2***
- ***uint16_t NOR_IDTypeDef::Device_Code3***
  Defines the device's codes used to identify the memory. These codes can be accessed by performing read operations with specific control signals and addresses set.They can also be accessed by issuing an Auto Select command

56.1.2 NOR_CFITypeDef

NOR_CFITypeDef is defined in the stm32h7xx_hal_nor.h

Data Fields

- ***uint16_t CFI_1***
- ***uint16_t CFI_2***
- ***uint16_t CFI_3***
- ***uint16_t CFI_4***

Field Documentation

- ***uint16_t NOR_CFITypeDef::CFI_1***
  < Defines the information stored in the memory's Common flash interface which contains a description of various electrical and timing parameters, density information and functions supported by the memory
- ***uint16_t NOR_CFITypeDef::CFI_2***
- ***uint16_t NOR_CFITypeDef::CFI_3***
- ***uint16_t NOR_CFITypeDef::CFI_4***

56.1.3 __NOR_HandleTypeDef

__NOR_HandleTypeDef is defined in the stm32h7xx_hal_nor.h

Data Fields

- ***FMC_NORSRAM_TypeDef * Instance***
- ***FMC_NORSRAM_EXTENDED_TypeDef * Extended***
- ***FMC_NORSRAM_InitTypeDef Init***

- ***uint32_t CommandSet***
- ***void(* MspInitCallback***

- ***void(* MspDeInitCallback***

Field Documentation

- ***FMC_NORSRAM_TypeDef* __NOR_HandleTypeDef::Instance***
  Register base address
- ***FMC_NORSRAM_EXTENDED_TypeDef* __NOR_HandleTypeDef::Extended***
  Extended mode register base address
- ***FMC_NORSRAM_InitTypeDef __NOR_HandleTypeDef::Init***
  NOR device control configuration parameters
- ***HAL_LockTypeDef __NOR_HandleTypeDef::Lock***
  NOR locking object
- ***__IO HAL_NOR_StateTypeDef __NOR_HandleTypeDef::State***
  NOR device access state
- ***uint32_t __NOR_HandleTypeDef::CommandSet***
  NOR algorithm command set and control
- ***void(* __NOR_HandleTypeDef::MspInitCallback)(struct __NOR_HandleTypeDef *hnor)***
  NOR Msp Init callback
- ***void(* __NOR_HandleTypeDef::MspDeInitCallback)(struct __NOR_HandleTypeDef *hnor)***
  NOR Msp DeInit callback

56.2 NOR Firmware driver API description

The following section lists the various functions of the NOR library.

56.2.1 How to use this driver

This driver is a generic layered driver which contains a set of APIs used to control NOR flash memories. It uses the FMC layer functions to interface with NOR devices. This driver is used as follows:

- NOR flash memory configuration sequence using the function HAL_NOR_Init() with control and timing parameters for both normal and extended mode.
- Read NOR flash memory manufacturer code and device IDs using the function HAL_NOR_Read_ID(). The read information is stored in the NOR_ID_TypeDef structure declared by the function caller.
- Access NOR flash memory by read/write data unit operations using the functions HAL_NOR_Read(), HAL_NOR_Program().
- Perform NOR flash erase block/chip operations using the functions HAL_NOR_Erase_Block() and HAL_NOR_Erase_Chip().
- Read the NOR flash CFI (common flash interface) IDs using the function HAL_NOR_Read_CFI(). The read information is stored in the NOR_CFI_TypeDef structure declared by the function caller.
- You can also control the NOR device by calling the control APIs HAL_NOR_WriteOperation_Enable()/ HAL_NOR_WriteOperation_Disable() to respectively enable/disable the NOR write operation
- You can monitor the NOR device HAL state by calling the function HAL_NOR_GetState()

Note: This driver is a set of generic APIs which handle standard NOR flash operations. If a NOR flash device contains different operations and/or implementations, it should be implemented separately.

NOR HAL driver macros list

Below the list of most used macros in NOR HAL driver.

- NOR_WRITE : NOR memory write data to specified address

Callback registration

The compilation define USE_HAL_NOR_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_NOR_RegisterCallback() to register a user callback, it allows to register following callbacks:

- MspInitCallback : NOR MspInit.

- MspDeInitCallback : NOR MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. Use function HAL_NOR_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. It allows to reset following callbacks:
- MspInitCallback : NOR MspInit.
- MspDeInitCallback : NOR MspDeInit. This function) takes as parameters the HAL peripheral handle and the Callback ID. By default, after the HAL_NOR_Init and if the state is HAL_NOR_STATE_RESET all callbacks are reset to the corresponding legacy weak (surcharged) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (surcharged) functions in the HAL_NOR_Init and HAL_NOR_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_NOR_Init and HAL_NOR_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/ unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_NOR_RegisterCallback before calling HAL_NOR_DeInit or HAL_NOR_Init function. When The compilation define USE_HAL_NOR_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

56.2.2 NOR Initialization and de_initialization functions

This section provides functions allowing to initialize/de-initialize the NOR memory

This section contains the following APIs:

- ***HAL_NOR_Init()***
- ***HAL_NOR_DeInit()***
- ***HAL_NOR_MspInit()***
- ***HAL_NOR_MspDeInit()***
- ***HAL_NOR_MspWait()***

56.2.3 NOR Input and Output functions

This section provides functions allowing to use and control the NOR memory

This section contains the following APIs:

- ***HAL_NOR_Read_ID()***
- ***HAL_NOR_ReturnToReadMode()***
- ***HAL_NOR_Read()***
- ***HAL_NOR_Program()***
- ***HAL_NOR_ReadBuffer()***
- ***HAL_NOR_ProgramBuffer()***
- ***HAL_NOR_Erase_Block()***
- ***HAL_NOR_Erase_Chip()***
- ***HAL_NOR_Read_CFI()***
- ***HAL_NOR_RegisterCallback()***
- ***HAL_NOR_UnRegisterCallback()***

56.2.4 NOR Control functions

This subsection provides a set of functions allowing to control dynamically the NOR interface.

This section contains the following APIs:

- ***HAL_NOR_WriteOperation_Enable()***
- ***HAL_NOR_WriteOperation_Disable()***

56.2.5 NOR State functions

This subsection permits to get in run-time the status of the NOR controller and the data flow.

This section contains the following APIs:

- *HAL_NOR_GetState()*
- *HAL_NOR_GetStatus()*

56.2.6 Detailed description of functions

HAL_NOR_Init

Function name

HAL_StatusTypeDef HAL_NOR_Init (NOR_HandleTypeDef * hnor, FMC_NORSRAM_TimingTypeDef * Timing, FMC_NORSRAM_TimingTypeDef * ExtTiming)

Function description

Perform the NOR memory Initialization sequence.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **Timing:** pointer to NOR control timing structure
- **ExtTiming:** pointer to NOR extended mode timing structure

Return values

- **HAL:** status

HAL_NOR_DeInit

Function name

HAL_StatusTypeDef HAL_NOR_DeInit (NOR_HandleTypeDef * hnor)

Function description

Perform NOR memory De-Initialization sequence.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **HAL:** status

HAL_NOR_MspInit

Function name

void HAL_NOR_MspInit (NOR_HandleTypeDef * hnor)

Function description

NOR MSP Init.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **None:**

HAL_NOR_MspDeInit

Function name

void HAL_NOR_MspDeInit (NOR_HandleTypeDef * hnor)

Function description

NOR MSP DeInit.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **None:**

HAL_NOR_MspWait

Function name

void HAL_NOR_MspWait (NOR_HandleTypeDef * hnor, uint32_t Timeout)

Function description

NOR MSP Wait for Ready/Busy signal.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **Timeout:** Maximum timeout value

Return values

- **None:**

HAL_NOR_Read_ID

Function name

HAL_StatusTypeDef HAL_NOR_Read_ID (NOR_HandleTypeDef * hnor, NOR_IDTypeDef * pNOR_ID)

Function description

Read NOR flash IDs.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **pNOR_ID:** pointer to NOR ID structure

Return values

- **HAL:** status

HAL_NOR_ReturnToReadMode

Function name

HAL_StatusTypeDef HAL_NOR_ReturnToReadMode (NOR_HandleTypeDef * hnor)

Function description

Returns the NOR memory to Read mode.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **HAL:** status

HAL_NOR_Read

Function name

HAL_StatusTypeDef HAL_NOR_Read (NOR_HandleTypeDef * hnor, uint32_t * pAddress, uint16_t * pData)

Function description

Read data from NOR memory.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **pAddress:** pointer to Device address
- **pData:** pointer to read data

Return values

- **HAL:** status

HAL_NOR_Program

Function name

HAL_StatusTypeDef HAL_NOR_Program (NOR_HandleTypeDef * hnor, uint32_t * pAddress, uint16_t * pData)

Function description

Program data to NOR memory.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **pAddress:** Device address
- **pData:** pointer to the data to write

Return values

- **HAL:** status

HAL_NOR_ReadBuffer

Function name

HAL_StatusTypeDef HAL_NOR_ReadBuffer (NOR_HandleTypeDef * hnor, uint32_t uwAddress, uint16_t * pData, uint32_t uwBufferSize)

Function description

Reads a half-word buffer from the NOR memory.

Parameters

- **hnor:** pointer to the NOR handle
- **uwAddress:** NOR memory internal address to read from.
- **pData:** pointer to the buffer that receives the data read from the NOR memory.
- **uwBufferSize:** number of Half word to read.

Return values

- **HAL:** status

HAL_NOR_ProgramBuffer

Function name

HAL_StatusTypeDef HAL_NOR_ProgramBuffer (NOR_HandleTypeDef * hnor, uint32_t uwAddress, uint16_t * pData, uint32_t uwBufferSize)

Function description

Writes a half-word buffer to the NOR memory.

Parameters

- **hnor:** pointer to the NOR handle
- **uwAddress:** NOR memory internal start write address
- **pData:** pointer to source data buffer.
- **uwBufferSize:** Size of the buffer to write

Return values

- **HAL:** status

HAL_NOR_Erase_Block

Function name

HAL_StatusTypeDef HAL_NOR_Erase_Block (NOR_HandleTypeDef * hnor, uint32_t BlockAddress, uint32_t Address)

Function description

Erase the specified block of the NOR memory.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **BlockAddress:** Block to erase address
- **Address:** Device address

Return values

- **HAL:** status

HAL_NOR_Erase_Chip

Function name

HAL_StatusTypeDef HAL_NOR_Erase_Chip (NOR_HandleTypeDef * hnor, uint32_t Address)

Function description

Erase the entire NOR chip.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **Address:** Device address

Return values

- **HAL:** status

HAL_NOR_Read_CFI

Function name

HAL_StatusTypeDef HAL_NOR_Read_CFI (NOR_HandleTypeDef * hnor, NOR_CFITypeDef * pNOR_CFI)

Function description

Read NOR flash CFI IDs.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **pNOR_CFI:** pointer to NOR CFI IDs structure

Return values

- **HAL:** status

HAL_NOR_RegisterCallback

Function name

HAL_StatusTypeDef HAL_NOR_RegisterCallback (NOR_HandleTypeDef * hnor, HAL_NOR_CallbackIDTypeDef CallbackId, pNOR_CallbackTypeDef pCallback)

Function description

Register a User NOR Callback To be used instead of the weak (surcharged) predefined callback.

Parameters

- **hnor:** : NOR handle
- **CallbackId:** : ID of the callback to be registered This parameter can be one of the following values:
  - HAL_NOR_MSP_INIT_CB_ID NOR MspInit callback ID
  - HAL_NOR_MSP_DEINIT_CB_ID NOR MspDeInit callback ID
- **pCallback:** : pointer to the Callback function

Return values

- **status:**

HAL_NOR_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_NOR_UnRegisterCallback (NOR_HandleTypeDef * hnor, HAL_NOR_CallbackIDTypeDef CallbackId)

Function description

Unregister a User NOR Callback NOR Callback is redirected to the weak (surcharged) predefined callback.

Parameters

- **hnor:** : NOR handle
- **CallbackId:** : ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_NOR_MSP_INIT_CB_ID NOR MspInit callback ID
  - HAL_NOR_MSP_DEINIT_CB_ID NOR MspDeInit callback ID

Return values

- **status:**

HAL_NOR_WriteOperation_Enable

Function name

HAL_StatusTypeDef HAL_NOR_WriteOperation_Enable (NOR_HandleTypeDef * hnor)

Function description

Enables dynamically NOR write operation.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **HAL:** status

HAL_NOR_WriteOperation_Disable

Function name

HAL_StatusTypeDef HAL_NOR_WriteOperation_Disable (NOR_HandleTypeDef * hnor)

Function description

Disables dynamically NOR write operation.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **HAL:** status

HAL_NOR_GetState

Function name

HAL_NOR_StateTypeDef HAL_NOR_GetState (NOR_HandleTypeDef * hnor)

Function description

return the NOR controller state

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **NOR:** controller state

HAL_NOR_GetStatus

Function name

HAL_NOR_StatusTypeDef HAL_NOR_GetStatus (NOR_HandleTypeDef * hnor, uint32_t Address, uint32_t Timeout)

Function description

Returns the NOR operation status.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **Address:** Device address
- **Timeout:** NOR programming Timeout

Return values

- **NOR_Status:** The returned value can be: HAL_NOR_STATUS_SUCCESS, HAL_NOR_STATUS_ERROR or HAL_NOR_STATUS_TIMEOUT

56.3 NOR Firmware driver defines

The following section lists the various define and macros of the module.

56.3.1 NOR

NOR

NOR Exported Macros

__HAL_NOR_RESET_HANDLE_STATE

Description:

- Reset NOR handle state.

Parameters:

- __HANDLE__: specifies the NOR handle.

Return value:

- None

57 HAL OPAMP Generic Driver

57.1 OPAMP Firmware driver registers structures

57.1.1 OPAMP_InitTypeDef

OPAMP_InitTypeDef is defined in the stm32h7xx_hal_opamp.h

Data Fields

- ***uint32_t PowerMode***
- ***uint32_t Mode***
- ***uint32_t InvertingInput***
- ***uint32_t NonInvertingInput***
- ***uint32_t PgaGain***
- ***uint32_t PgaConnect***
- ***uint32_t UserTrimming***
- ***uint32_t TrimmingValueP***
- ***uint32_t TrimmingValueN***
- ***uint32_t TrimmingValuePHighSpeed***
- ***uint32_t TrimmingValueNHighSpeed***

Field Documentation

- ***uint32_t OPAMP_InitTypeDef::PowerMode***

  Specifies the power mode Normal or High Speed. This parameter must be a value of ***OPAMP_PowerMode***
- ***uint32_t OPAMP_InitTypeDef::Mode***

  Specifies the OPAMP mode This parameter must be a value of ***OPAMP_Mode*** mode is either Standalone, - Follower or PGA
- ***uint32_t OPAMP_InitTypeDef::InvertingInput***

  Specifies the inverting input in Standalone & PGA modes
  - In Standalone mode i.e when mode is OPAMP_STANDALONE_MODE This parameter must be a value of ***OPAMP_InvertingInput***
  - In Follower mode i.e when mode is OPAMP_FOLLOWER_MODE & In PGA mode i.e when mode is OPAMP_PGA_MODE This parameter is Not Applicable
- ***uint32_t OPAMP_InitTypeDef::NonInvertingInput***

  Specifies the non inverting input of the opamp: This parameter must be a value of ***OPAMP_NonInvertingInput***
- ***uint32_t OPAMP_InitTypeDef::PgaGain***

  Specifies the gain in PGA mode i.e. when mode is OPAMP_PGA_MODE. This parameter must be a value of ***OPAMP_PgaGain***
- ***uint32_t OPAMP_InitTypeDef::PgaConnect***

  Specifies the inverting pin in PGA mode i.e. when mode is OPAMP_PGA_MODE This parameter must be a value of ***OPAMP_PgaConnect*** Either: not connected, connected to VINM0, connected to VINM1 (VINM0 or VINM1 are typically used for external filtering)
- ***uint32_t OPAMP_InitTypeDef::UserTrimming***

  Specifies the trimming mode This parameter must be a value of ***OPAMP_UserTrimming*** UserTrimming is either factory or user trimming.
- ***uint32_t OPAMP_InitTypeDef::TrimmingValueP***

  Specifies the offset trimming value (PMOS) in Normal Mode i.e. when UserTrimming is OPAMP_TRIMMING_USER. This parameter must be a number between Min_Data = 0 and Max_Data = 31. 16 is typical default value

- ***uint32_t OPAMP_InitTypeDef::TrimmingValueN***

  Specifies the offset trimming value (NMOS) in Normal Mode i.e. when UserTrimming is OPAMP_TRIMMING_USER. This parameter must be a number between Min_Data = 0 and Max_Data = 31. 16 is typical default value
- ***uint32_t OPAMP_InitTypeDef::TrimmingValuePHighSpeed***

  Specifies the offset trimming value (PMOS) in High Speed Mode i.e. when UserTrimming is OPAMP_TRIMMING_USER. This parameter must be a number between Min_Data = 0 and Max_Data = 31. 16 is typical default value
- ***uint32_t OPAMP_InitTypeDef::TrimmingValueNHighSpeed***

  Specifies the offset trimming value (NMOS) in High Speed Mode i.e. when UserTrimming is OPAMP_TRIMMING_USER. This parameter must be a number between Min_Data = 0 and Max_Data = 31. 16 is typical default value

57.1.2 __OPAMP_HandleTypeDef

__OPAMP_HandleTypeDef is defined in the stm32h7xx_hal_opamp.h

Data Fields

- ***OPAMP_TypeDef * Instance***
- ***OPAMP_InitTypeDef Init***
- ***HAL_StatusTypeDef Status***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_OPAMP_StateTypeDef State***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***OPAMP_TypeDef* __OPAMP_HandleTypeDef::Instance***

  OPAMP instance's registers base address
- ***OPAMP_InitTypeDef __OPAMP_HandleTypeDef::Init***

  OPAMP required parameters
- ***HAL_StatusTypeDef __OPAMP_HandleTypeDef::Status***

  OPAMP peripheral status
- ***HAL_LockTypeDef __OPAMP_HandleTypeDef::Lock***

  Locking object
- ***__IO HAL_OPAMP_StateTypeDef __OPAMP_HandleTypeDef::State***

  OPAMP communication state
- ***void(* __OPAMP_HandleTypeDef::MspInitCallback)(struct __OPAMP_HandleTypeDef *hopamp)***
- ***void(* __OPAMP_HandleTypeDef::MspDeInitCallback)(struct __OPAMP_HandleTypeDef *hopamp)***

57.2 OPAMP Firmware driver API description

The following section lists the various functions of the OPAMP library.

57.2.1 OPAMP Peripheral Features

The device integrates 2 operational amplifiers OPAMP1 & OPAMP2

1. The OPAMP(s) provides several exclusive running modes.
   - Standalone mode
   - Programmable Gain Amplifier (PGA) modes
   - Follower mode
2. Each OPAMP(s) can be configured in normal and high speed mode.

3. The OPAMP(s) provide(s) calibration capabilities.
   - Calibration aims at correcting some offset for running mode.
   - The OPAMP uses either factory calibration settings OR user defined calibration (trimming) settings (i.e. trimming mode).
   - The user defined settings can be figured out using self calibration handled by HAL_OPAMP_SelfCalibrate, HAL_OPAMPEx_SelfCalibrateAll
   - HAL_OPAMP_SelfCalibrate:
     - Runs automatically the calibration in 2 steps. (90% of VDDA for NMOS transistors, 10% of VDDA for PMOS transistors). (As OPAMP is Rail-to-rail input/output, these 2 steps calibration is appropriate and enough in most cases).
     - Runs automatically the calibration.
     - Enables the user trimming mode
     - Updates the init structure with trimming values with fresh calibration results. The user may store the calibration results for larger (ex monitoring the trimming as a function of temperature for instance)
     - HAL_OPAMPEx_SelfCalibrateAll runs calibration of all OPAMPs in parallel to save search time.
4. Running mode: Standalone mode
   - Gain is set externally (gain depends on external loads).
   - Follower mode also possible externally by connecting the inverting input to the output.
5. Running mode: Follower mode
   - No Inverting Input is connected.
6. Running mode: Programmable Gain Amplifier (PGA) mode (Resistor feedback output)
7. The OPAMP(s) output(s) can be internally connected to resistor feedback output.
8. OPAMP gain can be selected as :
   a. Gain of x2, x4, x8 or x16 for non inverting mode with:
      - VREF- referenced.
      - Filtering on VINM0, VREF- referenced.
      - VINM0 node for bias voltage and VINP0 for input signal.
      - VINM0 node for bias voltage and VINP0 for input signal, VINM1 node for filtering.
   b. Gain of x-1, x-3, x-7 or x-15 for inverting mode with:
      - VINM0 node for input signal and VINP0 for bias.
      - VINM0 node for input signal and VINP0 for bias voltage, VINM1 node for filtering.
9. The OPAMPs inverting input can be selected according to the Reference Manual "OPAMP functional description" chapter.
10. The OPAMPs non inverting input can be selected according to the Reference Manual "OPAMP functional description" chapter.

57.2.2 How to use this driver

High speed / normal power mode

To run in high speed mode:

1. Configure the OPAMP using HAL_OPAMP_Init() function:
   - Select OPAMP_POWERMODE_HIGHSPEED
   - Otherwise select OPAMP_POWERMODE_NORMAL

Calibration

To run the OPAMP calibration self calibration:

1. Start calibration using HAL_OPAMP_SelfCalibrate. Store the calibration results.

Running mode

To use the OPAMP, perform the following steps:

1. Fill in the HAL_OPAMP_MspInit() to
   – Enable the OPAMP Peripheral clock using macro __HAL_RCC_OPAMP_CLK_ENABLE()
   – Configure the OPAMP input AND output in analog mode using HAL_GPIO_Init() to map the OPAMP output to the GPIO pin.
2. Registrate Callbacks
   – The compilation define USE_HAL_OPAMP_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.
   – Use Functions HAL_OPAMP_RegisterCallback() to register a user callback, it allows to register following callbacks:
     ◦ MspInitCallback : OPAMP MspInit.
     ◦ MspDeInitCallback : OPAMP MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.
   – Use function HAL_OPAMP_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. It allows to reset following callbacks:
     ◦ MspInitCallback : OPAMP MspInit.
     ◦ MspDeInitCallback : OPAMP MspDeInit.
     ◦ All Callbacks
3. Configure the OPAMP using HAL_OPAMP_Init() function:
   – Select the mode
   – Select the inverting input
   – Select the non-inverting input
   – If PGA mode is enabled, Select if inverting input is connected.
   – Select either factory or user defined trimming mode.
   – If the user-defined trimming mode is enabled, select PMOS & NMOS trimming values (typically values set by HAL_OPAMP_SelfCalibrate function).
4. Enable the OPAMP using HAL_OPAMP_Start() function.
5. Disable the OPAMP using HAL_OPAMP_Stop() function.
6. Lock the OPAMP in running mode using HAL_OPAMP_Lock() function. Caution: On STM32H7, HAL OPAMP lock is software lock only (not hardware lock as on some other STM32 devices)
7. If needed, unlock the OPAMP using HAL_OPAMPEx_Unlock() function.

Running mode: change of configuration while OPAMP ON

To Re-configure OPAMP when OPAMP is ON (change on the fly)

1. If needed, fill in the HAL_OPAMP_MspInit()
   – This is the case for instance if you wish to use new OPAMP I/O
2. Configure the OPAMP using HAL_OPAMP_Init() function:
   – As in configure case, select first the parameters you wish to modify.
3. Change from high speed mode to normal power mode (& vice versa) requires first HAL_OPAMP_DeInit() (force OPAMP OFF) and then HAL_OPAMP_Init(). In other words, of OPAMP is ON, HAL_OPAMP_Init can NOT change power mode alone.

57.2.3 Initialization and de-initialization functions

This section contains the following APIs:

- ***HAL_OPAMP_Init()***
- ***HAL_OPAMP_DeInit()***
- ***HAL_OPAMP_MspInit()***
- ***HAL_OPAMP_MspDeInit()***

57.2.4 IO operation functions

This subsection provides a set of functions allowing to manage the OPAMP start, stop and calibration actions.

This section contains the following APIs:

- *HAL_OPAMP_Start()*
- *HAL_OPAMP_Stop()*
- *HAL_OPAMP_SelfCalibrate()*

57.2.5 Peripheral Control functions

This subsection provides a set of functions allowing to control the OPAMP data transfers.

This section contains the following APIs:

- *HAL_OPAMP_Lock()*
- *HAL_OPAMP_GetTrimOffset()*
- *HAL_OPAMP_RegisterCallback()*
- *HAL_OPAMP_UnRegisterCallback()*

57.2.6 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- *HAL_OPAMP_GetState()*

57.2.7 Detailed description of functions

HAL_OPAMP_Init

Function name

HAL_StatusTypeDef HAL_OPAMP_Init (OPAMP_HandleTypeDef * hopamp)

Function description

Initialize the OPAMP according to the specified parameters in the OPAMP_InitTypeDef and initialize the associated handle.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

Notes

- If the selected opamp is locked, initialization can't be performed. To unlock the configuration, perform a system reset.

HAL_OPAMP_DeInit

Function name

HAL_StatusTypeDef HAL_OPAMP_DeInit (OPAMP_HandleTypeDef * hopamp)

Function description

DeInitialize the OPAMP peripheral.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

Notes

- Deinitialization can be performed if the OPAMP configuration is locked. (the lock is SW in H7)

HAL_OPAMP_MspInit

Function name

void HAL_OPAMP_MspInit (OPAMP_HandleTypeDef * hopamp)

Function description

Initialize the OPAMP MSP.

Parameters

- **hopamp:** OPAMP handle

Return values

- **None:**

HAL_OPAMP_MspDeInit

Function name

void HAL_OPAMP_MspDeInit (OPAMP_HandleTypeDef * hopamp)

Function description

DeInitialize OPAMP MSP.

Parameters

- **hopamp:** OPAMP handle

Return values

- **None:**

HAL_OPAMP_Start

Function name

HAL_StatusTypeDef HAL_OPAMP_Start (OPAMP_HandleTypeDef * hopamp)

Function description

Start the OPAMP.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

HAL_OPAMP_Stop

Function name

HAL_StatusTypeDef HAL_OPAMP_Stop (OPAMP_HandleTypeDef * hopamp)

Function description

Stop the OPAMP.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

HAL_OPAMP_SelfCalibrate

Function name

HAL_StatusTypeDef HAL_OPAMP_SelfCalibrate (OPAMP_HandleTypeDef * hopamp)

Function description

Run the self calibration of one OPAMP.

Parameters

- **hopamp:** handle

Return values

- **Updated:** offset trimming values (PMOS & NMOS), user trimming is enabled
- **HAL:** status

Notes

- Calibration is performed in the mode specified in OPAMP init structure (mode normal or high-speed). To perform calibration for both modes, repeat this function twice after OPAMP init structure accordingly updated.

HAL_OPAMP_RegisterCallback

Function name

HAL_StatusTypeDef HAL_OPAMP_RegisterCallback (OPAMP_HandleTypeDef * hopamp, HAL_OPAMP_CallbackIDTypeDef CallbackId, pOPAMP_CallbackTypeDef pCallback)

Function description

Register a User OPAMP Callback To be used instead of the weak (surcharged) predefined callback.

Parameters

- **hopamp:** OPAMP handle
- **CallbackId:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_OPAMP_MSPINIT_CB_ID OPAMP MspInit callback ID
  - HAL_OPAMP_MSPDEINIT_CB_ID OPAMP MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

HAL_OPAMP_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_OPAMP_UnRegisterCallback (OPAMP_HandleTypeDef * hopamp, HAL_OPAMP_CallbackIDTypeDef CallbackId)

Function description

Unregister a User OPAMP Callback OPAMP Callback is redirected to the weak (surcharged) predefined callback.

Parameters

- **hopamp:** OPAMP handle
- **CallbackId:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_OPAMP_MSPINIT_CB_ID OPAMP MSP Init Callback ID
  - HAL_OPAMP_MSPDEINIT_CB_ID OPAMP MSP DeInit Callback ID
  - HAL_OPAMP_ALL_CB_ID OPAMP All Callbacks

Return values

- **status:**

HAL_OPAMP_Lock

Function name

HAL_StatusTypeDef HAL_OPAMP_Lock (OPAMP_HandleTypeDef * hopamp)

Function description

Lock the selected OPAMP configuration.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

Notes

- On STM32H7, HAL OPAMP lock is software lock only (in contrast of hardware lock available on some other STM32 devices)

HAL_OPAMP_GetTrimOffset

Function name

HAL_OPAMP_TrimmingValueTypeDef HAL_OPAMP_GetTrimOffset (OPAMP_HandleTypeDef * hopamp, uint32_t trimmingoffset)

Function description

Return the OPAMP factory trimming value.

Parameters

- **hopamp:** OPAMP handle
- **trimmingoffset:** Trimming offset (P or N) This parameter must be a value of OPAMP Factory Trimming

Return values

- **Trimming:** value (P or N): range: 0->31 or OPAMP_FACTORYTRIMMING_DUMMY if trimming value is not available

Notes

- On STM32H7 OPAMP, user can retrieve factory trimming if OPAMP has never been set to user trimming before. Therefore, this function must be called when OPAMP init parameter "UserTrimming" is set to trimming factory, and before OPAMP calibration (function "HAL_OPAMP_SelfCalibrate()"). Otherwise, factory trimming value cannot be retrieved and error status is returned.
- Calibration parameter retrieved is corresponding to the mode specified in OPAMP init structure (mode normal or high-speed). To retrieve calibration parameters for both modes, repeat this function after OPAMP init structure accordingly updated.

HAL_OPAMP_GetState

Function name

HAL_OPAMP_StateTypeDef HAL_OPAMP_GetState (OPAMP_HandleTypeDef * hopamp)

Function description

Return the OPAMP handle state.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** state

57.3 OPAMP Firmware driver defines

The following section lists the various define and macros of the module.

57.3.1 OPAMP

OPAMP

OPAMP Exported Macros

__HAL_OPAMP_RESET_HANDLE_STATE

Description:

- Reset OPAMP handle state.

Parameters:

- __HANDLE__: OPAMP handle.

Return value:

- None

OPAMP Factory Trimming

OPAMP_FACTORYTRIMMING_DUMMY

Dummy value if trimming value could not be retrieved

OPAMP_FACTORYTRIMMING_N

Offset trimming N

OPAMP_FACTORYTRIMMING_P

Offset trimming P

OPAMP Inverting Input

OPAMP_INVERTINGINPUT_IO0

OPAMP inverting input connected to dedicated IO pin

OPAMP_INVERTINGINPUT_IO1

OPAMP inverting input connected to dedicated IO pin

OPAMP Mode

OPAMP_STANDALONE_MODE

standalone mode

OPAMP_PGA_MODE

PGA mode

OPAMP_FOLLOWER_MODE

follower mode

OPAMP Non Inverting Input

OPAMP_NONINVERTINGINPUT_IO0

OPAMP non-inverting input connected to dedicated IO pin

OPAMP_NONINVERTINGINPUT_DAC_CH

OPAMP non-inverting input connected internally to DAC channel

OPAMP Pga Connect

OPAMP_PGA_CONNECT_INVERTINGINPUT_NO

In PGA mode, the inverting input is not connected

OPAMP_PGA_CONNECT_INVERTINGINPUT_IO0

In PGA mode, the inverting input is connected to VINM0

OPAMP_PGA_CONNECT_INVERTINGINPUT_IO0_BIAS

In PGA mode, the inverting input is connected to VINM0 or bias

OPAMP_PGA_CONNECT_INVERTINGINPUT_IO0_IO1_BIAS

In PGA mode, the inverting input is connected to VINM0 or bias , VINM1 connected for filtering

OPAMP Pga Gain

OPAMP_PGA_GAIN_2_OR_MINUS_1

PGA gain could be 2 or -1

OPAMP_PGA_GAIN_4_OR_MINUS_3

PGA gain could be 4 or -3

OPAMP_PGA_GAIN_8_OR_MINUS_7

PGA gain could be 8 or -7

OPAMP_PGA_GAIN_16_OR_MINUS_15

PGA gain could be 16 or -15

OPAMP PowerMode

OPAMP_POWERMODE_NORMAL

OPAMP_POWERMODE_HIGHSPEED

OPAMP User Trimming

OPAMP_TRIMMING_FACTORY

Factory trimming

OPAMP_TRIMMING_USER

User trimming

OPAMP VREF

OPAMP_VREF_3VDDA

OPAMP Vref = 3.3% VDDA

OPAMP_VREF_10VDDA

OPAMP Vref = 10% VDDA

OPAMP_VREF_50VDDA

OPAMP Vref = 50% VDDA

OPAMP_VREF_90VDDA

OPAMP Vref = 90% VDDA

58 HAL OPAMP Extension Driver

58.1 OPAMPEx Firmware driver API description

The following section lists the various functions of the OPAMPEx library.

58.1.1 Extended IO operation functions

- OPAMP Self calibration.

58.1.2 Peripheral Control functions

- OPAMP unlock.

This section contains the following APIs:

- ***HAL_OPAMPEx_Unlock()***

58.1.3 Detailed description of functions

HAL_OPAMPEx_SelfCalibrateAll

Function name

HAL_StatusTypeDef HAL_OPAMPEx_SelfCalibrateAll (OPAMP_HandleTypeDef * hopamp1, OPAMP_HandleTypeDef * hopamp2)

Function description

Run the self calibration of 2 OPAMPs in parallel.

Parameters

- **hopamp1:** handle
- **hopamp2:** handle

Return values

- **HAL:** status

Notes

- Trimming values (PMOS & NMOS) are updated and user trimming is enabled is calibration is successful.
- Calibration is performed in the mode specified in OPAMP init structure (mode normal or low power). To perform calibration for both modes, repeat this function twice after OPAMP init structure accordingly updated.

HAL_OPAMPEx_Unlock

Function name

HAL_StatusTypeDef HAL_OPAMPEx_Unlock (OPAMP_HandleTypeDef * hopamp)

Function description

Unlock the selected OPAMP configuration.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

Notes

- This function must be called only when OPAMP is in state "locked".

59 HAL OSPI Generic Driver

59.1 OSPI Firmware driver registers structures

59.1.1 OSPI_InitTypeDef

OSPI_InitTypeDef is defined in the stm32h7xx_hal_ospi.h

Data Fields

- ***uint32_t FifoThreshold***
- ***uint32_t DualQuad***
- ***uint32_t MemoryType***
- ***uint32_t DeviceSize***
- ***uint32_t ChipSelectHighTime***
- ***uint32_t FreeRunningClock***
- ***uint32_t ClockMode***
- ***uint32_t WrapSize***
- ***uint32_t ClockPrescaler***
- ***uint32_t SampleShifting***
- ***uint32_t DelayHoldQuarterCycle***
- ***uint32_t ChipSelectBoundary***
- ***uint32_t DelayBlockBypass***
- ***uint32_t MaxTran***
- ***uint32_t Refresh***

Field Documentation

- ***uint32_t OSPI_InitTypeDef::FifoThreshold***

  This is the threshold used by the Peripheral to generate the interrupt indicating that data are available in reception or free place is available in transmission. This parameter can be a value between 1 and 32
- ***uint32_t OSPI_InitTypeDef::DualQuad***

  It enables or not the dual-quad mode which allow to access up to quad mode on two different devices to increase the throughput. This parameter can be a value of ***OSPI_DualQuad***
- ***uint32_t OSPI_InitTypeDef::MemoryType***

  It indicates the external device type connected to the OSPI. This parameter can be a value of ***OSPI_MemoryType***
- ***uint32_t OSPI_InitTypeDef::DeviceSize***

  It defines the size of the external device connected to the OSPI, it corresponds to the number of address bits required to access the external device. This parameter can be a value between 1 and 32
- ***uint32_t OSPI_InitTypeDef::ChipSelectHighTime***

  It defines the minimum number of clocks which the chip select must remain high between commands. This parameter can be a value between 1 and 8
- ***uint32_t OSPI_InitTypeDef::FreeRunningClock***

  It enables or not the free running clock. This parameter can be a value of ***OSPI_FreeRunningClock***
- ***uint32_t OSPI_InitTypeDef::ClockMode***

  It indicates the level of clock when the chip select is released. This parameter can be a value of ***OSPI_ClockMode***
- ***uint32_t OSPI_InitTypeDef::WrapSize***

  It indicates the wrap-size corresponding the external device configuration. This parameter can be a value of ***OSPI_WrapSize***

- ***uint32_t OSPI_InitTypeDef::ClockPrescaler***
  It specifies the prescaler factor used for generating the external clock based on the AHB clock. This parameter can be a value between 1 and 256
- ***uint32_t OSPI_InitTypeDef::SampleShifting***
  It allows to delay to 1/2 cycle the data sampling in order to take in account external signal delays. This parameter can be a value of ***OSPI_SampleShifting***
- ***uint32_t OSPI_InitTypeDef::DelayHoldQuarterCycle***
  It allows to hold to 1/4 cycle the data. This parameter can be a value of ***OSPI_DelayHoldQuarterCycle***
- ***uint32_t OSPI_InitTypeDef::ChipSelectBoundary***
  It enables the transaction boundary feature and defines the boundary of bytes to release the chip select. This parameter can be a value between 0 and 31
- ***uint32_t OSPI_InitTypeDef::DelayBlockBypass***
  It enables the delay block bypass, so the sampling is not affected by the delay block. This parameter can be a value of ***OSPI_DelayBlockBypass***
- ***uint32_t OSPI_InitTypeDef::MaxTran***
  It enables the communication regulation feature. The chip select is released every MaxTran+1 bytes when the other OctoSPI request the access to the bus. This parameter can be a value between 0 and 255
- ***uint32_t OSPI_InitTypeDef::Refresh***
  It enables the refresh rate feature. The chip select is released every Refresh+1 clock cycles. This parameter can be a value between 0 and 0xFFFFFFFF

59.1.2 __OSPI_HandleTypeDef

__OSPI_HandleTypeDef is defined in the stm32h7xx_hal_ospi.h

Data Fields

- ***OCTOSPI_TypeDef * Instance***
- ***OSPI_InitTypeDef Init***
- ***uint8_t * pBuffPtr***
- ***__IO uint32_t XferSize***
- ***__IO uint32_t XferCount***
- ***MDMA_HandleTypeDef * hmdma***
- ***__IO uint32_t State***
- ***__IO uint32_t ErrorCode***
- ***uint32_t Timeout***
- ***void(* ErrorCallback***
- ***void(* AbortCpltCallback***
- ***void(* FifoThresholdCallback***
- ***void(* CmdCpltCallback***
- ***void(* RxCpltCallback***
- ***void(* TxCpltCallback***
- ***void(* RxHalfCpltCallback***
- ***void(* TxHalfCpltCallback***
- ***void(* StatusMatchCallback***
- ***void(* TimeOutCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***OCTOSPI_TypeDef* __OSPI_HandleTypeDef::Instance***
  OSPI registers base address
- ***OSPI_InitTypeDef __OSPI_HandleTypeDef::Init***
  OSPI initialization parameters

- ***uint8_t* __OSPI_HandleTypeDef::pBuffPtr***
  Address of the OSPI buffer for transfer
- ***__IO uint32_t __OSPI_HandleTypeDef::XferSize***
  Number of data to transfer
- ***__IO uint32_t __OSPI_HandleTypeDef::XferCount***
  Counter of data transferred
- ***MDMA_HandleTypeDef* __OSPI_HandleTypeDef::hmdma***
  Handle of the MDMA channel used for the transfer
- ***__IO uint32_t __OSPI_HandleTypeDef::State***
  Internal state of the OSPI HAL driver
- ***__IO uint32_t __OSPI_HandleTypeDef::ErrorCode***
  Error code in case of HAL driver internal error
- ***uint32_t __OSPI_HandleTypeDef::Timeout***
  Timeout used for the OSPI external device access
- ***void(* __OSPI_HandleTypeDef::ErrorCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::AbortCpltCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::FifoThresholdCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::CmdCpltCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::RxCpltCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::TxCpltCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::RxHalfCpltCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::TxHalfCpltCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::StatusMatchCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::TimeOutCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::MspInitCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::MspDeInitCallback)(struct __OSPI_HandleTypeDef *hospi)***

59.1.3 OSPI_RegularCmdTypeDef

OSPI_RegularCmdTypeDef is defined in the stm32h7xx_hal_ospi.h

Data Fields

- ***uint32_t OperationType***
- ***uint32_t FlashId***
- ***uint32_t Instruction***
- ***uint32_t InstructionMode***
- ***uint32_t InstructionSize***
- ***uint32_t InstructionDtrMode***
- ***uint32_t Address***
- ***uint32_t AddressMode***
- ***uint32_t AddressSize***
- ***uint32_t AddressDtrMode***
- ***uint32_t AlternateBytes***
- ***uint32_t AlternateBytesMode***
- ***uint32_t AlternateBytesSize***
- ***uint32_t AlternateBytesDtrMode***
- ***uint32_t DataMode***
- ***uint32_t NbData***
- ***uint32_t DataDtrMode***

- ***uint32_t DummyCycles***
- ***uint32_t DQSMode***
- ***uint32_t SIOOMode***

Field Documentation

- ***uint32_t OSPI_RegularCmdTypeDef::OperationType***

  It indicates if the configuration applies to the common registers or to the registers for the write operation (these registers are only used for memory-mapped mode). This parameter can be a value of ***OSPI_OperationType***
- ***uint32_t OSPI_RegularCmdTypeDef::FlashId***

  It indicates which external device is selected for this command (it applies only if Dualquad is disabled in the initialization structure). This parameter can be a value of ***OSPI_FlashID***
- ***uint32_t OSPI_RegularCmdTypeDef::Instruction***

  It contains the instruction to be sent to the device. This parameter can be a value between 0 and 0xFFFFFFFF
- ***uint32_t OSPI_RegularCmdTypeDef::InstructionMode***

  It indicates the mode of the instruction. This parameter can be a value of ***OSPI_InstructionMode***
- ***uint32_t OSPI_RegularCmdTypeDef::InstructionSize***

  It indicates the size of the instruction. This parameter can be a value of ***OSPI_InstructionSize***
- ***uint32_t OSPI_RegularCmdTypeDef::InstructionDtrMode***

  It enables or not the DTR mode for the instruction phase. This parameter can be a value of ***OSPI_InstructionDtrMode***
- ***uint32_t OSPI_RegularCmdTypeDef::Address***

  It contains the address to be sent to the device. This parameter can be a value between 0 and 0xFFFFFFFF
- ***uint32_t OSPI_RegularCmdTypeDef::AddressMode***

  It indicates the mode of the address. This parameter can be a value of ***OSPI_AddressMode***
- ***uint32_t OSPI_RegularCmdTypeDef::AddressSize***

  It indicates the size of the address. This parameter can be a value of ***OSPI_AddressSize***
- ***uint32_t OSPI_RegularCmdTypeDef::AddressDtrMode***

  It enables or not the DTR mode for the address phase. This parameter can be a value of ***OSPI_AddressDtrMode***
- ***uint32_t OSPI_RegularCmdTypeDef::AlternateBytes***

  It contains the alternate bytes to be sent to the device. This parameter can be a value between 0 and 0xFFFFFFFF
- ***uint32_t OSPI_RegularCmdTypeDef::AlternateBytesMode***

  It indicates the mode of the alternate bytes. This parameter can be a value of ***OSPI_AlternateBytesMode***
- ***uint32_t OSPI_RegularCmdTypeDef::AlternateBytesSize***

  It indicates the size of the alternate bytes. This parameter can be a value of ***OSPI_AlternateBytesSize***
- ***uint32_t OSPI_RegularCmdTypeDef::AlternateBytesDtrMode***

  It enables or not the DTR mode for the alternate bytes phase. This parameter can be a value of ***OSPI_AlternateBytesDtrMode***
- ***uint32_t OSPI_RegularCmdTypeDef::DataMode***

  It indicates the mode of the data. This parameter can be a value of ***OSPI_DataMode***
- ***uint32_t OSPI_RegularCmdTypeDef::NbData***

  It indicates the number of data transferred with this command. This field is only used for indirect mode. This parameter can be a value between 1 and 0xFFFFFFFF
- ***uint32_t OSPI_RegularCmdTypeDef::DataDtrMode***

  It enables or not the DTR mode for the data phase. This parameter can be a value of ***OSPI_DataDtrMode***
- ***uint32_t OSPI_RegularCmdTypeDef::DummyCycles***

  It indicates the number of dummy cycles inserted before data phase. This parameter can be a value between 0 and 31

- ***uint32_t OSPI_RegularCmdTypeDef::DQSMode***
  It enables or not the data strobe management. This parameter can be a value of ***OSPI_DQSMode***
- ***uint32_t OSPI_RegularCmdTypeDef::SIOOMode***
  It enables or not the SIOO mode. This parameter can be a value of ***OSPI_SIOOMode***

59.1.4 OSPI_HyperbusCfgTypeDef

OSPI_HyperbusCfgTypeDef is defined in the stm32h7xx_hal_ospi.h

Data Fields

- ***uint32_t RWRecoveryTime***
- ***uint32_t AccessTime***
- ***uint32_t WriteZeroLatency***
- ***uint32_t LatencyMode***

Field Documentation

- ***uint32_t OSPI_HyperbusCfgTypeDef::RWRecoveryTime***
  It indicates the number of cycles for the device read write recovery time. This parameter can be a value between 0 and 255
- ***uint32_t OSPI_HyperbusCfgTypeDef::AccessTime***
  It indicates the number of cycles for the device access time. This parameter can be a value between 0 and 255
- ***uint32_t OSPI_HyperbusCfgTypeDef::WriteZeroLatency***
  It enables or not the latency for the write access. This parameter can be a value of ***OSPI_WriteZeroLatency***
- ***uint32_t OSPI_HyperbusCfgTypeDef::LatencyMode***
  It configures the latency mode. This parameter can be a value of ***OSPI_LatencyMode***

59.1.5 OSPI_HyperbusCmdTypeDef

OSPI_HyperbusCmdTypeDef is defined in the stm32h7xx_hal_ospi.h

Data Fields

- ***uint32_t AddressSpace***
- ***uint32_t Address***
- ***uint32_t AddressSize***
- ***uint32_t NbData***
- ***uint32_t DQSMode***

Field Documentation

- ***uint32_t OSPI_HyperbusCmdTypeDef::AddressSpace***
  It indicates the address space accessed by the command. This parameter can be a value of ***OSPI_AddressSpace***
- ***uint32_t OSPI_HyperbusCmdTypeDef::Address***
  It contains the address to be sent tot he device. This parameter can be a value between 0 and 0xFFFFFFFF
- ***uint32_t OSPI_HyperbusCmdTypeDef::AddressSize***
  It indicates the size of the address. This parameter can be a value of ***OSPI_AddressSize***
- ***uint32_t OSPI_HyperbusCmdTypeDef::NbData***
  It indicates the number of data transferred with this command. This field is only used for indirect mode. This parameter can be a value between 1 and 0xFFFFFFFF In case of autopolling mode, this parameter can be any value between 1 and 4
- ***uint32_t OSPI_HyperbusCmdTypeDef::DQSMode***
  It enables or not the data strobe management. This parameter can be a value of ***OSPI_DQSMode***

59.1.6 OSPI_AutoPollingTypeDef

OSPI_AutoPollingTypeDef is defined in the stm32h7xx_hal_ospi.h

Data Fields

- ***uint32_t Match***
- ***uint32_t Mask***
- ***uint32_t MatchMode***
- ***uint32_t AutomaticStop***
- ***uint32_t Interval***

Field Documentation

- ***uint32_t OSPI_AutoPollingTypeDef::Match***

  Specifies the value to be compared with the masked status register to get a match. This parameter can be any value between 0 and 0xFFFFFFFF
- ***uint32_t OSPI_AutoPollingTypeDef::Mask***

  Specifies the mask to be applied to the status bytes received. This parameter can be any value between 0 and 0xFFFFFFFF
- ***uint32_t OSPI_AutoPollingTypeDef::MatchMode***

  Specifies the method used for determining a match. This parameter can be a value of ***OSPI_MatchMode***
- ***uint32_t OSPI_AutoPollingTypeDef::AutomaticStop***

  Specifies if automatic polling is stopped after a match. This parameter can be a value of ***OSPI_AutomaticStop***
- ***uint32_t OSPI_AutoPollingTypeDef::Interval***

  Specifies the number of clock cycles between two read during automatic polling phases. This parameter can be any value between 0 and 0xFFFF

59.1.7 OSPI_MemoryMappedTypeDef

OSPI_MemoryMappedTypeDef is defined in the stm32h7xx_hal_ospi.h

Data Fields

- ***uint32_t TimeOutActivation***
- ***uint32_t TimeOutPeriod***

Field Documentation

- ***uint32_t OSPI_MemoryMappedTypeDef::TimeOutActivation***

  Specifies if the timeout counter is enabled to release the chip select. This parameter can be a value of ***OSPI_TimeOutActivation***
- ***uint32_t OSPI_MemoryMappedTypeDef::TimeOutPeriod***

  Specifies the number of clock to wait when the FIFO is full before to release the chip select. This parameter can be any value between 0 and 0xFFFF

59.1.8 OSPIM_CfgTypeDef

OSPIM_CfgTypeDef is defined in the stm32h7xx_hal_ospi.h

Data Fields

- ***uint32_t ClkPort***
- ***uint32_t DQSPort***
- ***uint32_t NCSPort***
- ***uint32_t IOLowPort***
- ***uint32_t IOHighPort***
- ***uint32_t Req2AckTime***

Field Documentation

- ***uint32_t OSPIM_CfgTypeDef::ClkPort***

  It indicates which port of the OSPI IO Manager is used for the CLK pins. This parameter can be a value between 1 and 8
- ***uint32_t OSPIM_CfgTypeDef::DQSPort***

  It indicates which port of the OSPI IO Manager is used for the DQS pin. This parameter can be a value between 0 and 8, 0 means that signal not used

- ***uint32_t OSPIM_CfgTypeDef::NCSPort***
  It indicates which port of the OSPI IO Manager is used for the NCS pin. This parameter can be a value between 1 and 8
- ***uint32_t OSPIM_CfgTypeDef::IOLowPort***
  It indicates which port of the OSPI IO Manager is used for the IO[3:0] pins. This parameter can be a value of ***OSPIM_IOPort***
- ***uint32_t OSPIM_CfgTypeDef::IOHighPort***
  It indicates which port of the OSPI IO Manager is used for the IO[7:4] pins. This parameter can be a value of ***OSPIM_IOPort***
- ***uint32_t OSPIM_CfgTypeDef::Req2AckTime***
  It indicates the minimum switching duration (in number of clock cycles) expected if some signals are multiplexed in the OSPI IO Manager with the other OSPI. This parameter can be a value between 1 and 256

59.2 OSPI Firmware driver API description

The following section lists the various functions of the OSPI library.

59.2.1 How to use this driver

Initialization

As prerequisite, fill in the HAL_OSPI_MspInit() :

- Enable OctoSPI and OctoSPIM clocks interface with __HAL_RCC_OSPIx_CLK_ENABLE().
- Reset OctoSPI Peripheral with __HAL_RCC_OSPIx_FORCE_RESET() and __HAL_RCC_OSPIx_RELEASE_RESET().
- Enable the clocks for the OctoSPI GPIOS with __HAL_RCC_GPIOx_CLK_ENABLE().
- Configure these OctoSPI pins in alternate mode using HAL_GPIO_Init().
- If interrupt or DMA mode is used, enable and configure OctoSPI global interrupt with HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ().
- If DMA mode is used, enable the clocks for the OctoSPI DMA channel with __HAL_RCC_DMAx_CLK_ENABLE(), configure DMA with HAL_DMA_Init(), link it with OctoSPI handle using __HAL_LINKDMA(), enable and configure DMA channel global interrupt with HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ().

Configure the fifo threshold, the dual-quad mode, the memory type, the device size, the CS high time, the free running clock, the clock mode, the wrap size, the clock prescaler, the sample shifting, the hold delay and the CS boundary using the HAL_OSPI_Init() function.

When using Hyperbus, configure the RW recovery time, the access time, the write latency and the latency mode unsing the HAL_OSPI_HyperbusCfg() function.

Indirect functional mode

In regular mode, configure the command sequence using the HAL_OSPI_Command() or HAL_OSPI_Command_IT() functions :

- Instruction phase : the mode used and if present the size, the instruction opcode and the DTR mode.
- Address phase : the mode used and if present the size, the address value and the DTR mode.
- Alternate-bytes phase : the mode used and if present the size, the alternate bytes values and the DTR mode.
- Dummy-cycles phase : the number of dummy cycles (mode used is same as data phase).
- Data phase : the mode used and if present the number of bytes and the DTR mode.
- Data strobe (DQS) mode : the activation (or not) of this mode
- Sending Instruction Only Once (SIOO) mode : the activation (or not) of this mode.
- Flash identifier : in dual-quad mode, indicates which flash is concerned
- Operation type : always common configuration

In Hyperbus mode, configure the command sequence using the HAL_OSPI_HyperbusCmd() function :

- Address space : indicate if the access will be done in register or memory
- Address size
- Number of data
- Data strobe (DQS) mode : the activation (or not) of this mode

If no data is required for the command (only for regular mode, not for Hyperbus mode), it is sent directly to the memory :

- In polling mode, the output of the function is done when the transfer is complete.
- In interrupt mode, HAL_OSPI_CmdCpltCallback() will be called when the transfer is complete.

For the indirect write mode, use HAL_OSPI_Transmit(), HAL_OSPI_Transmit_DMA() or HAL_OSPI_Transmit_IT() after the command configuration :

- In polling mode, the output of the function is done when the transfer is complete.
- In interrupt mode, HAL_OSPI_FifoThresholdCallback() will be called when the fifo threshold is reached and HAL_OSPI_TxCpltCallback() will be called when the transfer is complete.
- In DMA mode, HAL_OSPI_TxHalfCpltCallback() will be called at the half transfer and HAL_OSPI_TxCpltCallback() will be called when the transfer is complete.

For the indirect read mode, use HAL_OSPI_Receive(), HAL_OSPI_Receive_DMA() or HAL_OSPI_Receive_IT() after the command configuration :

- In polling mode, the output of the function is done when the transfer is complete.
- In interrupt mode, HAL_OSPI_FifoThresholdCallback() will be called when the fifo threshold is reached and HAL_OSPI_RxCpltCallback() will be called when the transfer is complete.
- In DMA mode, HAL_OSPI_RxHalfCpltCallback() will be called at the half transfer and HAL_OSPI_RxCpltCallback() will be called when the transfer is complete.

Auto-polling functional mode

Configure the command sequence by the same way than the indirect mode

Configure the auto-polling functional mode using the HAL_OSPI_AutoPolling() or HAL_OSPI_AutoPolling_IT() functions :

- The size of the status bytes, the match value, the mask used, the match mode (OR/AND), the polling interval and the automatic stop activation.

After the configuration :

- In polling mode, the output of the function is done when the status match is reached. The automatic stop is activated to avoid an infinite loop.
- In interrupt mode, HAL_OSPI_StatusMatchCallback() will be called each time the status match is reached.

MDMA functional mode

Configure the SourceInc and DestinationInc of MDMA parameters in the HAL_OSPI_MspInit() function :

- MDMA settings for write operation :
  - The DestinationInc should be MDMA_DEST_INC_DISABLE
  - The SourceInc must be a value of @ref MDMA_Source_increment_mode (Except the MDMA_SRC_INC_DOUBLEWORD).
  - The SourceDataSize must be a value of @ref MDMA Source data size (Except the MDMA_SRC_DATASIZE_DOUBLEWORD) aligned with @ref MDMA_Source_increment_mode .
  - The DestDataSize must be a value of @ref MDMA Destination data size (Except the MDMA_DEST_DATASIZE_DOUBLEWORD)
- MDMA settings for read operation :
  - The SourceInc should be MDMA_SRC_INC_DISABLE
  - The DestinationInc must be a value of @ref MDMA_Destination_increment_mode (Except the MDMA_DEST_INC_DOUBLEWORD).
  - The SourceDataSize must be a value of @ref MDMA Source data size (Except the MDMA_SRC_DATASIZE_DOUBLEWORD) .
  - The DestDataSize must be a value of @ref MDMA Destination data size (Except the MDMA_DEST_DATASIZE_DOUBLEWORD) aligned with @ref MDMA_Destination_increment_mode.

- The buffer Transfer Length (BufferTransferLength) = number of bytes in the FIFO (FifoThreshold) of the Octospi.

In case of wrong MDMA setting

- For write operation :
  - If the DestinationInc is different to MDMA_DEST_INC_DISABLE , it will be disabled by the HAL_OSPI_Transmit_DMA().
- For read operation :
  - If the SourceInc is not set to MDMA_SRC_INC_DISABLE , it will be disabled by the HAL_OSPI_Receive_DMA().

Memory-mapped functional mode

Configure the command sequence by the same way than the indirect mode except for the operation type in regular mode :

- Operation type equals to read configuration : the command configuration applies to read access in memory-mapped mode
- Operation type equals to write configuration : the command configuration applies to write access in memory-mapped mode
- Both read and write configuration should be performed before activating memory-mapped mode

Configure the memory-mapped functional mode using the HAL_OSPI_MemoryMapped() functions :

- The timeout activation and the timeout period.

After the configuration, the OctoSPI will be used as soon as an access on the AHB is done on the address range. HAL_OSPI_TimeOutCallback() will be called when the timeout expires.

Errors management and abort functionality

HAL_OSPI_GetError() function gives the error raised during the last operation.

HAL_OSPI_Abort() and HAL_OSPI_AbortIT() functions aborts any on-going operation and flushes the fifo :

- In polling mode, the output of the function is done when the transfer complete bit is set and the busy bit cleared.
- In interrupt mode, HAL_OSPI_AbortCpltCallback() will be called when the transfer complete bit is set.

Control functions

HAL_OSPI_GetState() function gives the current state of the HAL OctoSPI driver.

HAL_OSPI_SetTimeout() function configures the timeout value used in the driver.

HAL_OSPI_SetFifoThreshold() function configures the threshold on the Fifo of the OSPI Peripheral.

HAL_OSPI_GetFifoThreshold() function gives the current of the Fifo's threshold

IO manager configuration functions

HAL_OSPIM_Config() function configures the IO manager for the OctoSPI instance.

Callback registration

The compilation define USE_HAL_OSPI_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.

Use function HAL_OSPI_RegisterCallback() to register a user callback, it allows to register following callbacks:

- ErrorCallback : callback when error occurs.
- AbortCpltCallback : callback when abort is completed.
- FifoThresholdCallback : callback when the fifo threshold is reached.
- CmdCpltCallback : callback when a command without data is completed.
- RxCpltCallback : callback when a reception transfer is completed.
- TxCpltCallback : callback when a transmission transfer is completed.
- RxHalfCpltCallback : callback when half of the reception transfer is completed.
- TxHalfCpltCallback : callback when half of the transmission transfer is completed.

- StatusMatchCallback : callback when a status match occurs.
- TimeOutCallback : callback when the timeout perioed expires.
- MspInitCallback : OSPI MspInit.
- MspDeInitCallback : OSPI MspDeInit.

This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_OSPI_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. It allows to reset following callbacks:

- ErrorCallback : callback when error occurs.
- AbortCpltCallback : callback when abort is completed.
- FifoThresholdCallback : callback when the fifo threshold is reached.
- CmdCpltCallback : callback when a command without data is completed.
- RxCpltCallback : callback when a reception transfer is completed.
- TxCpltCallback : callback when a transmission transfer is completed.
- RxHalfCpltCallback : callback when half of the reception transfer is completed.
- TxHalfCpltCallback : callback when half of the transmission transfer is completed.
- StatusMatchCallback : callback when a status match occurs.
- TimeOutCallback : callback when the timeout perioed expires.
- MspInitCallback : OSPI MspInit.
- MspDeInitCallback : OSPI MspDeInit.

This function) takes as parameters the HAL peripheral handle and the Callback ID.

By default, after the HAL_OSPI_Init() and if the state is HAL_OSPI_STATE_RESET all callbacks are reset to the corresponding legacy weak (surcharged) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (surcharged) functions in the HAL_OSPI_Init() and HAL_OSPI_DeInit() only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_OSPI_Init() and HAL_OSPI_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand)

Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_OSPI_RegisterCallback() before calling HAL_OSPI_DeInit() or HAL_OSPI_Init() function.

When The compilation define USE_HAL_OSPI_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

59.2.2 Initialization and Configuration functions

This subsection provides a set of functions allowing to :

- Initialize the OctoSPI.
- De-initialize the OctoSPI.

This section contains the following APIs:

- ***HAL_OSPI_Init()***
- ***HAL_OSPI_MspInit()***
- ***HAL_OSPI_DeInit()***
- ***HAL_OSPI_MspDeInit()***

59.2.3 IO operation functions

This subsection provides a set of functions allowing to :

- Handle the interrupts.
- Handle the command sequence (regular and Hyperbus).
- Handle the Hyperbus configuration.
- Transmit data in blocking, interrupt or DMA mode.

- Receive data in blocking, interrupt or DMA mode.
- Manage the auto-polling functional mode.
- Manage the memory-mapped functional mode.

This section contains the following APIs:

- *HAL_OSPI_IRQHandler()*
- *HAL_OSPI_Command()*
- *HAL_OSPI_Command_IT()*
- *HAL_OSPI_HyperbusCfg()*
- *HAL_OSPI_HyperbusCmd()*
- *HAL_OSPI_Transmit()*
- *HAL_OSPI_Receive()*
- *HAL_OSPI_Transmit_IT()*
- *HAL_OSPI_Receive_IT()*
- *HAL_OSPI_Transmit_DMA()*
- *HAL_OSPI_Receive_DMA()*
- *HAL_OSPI_AutoPolling()*
- *HAL_OSPI_AutoPolling_IT()*
- *HAL_OSPI_MemoryMapped()*
- *HAL_OSPI_ErrorCallback()*
- *HAL_OSPI_AbortCpltCallback()*
- *HAL_OSPI_FifoThresholdCallback()*
- *HAL_OSPI_CmdCpltCallback()*
- *HAL_OSPI_RxCpltCallback()*
- *HAL_OSPI_TxCpltCallback()*
- *HAL_OSPI_RxHalfCpltCallback()*
- *HAL_OSPI_TxHalfCpltCallback()*
- *HAL_OSPI_StatusMatchCallback()*
- *HAL_OSPI_TimeOutCallback()*
- *HAL_OSPI_RegisterCallback()*
- *HAL_OSPI_UnRegisterCallback()*

59.2.4 Peripheral Control and State functions

This subsection provides a set of functions allowing to :

- Check in run-time the state of the driver.
- Check the error code set during last operation.
- Abort any operation.
- Manage the Fifo threshold.
- Configure the timeout duration used in the driver.

This section contains the following APIs:

- *HAL_OSPI_Abort()*
- *HAL_OSPI_Abort_IT()*
- *HAL_OSPI_SetFifoThreshold()*
- *HAL_OSPI_GetFifoThreshold()*
- *HAL_OSPI_SetTimeout()*

59.2.5 IO Manager configuration function

This subsection provides a set of functions allowing to :

- Configure the IO manager.

This section contains the following APIs:

- *HAL_OSPIM_Config()*

59.2.6 Detailed description of functions

HAL_OSPI_Init

Function name

HAL_StatusTypeDef HAL_OSPI_Init (OSPI_HandleTypeDef * hospi)

Function description

Initialize the OSPI mode according to the specified parameters in the OSPI_InitTypeDef and initialize the associated handle.

Parameters

- **hospi:** : OSPI handle

Return values

- **HAL:** status

HAL_OSPI_MspInit

Function name

void HAL_OSPI_MspInit (OSPI_HandleTypeDef * hospi)

Function description

Initialize the OSPI MSP.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_DeInit

Function name

HAL_StatusTypeDef HAL_OSPI_DeInit (OSPI_HandleTypeDef * hospi)

Function description

De-Initialize the OSPI peripheral.

Parameters

- **hospi:** : OSPI handle

Return values

- **HAL:** status

HAL_OSPI_MspDeInit

Function name

void HAL_OSPI_MspDeInit (OSPI_HandleTypeDef * hospi)

Function description

DeInitialize the OSPI MSP.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_IRQHandler

Function name

void HAL_OSPI_IRQHandler (OSPI_HandleTypeDef * hospi)

Function description

Handle OSPI interrupt request.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_Command

Function name

HAL_StatusTypeDef HAL_OSPI_Command (OSPI_HandleTypeDef * hospi, OSPI_RegularCmdTypeDef * cmd, uint32_t Timeout)

Function description

Set the command configuration.

Parameters

- **hospi:** : OSPI handle
- **cmd:** : structure that contains the command configuration information
- **Timeout:** : Timeout duration

Return values

- **HAL:** status

HAL_OSPI_Command_IT

Function name

HAL_StatusTypeDef HAL_OSPI_Command_IT (OSPI_HandleTypeDef * hospi, OSPI_RegularCmdTypeDef * cmd)

Function description

Set the command configuration in interrupt mode.

Parameters

- **hospi:** : OSPI handle
- **cmd:** : structure that contains the command configuration information

Return values

- **HAL:** status

Notes

- This function is used only in Indirect Read or Write Modes

HAL_OSPI_HyperbusCfg

Function name

HAL_StatusTypeDef HAL_OSPI_HyperbusCfg (OSPI_HandleTypeDef * hospi, OSPI_HyperbusCfgTypeDef * cfg, uint32_t Timeout)

Function description

Configure the Hyperbus parameters.

Parameters

- **hospi:** : OSPI handle
- **cfg:** : Structure containing the Hyperbus configuration
- **Timeout:** : Timeout duration

Return values

- **HAL:** status

HAL_OSPI_HyperbusCmd

Function name

HAL_StatusTypeDef HAL_OSPI_HyperbusCmd (OSPI_HandleTypeDef * hospi, OSPI_HyperbusCmdTypeDef * cmd, uint32_t Timeout)

Function description

Set the Hyperbus command configuration.

Parameters

- **hospi:** : OSPI handle
- **cmd:** : Structure containing the Hyperbus command
- **Timeout:** : Timeout duration

Return values

- **HAL:** status

HAL_OSPI_Transmit

Function name

HAL_StatusTypeDef HAL_OSPI_Transmit (OSPI_HandleTypeDef * hospi, uint8_t * pData, uint32_t Timeout)

Function description

Transmit an amount of data in blocking mode.

Parameters

- **hospi:** : OSPI handle
- **pData:** : pointer to data buffer
- **Timeout:** : Timeout duration

Return values

- **HAL:** status

Notes

- This function is used only in Indirect Write Mode

HAL_OSPI_Receive

Function name

HAL_StatusTypeDef HAL_OSPI_Receive (OSPI_HandleTypeDef * hospi, uint8_t * pData, uint32_t Timeout)

Function description

Receive an amount of data in blocking mode.

Parameters

- **hospi:** : OSPI handle
- **pData:** : pointer to data buffer
- **Timeout:** : Timeout duration

Return values

- **HAL:** status

Notes

- This function is used only in Indirect Read Mode

HAL_OSPI_Transmit_IT

Function name

HAL_StatusTypeDef HAL_OSPI_Transmit_IT (OSPI_HandleTypeDef * hospi, uint8_t * pData)

Function description

Send an amount of data in non-blocking mode with interrupt.

Parameters

- **hospi:** : OSPI handle
- **pData:** : pointer to data buffer

Return values

- **HAL:** status

Notes

- This function is used only in Indirect Write Mode

HAL_OSPI_Receive_IT

Function name

HAL_StatusTypeDef HAL_OSPI_Receive_IT (OSPI_HandleTypeDef * hospi, uint8_t * pData)

Function description

Receive an amount of data in non-blocking mode with interrupt.

Parameters

- **hospi:** : OSPI handle
- **pData:** : pointer to data buffer

Return values

- **HAL:** status

Notes

- This function is used only in Indirect Read Mode

HAL_OSPI_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_OSPI_Transmit_DMA (OSPI_HandleTypeDef * hospi, uint8_t * pData)

Function description

Send an amount of data in non-blocking mode with DMA.

Parameters

- **hospi:** : OSPI handle
- **pData:** : pointer to data buffer

Return values

- **HAL:** status

Notes

- This function is used only in Indirect Write Mode
- If DMA peripheral access is configured as halfword, the number of data and the fifo threshold should be aligned on halfword
- If DMA peripheral access is configured as word, the number of data and the fifo threshold should be aligned on word

HAL_OSPI_Receive_DMA

Function name

HAL_StatusTypeDef HAL_OSPI_Receive_DMA (OSPI_HandleTypeDef * hospi, uint8_t * pData)

Function description

Receive an amount of data in non-blocking mode with DMA.

Parameters

- **hospi:** : OSPI handle
- **pData:** : pointer to data buffer.

Return values

- **HAL:** status

Notes

- This function is used only in Indirect Read Mode
- If DMA peripheral access is configured as halfword, the number of data and the fifo threshold should be aligned on halfword
- If DMA peripheral access is configured as word, the number of data and the fifo threshold should be aligned on word

HAL_OSPI_AutoPolling

Function name

HAL_StatusTypeDef HAL_OSPI_AutoPolling (OSPI_HandleTypeDef * hospi, OSPI_AutoPollingTypeDef * cfg, uint32_t Timeout)

Function description

Configure the OSPI Automatic Polling Mode in blocking mode.

Parameters

- **hospi:** : OSPI handle
- **cfg:** : structure that contains the polling configuration information.
- **Timeout:** : Timeout duration

Return values

- **HAL:** status

Notes

- This function is used only in Automatic Polling Mode

HAL_OSPI_AutoPolling_IT

Function name

HAL_StatusTypeDef HAL_OSPI_AutoPolling_IT (OSPI_HandleTypeDef * hospi, OSPI_AutoPollingTypeDef * cfg)

Function description

Configure the OSPI Automatic Polling Mode in non-blocking mode.

Parameters

- **hospi:** : OSPI handle
- **cfg:** : structure that contains the polling configuration information.

Return values

- **HAL:** status

Notes

- This function is used only in Automatic Polling Mode

HAL_OSPI_MemoryMapped

Function name

HAL_StatusTypeDef HAL_OSPI_MemoryMapped (OSPI_HandleTypeDef * hospi, OSPI_MemoryMappedTypeDef * cfg)

Function description

Configure the Memory Mapped mode.

Parameters

- **hospi:** : OSPI handle
- **cfg:** : structure that contains the memory mapped configuration information.

Return values

- **HAL:** status

Notes

- This function is used only in Memory mapped Mode

HAL_OSPI_ErrorCallback

Function name

void HAL_OSPI_ErrorCallback (OSPI_HandleTypeDef * hospi)

Function description

Transfer Error callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_AbortCpltCallback

Function name

void HAL_OSPI_AbortCpltCallback (OSPI_HandleTypeDef * hospi)

Function description

Abort completed callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_FifoThresholdCallback

Function name

void HAL_OSPI_FifoThresholdCallback (OSPI_HandleTypeDef * hospi)

Function description

FIFO Threshold callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_CmdCpltCallback

Function name

void HAL_OSPI_CmdCpltCallback (OSPI_HandleTypeDef * hospi)

Function description

Command completed callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_RxCpltCallback

Function name

void HAL_OSPI_RxCpltCallback (OSPI_HandleTypeDef * hospi)

Function description

Rx Transfer completed callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_TxCpltCallback

Function name

void HAL_OSPI_TxCpltCallback (OSPI_HandleTypeDef * hospi)

Function description

Tx Transfer completed callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_RxHalfCpltCallback

Function name

void HAL_OSPI_RxHalfCpltCallback (OSPI_HandleTypeDef * hospi)

Function description

Rx Half Transfer completed callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_TxHalfCpltCallback

Function name

void HAL_OSPI_TxHalfCpltCallback (OSPI_HandleTypeDef * hospi)

Function description

Tx Half Transfer completed callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_StatusMatchCallback

Function name

void HAL_OSPI_StatusMatchCallback (OSPI_HandleTypeDef * hospi)

Function description

Status Match callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_TimeOutCallback

Function name

void HAL_OSPI_TimeOutCallback (OSPI_HandleTypeDef * hospi)

Function description

Timeout callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_RegisterCallback

Function name

HAL_StatusTypeDef HAL_OSPI_RegisterCallback (OSPI_HandleTypeDef * hospi, HAL_OSPI_CallbackIDTypeDef CallbackID, pOSPI_CallbackTypeDef pCallback)

Function description

Register a User OSPI Callback To be used instead of the weak (surcharged) predefined callback.

Parameters

- **hospi:** : OSPI handle
- **CallbackID:** : ID of the callback to be registered This parameter can be one of the following values:
  - HAL_OSPI_ERROR_CB_ID OSPI Error Callback ID
  - HAL_OSPI_ABORT_CB_ID OSPI Abort Callback ID
  - HAL_OSPI_FIFO_THRESHOLD_CB_ID OSPI FIFO Threshold Callback ID
  - HAL_OSPI_CMD_CPLT_CB_ID OSPI Command Complete Callback ID
  - HAL_OSPI_RX_CPLT_CB_ID OSPI Rx Complete Callback ID
  - HAL_OSPI_TX_CPLT_CB_ID OSPI Tx Complete Callback ID
  - HAL_OSPI_RX_HALF_CPLT_CB_ID OSPI Rx Half Complete Callback ID
  - HAL_OSPI_TX_HALF_CPLT_CB_ID OSPI Tx Half Complete Callback ID
  - HAL_OSPI_STATUS_MATCH_CB_ID OSPI Status Match Callback ID
  - HAL_OSPI_TIMEOUT_CB_ID OSPI Timeout Callback ID
  - HAL_OSPI_MSP_INIT_CB_ID OSPI MspInit callback ID
  - HAL_OSPI_MSP_DEINIT_CB_ID OSPI MspDeInit callback ID
- **pCallback:** : pointer to the Callback function

Return values

- **status:**

HAL_OSPI_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_OSPI_UnRegisterCallback (OSPI_HandleTypeDef * hospi, HAL_OSPI_CallbackIDTypeDef CallbackID)

Function description

Unregister a User OSPI Callback OSPI Callback is redirected to the weak (surcharged) predefined callback.

Parameters

- **hospi:** : OSPI handle
- **CallbackID:** : ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_OSPI_ERROR_CB_ID OSPI Error Callback ID
  - HAL_OSPI_ABORT_CB_ID OSPI Abort Callback ID
  - HAL_OSPI_FIFO_THRESHOLD_CB_ID OSPI FIFO Threshold Callback ID
  - HAL_OSPI_CMD_CPLT_CB_ID OSPI Command Complete Callback ID
  - HAL_OSPI_RX_CPLT_CB_ID OSPI Rx Complete Callback ID
  - HAL_OSPI_TX_CPLT_CB_ID OSPI Tx Complete Callback ID
  - HAL_OSPI_RX_HALF_CPLT_CB_ID OSPI Rx Half Complete Callback ID
  - HAL_OSPI_TX_HALF_CPLT_CB_ID OSPI Tx Half Complete Callback ID
  - HAL_OSPI_STATUS_MATCH_CB_ID OSPI Status Match Callback ID
  - HAL_OSPI_TIMEOUT_CB_ID OSPI Timeout Callback ID
  - HAL_OSPI_MSP_INIT_CB_ID OSPI MspInit callback ID
  - HAL_OSPI_MSP_DEINIT_CB_ID OSPI MspDeInit callback ID

Return values

- **status:**

HAL_OSPI_Abort

Function name

HAL_StatusTypeDef HAL_OSPI_Abort (OSPI_HandleTypeDef * hospi)

Function description

Abort the current transmission.

Parameters

- **hospi:** : OSPI handle

Return values

- **HAL:** status

HAL_OSPI_Abort_IT

Function name

HAL_StatusTypeDef HAL_OSPI_Abort_IT (OSPI_HandleTypeDef * hospi)

Function description

Abort the current transmission (non-blocking function)

Parameters

- **hospi:** : OSPI handle

Return values

- **HAL:** status

HAL_OSPI_SetFifoThreshold

Function name

HAL_StatusTypeDef HAL_OSPI_SetFifoThreshold (OSPI_HandleTypeDef * hospi, uint32_t Threshold)

Function description

Set OSPI Fifo threshold.

Parameters

- **hospi:** : OSPI handle.
- **Threshold:** : Threshold of the Fifo.

Return values

- **HAL:** status

HAL_OSPI_GetFifoThreshold

Function name

uint32_t HAL_OSPI_GetFifoThreshold (OSPI_HandleTypeDef * hospi)

Function description

Get OSPI Fifo threshold.

Parameters

- **hospi:** : OSPI handle.

Return values

- **Fifo:** threshold

HAL_OSPI_SetTimeout

Function name

HAL_StatusTypeDef HAL_OSPI_SetTimeout (OSPI_HandleTypeDef * hospi, uint32_t Timeout)

Function description

Set OSPI timeout.

Parameters

- **hospi:** : OSPI handle.
- **Timeout:** : Timeout for the memory access.

Return values

- **None:**

HAL_OSPI_GetError

Function name

uint32_t HAL_OSPI_GetError (OSPI_HandleTypeDef * hospi)

Function description

Return the OSPI error code.

Parameters

- **hospi:** : OSPI handle

Return values

- **OSPI:** Error Code

HAL_OSPI_GetState

Function name

uint32_t HAL_OSPI_GetState (OSPI_HandleTypeDef * hospi)

Function description

Return the OSPI handle state.

Parameters

- **hospi:** : OSPI handle

Return values

- **HAL:** state

HAL_OSPIM_Config

Function name

HAL_StatusTypeDef HAL_OSPIM_Config (OSPI_HandleTypeDef * hospi, OSPIM_CfgTypeDef * cfg, uint32_t Timeout)

Function description

Configure the OctoSPI IO manager.

Parameters

- **hospi:** : OSPI handle
- **cfg:** : Configuration of the IO Manager for the instance
- **Timeout:** : Timeout duration

Return values

- **HAL:** status

59.3 OSPI Firmware driver defines

The following section lists the various define and macros of the module.

59.3.1 OSPI

OSPI

OSPI Address DTR Mode

HAL_OSPI_ADDRESS_DTR_DISABLE

DTR mode disabled for address phase

HAL_OSPI_ADDRESS_DTR_ENABLE

DTR mode enabled for address phase

OSPI Address Mode

HAL_OSPI_ADDRESS_NONE

No address

HAL_OSPI_ADDRESS_1_LINE

Address on a single line

HAL_OSPI_ADDRESS_2_LINES

Address on two lines

HAL_OSPI_ADDRESS_4_LINES

Address on four lines

HAL_OSPI_ADDRESS_8_LINES

Address on eight lines

OSPI Address Size

HAL_OSPI_ADDRESS_8_BITS

8-bit address

HAL_OSPI_ADDRESS_16_BITS

16-bit address

HAL_OSPI_ADDRESS_24_BITS

24-bit address

HAL_OSPI_ADDRESS_32_BITS

32-bit address

OSPI Hyperbus Address Space

HAL_OSPI_MEMORY_ADDRESS_SPACE

HyperBus memory mode

HAL_OSPI_REGISTER_ADDRESS_SPACE

HyperBus register mode

OSPI Alternate Bytes DTR Mode

HAL_OSPI_ALTERNATE_BYTES_DTR_DISABLE

DTR mode disabled for alternate bytes phase

HAL_OSPI_ALTERNATE_BYTES_DTR_ENABLE

DTR mode enabled for alternate bytes phase

OSPI Alternate Bytes Mode

HAL_OSPI_ALTERNATE_BYTES_NONE

No alternate bytes

HAL_OSPI_ALTERNATE_BYTES_1_LINE

Alternate bytes on a single line

HAL_OSPI_ALTERNATE_BYTES_2_LINES

Alternate bytes on two lines

HAL_OSPI_ALTERNATE_BYTES_4_LINES

Alternate bytes on four lines

HAL_OSPI_ALTERNATE_BYTES_8_LINES

Alternate bytes on eight lines

OSPI Alternate Bytes Size

HAL_OSPI_ALTERNATE_BYTES_8_BITS

8-bit alternate bytes

HAL_OSPI_ALTERNATE_BYTES_16_BITS

16-bit alternate bytes

HAL_OSPI_ALTERNATE_BYTES_24_BITS

24-bit alternate bytes

HAL_OSPI_ALTERNATE_BYTES_32_BITS

32-bit alternate bytes

OSPI Automatic Stop

HAL_OSPI_AUTOMATIC_STOP_DISABLE

AutoPolling stops only with abort or OSPI disabling

HAL_OSPI_AUTOMATIC_STOP_ENABLE

AutoPolling stops as soon as there is a match

OSPI Clock Mode

HAL_OSPI_CLOCK_MODE_0

CLK must stay low while nCS is high

HAL_OSPI_CLOCK_MODE_3

CLK must stay high while nCS is high

OSPI Data DTR Mode

HAL_OSPI_DATA_DTR_DISABLE

DTR mode disabled for data phase

HAL_OSPI_DATA_DTR_ENABLE

DTR mode enabled for data phase

OSPI Data Mode

HAL_OSPI_DATA_NONE

No data

HAL_OSPI_DATA_1_LINE

Data on a single line

HAL_OSPI_DATA_2_LINES

Data on two lines

HAL_OSPI_DATA_4_LINES

Data on four lines

HAL_OSPI_DATA_8_LINES

Data on eight lines

OSPI Delay Block Bypaas

HAL_OSPI_DELAY_BLOCK_USED

Sampling clock is delayed by the delay block

HAL_OSPI_DELAY_BLOCK_BYPASSED

Delay block is bypassed

OSPI Delay Hold Quarter Cycle

HAL_OSPI_DHQC_DISABLE

No Delay

HAL_OSPI_DHQC_ENABLE

Delay Hold 1/4 cycle

OSPI DQS Mode

HAL_OSPI_DQS_DISABLE

DQS disabled

HAL_OSPI_DQS_ENABLE

DQS enabled

OSPI Dual-Quad

HAL_OSPI_DUALQUAD_DISABLE

Dual-Quad mode disabled

HAL_OSPI_DUALQUAD_ENABLE

Dual-Quad mode enabled

OSPI Error Code

HAL_OSPI_ERROR_NONE

No error

HAL_OSPI_ERROR_TIMEOUT

Timeout error

HAL_OSPI_ERROR_TRANSFER

Transfer error

HAL_OSPI_ERROR_DMA

DMA transfer error

HAL_OSPI_ERROR_INVALID_PARAM

Invalid parameters error

HAL_OSPI_ERROR_INVALID_SEQUENCE

Sequence of the state machine is incorrect

HAL_OSPI_ERROR_INVALID_CALLBACK

Invalid callback error

OSPI Exported Macros

__HAL_OSPI_RESET_HANDLE_STATE

Description:

- Reset OSPI handle state.

Parameters:

- __HANDLE__: specifies the OSPI Handle.

Return value:

- None

__HAL_OSPI_ENABLE

Description:

- Enable the OSPI peripheral.

Parameters:

- __HANDLE__: specifies the OSPI Handle.

Return value:

- None

__HAL_OSPI_DISABLE

Description:

- Disable the OSPI peripheral.

Parameters:

- __HANDLE__: specifies the OSPI Handle.

Return value:

- None

__HAL_OSPI_ENABLE_IT

Description:

- Enable the specified OSPI interrupt.

Parameters:

- __HANDLE__: specifies the OSPI Handle.
- __INTERRUPT__: specifies the OSPI interrupt source to enable. This parameter can be one of the following values:
  - HAL_OSPI_IT_TO: OSPI Timeout interrupt
  - HAL_OSPI_IT_SM: OSPI Status match interrupt
  - HAL_OSPI_IT_FT: OSPI FIFO threshold interrupt
  - HAL_OSPI_IT_TC: OSPI Transfer complete interrupt
  - HAL_OSPI_IT_TE: OSPI Transfer error interrupt

Return value:

- None

__HAL_OSPI_DISABLE_IT

Description:

- Disable the specified OSPI interrupt.

Parameters:

- __HANDLE__: specifies the OSPI Handle.
- __INTERRUPT__: specifies the OSPI interrupt source to disable. This parameter can be one of the following values:
  - HAL_OSPI_IT_TO: OSPI Timeout interrupt
  - HAL_OSPI_IT_SM: OSPI Status match interrupt
  - HAL_OSPI_IT_FT: OSPI FIFO threshold interrupt
  - HAL_OSPI_IT_TC: OSPI Transfer complete interrupt
  - HAL_OSPI_IT_TE: OSPI Transfer error interrupt

Return value:

- None

__HAL_OSPI_GET_IT_SOURCE

Description:

- Check whether the specified OSPI interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the OSPI Handle.
- __INTERRUPT__: specifies the OSPI interrupt source to check. This parameter can be one of the following values:
  - HAL_OSPI_IT_TO: OSPI Timeout interrupt
  - HAL_OSPI_IT_SM: OSPI Status match interrupt
  - HAL_OSPI_IT_FT: OSPI FIFO threshold interrupt
  - HAL_OSPI_IT_TC: OSPI Transfer complete interrupt
  - HAL_OSPI_IT_TE: OSPI Transfer error interrupt

Return value:

- The: new state of __INTERRUPT__ (TRUE or FALSE).

__HAL_OSPI_GET_FLAG

Description:

- Check whether the selected OSPI flag is set or not.

Parameters:

- __HANDLE__: specifies the OSPI Handle.
- __FLAG__: specifies the OSPI flag to check. This parameter can be one of the following values:
  - HAL_OSPI_FLAG_BUSY: OSPI Busy flag
  - HAL_OSPI_FLAG_TO: OSPI Timeout flag
  - HAL_OSPI_FLAG_SM: OSPI Status match flag
  - HAL_OSPI_FLAG_FT: OSPI FIFO threshold flag
  - HAL_OSPI_FLAG_TC: OSPI Transfer complete flag
  - HAL_OSPI_FLAG_TE: OSPI Transfer error flag

Return value:

- None

__HAL_OSPI_CLEAR_FLAG

Description:

- Clears the specified OSPI's flag status.

Parameters:

- __HANDLE__: specifies the OSPI Handle.
- __FLAG__: specifies the OSPI clear register flag that needs to be set This parameter can be one of the following values:
  - HAL_OSPI_FLAG_TO: OSPI Timeout flag
  - HAL_OSPI_FLAG_SM: OSPI Status match flag
  - HAL_OSPI_FLAG_TC: OSPI Transfer complete flag
  - HAL_OSPI_FLAG_TE: OSPI Transfer error flag

Return value:

- None

OSPI Flags

HAL_OSPI_FLAG_BUSY

Busy flag: operation is ongoing

HAL_OSPI_FLAG_TO

Timeout flag: timeout occurs in memory-mapped mode

HAL_OSPI_FLAG_SM

Status match flag: received data matches in autopolling mode

HAL_OSPI_FLAG_FT

Fifo threshold flag: Fifo threshold reached or data left after read from memory is complete

HAL_OSPI_FLAG_TC

Transfer complete flag: programmed number of data have been transferred or the transfer has been aborted

HAL_OSPI_FLAG_TE

Transfer error flag: invalid address is being accessed

OSPI Flash Id

HAL_OSPI_FLASH_ID_1

FLASH 1 selected

HAL_OSPI_FLASH_ID_2

FLASH 2 selected

OSPI Free Running Clock

HAL_OSPI_FREERUNCLK_DISABLE

CLK is not free running

HAL_OSPI_FREERUNCLK_ENABLE

CLK is free running (always provided)

OSPI Instruction DTR Mode

HAL_OSPI_INSTRUCTION_DTR_DISABLE

DTR mode disabled for instruction phase

HAL_OSPI_INSTRUCTION_DTR_ENABLE

DTR mode enabled for instruction phase

OSPI Instruction Mode

HAL_OSPI_INSTRUCTION_NONE

No instruction

HAL_OSPI_INSTRUCTION_1_LINE

Instruction on a single line

HAL_OSPI_INSTRUCTION_2_LINES

Instruction on two lines

HAL_OSPI_INSTRUCTION_4_LINES

Instruction on four lines

HAL_OSPI_INSTRUCTION_8_LINES

Instruction on eight lines

OSPI Instruction Size

HAL_OSPI_INSTRUCTION_8_BITS

8-bit instruction

HAL_OSPI_INSTRUCTION_16_BITS

16-bit instruction

HAL_OSPI_INSTRUCTION_24_BITS

24-bit instruction

HAL_OSPI_INSTRUCTION_32_BITS

32-bit instruction

OSPI Interrupts

HAL_OSPI_IT_TO

Interrupt on the timeout flag

HAL_OSPI_IT_SM

Interrupt on the status match flag

HAL_OSPI_IT_FT

Interrupt on the fifo threshold flag

HAL_OSPI_IT_TC

Interrupt on the transfer complete flag

HAL_OSPI_IT_TE

Interrupt on the transfer error flag

OSPI Hyperbus Latency Mode

HAL_OSPI_VARIABLE_LATENCY

Variable initial latency

HAL_OSPI_FIXED_LATENCY

Fixed latency

OSPI Match Mode

HAL_OSPI_MATCH_MODE_AND

AND match mode between unmasked bits

HAL_OSPI_MATCH_MODE_OR

OR match mode between unmasked bits

OSPI Memory Type

HAL_OSPI_MEMTYPE_MICRON

Micron mode

HAL_OSPI_MEMTYPE_MACRONIX

Macronix mode

HAL_OSPI_MEMTYPE_APMEMORY

AP Memory mode

HAL_OSPI_MEMTYPE_MACRONIX_RAM

Macronix RAM mode

HAL_OSPI_MEMTYPE_HYPERBUS

Hyperbus mode

OSPI Operation Type

HAL_OSPI_OPTYPE_COMMON_CFG

Common configuration (indirect or auto-polling mode)

HAL_OSPI_OPTYPE_READ_CFG

Read configuration (memory-mapped mode)

HAL_OSPI_OPTYPE_WRITE_CFG

Write configuration (memory-mapped mode)

HAL_OSPI_OPTYPE_WRAP_CFG

Wrap configuration (memory-mapped mode)

OSPI Sample Shifting

HAL_OSPI_SAMPLE_SHIFTING_NONE

No shift

HAL_OSPI_SAMPLE_SHIFTING_HALFCYCLE

1/2 cycle shift

OSPI SIOO Mode

HAL_OSPI_SIOO_INST_EVERY_CMD

Send instruction on every transaction

HAL_OSPI_SIOO_INST_ONLY_FIRST_CMD

Send instruction only for the first command

OSPI State

HAL_OSPI_STATE_RESET

Initial state

HAL_OSPI_STATE_HYPERBUS_INIT

Initialization done in hyperbus mode but timing configuration not done

HAL_OSPI_STATE_READY

Driver ready to be used

HAL_OSPI_STATE_CMD_CFG

Command (regular or hyperbus) configured, ready for an action

HAL_OSPI_STATE_READ_CMD_CFG

Read command configuration done, not the write command configuration

HAL_OSPI_STATE_WRITE_CMD_CFG

Write command configuration done, not the read command configuration

HAL_OSPI_STATE_BUSY_CMD

Command without data on-going

HAL_OSPI_STATE_BUSY_TX

Indirect Tx on-going

HAL_OSPI_STATE_BUSY_RX

Indirect Rx on-going

HAL_OSPI_STATE_BUSY_AUTO_POLLING

Auto-polling on-going

HAL_OSPI_STATE_BUSY_MEM_MAPPED

Memory-mapped on-going

HAL_OSPI_STATE_ABORT

Abort on-going

HAL_OSPI_STATE_ERROR

Blocking error, driver should be re-initialized

OSPI Timeout Activation

HAL_OSPI_TIMEOUT_COUNTER_DISABLE

Timeout counter disabled, nCS remains active

HAL_OSPI_TIMEOUT_COUNTER_ENABLE

Timeout counter enabled, nCS released when timeout expires

OSPI Timeout definition

HAL_OSPI_TIMEOUT_DEFAULT_VALUE

OSPI Wrap-Size

HAL_OSPI_WRAP_NOT_SUPPORTED

wrapped reads are not supported by the memory

HAL_OSPI_WRAP_16_BYTES

external memory supports wrap size of 16 bytes

HAL_OSPI_WRAP_32_BYTES

external memory supports wrap size of 32 bytes

HAL_OSPI_WRAP_64_BYTES

external memory supports wrap size of 64 bytes

HAL_OSPI_WRAP_128_BYTES

external memory supports wrap size of 128 bytes

OSPI Hyperbus Write Zero Latency Activation

HAL_OSPI_LATENCY_ON_WRITE

Latency on write accesses

HAL_OSPI_NO_LATENCY_ON_WRITE

No latency on write accesses

60 HAL OTFDEC Generic Driver

60.1 OTFDEC Firmware driver registers structures

60.1.1 OTFDEC_RegionConfigTypeDef

OTFDEC_RegionConfigTypeDef is defined in the stm32h7xx_hal_otfdec.h

Data Fields

- ***uint32_t Nonce***
- ***uint32_t StartAddress***
- ***uint32_t EndAddress***
- ***uint16_t Version***

Field Documentation

- ***uint32_t OTFDEC_RegionConfigTypeDef::Nonce[2]***

- ***void(* __OTFDEC_HandleTypeDef::MspInitCallback)(struct __OTFDEC_HandleTypeDef *hotfdec)***
  OTFDEC Msp Init callback
- ***void(* __OTFDEC_HandleTypeDef::MspDeInitCallback)(struct __OTFDEC_HandleTypeDef *hotfdec)***
  OTFDEC Msp DeInit callback

60.2 OTFDEC Firmware driver API description

The following section lists the various functions of the OTFDEC library.

60.2.1 How to use this driver

The OTFDEC HAL driver can be used as follows:

1. Declare an OTFDEC_HandleTypeDef handle structure (eg. OTFDEC_HandleTypeDef hotfdec).
2. Initialize the OTFDEC low level resources by implementing the HAL_OTFDEC_MspInit() API:
   - Enable the OTFDEC interface clock.
   - NVIC configuration if interrupts are used
     - Configure the OTFDEC interrupt priority.
     - Enable the NVIC OTFDEC IRQ handle.
3. Initialize the OTFDEC peripheral by calling the HAL_OTFDEC_Init() API.
4. For each region,
   - Configure the region deciphering mode by calling the HAL_OTFDEC_RegionSetMode() API.
   - Write the region Key by calling the HAL_OTFDEC_RegionSetKey() API. If desired, read the key CRC by calling HAL_OTFDEC_RegionGetKeyCRC() API and compare the result with the theoretically expected CRC.
   - Initialize the OTFDEC region config structure with the Nonce, protected region start and end addresses and firmware version, and wrap-up the region configuration by calling HAL_OTFDEC_RegionConfig() API.
5. At this point, the OTFDEC region configuration is done and the deciphering is enabled. The region can be deciphered on the fly after having made sure the OctoSPI is configured in memory-mapped mode.

Note: Warning: the OTFDEC deciphering is based on a different endianness compared to the AES-CTR as implemented in the AES peripheral. E.g., if the OTFEC resorts to the Key (B0, B1, B2, B3) where Bi are 32-bit longwords and B0 is the Least Significant Word, the AES has to be configured with the Key (B3, B2, B1, B0) to report the same result (with the same swapping applied to the Initialization Vector).

Callback registration

The compilation flag USE_HAL_OTFDEC_REGISTER_CALLBACKS, when set to 1, allows the user to configure dynamically the driver callbacks. Use Functions HAL_OTFDEC_RegisterCallback() to register an interrupt callback.

Function HAL_OTFDEC_RegisterCallback() allows to register following callbacks:

- ErrorCallback : OTFDEC error callback
- MspInitCallback : OTFDEC Msp Init callback
- MspDeInitCallback : OTFDEC Msp DeInit callback This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_OTFDEC_UnRegisterCallback to reset a callback to the default weak function.

HAL_OTFDEC_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- ErrorCallback : OTFDEC error callback
- MspInitCallback : OTFDEC Msp Init callback
- MspDeInitCallback : OTFDEC Msp DeInit callback

By default, after the HAL_OTFDEC_Init() and when the state is HAL_OTFDEC_STATE_RESET all callbacks are set to the corresponding weak functions: example HAL_OTFDEC_ErrorCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_OTFDEC_Init()HAL_OTFDEC_DeInit() only when these callbacks are null (not registered beforehand).

If MspInit or MspDeInit are not null, the HAL_OTFDEC_Init()/HAL_OTFDEC_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in HAL_OTFDEC_STATE_READY state only. Exception done MspInit/MspDeInit functions that can be registered/unregistered in HAL_OTFDEC_STATE_READY or HAL_OTFDEC_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit.

Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_OTFDEC_RegisterCallback() before calling HAL_OTFDEC_DeInit() or HAL_OTFDEC_Init() function.

When the compilation flag USE_HAL_OTFDEC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

60.2.2 Initialization and de-initialization functions

This section contains the following APIs:

- *HAL_OTFDEC_Init()*
- *HAL_OTFDEC_DeInit()*
- *HAL_OTFDEC_MspInit()*
- *HAL_OTFDEC_MspDeInit()*
- *HAL_OTFDEC_RegisterCallback()*
- *HAL_OTFDEC_UnRegisterCallback()*

60.2.3 OTFDEC IRQ handler management

This section provides OTFDEC IRQ handler function.

This section contains the following APIs:

- *HAL_OTFDEC_IRQHandler()*
- *HAL_OTFDEC_ErrorCallback()*

60.2.4 Peripheral Control functions

This subsection permits to configure the OTFDEC peripheral

This section contains the following APIs:

- *HAL_OTFDEC_RegionKeyLock()*
- *HAL_OTFDEC_RegionSetKey()*
- *HAL_OTFDEC_RegionSetMode()*
- *HAL_OTFDEC_RegionConfig()*
- *HAL_OTFDEC_KeyCRCComputation()*
- *HAL_OTFDEC_RegionEnable()*
- *HAL_OTFDEC_RegionDisable()*

60.2.5 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- *HAL_OTFDEC_GetState()*
- *HAL_OTFDEC_RegionGetKeyCRC()*
- *HAL_OTFDEC_RegionGetConfig()*

60.2.6 Detailed description of functions

HAL_OTFDEC_Init

Function name

HAL_StatusTypeDef HAL_OTFDEC_Init (OTFDEC_HandleTypeDef * hotfdec)

Function description

Initialize the OTFDEC peripheral and create the associated handle.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **HAL:** status

HAL_OTFDEC_DeInit

Function name

HAL_StatusTypeDef HAL_OTFDEC_DeInit (OTFDEC_HandleTypeDef * hotfdec)

Function description

DeInitialize the OTFDEC peripheral.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **HAL:** status

HAL_OTFDEC_MspInit

Function name

void HAL_OTFDEC_MspInit (OTFDEC_HandleTypeDef * hotfdec)

Function description

Initialize the OTFDEC MSP.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **None:**

HAL_OTFDEC_MspDeInit

Function name

void HAL_OTFDEC_MspDeInit (OTFDEC_HandleTypeDef * hotfdec)

Function description

DeInitialize OTFDEC MSP.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **None:**

HAL_OTFDEC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegisterCallback (OTFDEC_HandleTypeDef * hotfdec, HAL_OTFDEC_CallbackIDTypeDef CallbackID, pOTFDEC_CallbackTypeDef pCallback)

Function description

Register a User OTFDEC Callback To be used instead of the weak predefined callback.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_OTFDEC_ERROR_CB_ID OTFDEC error callback ID
  - HAL_OTFDEC_MSPINIT_CB_ID MspInit callback ID
  - HAL_OTFDEC_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_OTFDEC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_OTFDEC_UnRegisterCallback (OTFDEC_HandleTypeDef * hotfdec, HAL_OTFDEC_CallbackIDTypeDef CallbackID)

Function description

Unregister a OTFDEC Callback OTFDEC callback is redirected to the weak predefined callback.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_OTFDEC_ERROR_CB_ID OTFDEC error callback ID
  - HAL_OTFDEC_MSPINIT_CB_ID MspInit callback ID
  - HAL_OTFDEC_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_OTFDEC_IRQHandler

Function name

void HAL_OTFDEC_IRQHandler (OTFDEC_HandleTypeDef * hotfdec)

Function description

Handle OTFDEC interrupt request.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **None:**

HAL_OTFDEC_ErrorCallback

Function name

void HAL_OTFDEC_ErrorCallback (OTFDEC_HandleTypeDef * hotfdec)

Function description

OTFDEC error callback.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **None:**

HAL_OTFDEC_RegionKeyLock

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionKeyLock (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex)

Function description

Lock region keys.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the keys of which are locked

Return values

- **HAL:** state

Notes

- Writes to this region KEYRx registers are ignored until next OTFDEC reset.

HAL_OTFDEC_RegionSetKey

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionSetKey (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex, uint32_t * pKey)

Function description

Set region keys.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the keys of which are set
- **pKey:** pointer at set of keys

Return values

- **HAL:** state

Notes

- The API reads the key CRC computed by the peripheral and compares it with that theoretically expected. An error is reported if they are different.

HAL_OTFDEC_RegionSetMode

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionSetMode (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex, uint32_t mode)

Function description

Set region mode.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the mode of which is set
- **mode:** This parameter can be only:
  - OTFDEC_REG_MODE_INSTRUCTION_ACCESSES_ONLY Only instruction accesses are decrypted
  - OTFDEC_REG_MODE_DATA_ACCESSES_ONLY Only data accesses are decrypted
  - OTFDEC_REG_MODE_INSTRUCTION_OR_DATA_ACCESSES All read accesses are decrypted (instruction or data)
  - OTFDEC_REG_MODE_INSTRUCTION_ACCESSES_ONLY_WITH_CIPHER Only instruction accesses are decrypted with proprietary cipher activated

Return values

- **HAL:** state

HAL_OTFDEC_RegionConfig

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionConfig (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex, OTFDEC_RegionConfigTypeDef * Config, uint32_t lock)

Function description

Set region configuration.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region that is configured
- **Config:** pointer on structure containing the region configuration parameters
- **lock:** configuration lock enable or disable parameter This parameter can be one of the following values:
  - OTFDEC_REG_CONFIGR_LOCK_DISABLE OTFDEC region configuration is not locked
  - OTFDEC_REG_CONFIGR_LOCK_ENABLE OTFDEC region configuration is locked

Return values

- **HAL:** state

Notes

- Region deciphering is enabled at the end of this function

HAL_OTFDEC_KeyCRCComputation

Function name

uint32_t HAL_OTFDEC_KeyCRCComputation (uint32_t * pKey)

Function description

Compute Key CRC.

Parameters

- **pKey:** pointer at set of keys

Return values

- **CRC:** value

HAL_OTFDEC_RegionEnable

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionEnable (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex)

Function description

Enable region deciphering.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the deciphering is enabled

Return values

- **HAL:** state

Notes

- An error is reported when the configuration is locked.

HAL_OTFDEC_RegionDisable

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionDisable (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex)

Function description

Disable region deciphering.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the deciphering is disabled

Return values

- **HAL:** state

Notes

- An error is reported when the configuration is locked.

HAL_OTFDEC_GetState

Function name

HAL_OTFDEC_StateTypeDef HAL_OTFDEC_GetState (OTFDEC_HandleTypeDef * hotfdec)

Function description

Return the OTFDEC state.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **HAL:** state

HAL_OTFDEC_RegionGetKeyCRC

Function name

uint32_t HAL_OTFDEC_RegionGetKeyCRC (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex)

Function description

Return region keys CRC.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the keys CRC of which is read

Return values

- **Key:** CRC

HAL_OTFDEC_RegionGetConfig

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionGetConfig (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex, OTFDEC_RegionConfigTypeDef * Config)

Function description

Return region configuration parameters.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the configuration of which is read
- **Config:** pointer on structure that will be filled up with the region configuration parameters

Return values

- **HAL:** state

60.3 OTFDEC Firmware driver defines

The following section lists the various define and macros of the module.

60.3.1 OTFDEC

OTFDEC

OTFDEC Error Definition

HAL_OTFDEC_ERROR_NONE

No error

HAL_OTFDEC_SECURITY_ERROR

Security error

HAL_OTFDEC_EXECUTE_ERROR

Execute-only Execute-Never error

HAL_OTFDEC_KEY_ERROR

Key error

HAL_OTFDEC_ERROR_INVALID_CALLBACK

Invalid Callback error

OTFDEC Exported Macros

__HAL_OTFDEC_RESET_HANDLE_STATE

Description:

- Reset OTFDEC handle state.

Parameters:

- __HANDLE__: pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return value:

- None

__HAL_OTFDEC_ENABLE_IT

Description:

- Enable OTFDEC peripheral interrupts combination.

Parameters:

- __HANDLE__: pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- __INTERRUPT__: mask on enabled interrupts This parameter can be one of the following values:
  - OTFDEC_SEC_ERROR_INT OTFDEC security error interrupt
  - OTFDEC_EXE_ERROR_INT OTFDEC execution error interrupt
  - OTFDEC_KEY_ERROR_INT OTFDEC key error interrupt
  - OTFDEC_SEC_EXE_ERROR_INT OTFDEC security and execution errors interrupts
  - OTFDEC_SEC_KEY_ERROR_INT OTFDEC security and key errors interrupts
  - OTFDEC_EXE_KEY_ERROR_INT OTFDEC execution and key errors interrupts
  - OTFDEC_ALL_INT OTFDEC all interrupts

Return value:

- None

__HAL_OTFDEC_DISABLE_IT

Description:

- Disable OTFDEC peripheral interrupts combination.

Parameters:

- __HANDLE__: pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- __INTERRUPT__: mask on disabled interrupts This parameter can be one of the following values:
  - OTFDEC_SEC_ERROR_INT OTFDEC security error interrupt
  - OTFDEC_EXE_ERROR_INT OTFDEC execution error interrupt
  - OTFDEC_KEY_ERROR_INT OTFDEC key error interrupt
  - OTFDEC_SEC_EXE_ERROR_INT OTFDEC security and execution errors interrupts
  - OTFDEC_SEC_KEY_ERROR_INT OTFDEC security and key errors interrupts
  - OTFDEC_EXE_KEY_ERROR_INT OTFDEC execution and key errors interrupts
  - OTFDEC_ALL_INT OTFDEC all interrupts

Return value:

- None

__HAL_OTFDEC_GET_FLAG

Description:

- Check whether the specified combination of OTFDEC interrupt flags is set or not.

Parameters:

- __HANDLE__: pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- __FLAG__: mask on combination of interrupts flags This parameter can be one of the following values:
  - OTFDEC_SEC_ERROR_INT OTFDEC security error interrupt flag
  - OTFDEC_EXE_ERROR_INT OTFDEC execution error interrupt flag
  - OTFDEC_KEY_ERROR_INT OTFDEC key error interrupt flag
  - OTFDEC_SEC_EXE_ERROR_INT OTFDEC security and execution errors interrupts flags
  - OTFDEC_SEC_KEY_ERROR_INT OTFDEC security and key errors interrupts flags
  - OTFDEC_EXE_KEY_ERROR_INT OTFDEC execution and key errors interrupts flag
  - OTFDEC_ALL_INT OTFDEC all interrupts flags

Return value:

- The: state of __FLAG__ (TRUE or FALSE).

__HAL_OTFDEC_CLEAR_FLAG

Description:

- Clear the specified combination of OTFDEC interrupt flags.

Parameters:

- __HANDLE__: pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- __FLAG__: mask on combination of interrupts flags This parameter can be one of the following values:
  - OTFDEC_SEC_ERROR_INT OTFDEC security error interrupt flag
  - OTFDEC_EXE_ERROR_INT OTFDEC execution error interrupt flag
  - OTFDEC_KEY_ERROR_INT OTFDEC key error interrupt flag
  - OTFDEC_SEC_EXE_ERROR_INT OTFDEC security and execution errors interrupts flags
  - OTFDEC_SEC_KEY_ERROR_INT OTFDEC security and key errors interrupts flags
  - OTFDEC_EXE_KEY_ERROR_INT OTFDEC execution and key errors interrupts flag
  - OTFDEC_ALL_INT OTFDEC all interrupts flags

Return value:

- None

OTFDEC Interrupts

OTFDEC_SEC_ERROR_INT

OTFDEC security error interrupt

OTFDEC_EXE_ERROR_INT

OTFDEC execution error interrupt

OTFDEC_KEY_ERROR_INT

OTFDEC key error interrupt

OTFDEC_SEC_EXE_ERROR_INT

OTFDEC security and execution errors interrupts

OTFDEC_SEC_KEY_ERROR_INT

OTFDEC security and key errors interrupts

OTFDEC_EXE_KEY_ERROR_INT

OTFDEC execution and key errors interrupts

OTFDEC_ALL_INT

OTFDEC all interrupts

OTFDEC Regions Index

OTFDEC_REGION1

OTFDEC region 1

OTFDEC_REGION2

OTFDEC region 2

OTFDEC_REGION3

OTFDEC region 3

OTFDEC_REGION4

OTFDEC region 4

OTFDEC Region Configuration Lock

OTFDEC_REG_CONFIGR_LOCK_DISABLE

OTFDEC region configuration lock disable

OTFDEC_REG_CONFIGR_LOCK_ENABLE

OTFDEC region configuration lock enable

OTFDEC Region Enable

OTFDEC_REG_CONFIGR_REG_DISABLE

OTFDEC region encryption or on-the-fly decryption disable

OTFDEC_REG_CONFIGR_REG_ENABLE

OTFDEC region encryption or on-the-fly decryption enable

OTFDEC Region Operating Mode

OTFDEC_REG_MODE_INSTRUCTION_ACCESSES_ONLY

Only instruction accesses are decrypted

OTFDEC_REG_MODE_DATA_ACCESSES_ONLY

Only data accesses are decrypted

OTFDEC_REG_MODE_INSTRUCTION_OR_DATA_ACCESSES

All read accesses are decrypted

OTFDEC_REG_MODE_INSTRUCTION_ACCESSES_ONLY_WITH_CIPHER

Only instruction accesses are decrypted with proprietary cipher activated

61 HAL PCD Generic Driver

61.1 PCD Firmware driver registers structures

61.2 PCD Firmware driver API description

The following section lists the various functions of the PCD library.

61.2.1 How to use this driver

The PCD HAL driver can be used as follows:

1. Declare a PCD_HandleTypeDef handle structure, for example: PCD_HandleTypeDef hpcd;
2. Fill parameters of Init structure in HCD handle
3. Call HAL_PCD_Init() API to initialize the PCD peripheral (Core, Device core, ...)
4. Initialize the PCD low level resources through the HAL_PCD_MspInit() API:
   a. Enable the PCD/USB Low Level interface clock using
      - __HAL_RCC_USB_OTG_FS_CLK_ENABLE();
      - __HAL_RCC_USB_OTG_HS_CLK_ENABLE(); (For High Speed Mode)
   b. Initialize the related GPIO clocks
   c. Configure PCD pin-out
   d. Configure PCD NVIC interrupt
5. Associate the Upper USB device stack to the HAL PCD Driver:
   a. hpcd.pData = pdev;
6. Enable PCD transmission and reception:
   a. HAL_PCD_Start();

61.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

This section contains the following APIs:

- ***HAL_PCD_Init()***
- ***HAL_PCD_DeInit()***
- ***HAL_PCD_MspInit()***
- ***HAL_PCD_MspDeInit()***
- ***HAL_PCD_RegisterCallback()***
- ***HAL_PCD_UnRegisterCallback()***
- ***HAL_PCD_RegisterDataOutStageCallback()***
- ***HAL_PCD_UnRegisterDataOutStageCallback()***
- ***HAL_PCD_RegisterDataInStageCallback()***
- ***HAL_PCD_UnRegisterDataInStageCallback()***
- ***HAL_PCD_RegisterIsoOutIncpltCallback()***
- ***HAL_PCD_UnRegisterIsoOutIncpltCallback()***
- ***HAL_PCD_RegisterIsoInIncpltCallback()***
- ***HAL_PCD_UnRegisterIsoInIncpltCallback()***
- ***HAL_PCD_RegisterBcdCallback()***
- ***HAL_PCD_UnRegisterBcdCallback()***
- ***HAL_PCD_RegisterLpmCallback()***
- ***HAL_PCD_UnRegisterLpmCallback()***

61.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the PCD data transfers.
This section contains the following APIs:

- *HAL_PCD_Start()*
- *HAL_PCD_Stop()*
- *HAL_PCD_IRQHandler()*
- *HAL_PCD_DataOutStageCallback()*
- *HAL_PCD_DataInStageCallback()*
- *HAL_PCD_SetupStageCallback()*
- *HAL_PCD_SOFCallback()*
- *HAL_PCD_ResetCallback()*
- *HAL_PCD_SuspendCallback()*
- *HAL_PCD_ResumeCallback()*
- *HAL_PCD_ISOOUTIncompleteCallback()*
- *HAL_PCD_ISOINIncompleteCallback()*
- *HAL_PCD_ConnectCallback()*
- *HAL_PCD_DisconnectCallback()*

61.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the PCD data transfers.
This section contains the following APIs:

- *HAL_PCD_DevConnect()*
- *HAL_PCD_DevDisconnect()*
- *HAL_PCD_SetAddress()*
- *HAL_PCD_EP_Open()*
- *HAL_PCD_EP_Close()*
- *HAL_PCD_EP_Receive()*
- *HAL_PCD_EP_GetRxCount()*
- *HAL_PCD_EP_Transmit()*
- *HAL_PCD_EP_SetStall()*
- *HAL_PCD_EP_ClrStall()*
- *HAL_PCD_EP_Abort()*
- *HAL_PCD_EP_Flush()*
- *HAL_PCD_ActivateRemoteWakeup()*
- *HAL_PCD_DeActivateRemoteWakeup()*
- *HAL_PCD_SetTestMode()*

61.2.5 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral and the data flow.
This section contains the following APIs:

- *HAL_PCD_GetState()*
- *HAL_PCD_SetTestMode()*

61.2.6 Detailed description of functions

HAL_PCD_Init

Function name

HAL_StatusTypeDef HAL_PCD_Init (PCD_HandleTypeDef * hpcd)

Function description

Initializes the PCD according to the specified parameters in the PCD_InitTypeDef and initialize the associated handle.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_DeInit

Function name

HAL_StatusTypeDef HAL_PCD_DeInit (PCD_HandleTypeDef * hpcd)

Function description

DeInitializes the PCD peripheral.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_MspInit

Function name

void HAL_PCD_MspInit (PCD_HandleTypeDef * hpcd)

Function description

Initializes the PCD MSP.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_MspDeInit

Function name

void HAL_PCD_MspDeInit (PCD_HandleTypeDef * hpcd)

Function description

DeInitializes PCD MSP.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_RegisterCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterCallback (PCD_HandleTypeDef * hpcd, HAL_PCD_CallbackIDTypeDef CallbackID, pPCD_CallbackTypeDef pCallback)

Function description

Register a User USB PCD Callback To be used instead of the weak predefined callback.

Parameters

- **hpcd:** USB PCD handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_PCD_SOF_CB_ID USB PCD SOF callback ID
  - HAL_PCD_SETUPSTAGE_CB_ID USB PCD Setup callback ID
  - HAL_PCD_RESET_CB_ID USB PCD Reset callback ID
  - HAL_PCD_SUSPEND_CB_ID USB PCD Suspend callback ID
  - HAL_PCD_RESUME_CB_ID USB PCD Resume callback ID
  - HAL_PCD_CONNECT_CB_ID USB PCD Connect callback ID
  - HAL_PCD_DISCONNECT_CB_ID USB PCD Disconnect callback ID
  - HAL_PCD_MSPINIT_CB_ID MspDeInit callback ID
  - HAL_PCD_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterCallback (PCD_HandleTypeDef * hpcd, HAL_PCD_CallbackIDTypeDef CallbackID)

Function description

Unregister an USB PCD Callback USB PCD callback is redirected to the weak predefined callback.

Parameters

- **hpcd:** USB PCD handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_PCD_SOF_CB_ID USB PCD SOF callback ID
  - HAL_PCD_SETUPSTAGE_CB_ID USB PCD Setup callback ID
  - HAL_PCD_RESET_CB_ID USB PCD Reset callback ID
  - HAL_PCD_SUSPEND_CB_ID USB PCD Suspend callback ID
  - HAL_PCD_RESUME_CB_ID USB PCD Resume callback ID
  - HAL_PCD_CONNECT_CB_ID USB PCD Connect callback ID
  - HAL_PCD_DISCONNECT_CB_ID USB PCD Disconnect callback ID
  - HAL_PCD_MSPINIT_CB_ID MspDeInit callback ID
  - HAL_PCD_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_PCD_RegisterDataOutStageCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterDataOutStageCallback (PCD_HandleTypeDef * hpcd, pPCD_DataOutStageCallbackTypeDef pCallback)

Function description

Register USB PCD Data OUT Stage Callback To be used instead of the weak HAL_PCD_DataOutStageCallback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD Data OUT Stage Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterDataOutStageCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterDataOutStageCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD Data OUT Stage Callback USB PCD Data OUT Stage Callback is redirected to the weak HAL_PCD_DataOutStageCallback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_RegisterDataInStageCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterDataInStageCallback (PCD_HandleTypeDef * hpcd, pPCD_DataInStageCallbackTypeDef pCallback)

Function description

Register USB PCD Data IN Stage Callback To be used instead of the weak HAL_PCD_DataInStageCallback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD Data IN Stage Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterDataInStageCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterDataInStageCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD Data IN Stage Callback USB PCD Data OUT Stage Callback is redirected to the weak HAL_PCD_DataInStageCallback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_RegisterIsoOutIncpltCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterIsoOutIncpltCallback (PCD_HandleTypeDef * hpcd, pPCD_IsoOutIncpltCallbackTypeDef pCallback)

Function description

Register USB PCD Iso OUT incomplete Callback To be used instead of the weak HAL_PCD_ISOOUTIncompleteCallback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD Iso OUT incomplete Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterIsoOutIncpltCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterIsoOutIncpltCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD Iso OUT incomplete Callback USB PCD Iso OUT incomplete Callback is redirected to the weak HAL_PCD_ISOOUTIncompleteCallback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_RegisterIsoInIncpltCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterIsoInIncpltCallback (PCD_HandleTypeDef * hpcd, pPCD_IsoInIncpltCallbackTypeDef pCallback)

Function description

Register USB PCD Iso IN incomplete Callback To be used instead of the weak HAL_PCD_ISOINIncompleteCallback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD Iso IN incomplete Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterIsoInIncpltCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterIsoInIncpltCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD Iso IN incomplete Callback USB PCD Iso IN incomplete Callback is redirected to the weak HAL_PCD_ISOINIncompleteCallback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_RegisterBcdCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterBcdCallback (PCD_HandleTypeDef * hpcd, pPCD_BcdCallbackTypeDef pCallback)

Function description

Register USB PCD BCD Callback To be used instead of the weak HAL_PCDEx_BCD_Callback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD BCD Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterBcdCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterBcdCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD BCD Callback USB BCD Callback is redirected to the weak HAL_PCDEx_BCD_Callback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_RegisterLpmCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterLpmCallback (PCD_HandleTypeDef * hpcd, pPCD_LpmCallbackTypeDef pCallback)

Function description

Register USB PCD LPM Callback To be used instead of the weak HAL_PCDEx_LPM_Callback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD LPM Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterLpmCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterLpmCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD LPM Callback USB LPM Callback is redirected to the weak HAL_PCDEx_LPM_Callback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_Start

Function name

HAL_StatusTypeDef HAL_PCD_Start (PCD_HandleTypeDef * hpcd)

Function description

Start the USB device.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_Stop

Function name

HAL_StatusTypeDef HAL_PCD_Stop (PCD_HandleTypeDef * hpcd)

Function description

Stop the USB device.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_IRQHandler

Function name

void HAL_PCD_IRQHandler (PCD_HandleTypeDef * hpcd)

Function description

Handles PCD interrupt request.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_SOFCallback

Function name

void HAL_PCD_SOFCallback (PCD_HandleTypeDef * hpcd)

Function description

USB Start Of Frame callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_SetupStageCallback

Function name

void HAL_PCD_SetupStageCallback (PCD_HandleTypeDef * hpcd)

Function description

Setup stage callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_ResetCallback

Function name

void HAL_PCD_ResetCallback (PCD_HandleTypeDef * hpcd)

Function description

USB Reset callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_SuspendCallback

Function name

void HAL_PCD_SuspendCallback (PCD_HandleTypeDef * hpcd)

Function description

Suspend event callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_ResumeCallback

Function name

void HAL_PCD_ResumeCallback (PCD_HandleTypeDef * hpcd)

Function description

Resume event callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_ConnectCallback

Function name

void HAL_PCD_ConnectCallback (PCD_HandleTypeDef * hpcd)

Function description

Connection event callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_DisconnectCallback

Function name

void HAL_PCD_DisconnectCallback (PCD_HandleTypeDef * hpcd)

Function description

Disconnection event callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_DataOutStageCallback

Function name

void HAL_PCD_DataOutStageCallback (PCD_HandleTypeDef * hpcd, uint8_t epnum)

Function description

Data OUT stage callback.

Parameters

- **hpcd:** PCD handle
- **epnum:** endpoint number

Return values

- **None:**

HAL_PCD_DataInStageCallback

Function name

void HAL_PCD_DataInStageCallback (PCD_HandleTypeDef * hpcd, uint8_t epnum)

Function description

Data IN stage callback.

Parameters

- **hpcd:** PCD handle
- **epnum:** endpoint number

Return values

- **None:**

HAL_PCD_ISOOUTIncompleteCallback

Function name

void HAL_PCD_ISOOUTIncompleteCallback (PCD_HandleTypeDef * hpcd, uint8_t epnum)

Function description

Incomplete ISO OUT callback.

Parameters

- **hpcd:** PCD handle
- **epnum:** endpoint number

Return values

- **None:**

HAL_PCD_ISOINIncompleteCallback

Function name

void HAL_PCD_ISOINIncompleteCallback (PCD_HandleTypeDef * hpcd, uint8_t epnum)

Function description

Incomplete ISO IN callback.

Parameters

- **hpcd:** PCD handle
- **epnum:** endpoint number

Return values

- **None:**

HAL_PCD_DevConnect

Function name

HAL_StatusTypeDef HAL_PCD_DevConnect (PCD_HandleTypeDef * hpcd)

Function description

Connect the USB device.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_DevDisconnect

Function name

HAL_StatusTypeDef HAL_PCD_DevDisconnect (PCD_HandleTypeDef * hpcd)

Function description

Disconnect the USB device.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_SetAddress

Function name

HAL_StatusTypeDef HAL_PCD_SetAddress (PCD_HandleTypeDef * hpcd, uint8_t address)

Function description

Set the USB Device address.

Parameters

- **hpcd:** PCD handle
- **address:** new device address

Return values

- **HAL:** status

HAL_PCD_EP_Open

Function name

HAL_StatusTypeDef HAL_PCD_EP_Open (PCD_HandleTypeDef * hpcd, uint8_t ep_addr, uint16_t ep_mps, uint8_t ep_type)

Function description

Open and configure an endpoint.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address
- **ep_mps:** endpoint max packet size
- **ep_type:** endpoint type

Return values

- **HAL:** status

HAL_PCD_EP_Close

Function name

HAL_StatusTypeDef HAL_PCD_EP_Close (PCD_HandleTypeDef * hpcd, uint8_t ep_addr)

Function description

Deactivate an endpoint.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **HAL:** status

HAL_PCD_EP_Receive

Function name

HAL_StatusTypeDef HAL_PCD_EP_Receive (PCD_HandleTypeDef * hpcd, uint8_t ep_addr, uint8_t * pBuf, uint32_t len)

Function description

Receive an amount of data.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address
- **pBuf:** pointer to the reception buffer
- **len:** amount of data to be received

Return values

- **HAL:** status

HAL_PCD_EP_Transmit

Function name

HAL_StatusTypeDef HAL_PCD_EP_Transmit (PCD_HandleTypeDef * hpcd, uint8_t ep_addr, uint8_t * pBuf, uint32_t len)

Function description

Send an amount of data.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address
- **pBuf:** pointer to the transmission buffer
- **len:** amount of data to be sent

Return values

- **HAL:** status

HAL_PCD_EP_SetStall

Function name

HAL_StatusTypeDef HAL_PCD_EP_SetStall (PCD_HandleTypeDef * hpcd, uint8_t ep_addr)

Function description

Set a STALL condition over an endpoint.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **HAL:** status

HAL_PCD_EP_ClrStall

Function name

HAL_StatusTypeDef HAL_PCD_EP_ClrStall (PCD_HandleTypeDef * hpcd, uint8_t ep_addr)

Function description

Clear a STALL condition over in an endpoint.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **HAL:** status

HAL_PCD_EP_Flush

Function name

HAL_StatusTypeDef HAL_PCD_EP_Flush (PCD_HandleTypeDef * hpcd, uint8_t ep_addr)

Function description

Flush an endpoint.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **HAL:** status

HAL_PCD_EP_Abort

Function name

HAL_StatusTypeDef HAL_PCD_EP_Abort (PCD_HandleTypeDef * hpcd, uint8_t ep_addr)

Function description

Abort an USB EP transaction.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **HAL:** status

HAL_PCD_ActivateRemoteWakeup

Function name

HAL_StatusTypeDef HAL_PCD_ActivateRemoteWakeup (PCD_HandleTypeDef * hpcd)

Function description

Activate remote wakeup signalling.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_DeActivateRemoteWakeup

Function name

HAL_StatusTypeDef HAL_PCD_DeActivateRemoteWakeup (PCD_HandleTypeDef * hpcd)

Function description

De-activate remote wakeup signalling.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_SetTestMode

Function name

HAL_StatusTypeDef HAL_PCD_SetTestMode (PCD_HandleTypeDef * hpcd, uint8_t testmode)

Function description

Set the USB Device high speed test mode.

Parameters

- **hpcd:** PCD handle
- **testmode:** USB Device high speed test mode

Return values

- **HAL:** status

HAL_PCD_EP_GetRxCount

Function name

uint32_t HAL_PCD_EP_GetRxCount (PCD_HandleTypeDef * hpcd, uint8_t ep_addr)

Function description

Get Received Data Size.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **Data:** Size

HAL_PCD_GetState

Function name

PCD_StateTypeDef HAL_PCD_GetState (PCD_HandleTypeDef * hpcd)

Function description

Return the PCD handle state.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** state

61.3 PCD Firmware driver defines

62 HAL PCD Extension Driver

62.1 PCDEx Firmware driver API description

The following section lists the various functions of the PCDEx library.

62.1.1 Extended features functions

This section provides functions allowing to:

- Update FIFO configuration

This section contains the following APIs:

- *HAL_PCDEx_SetTxFiFo()*
- *HAL_PCDEx_SetRxFiFo()*
- *HAL_PCDEx_ActivateLPM()*
- *HAL_PCDEx_DeActivateLPM()*
- *HAL_PCDEx_BCD_VBUSDetect()*
- *HAL_PCDEx_ActivateBCD()*
- *HAL_PCDEx_DeActivateBCD()*
- *HAL_PCDEx_LPM_Callback()*
- *HAL_PCDEx_BCD_Callback()*

62.1.2 Detailed description of functions

HAL_PCDEx_SetTxFiFo

Function name

HAL_StatusTypeDef HAL_PCDEx_SetTxFiFo (PCD_HandleTypeDef * hpcd, uint8_t fifo, uint16_t size)

Function description

Set Tx FIFO.

Parameters

- **hpcd:** PCD handle
- **fifo:** The number of Tx fifo
- **size:** Fifo size

Return values

- **HAL:** status

HAL_PCDEx_SetRxFiFo

Function name

HAL_StatusTypeDef HAL_PCDEx_SetRxFiFo (PCD_HandleTypeDef * hpcd, uint16_t size)

Function description

Set Rx FIFO.

Parameters

- **hpcd:** PCD handle
- **size:** Size of Rx fifo

Return values

- **HAL:** status

HAL_PCDEx_ActivateLPM

Function name

HAL_StatusTypeDef HAL_PCDEx_ActivateLPM (PCD_HandleTypeDef * hpcd)

Function description

Activate LPM feature.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCDEx_DeActivateLPM

Function name

HAL_StatusTypeDef HAL_PCDEx_DeActivateLPM (PCD_HandleTypeDef * hpcd)

Function description

Deactivate LPM feature.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCDEx_ActivateBCD

Function name

HAL_StatusTypeDef HAL_PCDEx_ActivateBCD (PCD_HandleTypeDef * hpcd)

Function description

Activate BatteryCharging feature.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCDEx_DeActivateBCD

Function name

HAL_StatusTypeDef HAL_PCDEx_DeActivateBCD (PCD_HandleTypeDef * hpcd)

Function description

Deactivate BatteryCharging feature.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCDEx_BCD_VBUSDetect

Function name

void HAL_PCDEx_BCD_VBUSDetect (PCD_HandleTypeDef * hpcd)

Function description

Handle BatteryCharging Process.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCDEx_LPM_Callback

Function name

void HAL_PCDEx_LPM_Callback (PCD_HandleTypeDef * hpcd, PCD_LPM_MsgTypeDef msg)

Function description

Send LPM message to user layer callback.

Parameters

- **hpcd:** PCD handle
- **msg:** LPM message

Return values

- **HAL:** status

HAL_PCDEx_BCD_Callback

Function name

void HAL_PCDEx_BCD_Callback (PCD_HandleTypeDef * hpcd, PCD_BCD_MsgTypeDef msg)

Function description

Send BatteryCharging message to user layer callback.

Parameters

- **hpcd:** PCD handle
- **msg:** LPM message

Return values

- **HAL:** status

63 HAL PSSI Generic Driver

63.1 PSSI Firmware driver registers structures

63.1.1 PSSI_InitTypeDef

PSSI_InitTypeDef is defined in the stm32h7xx_hal_pssi.h

Data Fields

- ***uint32_t DataWidth***
- ***uint32_t BusWidth***
- ***uint32_t ControlSignal***
- ***uint32_t ClockPolarity***
- ***uint32_t DataEnablePolarity***

- ***DMA_HandleTypeDef* __PSSI_HandleTypeDef::hdmarx***
  PSSI Rx DMA Handle parameters
- ***void(* __PSSI_HandleTypeDef::TxCpltCallback)(struct __PSSI_HandleTypeDef *hpssi)***
  PSSI transfer complete callback.
- ***void(* __PSSI_HandleTypeDef::RxCpltCallback)(struct __PSSI_HandleTypeDef *hpssi)***
  PSSI transfer complete callback.
- ***void(* __PSSI_HandleTypeDef::ErrorCallback)(struct __PSSI_HandleTypeDef *hpssi)***
  PSSI transfer complete callback.
- ***void(* __PSSI_HandleTypeDef::AbortCpltCallback)(struct __PSSI_HandleTypeDef *hpssi)***
  PSSI transfer error callback.
- ***void(* __PSSI_HandleTypeDef::MspInitCallback)(struct __PSSI_HandleTypeDef *hpssi)***
  PSSI Msp Init callback.
- ***void(* __PSSI_HandleTypeDef::MspDeInitCallback)(struct __PSSI_HandleTypeDef *hpssi)***
  PSSI Msp DeInit callback.
- ***HAL_LockTypeDef __PSSI_HandleTypeDef::Lock***
  PSSI lock.
- ***__IO HAL_PSSI_StateTypeDef __PSSI_HandleTypeDef::State***
  PSSI transfer state.
- ***__IO uint32_t __PSSI_HandleTypeDef::ErrorCode***
  PSSI error code.

63.2 PSSI Firmware driver API description

The following section lists the various functions of the PSSI library.

63.2.1 How to use this driver

The PSSI HAL driver can be used as follows:

1. Declare a PSSI_HandleTypeDef handle structure, for example: PSSI_HandleTypeDef hpssi;

2. Initialize the PSSI low level resources by implementing the @ref HAL_PSSI_MspInit() API:
   a. Enable the PSSIx interface clock
   b. PSSI pins configuration
      - Enable the clock for the PSSI GPIOs
      - Configure PSSI pins as alternate function open-drain
   c. NVIC configuration if you need to use interrupt process
      - Configure the PSSIx interrupt priority
      - Enable the NVIC PSSI IRQ Channel
   d. DMA Configuration if you need to use DMA process
      - Declare DMA_HandleTypeDef handles structure for the transmit and receive
      - Enable the DMAx interface clock
      - Configure the DMA handle parameters
      - Configure the DMA Tx and Rx
      - Associate the initialized DMA handle to the hpssi DMA Tx and Rx handle
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx and Rx
3. Configure the Communication Bus Width, Control Signals, Input Polarity and Output Polarity in the hpssi Init structure.
4. Initialize the PSSI registers by calling the @ref HAL_PSSI_Init(), configure also the low level Hardware (GPIO, CLOCK, NVIC...etc) by calling the customized @ref HAL_PSSI_MspInit(&hpssi) API.
5. For PSSI IO operations, two operation modes are available within this driver :

Polling mode IO operation

- Transmit an amount of data by byte in blocking mode using @ref HAL_PSSI_Transmit()
- Receive an amount of data by byte in blocking mode using @ref HAL_PSSI_Receive()

DMA mode IO operation

- Transmit an amount of data in non-blocking mode (DMA) using @ref HAL_PSSI_Transmit_DMA()
- At transmission end of transfer, @ref HAL_PSSI_TxCpltCallback() is executed and user can add his own code by customization of function pointer @ref HAL_PSSI_TxCpltCallback()
- Receive an amount of data in non-blocking mode (DMA) using @ref HAL_PSSI_Receive_DMA()
- At reception end of transfer, @ref HAL_PSSI_RxCpltCallback() is executed and user can add his own code by customization of function pointer @ref HAL_PSSI_RxCpltCallback()
- In case of transfer Error, @ref HAL_PSSI_ErrorCallback() function is executed and user can add his own code by customization of function pointer @ref HAL_PSSI_ErrorCallback()
- Abort a PSSI process communication with Interrupt using @ref HAL_PSSI_Abort_IT()
- End of abort process, @ref HAL_PSSI_AbortCpltCallback() is executed and user can add his own code by customization of function pointer @ref HAL_PSSI_AbortCpltCallback()

PSSI HAL driver macros list

Below the list of most used macros in PSSI HAL driver.

- @ref HAL_PSSI_ENABLE : Enable the PSSI peripheral
- @ref HAL_PSSI_DISABLE : Disable the PSSI peripheral
- @ref HAL_PSSI_GET_FLAG : Check whether the specified PSSI flag is set or not
- @ref HAL_PSSI_CLEAR_FLAG : Clear the specified PSSI pending flag
- @ref HAL_PSSI_ENABLE_IT : Enable the specified PSSI interrupt
- @ref HAL_PSSI_DISABLE_IT : Disable the specified PSSI interrupt

Callback registration

Note: You can refer to the PSSI HAL driver header file for more useful macros

63.2.2 Initialization and de-initialization functions

This subsection provides a set of functions allowing to initialize and deinitialize the PSSIx peripheral:

- User must implement HAL_PSSI_MspInit() function in which he configures all related peripherals resources (CLOCK, GPIO, DMA, IT and NVIC).
- Call the function HAL_PSSI_Init() to configure the selected device with the selected configuration:
  - Data Width
  - Control Signals
  - Input Clock polarity
  - Output Clock polarity
- Call the function HAL_PSSI_DeInit() to restore the default configuration of the selected PSSIx peripheral.

This section contains the following APIs:

- ***HAL_PSSI_Init()***
- ***HAL_PSSI_DeInit()***
- ***HAL_PSSI_MspInit()***
- ***HAL_PSSI_MspDeInit()***
- ***HAL_PSSI_RegisterCallback()***
- ***HAL_PSSI_UnRegisterCallback()***

63.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the PSSI data transfers.

1. There are two modes of transfer:
   - Blocking mode : The communication is performed in the polling mode. The status of all data processing is returned by the same function after finishing transfer.
   - No-Blocking mode : The communication is performed using DMA. These functions return the status of the transfer startup. The end of the data processing will be indicated through the dedicated the DMA IRQ .
2. Blocking mode functions are :
   - HAL_PSSI_Transmit()
   - HAL_PSSI_Receive()
3. No-Blocking mode functions with DMA are :
   - HAL_PSSI_Transmit_DMA()
   - HAL_PSSI_Receive_DMA()
4. A set of Transfer Complete Callbacks are provided in non Blocking mode:
   - HAL_PSSI_TxCpltCallback()
   - HAL_PSSI_RxCpltCallback()
   - HAL_PSSI_ErrorCallback()
   - HAL_PSSI_AbortCpltCallback()

This section contains the following APIs:

- ***HAL_PSSI_Transmit()***
- ***HAL_PSSI_Receive()***
- ***HAL_PSSI_Transmit_DMA()***
- ***HAL_PSSI_Receive_DMA()***
- ***HAL_PSSI_Abort_DMA()***

63.2.4 Peripheral State, Mode and Error functions

This subsection permit to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- ***HAL_PSSI_GetState()***
- ***HAL_PSSI_GetError()***

63.2.5 Detailed description of functions

HAL_PSSI_Init

Function name

HAL_StatusTypeDef HAL_PSSI_Init (PSSI_HandleTypeDef * hpssi)

Function description

Initializes the PSSI according to the specified parameters in the PSSI_InitTypeDef and initialize the associated handle.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **HAL:** status

HAL_PSSI_DeInit

Function name

HAL_StatusTypeDef HAL_PSSI_DeInit (PSSI_HandleTypeDef * hpssi)

Function description

DeInitialize the PSSI peripheral.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **HAL:** status

HAL_PSSI_MspInit

Function name

void HAL_PSSI_MspInit (PSSI_HandleTypeDef * hpssi)

Function description

Initialize the PSSI MSP.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_MspDeInit

Function name

void HAL_PSSI_MspDeInit (PSSI_HandleTypeDef * hpssi)

Function description

DeInitialize the PSSI MSP.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_RegisterCallback

Function name

HAL_StatusTypeDef HAL_PSSI_RegisterCallback (PSSI_HandleTypeDef * hpssi, HAL_PSSI_CallbackIDTypeDef CallbackID, pPSSI_CallbackTypeDef pCallback)

Function description

Register a User PSSI Callback To be used instead of the weak predefined callback.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_PSSI_TX_COMPLETE_CB_ID Tx Transfer completed callback ID
  - HAL_PSSI_RX_COMPLETE_CB_ID Rx Transfer completed callback ID
  - HAL_PSSI_ERROR_CB_ID Error callback ID
  - HAL_PSSI_ABORT_CB_ID Abort callback ID
  - HAL_PSSI_MSPINIT_CB_ID MspInit callback ID
  - HAL_PSSI_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

Notes

- The HAL_PSSI_RegisterCallback() may be called before HAL_PSSI_Init() in HAL_PSSI_STATE_RESET to register callbacks for HAL_PSSI_MSPINIT_CB_ID and HAL_PSSI_MSPDEINIT_CB_ID.

HAL_PSSI_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_PSSI_UnRegisterCallback (PSSI_HandleTypeDef * hpssi, HAL_PSSI_CallbackIDTypeDef CallbackID)

Function description

Unregister an PSSI Callback PSSI callback is redirected to the weak predefined callback.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_PSSI_TX_COMPLETE_CB_ID Tx Transfer completed callback ID
  - HAL_PSSI_RX_COMPLETE_CB_ID Rx Transfer completed callback ID
  - HAL_PSSI_ERROR_CB_ID Error callback ID
  - HAL_PSSI_ABORT_CB_ID Abort callback ID
  - HAL_PSSI_MSPINIT_CB_ID MspInit callback ID
  - HAL_PSSI_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

Notes

- The HAL_PSSI_UnRegisterCallback() may be called before HAL_PSSI_Init() in HAL_PSSI_STATE_RESET to un-register callbacks for HAL_PSSI_MSPINIT_CB_ID and HAL_PSSI_MSPDEINIT_CB_ID.

HAL_PSSI_Transmit

Function name

HAL_StatusTypeDef HAL_PSSI_Transmit (PSSI_HandleTypeDef * hpssi, uint8_t * pData, uint32_t Size, uint32_t Timeout)

Function description

Transmits in master mode an amount of data in blocking mode.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent (in bytes)
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PSSI_Receive

Function name

HAL_StatusTypeDef HAL_PSSI_Receive (PSSI_HandleTypeDef * hpssi, uint8_t * pData, uint32_t Size, uint32_t Timeout)

Function description

Receives an amount of data in blocking mode.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be received (in bytes)
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PSSI_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_PSSI_Transmit_DMA (PSSI_HandleTypeDef * hpssi, uint32_t * pData, uint32_t Size)

Function description

Transmit an amount of data in non-blocking mode with DMA.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent (in bytes)

Return values

- **HAL:** status

HAL_PSSI_Receive_DMA

Function name

HAL_StatusTypeDef HAL_PSSI_Receive_DMA (PSSI_HandleTypeDef * hpssi, uint32_t * pData, uint32_t Size)

Function description

Receive an amount of data in non-blocking mode with DMA.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be received (in bytes)

Return values

- **HAL:** status

HAL_PSSI_Abort_DMA

Function name

HAL_StatusTypeDef HAL_PSSI_Abort_DMA (PSSI_HandleTypeDef * hpssi)

Function description

Abort a DMA process communication with Interrupt.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **HAL:** status

HAL_PSSI_GetState

Function name

HAL_PSSI_StateTypeDef HAL_PSSI_GetState (PSSI_HandleTypeDef * hpssi)

Function description

Return the PSSI handle state.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **HAL:** state

HAL_PSSI_GetError

Function name

uint32_t HAL_PSSI_GetError (PSSI_HandleTypeDef * hpssi)

Function description

Return the PSSI error code.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **PSSI:** Error Code

HAL_PSSI_IRQHandler

Function name

void HAL_PSSI_IRQHandler (PSSI_HandleTypeDef * hpssi)

Function description

This function handles PSSI event interrupt request.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_TxCpltCallback

Function name

void HAL_PSSI_TxCpltCallback (PSSI_HandleTypeDef * hpssi)

Function description

Tx Transfer complete callback.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_RxCpltCallback

Function name

void HAL_PSSI_RxCpltCallback (PSSI_HandleTypeDef * hpssi)

Function description

Rx Transfer complete callback.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_ErrorCallback

Function name

void HAL_PSSI_ErrorCallback (PSSI_HandleTypeDef * hpssi)

Function description

PSSI error callback.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_AbortCpltCallback

Function name

void HAL_PSSI_AbortCpltCallback (PSSI_HandleTypeDef * hpssi)

Function description

PSSI abort callback.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

63.3 PSSI Firmware driver defines

The following section lists the various define and macros of the module.

63.3.1 PSSI

PSSI

PSSI Bus Width

HAL_PSSI_8LINES

8 data lines

HAL_PSSI_16LINES

16 data lines

PSSI Data Width

HAL_PSSI_8BITS

8 Bits

HAL_PSSI_16BITS

16 Bits

HAL_PSSI_32BITS

32 Bits

PSSI definitions

PSSI_MAX_NBYTE_SIZE

PSSI_TIMEOUT_TRANSMIT

Timeout Value

PSSI_CR_OUTEN_INPUT

Input Mode

PSSI_CR_OUTEN_OUTPUT

Output Mode

PSSI_CR_DMA_ENABLE

DMA Mode Enable

PSSI_CR_DMA_DISABLE

DMA Mode Disable

PSSI_CR_16BITS

16 Lines Mode

PSSI_CR_8BITS

8 Lines Mode

PSSI_FLAG_RTT1B

1 Byte Fifo Flag

PSSI_FLAG_RTT4B

4 Bytes Fifo Flag

PSSI Error Code

HAL_PSSI_ERROR_NONE

No error

HAL_PSSI_ERROR_NOT_SUPPORTED

Not supported operation

HAL_PSSI_ERROR_UNDER_RUN

FIFO Under-run error

HAL_PSSI_ERROR_OVER_RUN

FIFO Over-run error

HAL_PSSI_ERROR_DMA

Dma error

HAL_PSSI_ERROR_TIMEOUT

Timeout error

HAL_PSSI_ERROR_INVALID_CALLBACK

Invalid callback error

PSSI Exported Macros

HAL_PSSI_RESET_HANDLE_STATE

Description:

- Reset PSSI handle state.

Parameters:

- __HANDLE__: specifies the PSSI handle.

Return value:

- None

HAL_PSSI_ENABLE

Description:

- Enable the PSSI.

Parameters:

- __HANDLE__: PSSI handle

Return value:

- None.

HAL_PSSI_DISABLE

Description:

- Disable the PSSI.

Parameters:

- __HANDLE__: PSSI handle

Return value:

- None.

HAL_PSSI_GET_STATUS

Description:

- Get the PSSI pending flags.

Parameters:

- __HANDLE__: PSSI handle
- __FLAG__: flag to check. This parameter can be any combination of the following values:
  - PSSI_FLAG_RTT1B: FIFO is ready to transfer one byte
  - PSSI_FLAG_RTT4B: FIFO is ready to transfer four bytes

Return value:

- The: state of FLAG.

HAL_PSSI_GET_FLAG

Description:

- Get the PSSI pending flags.

Parameters:

- __HANDLE__: PSSI handle
- __FLAG__: flag to check. This parameter can be any combination of the following values:
  - PSSI_FLAG_OVR_RIS: Data Buffer overrun/underrun error flag

Return value:

- The: state of FLAG.

HAL_PSSI_CLEAR_FLAG

Description:

- Clear the PSSI pending flags.

Parameters:

- __HANDLE__: PSSI handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - PSSI_FLAG_OVR_RIS: Data Buffer overrun/underrun error flag

Return value:

- None

HAL_PSSI_ENABLE_IT

Description:

- Enable the specified PSSI interrupts.

Parameters:

- __HANDLE__: PSSI handle
- __INTERRUPT__: specifies the PSSI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - PSSI_FLAG_OVR_RIS: Configuration error mask

Return value:

- None

HAL_PSSI_DISABLE_IT

Description:

- Disable the specified PSSI interrupts.

Parameters:

- __HANDLE__: PSSI handle
- __INTERRUPT__: specifies the PSSI interrupt sources to be disabled. This parameter can be any combination of the following values:
  - PSSI_IT_OVR_IE: Configuration error mask

Return value:

- None

HAL_PSSI_GET_IT_SOURCE

Description:

- Check whether the specified PSSI interrupt source is enabled or not.

Parameters:

- __HANDLE__: PSSI handle
- __INTERRUPT__: specifies the PSSI interrupt source to check. This parameter can be one of the following values:
  - PSSI_IT_OVR_IE: Data Buffer overrun/underrun error interrupt mask

Return value:

- The: state of INTERRUPT source.

IS_PSSI_CONTROL_SIGNAL

Description:

- Check whether the PSSI Control signal is valid.

Parameters:

- __CONTROL__: Control signals configuration

Return value:

- Valid: or not.

IS_PSSI_BUSWIDTH

Description:

- Check whether the PSSI Bus Width is valid.

Parameters:

- __BUSWIDTH__: PSSI Bush width

Return value:

- Valid: or not.

IS_PSSI_CLOCK_POLARITY

Description:

- Check whether the PSSI Clock Polarity is valid.

Parameters:

- __CLOCKPOL__: PSSI Clock Polarity

Return value:

- Valid: or not.

IS_PSSI_DE_POLARITY

Description:

- Check whether the PSSI Data Enable Polarity is valid.

Parameters:

- __DEPOL__: PSSI DE Polarity

Return value:

- Valid: or not.

IS_PSSI_RDY_POLARITY

Description:

- Check whether the PSSI Ready Polarity is valid.

Parameters:

- __RDYPOL__: PSSI RDY Polarity

Return value:

- Valid: or not.

PSSI Interrupts

PSSI_FLAG_OVR_RIS

Overrun, Underrun errors flag

PSSI_FLAG_MASK

Overrun, Underrun errors Mask

PSSI_FLAG_OVR_MIS

Overrun, Underrun masked errors flag

PSSI mode

HAL_PSSI_UNIDIRECTIONAL

Uni-directional mode

HAL_PSSI_BIDIRECTIONAL

Bi-directional mode

64 HAL PWR Generic Driver

64.1 PWR Firmware driver registers structures

64.1.1 PWR_PVDTypeDef

PWR_PVDTypeDef is defined in the stm32h7xx_hal_pwr.h

Data Fields

- ***uint32_t PVDLevel***
- ***uint32_t Mode***

Field Documentation

- ***uint32_t PWR_PVDTypeDef::PVDLevel***

  PVDLevel: Specifies the PVD detection level. This parameter can be a value of ***PWR_PVD_detection_level***.
- ***uint32_t PWR_PVDTypeDef::Mode***

  Mode: Specifies the EXTI operating mode for the PVD event. This parameter can be a value of ***PWR_PVD_Mode***.

64.2 PWR Firmware driver API description

The following section lists the various functions of the PWR library.

64.2.1 PWR peripheral overview

1. The Power control (PWR) provides an overview of the supply architecture for the different power domains and of the supply configuration controller. In the H7 family, the number of power domains is different between device lines. This difference is due to characteristics of each device.
2. Domain architecture overview for the different H7 lines: (+) Dual core lines are STM32H745, STM32H747, STM32H755 and STM32H757. These devices have 3 power domains (D1, D2 and D3). The domain D1 contains a CPU (Cortex-M7), a Flash memory and some peripherals. The D2 domain contains peripherals and a CPU (Cortex-M4). The D3 domain contains the system control, I/O logic and low-power peripherals. (+) STM32H72x, STM32H73x, STM32H742, STM32H743, STM32H750 and STM32H753 devices have 3 power domains (D1, D2 and D3). The domain D1 contains a CPU (Cortex-M7), a Flash memory and some peripherals. The D2 domain contains peripherals. The D3 domains contains the system control, I/O logic and low-power peripherals. (+) STM32H7Axxx and STM32H7Bxxx devices have 2 power domains (CD and SRD). The core domain (CD) contains a CPU (Cortex-M7), a Flash memory and peripherals. The SmartRun domain contains the system control, I/O logic and low-power peripherals.
3. Every entity have low power mode as described below :
4. The CPU low power modes are : (+) CPU CRUN. (+) CPU CSLEEP. (+) CPU CSTOP.
5. The domain low power modes are : (+) DRUN. (+) DSTOP. (+) DSTANDBY.
6. The SYSTEM low power modes are : (+) RUN* : The Run* mode is entered after a POR reset and a wakeup from Standby. In Run* mode, the performance is limited and the system supply configuration shall be programmed. The system enters Run mode only when the ACTVOSRDY bit in PWR control status register 1 (PWR_CSR1) is set to 1. (+) RUN. (+) STOP. (+) STANDBY.

(#) The Power control (PWR) provides an overview of the supply architecture for the different power domains and of the supply configuration controller. In the H7 family, the number of power domains is different between device lines. This difference is due to characteristics of each device. (#) Domain architecture overview for the different H7 lines:

- Dual core lines are STM32H745, STM32H747, STM32H755 and STM32H757. These devices have 3 power domains (D1, D2 and D3). The domain D1 contains a CPU (Cortex-M7), a Flash memory and some peripherals. The D2 domain contains peripherals and a CPU (Cortex-M4). The D3 domain contains the system control, I/O logic and low-power peripherals.

- STM32H72x, STM32H73x, STM32H742, STM32H743, STM32H750 and STM32H753 devices have 3 power domains (D1, D2 and D3). The domain D1 contains a CPU (Cortex-M7), a Flash memory and some peripherals. The D2 domain contains peripherals. The D3 domains contains the system control, I/O logic and low-power peripherals.
- STM32H7Axxx and STM32H7Bxxx devices have 2 power domains (CD and SRD). The core domain (CD) contains a CPU (Cortex-M7), a Flash memory and peripherals. The SmartRun domain contains the system control, I/O logic and low-power peripherals. (#) Every entity have low power mode as described below : (#) The CPU low power modes are :
- CPU CRUN.
- CPU CSLEEP.
- CPU CSTOP. (#) The domain low power modes are :
- DRUN.
- DSTOP.
- DSTANDBY. (#) The SYSTEM low power modes are :
- RUN* : The Run* mode is entered after a POR reset and a wakeup from Standby. In Run* mode, the performance is limited and the system supply configuration shall be programmed. The system enters Run mode only when the ACTVOSRDY bit in PWR control status register 1 (PWR_CSR1) is set to 1.
- RUN.
- STOP.
- STANDBY.

64.2.2 How to use this driver

1. Power management peripheral is active by default at startup level in STM32h7xx lines.
2. Call HAL_PWR_EnableBkUpAccess() and HAL_PWR_DisableBkUpAccess() functions to enable/disable access to the backup domain (RTC registers, RTC backup data registers and backup SRAM).
3. Call HAL_PWR_ConfigPVD() after setting parameters to be configured (event mode and voltage threshold) in order to set up the Power Voltage Detector, then use HAL_PWR_EnablePVD() and HAL_PWR_DisablePVD() functions to start and stop the PVD detection. (+) PVD level could be one of the following values :
   – 1V95
   – 2V1
   – 2V25
   – 2V4
   – 2V55
   – 2V7
   – 2V85
   – External voltage level
4. Call HAL_PWR_EnableWakeUpPin() and HAL_PWR_DisableWakeUpPin() functions with the right parameter to configure the wake up pin polarity (Low or High) and to enable and disable it.
5. Call HAL_PWR_EnterSLEEPMode() function to enter the current Core in SLEEP mode. Wake-up from SLEEP mode could be following to an event or an interrupt according to low power mode intrinsic request called (__WFI() or __WFE()). Please ensure to clear all CPU pending events by calling HAL_PWREx_ClearPendingEvent() function when trying to enter the Cortex-Mx in SLEEP mode with __WFE() entry.
6. Call HAL_PWR_EnterSTOPMode() function to enter the whole system to Stop 0 mode for single core devices. For dual core devices, this API will enter the domain (containing Cortex-Mx that executing this function) in DSTOP mode. According to the used parameter, user could select the regulator to be kept actif in low power mode and wake-up event type. Please ensure to clear all CPU pending events by calling HAL_PWREx_ClearPendingEvent() function when trying to enter the Cortex-Mx in CSTOP mode with __WFE() entry.
7. Call HAL_PWR_EnterSTANDBYMode() function to enter the whole system in STANDBY mode for single core devices. For dual core devices, this API will enter the domain (containing Cortex-Mx that executing this function) in DSTANDBY mode.

8. Call HAL_PWR_EnableSleepOnExit() and HAL_PWR_DisableSleepOnExit() APIs to enable and disable the Cortex-Mx re-entring in SLEEP mode after an interruption handling is over.
9. Call HAL_PWR_EnableSEVOnPend() and HAL_PWR_DisableSEVOnPend() functions to configure the Cortex-Mx to wake-up after any pending event / interrupt even if it's disabled or has insufficient priority to cause exception entry.
10. Call HAL_PWR_PVD_IRQHandler() function to handle the PWR PVD interrupt request.

(#) Power management peripheral is active by default at startup level in STM32h7xx lines. (#) Call HAL_PWR_EnableBkUpAccess() and HAL_PWR_DisableBkUpAccess() functions to enable/disable access to the backup domain (RTC registers, RTC backup data registers and backup SRAM). (#) Call HAL_PWR_ConfigPVD() after setting parameters to be configured (event mode and voltage threshold) in order to set up the Power Voltage Detector, then use HAL_PWR_EnablePVD() and HAL_PWR_DisablePVD() functions to start and stop the PVD detection.

- PVD level could be one of the following values :
  - 1V95
  - 2V1
  - 2V25
  - 2V4
  - 2V55
  - 2V7
  - 2V85
  - External voltage level (#) Call HAL_PWR_EnableWakeUpPin() and HAL_PWR_DisableWakeUpPin() functions with the right parameter to configure the wake up pin polarity (Low or High) and to enable and disable it. (#) Call HAL_PWR_EnterSLEEPMode() function to enter the current Core in SLEEP mode. Wake-up from SLEEP mode could be following to an event or an interrupt according to low power mode intrinsic request called (__WFI() or __WFE()). Please ensure to clear all CPU pending events by calling HAL_PWREx_ClearPendingEvent() function when trying to enter the Cortex-Mx in SLEEP mode with __WFE() entry. (#) Call HAL_PWR_EnterSTOPMode() function to enter the whole system to Stop 0 mode for single core devices. For dual core devices, this API will enter the domain (containing Cortex-Mx that executing this function) in DSTOP mode. According to the used parameter, user could select the regulator to be kept actif in low power mode and wake-up event type. Please ensure to clear all CPU pending events by calling HAL_PWREx_ClearPendingEvent() function when trying to enter the Cortex-Mx in CSTOP mode with __WFE() entry. (#) Call HAL_PWR_EnterSTANDBYMode() function to enter the whole system in STANDBY mode for single core devices. For dual core devices, this API will enter the domain (containing Cortex-Mx that executing this function) in DSTANDBY mode. (#) Call HAL_PWR_EnableSleepOnExit() and HAL_PWR_DisableSleepOnExit() APIs to enable and disable the Cortex-Mx re-entring in SLEEP mode after an interruption handling is over. (#) Call HAL_PWR_EnableSEVOnPend() and HAL_PWR_DisableSEVOnPend() functions to configure the Cortex-Mx to wake-up after any pending event / interrupt even if it's disabled or has insufficient priority to cause exception entry. (#) Call HAL_PWR_PVD_IRQHandler() function to handle the PWR PVD interrupt request.

PWR HAL driver macros list

Below the list of most used macros in PWR HAL driver.

- __HAL_PWR_VOLTAGESCALING_CONFIG() : Configure the main internal regulator output voltage.
- __HAL_PWR_GET_FLAG() : Get the PWR pending flags.
- __HAL_PWR_CLEAR_FLAG() : Clear the PWR pending flags.

64.2.3 Initialization and De-Initialization Functions

This section provides functions allowing to deinitialize power peripheral.

After system reset, the backup domain (RTC registers, RTC backup data registers and backup SRAM) is protected against possible unwanted write accesses. The HAL_PWR_EnableBkUpAccess() function enables the access to the backup domain. The HAL_PWR_DisableBkUpAccess() function disables the access to the backup domain.

This section contains the following APIs:

- ***HAL_PWR_DeInit()***

- *HAL_PWR_EnableBkUpAccess()*
- *HAL_PWR_DisableBkUpAccess()*

64.2.4 Peripheral Control Functions

This section provides functions allowing to control power peripheral.

PVD configuration

- The PVD is used to monitor the VDD power supply by comparing it to a threshold selected by the PVD Level (PLS[7:0] bits in the PWR_CR1 register).
- A PVDO flag is available to indicate if VDD is higher or lower than the PVD threshold. This event is internally connected to the EXTI line 16 to generate an interrupt if enabled. It is configurable through __HAL_PWR_PVD_EXTI_ENABLE_IT() macro.
- The PVD is stopped in STANDBY mode.

Wake-up pin configuration

- Wake-up pin is used to wake up the system from STANDBY mode. The pin pull is configurable through the WKUPEPR register to be in No-pull, Pull-up and Pull-down. The pin polarity is configurable through the WKUPEPR register to be active on rising or falling edges.
- There are up to six Wake-up pin in the STM32H7 devices family.

Low Power modes configuration

The device present 3 principles low-power modes features:

- SLEEP mode : Cortex-Mx is stopped and all PWR domains are remaining active (Powered and Clocked).
- STOP mode : Cortex-Mx is stopped, clocks are stopped and the regulator is running. The Main regulator or the LP regulator could be selected.
- STANDBY mode : All PWR domains enter DSTANDBY mode and the VCORE supply regulator is powered off.

SLEEP mode

- Entry: The SLEEP mode is entered by using the HAL_PWR_EnterSLEEPMode(Regulator, SLEEPEntry) function.
  - PWR_SLEEPENTRY_WFI: enter SLEEP mode with WFI instruction.
  - PWR_SLEEPENTRY_WFE: enter SLEEP mode with WFE instruction.

Note: The Regulator parameter is not used for the STM32H7 family and is kept as parameter just to maintain compatibility with the lower power families (STM32L).

- Exit: Any peripheral interrupt acknowledged by the nested vectored interrupt controller (NVIC) can wake up the device from SLEEP mode.

STOP mode

In system STOP mode, all clocks in the 1.2V domain are stopped, the PLL, the HSI, and the HSE RC oscillators are disabled. Internal SRAM and register contents are preserved. The voltage regulator can be configured either in normal or low-power mode. To minimize the consumption in STOP mode, FLASH can be powered off before entering the STOP mode using the HAL_PWREx_EnableFlashPowerDown() function. It can be switched on again by software after exiting the STOP mode using the HAL_PWREx_DisableFlashPowerDown() function.

- Entry: The STOP mode is entered using the HAL_PWR_EnterSTOPMode(Regulator, STOPEntry) function with:
  - Regulator:
    - PWR_MAINREGULATOR_ON: Main regulator ON.
    - PWR_LOWPOWERREGULATOR_ON: Low Power regulator ON.
  - STOPEntry:
    - PWR_STOPENTRY_WFI: enter STOP mode with WFI instruction.
    - PWR_STOPENTRY_WFE: enter STOP mode with WFE instruction.

- Exit: Any EXTI Line (Internal or External) configured in Interrupt/Event mode.

STANDBY mode

- The system STANDBY mode allows to achieve the lowest power consumption. It is based on the Cortex-Mx deep SLEEP mode, with the voltage regulator disabled. The system is consequently powered off. The PLL, the HSI oscillator and the HSE oscillator are also switched off. SRAM and register contents are lost except for the RTC registers, RTC backup registers, backup SRAM and standby circuitry.

The voltage regulator is OFF. (++) Entry: (+++) The STANDBY mode is entered using the HAL_PWR_EnterSTANDBYMode() function. (++) Exit: (+++) WKUP pin rising or falling edge, RTC alarm (Alarm A and Alarm B), RTC wakeup, tamper event, time stamp event, external reset in NRST pin, IWDG reset.

Auto-wakeup (AWU) from low-power mode

- The MCU can be woken up from low-power mode by an RTC Alarm event, an RTC Wakeup event, a tamper event or a time-stamp event, without depending on an external interrupt (Auto-wakeup mode).
- RTC auto-wakeup (AWU) from the STOP and STANDBY modes
  - To wake up from the STOP mode with an RTC alarm event, it is necessary to configure the RTC to generate the RTC alarm using the HAL_RTC_SetAlarm_IT() function.
  - To wake up from the STOP mode with an RTC Tamper or time stamp event, it is necessary to configure the RTC to detect the tamper or time stamp event using the HAL_RTCEx_SetTimeStamp_IT() or HAL_RTCEx_SetTamper_IT() functions.
  - To wake up from the STOP mode with an RTC WakeUp event, it is necessary to configure the RTC to generate the RTC WakeUp event using the HAL_RTCEx_SetWakeUpTimer_IT() function.

This section contains the following APIs:

- ***HAL_PWR_ConfigPVD()***
- ***HAL_PWR_EnablePVD()***
- ***HAL_PWR_DisablePVD()***
- ***HAL_PWR_EnableWakeUpPin()***
- ***HAL_PWR_DisableWakeUpPin()***
- ***HAL_PWR_EnterSLEEPMode()***
- ***HAL_PWR_EnterSTOPMode()***
- ***HAL_PWR_EnterSTANDBYMode()***
- ***HAL_PWR_EnableSleepOnExit()***
- ***HAL_PWR_DisableSleepOnExit()***
- ***HAL_PWR_EnableSEVOnPend()***
- ***HAL_PWR_DisableSEVOnPend()***
- ***HAL_PWR_PVD_IRQHandler()***
- ***HAL_PWR_PVDCallback()***

64.2.5 Interrupt Handling Functions

This section provides functions allowing to handle the PVD pending interrupts.

This section contains the following APIs:

- ***HAL_PWR_PVD_IRQHandler()***
- ***HAL_PWR_PVDCallback()***

64.2.6 Detailed description of functions

HAL_PWR_DeInit

Function name

void HAL_PWR_DeInit (void)

Function description

Deinitialize the HAL PWR peripheral registers to their default reset values.

Return values

- **None.:**

Notes

- This functionality is not available in this product. The prototype is kept just to maintain compatibility with other products.

HAL_PWR_EnableBkUpAccess

Function name

void HAL_PWR_EnableBkUpAccess (void)

Function description

Enable access to the backup domain (RTC registers, RTC backup data registers and backup SRAM).

Return values

- **None.:**

Notes

- If the HSE divided by 2, 3, ..31 is used as the RTC clock, the Backup Domain Access should be kept enabled.

HAL_PWR_DisableBkUpAccess

Function name

void HAL_PWR_DisableBkUpAccess (void)

Function description

Disable access to the backup domain (RTC registers, RTC backup data registers and backup SRAM).

Return values

- **None.:**

Notes

- If the HSE divided by 2, 3, ..31 is used as the RTC clock, the Backup Domain Access should be kept enabled.

HAL_PWR_ConfigPVD

Function name
